Comment: A commenter requested that CMS clarify the instructions for line 29 of Worksheet S-10 so that non-Medicare bad debt is not multiplied by the CCR. This commenter stated that while CMS' revised cost report instructions indicate that non-reimbursed Medicare bad debt is not multiplied by the CCR, CMS' September 2017 transmittal²¹⁴ states that non-Medicare bad debt should be multiplied by the CCR.

²¹⁴ <https://www.cms.gov/regulations-and-guidance/guidance/transmittals/2017downloads/r11p240.pdf>

Response: We appreciate the commenter's concerns regarding the need for clarification of the Worksheet S-10 instructions. We reiterate our commitment to continuing to work with impacted parties to address their concerns regarding the Worksheet S-10 instructions through provider education and further refinement of the instructions, as appropriate. We also encourage providers to share with their respective MAC any questions they have regarding Worksheet S-10 instructions, reporting, and submission deadlines.

We continue to believe our efforts to refine the Worksheet S-10 instructions and related guidance have improved provider understanding of Worksheet S-10 and made the instructions clearer. We also recognize that there are continuing opportunities to further improve the accuracy and consistency of the information that is reported on the Worksheet S-10, and to the extent that commenters have raised new questions and concerns regarding the reporting requirements, we will attempt to address them through future rulemaking and/or sub-regulatory guidance and subsequent outreach [to MACs and providers]. However, as stated in previous IPPS/LTCH PPS rulemakings (*see, e.g.*, the FY 2024 IPPS/LTCH PPS final rule (88 FR 59008 and 59009)), we continue to believe that the Worksheet S-10 instructions are sufficiently clear and allow hospitals to accurately complete Worksheet S-10.

Regarding the commenter's request that CMS clarify whether non-Medicare bad debt is multiplied by CCR, we believe that the Worksheet S-10 instructions are clear and indicate that the CCR will not be applied to the deductible and coinsurance amounts for insured patients approved for charity care and non-reimbursed Medicare bad debt.

- New Hospital Policy for Purposes of Factor 3

For purposes of identifying new hospitals, for FY 2025, the FY 2021 cost reports are the most recent year of cost reports for which audits of Worksheet S-10 data have been conducted. Thus, hospitals with CCNs established on or after October 1, 2021, will be subject to the new hospital policy in FY 2025. If a new hospital is ultimately determined to be eligible for Medicare DSH payments for FY 2025, the hospital will receive an uncompensated care payment calculated

using a Factor 3 where the numerator is the uncompensated care costs reported on Worksheet S-10 of the hospital's FY 2025 cost report, and the denominator is the sum of the uncompensated care costs reported on Worksheet S-10 of the FY 2021 cost reports for all DSH-eligible hospitals. In addition, we will apply a scaling factor, as discussed previously, to the Factor 3 calculation for a new hospital. As we explained in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59004), we believe applying the scaling factor is appropriate for purposes of calculating Factor 3 for all hospitals, including new hospitals and hospitals that are treated as new hospitals, to improve consistency and predictability across all hospitals.

- Newly Merged Hospital Policy for Purposes of Factor 3

For FY 2025, the eligibility of a newly merged hospital to receive interim uncompensated care payments will be based on whether the surviving CCN has a preliminary projection of being DSH-eligible, and the amount of any interim uncompensated care payments will be based on the uncompensated care costs from the FY 2019, FY 2020, and FY 2021 cost reports available for the surviving CCN at the time the final rule is developed. However, at cost report settlement, we will determine the newly merged hospital's final uncompensated care payment based on the uncompensated care costs reported on its FY 2025 cost report. That is, we will revise the numerator of Factor 3 for the newly merged hospital to reflect the uncompensated care costs reported on the newly merged hospital's FY 2025 cost report. The denominator will be the sum of the uncompensated care costs reported on Worksheet S-10 of the FY 2021 cost reports for all DSH-eligible hospitals, which is the most recent fiscal year for which audits have been conducted. We will also apply a scaling factor, as described previously.

Comment: A few commenters expressed support for the uncompensated care payment policies currently in place for newly merged hospitals – specifically, the policy stating that final uncompensated care payments for these hospitals will be determined during cost report settlement based on the surviving hospital's cost report for the applicable fiscal year. These commenters also indicated support for our policy whereby MACs make the final determination

concerning whether new hospitals are eligible to receive DSH payments at cost report settlement based on the new hospital's cost report for the respective fiscal year.

Response: We appreciate the continued support for our policies for new and newly merged hospitals.

For a hospital that is subject to either of the trims for potentially aberrant data (the UCC trim and alternative trim methodology explained in the previous section of this final rule) and is ultimately determined to be DSH-eligible at cost report settlement, its uncompensated care payment will be calculated only after the hospital's reporting of insured charity care costs on its FY 2025 Worksheet S-10 has been reviewed. Accordingly, the MAC will calculate a Factor 3 for the hospital only after reviewing the uncompensated care information reported on Worksheet S-10 of the hospital's FY 2025 cost report. Then we will calculate Factor 3 for the hospital using the same methodology used to determine Factor 3 for new hospitals. Specifically, the numerator will reflect the uncompensated care costs reported on the hospital's FY 2025 cost report, while the denominator will reflect the sum of the uncompensated care costs reported on Worksheet S-10 of the FY 2021 cost reports of all DSH-eligible hospitals. In addition, we will apply a scaling factor, as discussed previously, to the Factor 3 calculation for the hospital.

We did not receive any comments on the discussion of the CCR trim methodology, the UCC trim methodology, or the alternative trim methodology.

Under the CCR trim methodology, for purposes of this final rule, the statewide average CCR was applied to 10 hospitals' FY 2019 reports, of which 4 hospitals had FY 2019 Worksheet S-10 data. The statewide average CCR was applied to 8 hospitals' FY 2020 reports, of which 3 hospitals had FY 2020 Worksheet S-10 data. The statewide average CCR was applied to 9 hospitals' FY 2021 reports, of which 4 hospitals had FY 2021 Worksheet S-10 data.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36197), we stated that for purposes of this FY 2025 IPPS/LTCH PPS final rule, consistent with our Factor 3 methodology since the FY 2014 IPPS/LTCH PPS final rule (78 FR 50642), we intended to use data from the

March 2024 HCRIS extract for this calculation. We explained that the March 2024 HCRIS extract would be the latest quarterly HCRIS extract that would be publicly available at the time of the development of the FY 2025 IPPS/LTCH PPS final rule.

Regarding requests from providers to amend and/or reopen previously audited Worksheet S-10 data for the most recent 3 cost reporting years that are used in the methodology for calculating Factor 3, we noted that MACs follow normal timelines and procedures. We explained that for purposes of the Factor 3 calculation for the FY 2025 IPPS/LTCH PPS final rule, any amended reports and/or reopened reports would need to have completed the amended report and/or reopened report submission processes by the end of March 2024. In other words, if the amended report and/or reopened report was not available for the March HCRIS extract, then that amended and/or reopened report data would not be part of the FY 2025 IPPS/LTCH PPS final rule's Factor 3 calculation. We noted that the March HCRIS data extract would be available during the comment period for the proposed rule if providers wanted to verify that their amended and/or reopened data is reflected in the March HCRIS extract.

d. Per-Discharge Amount of Interim Uncompensated Care Payments for FY 2025

Since FY 2014, we have made interim uncompensated care payments during the fiscal year on a per-discharge basis. Typically, we use a 3-year average of the number of discharges for a hospital to produce an estimate of the amount of the hospital's uncompensated care payment per discharge. Specifically, the hospital's total uncompensated care payment amount for the applicable fiscal year is divided by the hospital's historical 3-year average of discharges computed using the most recent available data to determine the uncompensated care payment per discharge for that fiscal year.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45247 and 45248), we modified this calculation for FY 2022 to be based on an average of FY 2018 and FY 2019 historical discharge data, rather than a 3-year average using the most recent 3 years of discharge data, which would have included data from FY 2018, FY 2019, and FY 2020. We explained our belief that

computing a 3-year average with FY 2020 discharge data would underestimate discharges, due to the decrease in discharges during the COVID-19 pandemic. For the same reason, in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49045), we calculated interim uncompensated care payments based on the 3-year average of discharges from FY 2018, FY 2019, and FY 2021 rather than a 3-year average using the most recent 3 years of discharge data.

We explained in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59010) that we believed that computing a 3-year average using the most recent 3 years of discharge data would potentially underestimate the number of discharges for FY 2024 due to the effects of the COVID-19 pandemic during FY 2020, which was the first year of the COVID-19 pandemic. We considered using an average of FY 2019, FY 2021, and FY 2022 discharge data to calculate the per-discharge amount for interim uncompensated care payments for FY 2024. However, we agreed with commenters that using FY 2019 data may overestimate discharge volume because updated claims data used to estimate the FY 2024 discharges in the Factor 1 calculation indicated that discharge volumes were not expected to return to pre-pandemic levels during FY 2024. Therefore, for FY 2024, we finalized a policy of calculating the per-discharge amount for interim uncompensated care payments using an average of FY 2021 and FY 2022 discharge data.

For FY 2025 and subsequent fiscal years, we proposed to calculate the per-discharge amount for interim uncompensated care payments using the average of the most recent 3 years of discharge data. Accordingly, for FY 2025, we proposed to use an average of discharge data from FY 2021, FY 2022, and FY 2023. We stated that we believed that our proposed approach would likely result in a better estimate of the number of discharges during FY 2025 and subsequent years for purposes of the interim uncompensated care payment calculation.

As we explained in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50645), we generally believe that it is appropriate to use a 3-year average of discharge data to reduce the degree to which we would over- or under-pay the uncompensated care payment on an interim basis. In any given year, a hospital could have low or high Medicare utilization that differs from other years.

For example, if a hospital had two Medicare discharges in its most recent year of claims data but experienced four discharges in FY 2025, during the fiscal year, we would pay two times the amount the hospital should receive and need to adjust for that at cost report settlement. Similarly, if a hospital had four Medicare discharges in its most recent year of claims data, but experienced two discharges in FY 2025, during the fiscal year, we would only pay half the amount the hospital should receive and need to adjust for that at cost report settlement.

In the FY 2025 IPPS/LTCH PPS proposed rule, we stated that we believed that, generally, use of the most recent 3 years of discharge data, rather than older data, is more likely to reflect current trends in discharge volume and provide an approximate estimate of the number of discharges in the applicable fiscal year. In addition, we noted that including discharge data from FY 2023 to compute this 3-year average would be consistent with the proposed use of FY 2023 Medicare claims in the IPPS ratesetting, as discussed in section I.E. of the preamble of this FY 2025 IPPS/LTCH PPS final rule.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to use the resulting 3-year average of the most recent years of available historical discharge data to calculate a per-discharge payment amount that would be used to make interim uncompensated care payments to each projected DSH-eligible hospital during FY 2025 and subsequent fiscal years. Interim uncompensated care payments made to a hospital during the fiscal year are reconciled following the end of the year to ensure that the final payment amount is consistent with the hospital's prospectively determined uncompensated care payment for the fiscal year.

We proposed to make conforming changes to the regulations under 42 CFR 412.106. Specifically, we proposed to modify paragraph (1) of § 412.106(i) to state that for FY 2025 and subsequent fiscal years, interim uncompensated care payments will be calculated based on an average of the most recent 3 years of available historical discharge data. We requested comments on this proposal.

Comment: Several commenters requested that CMS use a two-year average of discharge

data to estimate the per-discharge amount of interim uncompensated care payments for FY 2025 and/or for future fiscal years. One commenter suggested that CMS use an average of the two most recent years of discharge data. These commenters stated that a two-year average would better reflect anticipated FY 2025 discharges. Some commenters stated CMS overestimated discharge volume in its rulemaking in recent years. Some commenters stated that this overestimation depresses interim uncompensated care payments. A commenter urged CMS to modify its interim uncompensated care payment methodology to improve the effectiveness of DSH payments and reduce overreliance on the reconciliation process for uncompensated care payments. This commenter also stated that it is inconsistent for CMS to project a decline in discharges for the Factor 1 calculation while not assuming the same decline when projecting the discharges used to calculate the per-discharge amount. This same commenter stated there may be year-to-year variations in discharge volume, but there are also larger trends that reflect changing treatment patterns, technology, Medicare Advantage penetration, and other factors. This same commenter supported a methodology that incorporates more than one year of data to appropriately temper volatility in year-to-year changes in discharge volume, but the commenter recommended to appropriately use more current data. This same commenter recommended using a two-year average of discharges to estimate the per-discharge amount of interim uncompensated care payments, in addition to incorporating a national adjustment factor so that the historical discharges can be trended forward to FY2025 estimate of discharges..

Response: We thank commenters for their feedback on calculation of the per-discharge amount of interim uncompensated care payments for FY 2025. In light of the commenters' concerns regarding a trend of decreasing discharge volume and possible overestimation of discharges in recent years, we believe that, on balance, omitting FY 2021 data from the calculation of interim uncompensated care payments is likely to more accurately estimate FY 2025 discharges. Therefore, we are finalizing our proposal with modification. Specifically, we will calculate the per-discharge amount of uncompensated care payments for FY 2025 using an

average of the most recent 2 years of available historical discharge data: FY 2022 and FY 2023 discharge data. We are modifying the text of § 412.106(i)(1) to state that for FY 2025, interim uncompensated care payments will be calculated based on an average of the most recent 2 years of available historical discharge data.

Additionally, we believe using an average of the most recent 3 years of available historical discharge data will appropriately reflect year-to-year variations in discharge volumes in FY 2026 and subsequent fiscal years. As explained earlier in this section of this final rule and in the proposed rule, the effect of the COVID-19 pandemic on discharges was the rationale for modifying the interim uncompensated care payment methodology in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45247 and 45248). We believe the effect on discharge volume of the COVID-19 pandemic will likely be diminished beginning in FY 2026. Therefore, consistent with the proposed rule, we are modifying the text of § 412.106(i)(1) to state that for FY 2026 and subsequent fiscal years, interim uncompensated care payments will be calculated based on an average of the most recent 3 years of available historical discharge data.

At this time, we are not adopting a national adjustment approach because, as we explain more fully earlier in this section and in the proposed rule, we believe that in FY 2026 and subsequent years, using an average of the most recent 3 years of available discharge data will likely result in a reasonable estimate at the provider level, for purposes of interim uncompensated care payments. We will consider commenters' other suggested modifications to our interim uncompensated care payment policies, such as using a national adjustment factor, in future rulemaking.

Further, as we explained in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36198-36199), we finalized a voluntary process in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58833 and 58834), through which a hospital may submit a request to its MAC for a lower per-discharge interim uncompensated care payment amount, including a reduction to zero, once before the beginning of the fiscal year and/or once during the fiscal year. In conjunction with this

request, the hospital must provide supporting documentation demonstrating that there would likely be a significant recoupment at cost report settlement if the per-discharge amount is not lowered (for example, recoupment of 10 percent or more of the hospital's total uncompensated care payment, or at least \$100,000). For example, a hospital might submit documentation showing a large projected increase in discharges during the fiscal year to support reduction of its per-discharge uncompensated care payment amount. As another example, a hospital might request that its per-discharge uncompensated care payment amount be reduced to zero midyear if the hospital's interim uncompensated care payments during the year have already surpassed the total uncompensated care payment calculated for the hospital.

Under the policy we finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58833 through 58834), the hospital's MAC will evaluate these requests and the supporting documentation before the beginning of the fiscal year and/or with midyear requests when the historical average number of discharges is lower than the hospital's projected discharges for the current fiscal year. If, following review of the request and the supporting documentation, the MAC agrees that there likely would be significant recoupment of the hospital's interim Medicare uncompensated care payments at cost report settlement, the only change that will be made is to lower the per-discharge amount either to the amount requested by the hospital or another amount determined by the MAC to be appropriate to reduce the likelihood of a substantial recoupment at cost report settlement. If the MAC determines it would be appropriate to reduce the interim Medicare uncompensated care payment per-discharge amount, that updated amount will be used for purposes of the outlier payment calculation for the remainder of the fiscal year. We are continuing to apply this policy for FY 2025. We refer readers to the Addendum in the FY 2023 IPPS/LTCH final rule for a more detailed discussion of the steps for determining the operating and capital Federal payment rate and the outlier payment calculation (87 FR 49431 through 49432). No change would be made to the total uncompensated care payment amount determined for the hospital on the basis of its Factor 3. In other words, any change to the per-discharge

uncompensated care payment amount will not change how the total uncompensated care payment amount will be reconciled at cost report settlement.

We received comments related to the uncompensated care payment reconciliation process.

Comment: A commenter recommended that CMS use the traditional payment reconciliation process to calculate final payments for uncompensated care costs pursuant to section 1886(r)(2) of the Act. This commenter did not object to CMS using prospective estimates, derived from the best data available, to calculate interim payments for uncompensated care costs. However, the commenter stated that interim payments should be subject to later reconciliation based on estimates derived from actual data from the fiscal year. This commenter also stated that CMS' current IPPS/LTCH PPS rulemaking process is flawed because CMS may use data and calculations in final rules that were not included in the relevant proposed rules without providing advance notice to hospitals, limiting their ability to provide informed comments. Several commenters stated that CMS fails to provide meaningful explanations of its uncompensated care payment calculations and is in violation of the Administrative Procedure Act. These commenters recommended that CMS satisfy its legal obligation by providing hospitals the opportunity to review and comment on the more recent data used to calculate Factors 1, 2, and 3 in each final rulemaking before the agency publishes the final rule.

Response: Consistent with the position that we have taken in past rulemakings, we continue to believe that applying our best estimates of the three factors used in the calculation of uncompensated care payments to determine payments prospectively is most conducive to administrative efficiency, finality, and predictability in payments (e.g., the FY 2024 IPPS/LTCH PPS final rule (88 FR 59011)). We continue to believe that, in affording the Secretary the discretion to estimate the three factors used to determine uncompensated care payments and by including a prohibition against administrative and judicial review of those estimates in section 1886(r)(3) of the Act, Congress recognized the importance of finality and predictability under a prospective payment system. As a result, we do not agree with the commenter's suggestion that

we should establish a process for reconciling our estimates of uncompensated care payments, which would be contrary to the notion of prospectivity in a payment system. Furthermore, we note that this rulemaking has been conducted consistent with the requirements of the Administrative Procedure Act and Title XVIII of the Act. Under the Administrative Procedure Act, a proposed rule is required to include either the terms or substance of the proposed rule, or a description of the subjects and issues involved. In this case, the FY 2025 IPPS/LTCH PPS proposed rule (86 FR 369193-36199) included a detailed discussion of our proposed methodology for calculating Factor 3 and the data that would be used. We made public the best data available at the time of the proposed rule to allow hospitals to understand the anticipated impact of the proposed methodology and submit comments, and we have considered those comments in determining our final policies for FY 2025.

e. Process for Notifying CMS of Merger Updates and to Report Upload Issues

As we have done for every proposed and final rule beginning in FY 2014, in conjunction with this final rule, we will publish on the CMS website a table listing Factor 3 for hospitals that we estimate will receive empirically justified Medicare DSH payments in FY 2025 (that is, those hospitals that will receive interim uncompensated care payments during the fiscal year), and for the remaining subsection (d) hospitals and subsection (d) Puerto Rico hospitals that have the potential of receiving an uncompensated care payment in the event that they receive an empirically justified Medicare DSH payment for the fiscal year as determined at cost report settlement. However, we note that a Factor 3 will not be published for new hospitals and hospitals that are subject to the alternative trim for hospitals with potentially aberrant data that are not projected to be DSH-eligible.

We also will publish a supplemental data file containing a list of the mergers that we are aware of and the computed uncompensated care payment for each merged hospital. In the DSH uncompensated care supplemental data file, we list new hospitals and the 8 hospitals that would be subject to the alternative trim for hospitals with potentially aberrant data that are not projected

to be DSH-eligible, with a N/A in the Factor 3 column.

Hospitals had 60 days from the date of public display of the FY 2025 IPPS/LTCH PPS proposed rule in the **Federal Register** to review the table and supplemental data file published on the CMS website in conjunction with the proposed rule and to notify CMS in writing of issues related to mergers and/or to report potential upload discrepancies due to MAC mishandling of Worksheet S-10 data during the report submission process.²¹⁵ In the proposed rule, we stated that comments raising issues or concerns that are specific to the information included in the table and supplemental data file should be submitted by email to the CMS inbox at Section3133DSH@cms.hhs.gov. We indicated that we would address comments related to mergers and/or reporting upload discrepancies submitted to the CMS DSH inbox as appropriate in the table and the supplemental data file that we publish on the CMS website in conjunction with the publication of the FY 2025 IPPS/LTCH PPS final rule. We also stated that all other comments submitted in response to our proposals for FY 2025 must be submitted in one of the three ways found in the **ADDRESSES** section of the proposed rule before the close of the comment period in order to be assured consideration. In addition, we noted that the CMS DSH inbox is not intended for Worksheet S-10 audit process related emails, which should be directed to the MACs.

²¹⁵ For example, if the report does not reflect audit results due to MAC mishandling, or the most recent report differs from a previously accepted, amended report due to MAC mishandling.

F. Impact on Medicare DSH Payment Adjustment of Implementation of New OMB Labor Market Delineations

As discussed in section III.B. of the preamble of this final rule, in the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to implement the new OMB labor market area delineations (which are based on 2020 Decennial Census data) for the FY 2025 wage index. We stated that this proposal also would have an impact on the calculation of Medicare DSH payment adjustments to certain hospitals. Hospitals that are designated as rural with less than 500 beds and are not rural referral centers (RRCs) or Medicare-dependent, small rural hospitals (MDHs) are subject to a maximum DSH payment adjustment of 12 percent. Accordingly, hospitals with less than 500 beds that are currently in urban counties that would become rural if we finalize our proposal to adopt the new OMB delineations, and that do not become RRCs or MDHs, would be subject to a maximum DSH payment adjustment of 12 percent. (We note, as discussed in section V.F.2. of the preamble of this final rule, under current law the MDH program will expire on December 31, 2024). We also note that urban hospitals are only subject to a maximum DSH payment adjustment of 12 percent if they have less than 100 beds.

In that same proposed rule, we explained that our existing regulations at 42 CFR 412.102 will apply in FY 2025 with respect to the calculation of the DSH payments to hospitals that are currently located in urban counties that would become rural if we finalize our proposal to adopt the new OMB delineations. The provisions of 42 CFR 412.102 specify that an urban hospital that was part of an MSA, but was redesignated as rural (as defined in the regulations), as a result of the most recent OMB standards for delineating statistical areas adopted by CMS, may receive an adjustment to its rural Federal payment amount for operating costs for two successive fiscal years. Specifically, the regulations state that, in the first year after a hospital loses urban status, the hospital will receive an additional payment that equals two thirds of the difference between the disproportionate share payments as applicable to the hospital before its redesignation from urban to rural and disproportionate share payments otherwise, applicable to the hospital

subsequent to its redesignation from urban to rural. In the second year after a hospital loses urban status, the hospital will receive an additional payment that equals one-third of the difference between the disproportionate share payments applicable to the hospital before its redesignation from urban to rural and disproportionate share payments otherwise applicable to the hospital subsequent to its redesignation from urban to rural.

Comment: Commenters generally supported the application of 42 CFR 412.102 for urban hospitals located in an area that is redesignated as rural as a result of the most recent OMB standards for delineating statistical areas adopted by CMS. A few commenters expressed concern about the impact on DSH payments when an urban hospital becomes rural with the adoption of the updates to the CBSA designations. According to these commenters, rural hospitals are disadvantaged in the DSH statutory formula.

Response: We appreciate the support of the commenters as well as the concerns raised by the commenters. As discussed in section III.B. of this preamble, after consideration of public comments, we are finalizing our proposal to implement the new OMB labor market area delineations for FY 2025. Therefore, 42 CFR 412.102 will apply to those urban hospitals currently located in an area that will be redesignated as rural beginning October 1, 2024. We believe the special treatment for these hospitals under the regulations at 42 CFR 412.102 helps mitigate the commenters' concerns as urban hospitals in areas that will be redesignated as rural due to the new OMB labor market area delineations may receive an additional payment for two years as described previously in this section.

G. Withdrawal of 42 CFR 412.106 (FY 2004 and Prior Fiscal Years) to the Extent it Included only "Covered Days" in the SSI Ratio

In *Becerra v. Empire Health Foundation, for Valley Hospital Medical Center*, 597 U.S. 424 (2022) (*Empire Health*), the Supreme Court addressed the question of whether Medicare patients remain "entitled to benefits under part A" when Medicare does not pay for their care, such as when they have exhausted their Medicare benefits for a spell of illness. Prior to fiscal

year (FY) 2005, when we calculated a hospital’s DSH adjustment we included in the Medicare fraction (also referred to as the Medicare-SSI fraction, SSI fraction, or SSI ratio) only “covered” Medicare patient days, that is, days paid by Medicare (see 42 CFR 412.106(b)(2)(i) (2003)). The “covered” days rule originated in the FY 1986 IPPS interim final rule (51 FR 16772 and 16788) and originally appeared in § 412.106(a)(1)(i) but was later re-numbered. The approach of excluding from the Medicare fraction patient days for which Medicare did not pay was based on an interpretation of the statute’s parenthetical phrase “(for such days).”

Section 1886(d)(5)(F)(vi)(I) of the Act. Following a series of judicial decisions rejecting a parallel interpretation of the same language in the numerator of the Medicaid fraction as counting only patient days actually paid by the Medicaid program, the Secretary revisited that approach in a 2004 rulemaking. Thus, the “covered days” rule was the relevant Medicare payment policy until it was revised and replaced by the FY 2005 IPPS final rule (69 FR 48916, 49099, and 49246).

The FY 2005 regulation at issue in *Empire Health* – codified in the FY 2005 IPPS final rule – interpreted the statute to mean that the Medicare fraction includes non-covered days in the SSI ratio. (For more information see 69 FR 48916, 49099, and 49246 (amending 42 CFR 412.106(b)(2)(i) to include in the Medicare fraction all days associated with patients who were entitled to Medicare Part A during their hospital stays, regardless of whether Medicare paid for those days).) In *Empire Health*, the Supreme Court upheld the FY 2005 regulation and held that the statute “disclose[s] a surprisingly clear meaning,” 597 U.S. at 434, namely that beneficiaries remain “entitled to benefits under part A” on days for which Medicare does not pay and thus the Medicare fraction includes total days, not only covered days. The Supreme Court also definitively resolved the meaning of the parenthetical phrase “(for such days)” in the Medicare fraction, rejecting the provider’s contention that the phrase changed the consistent meaning of “entitled to benefits under Part A” from “meeting Medicare’s statutory (age or disability) criteria on the days in question,” to “actually receiving Medicare payments.” *Id.* at

440. The Court determined that the “for such days” parenthetical “instead works as HHS says: hand in hand with the ordinary statutory meaning of ‘entitled to [Part A] benefits.’” *Id.*

The Supreme Court has concluded that the interpretation set forth in the FY 2005 IPPS final rule “correctly construes the statutory language at issue.” *Empire Health*, 597 U.S. at 434. Because the pre-FY 2005 rule conflicts with the plain meaning of the statute, as confirmed by the Supreme Court, it cannot govern the calculation of DSH payments for hospitals with properly pending claims in DSH appeals or open cost reports that include discharges that need to be determined pursuant to the statute, regardless of whether such discharges would otherwise pre-date the change in the regulation finalized by the FY 2005 IPPS final rule. For that reason, we proposed to formally withdraw 42 CFR 412.106 as it existed prior to the effective date of the FY 2005 IPPS final rule to the extent it included only covered days in the SSI ratio. We will apply the statute as understood by the Supreme Court in *Empire Health*, instead of the pre-FY 2005 regulation, to any properly pending claim in a DSH appeal or open cost report to which that regulation would otherwise have applied. We do not believe this change constitutes an exercise of our “retroactive” rulemaking authority under section 1871(e)(1)(A) of the Act. Rather, we will apply the plain meaning of the statute (as it has existed unchanged, in relevant part, since its enactment on April 7, 1986). Moreover, because we are applying the substantive legal standard established by the statute itself, and not filling any gap therein, notice-and-comment rulemaking is not required by section 1871(e)(1)(A) of the Act, as construed in *Azar v. Allina Health Services*, 139 S. Ct. 1804 (June 3, 2019).

The withdrawal of this regulation will not serve as a basis to reopen a CMS or contractor determination, a contractor hearing decision, a CMS reviewing official decision, or a decision by the Provider Reimbursement Review Board or the Administrator. We recognize that hospitals may have anticipated receiving greater Medicare reimbursement for still-open pre-FY 2005 cost reporting periods in circumstances where the “covered” days limitation would have resulted in a

larger DSH adjustment. However, we are obliged to apply the statute as the Supreme Court determined Congress wrote it.

Comment: A commenter opposed our proposal to withdraw 42 CFR 412.106 for several reasons. The commenter stated that our proposal is based on a misreading of *Empire Health*. According to the commenter, the Supreme Court held that our interpretation of section 1886(d)(5)(F)(vi)(I) of the Act to include unpaid patient days in the Medicare fraction is merely supported by the statute, not required by the statute. The commenter argued that the proposal rests on an interpretation not required by statute, citing *Northeast Hospital Corp. v. Sebelius*, 657 F.3d 1 (D.C. Cir. 2011), and is against the public interest, thus constituting improper retroactive rulemaking. The commenter further argued that our proposal would unfairly penalize affected hospitals and deprive them of fair notice and due process. In addition, the commenter argued our proposal would be unfair to hospitals that are still waiting to receive DSH payments calculated in accordance with the pre-FY 2005 version of 42 CFR 412.106 because other hospitals already received the benefit of that rule before the Supreme Court issued its decision in *Empire Health*. The commenter also asserted that we did not finalize the 2005 revision until 2007 with a technical correction to the regulation text.

Response: We disagree with the commenter's reading of the Supreme Court's *Empire Health* decision. *Empire Health* addressed the question of whether, for purposes of calculating a hospital's DSH adjustment and Medicare fraction, Medicare patients remain "entitled to benefits under part A" when Medicare does not pay for their care, such as when they have exhausted their Medicare benefits for a spell of illness. As we explained in the proposed rule, prior to FY 2005, our approach to calculating a hospital's DSH adjustment, as provided in our regulations starting with the FY 1986 IPPS interim final rule (51 FR 16772 and 16788), was to include in the Medicare fraction only "covered" Medicare patient days, that is, days paid by Medicare. The "covered days" approach was based on an interpretation of the statute's parenthetical phrase "(for such days)." Following a series of judicial decisions rejecting a parallel interpretation of

the “(for such days)” language in the numerator of the Medicaid fraction as counting only patient days actually paid by the Medicaid program, we revised and replaced this rule in the FY 2005 IPPS final rule (69 FR 48916, 49099, and 49246). We note that we further disagree with the commenter’s assertion that we did not finalize this revision until 2007 with a technical correction to the regulation text. Under the policy finalized in the FY 2005 IPPS final rule, we interpreted the statute to mean that the Medicare fraction includes covered *and* non-covered Medicare patient days (that is, “total days”) because Medicare patients remain entitled to Part A benefits even on patient days not covered by Medicare. In upholding this reading of the statute, the Supreme Court in *Empire Health* did not conclude merely, as the commenter states, that the statute “supported” our interpretation. Rather, the Court concluded that “being ‘entitled’ to Medicare benefits . . . means—in the [DSH] fraction descriptions, as throughout the statute—meeting the basic statutory criteria, not actually receiving payment for a given day’s treatment.” 597 U.S. at 435. The Court reaffirmed that this was its own conclusion when it said elsewhere, “The structure of the relevant statutory provisions reinforces *our conclusion* that ‘entitled to [Part A] benefits’ means qualifying for those benefits, and nothing more.” *Id.* at 442 (alteration in original) (emphasis added). And the Court rejected the notion that the “(for such days)” parenthetical required a “covered days” approach, concluding instead that it “works as HHS says: hand in hand with the ordinary statutory meaning of ‘entitled to [Part A] benefits.’” *Id.* at 440 (alteration in original). We note that the Supreme Court’s holding in *Empire Health* displaced *Northeast Hospital Corp. v. Sebelius*, 657 F.3d 1, 6-13 (D.C. Cir. 2011), to the extent that it supports a conclusion that the statutory language was ambiguous on the issue of “covered days” versus “total days.” Thus, in the wake of *Empire Health*, the commenter’s reliance on *Northeast* in support of its opposition to our proposal is unfounded.

We also disagree with the commenter’s suggestion that *Empire Health* left a gap in the statute for the agency to fill that would require notice-and-comment rulemaking under the Supreme Court’s earlier decision in *Azar v. Allina Health Services*, 587 U.S. 566 (2019). To the

contrary, *Empire Health* made clear that the statute established the substantive legal standard that we articulated in the FY 2005 IPPS final rule (i.e., for purposes of the DSH adjustment calculation, Medicare patients are “entitled to [Part A] benefits” if they are qualified for those benefits, regardless of whether Medicare pays for their hospital stay, and all patient days associated with these patients are counted in the Medicare fraction). It follows from this, as we stated in the FY 2025 proposed rule, that the pre-FY 2005 rule that counted only covered days in the Medicare fraction conflicts with the plain meaning of the statute, and it should thus be withdrawn.

Contrary to the commenter’s contention and consistent with what we said in the proposed rule, we do not believe that withdrawing a regulation that conflicts with the governing statute constitutes an exercise of our “retroactive” rulemaking authority under section 1871(e)(1)(A) of the Act. Rather, we are simply giving effect to the language of the statute as it has existed throughout the relevant time period. Nonetheless, even if the withdrawal could be seen as an exercise of retroactive rulemaking, the Secretary has determined that the withdrawal is necessary to comply with statutory requirements; namely, the statutory requirement that we include in the Medicare fraction all patient days attributable to Medicare patients, regardless of whether Medicare paid for services on those days. As we stated in the proposed rule, we must follow the statute as the Supreme Court determined Congress wrote it. This would be a sufficient basis for us to engage in retroactive rulemaking, per section 1871(e)(1)(A)(i) of the Act, if this withdrawal could be seen as retroactive rulemaking, which it is not. As such, it is unnecessary for us to address the commenter’s additional assertion that the Secretary is not authorized here, under section 1871(e)(1)(A)(ii) of the Act, to apply a change in regulations retroactively to further the public interest. We do not have authority to make DSH adjustments that do not comply with the statute as written by Congress and interpreted by the Supreme Court, and it would therefore be contrary to the public interest for us to maintain the rule in its pre-FY 2005 form. We also disagree with the commenter’s claim that our proposed withdrawal of the pre-FY 2005 rule is

contrary to the public interest because some hospitals' DSH adjustments will be reduced. Following the statute as written and in accordance with Supreme Court precedent is in the public interest, not contrary to it, even if it results in smaller DSH payment adjustments than some hospitals may have hoped for. Moreover, while we agree with the commenter that advance notice-and-comment rulemaking is generally both necessary and in the public interest, we have taken that interest into account here by finalizing the proposed withdrawal only after a notice-and-comment process. In any event, the commenter does not point to any authority for the proposition that the interest in advance notice-and-comment rulemaking, as they envision it, could permit us to keep on the books and follow a regulation that is contrary to the statute.

We also disagree with the commenter's assertion that our proposal would penalize affected hospitals and deprive them of fair notice and due process. Our proposal applies the meaning of the statute as it was written in 1986, and the operative language has not changed in any material way since then. As we said in the proposed rule, we recognize that hospitals may have anticipated receiving greater Medicare reimbursement for their still-open pre-FY 2005 cost reporting periods in circumstances where the "covered days" limitation would have resulted in a larger DSH payment. Nonetheless, it would not be reasonable for those hospitals to expect us to ignore the statute and pay them more than Congress allowed or, to the extent their still-open DSH adjustments were already paid based on the pre-FY 2005 rule, allow them to retain overpayments not authorized by Congress, after the Supreme Court settled the plain meaning of the statute. Our proposal was not meant to penalize affected hospitals in any way, and it is not an enforcement action. Rather, our proposal was intended to ensure, going forward, that providers' DSH adjustments are paid in accordance with the statute.

Finally, we disagree with the commenter's assertion that our proposal would be unfair to affected hospitals because other hospitals whose cost reporting periods were settled before the Supreme Court issued *Empire Health* received the benefit of the "covered days" limitation. That other hospitals were paid on the basis of "covered days" in the past cannot justify continuing to

do so going forward now that the Supreme Court has settled the meaning of the statute. It is neither unfair nor unusual for cost reports to be finalized differently from one another with respect to a legal issue depending on the outcome of litigation raising that issue and the status of a hospital's cost report at the time of a final non-appealable decision. And while *Empire Health* did not specifically address the legality of the pre-FY 2005 rule, that rule directly conflicts with the meaning of the statute as settled by the Supreme Court in that case. Further, to the extent the commenter argues that it is unfair that affected hospitals had to wait for years to receive their DSH adjustment payments and, in the process, lost the benefit of the "covered days" limitation that other hospitals already benefited from, we note that the wait was caused by protracted litigation over numerous aspects of the DSH calculation and the scope of the Medicare statute's rulemaking requirements, which significantly slowed (and, at times, ground to a halt) our ability to perform such calculations and enable our contractors to settle providers' open cost reports that were involved in, or affected by, such litigation.

After considering the comment received, we are finalizing our proposal to formally withdraw 42 CFR 412.106 as it existed prior to the effective date of the FY 2005 IPPS final rule to the extent it included only covered days in the SSI ratio when calculating a hospital's DSH adjustment. The withdrawal of this regulation will not serve as a basis to reopen a CMS or contractor determination, a contractor hearing decision, a CMS reviewing official decision, or a decision by the Provider Reimbursement Review Board or the Administrator.

We received several comments outside the scope of the proposed rule. These comments related to the exclusion of days associated with uncompensated care pools under section 1115 waivers from the numerator of the Medicaid fraction, requests for CMS to modernize DSH and work more closely with other agencies, Medicaid eligibility and redetermination, and concern over 340B eligibility. Because we consider these public comments to be outside the scope of the proposed rule, we are not addressing these comments in this final rule.

V. Other Decisions and Changes to the IPPS for Operating Costs

A. Changes to MS-DRGs Subject to Postacute Care Transfer Policy and MS-DRG Special Payments Policies (§ 412.4)

1. Background

Existing regulations at 42 CFR 412.4(a) define discharges under the IPPS as situations in which a patient is formally released from an acute care hospital or dies in the hospital. Section 412.4(b) defines acute care transfers, and § 412.4(c) defines postacute care transfers. Our policy set forth in § 412.4(f) provides that when a patient is transferred and his or her length of stay is less than the geometric mean length of stay for the MS-DRG to which the case is assigned, the transferring hospital is generally paid based on a graduated per diem rate for each day of stay, not to exceed the full MS-DRG payment that would have been made if the patient had been discharged without being transferred.

The per diem rate paid to a transferring hospital is calculated by dividing the full MS-DRG payment by the geometric mean length of stay for the MS-DRG. Based on an analysis that showed that the first day of hospitalization is the most expensive (60 FR 45804), our policy generally provides for payment that is twice the per diem amount for the first day, with each subsequent day paid at the per diem amount up to the full MS-DRG payment (§ 412.4(f)(1)). Transfer cases also are eligible for outlier payments. In general, the outlier threshold for transfer cases, as described in § 412.80(b), is equal to (Fixed-Loss Outlier threshold for Nontransfer Cases adjusted for geographic variations in costs / Geometric Mean Length of Stay for the MS-DRG) *(Length of Stay for the Case plus 1 day).

We established the criteria set forth in § 412.4(d) for determining which DRGs qualify for postacute care transfer payments in the FY 2006 IPPS final rule (70 FR 47419 through 47420). The determination of whether a DRG is subject to the postacute care transfer policy was initially based on the Medicare Version 23.0 GROUPER (FY 2006) and data from the FY 2004 MedPAR file. However, if a DRG did not exist in Version 23.0 or a DRG included in Version

23.0 is revised, we use the current version of the Medicare GROUPER and the most recent complete year of MedPAR data to determine if the DRG is subject to the postacute care transfer policy. Specifically, if the MS-DRG's total number of discharges to postacute care equals or exceeds the 55th percentile for all MS-DRGs and the proportion of short-stay discharges to postacute care to total discharges in the MS-DRG exceeds the 55th percentile for all MS-DRGs, CMS will apply the postacute care transfer policy to that MS-DRG and to any other MS-DRG that shares the same base MS-DRG. The statute at subparagraph 1886(d)(5)(J) of the Act directs CMS to identify MS-DRGs based on a high volume of discharges to postacute care facilities and a disproportionate use of postacute care services. As discussed in the FY 2006 IPPS final rule (70 FR 47416), we determined that the 55th percentile is an appropriate level at which to establish these thresholds. In that same final rule (70 FR 47419), we stated that we will not revise the list of DRGs subject to the postacute care transfer policy annually unless we are making a change to a specific MS-DRG.

To account for MS-DRGs subject to the postacute care policy that exhibit exceptionally higher shares of costs very early in the hospital stay, § 412.4(f) also includes a special payment methodology. For these MS-DRGs, hospitals receive 50 percent of the full MS-DRG payment, plus the single per diem payment, for the first day of the stay, as well as a per diem payment for subsequent days (up to the full MS-DRG payment (§ 412.4(f)(6))). For an MS-DRG to qualify for the special payment methodology, the geometric mean length of stay must be greater than 4 days, and the average charges of 1-day discharge cases in the MS-DRG must be at least 50 percent of the average charges for all cases within the MS-DRG. MS-DRGs that are part of an MS-DRG severity level group will qualify under the MS-DRG special payment methodology policy if any one of the MS-DRGs that share that same base MS-DRG qualifies (§ 412.4(f)(6)).

Prior to the enactment of the Bipartisan Budget Act of 2018 (Pub. L. 115-123), under section 1886(d)(5)(J) of the Act, a discharge was deemed a “qualified discharge” if the individual was discharged to one of the following postacute care settings:

- A hospital or hospital unit that is not a subsection (d) hospital.
- A skilled nursing facility.
- Related home health services provided by a home health agency provided within a timeframe established by the Secretary (beginning within 3 days after the date of discharge).

Section 53109 of the Bipartisan Budget Act of 2018 amended section 1886(d)(5)(J)(ii) of the Act to also include discharges to hospice care provided by a hospice program as a qualified discharge, effective for discharges occurring on or after October 1, 2018. In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41394), we made conforming amendments to § 412.4(c) of the regulation to include discharges to hospice care occurring on or after October 1, 2018, as qualified discharges. We specified that hospital bills with a Patient Discharge Status code of 50 (Discharged/Transferred to Hospice - Routine or Continuous Home Care) or 51 (Discharged/Transferred to Hospice, General Inpatient Care or Inpatient Respite) are subject to the postacute care transfer policy in accordance with this statutory amendment.

2. Changes for FY 2025

As discussed in the proposed rule and section II.C. of the preamble this final rule, based on our analysis of FY 2023 MedPAR claims data, CMS proposed to make changes to a number of MS-DRGs, effective for FY 2025. Specifically, we proposed the following changes:

- Adding ICD-10-PCS codes describing left atrial appendage closure (LAAC) procedures and cardiac ablation procedures to proposed new MS-DRG 317 (Concomitant Left Atrial Appendage Closure and Cardiac Ablation).
- Deleting existing MS-DRGs 453, 454, and 455 (Combined Anterior and Posterior Spinal Fusion with MCC, with CC, and without CC/MCC, respectively) and to reassign procedures from the existing MS-DRGs, 453, 454, and 455 and MS-DRGs 459 and 460 (Spinal Fusion Except Cervical with MCC and without MCC, respectively) to proposed new MS-DRG 402 (Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical), proposed new MS-DRGs 426, 427, and 428 (Multiple Level Combined Anterior and Posterior Spinal

Fusion Except Cervical with MCC, with CC, without MCC/CC, respectively), proposed new MS-DRGs 429 and 430 (Combined Anterior and Posterior Cervical Spinal Fusion with MCC and without MCC, respectively), and proposed new MS-DRGs 447 and 448 (Multiple Level Spinal Fusion Except Cervical with MCC and without MCC, respectively). We also proposed to revise the title of MS-DRGs 459 and 460 to “Single Level Spinal Fusion Except Cervical with MCC and without MCC, respectively”. As discussed in section II.C. of the preamble of this final rule and later in this section, we are finalizing our proposals, with modification, to reflect the reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device and to delete MS-DRGs 459 and 460 and renumber as MS-DRGs 450 and 451.

- Reassigning cases that report a principal diagnosis of acute leukemia with an “other” O.R. procedure from MS-DRGs 834, 835, and 836 (Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) to new MS-DRG 850 (Acute Leukemia with Other O.R. Procedures). We note that we also proposed to revise the title of MS-DRGs 834, 835, and 836 from “Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without CC/MCC”, respectively to “Acute Leukemia with MCC, with CC, and without CC/MCC”.

We noted in the proposed rule that proposed revised MS-DRGs 459 and 460 are currently subject to the postacute care transfer policy. We stated that we believe it is appropriate to reevaluate the postacute care transfer policy status for MS-DRGs 459 and 460. When proposing changes to MS-DRGs that involve adding, deleting, and reassigning procedures between proposed new and revised MS-DRGs, we continue to believe it is necessary to evaluate all of the affected MS-DRGs to determine whether they should be subject to the postacute care transfer policy.

We stated that MS-DRGs 834, 835, and 836 are currently not subject to the postacute care transfer policy. We noted that while we are proposing to reassign certain cases from these MS-DRGs to newly proposed MS-DRGs, we estimated that less than 5 percent of the current

cases would shift from the current assigned MS-DRGs to the proposed new MS-DRGs. We stated that we do not consider these proposed revisions to constitute a material change that would warrant reevaluation of the postacute care status of MS-DRGs 834, 835, and 836. CMS may further evaluate what degree of shifts in cases for existing MS-DRGs warrant consideration for the review of postacute care transfer and special payment policy status in future rulemaking.

In light of the proposed changes to the MS-DRGs for FY 2025, according to the regulations under § 412.4(d), we evaluated the MS-DRGs using the general postacute care transfer policy criteria and data from the FY 2023 MedPAR file. If an MS-DRG qualified for the postacute care transfer policy, we also evaluated that MS-DRG under the special payment methodology criteria according to regulations at § 412.4(f)(6). We continue to believe it is appropriate to assess new MS-DRGs and reassess revised MS-DRGs when proposing reassignment of procedure codes or diagnosis codes that would result in material changes to an MS-DRG.

We stated that proposed new MS-DRGs 426, 427, 447, and 448 would qualify to be included on the list of MS-DRGs that are subject to the postacute care transfer policy. As described in the regulations at § 412.4(d)(3)(ii)(D), MS-DRGs that share the same base MS DRG will all qualify under the postacute care transfer policy if any one of the MS-DRGs that share that same base MS-DRG qualifies. We therefore proposed to add proposed new MS-DRGs 426, 427, 428, 447, and 448 to the list of MS-DRGs that are subject to the postacute care transfer policy.

We noted that MS-DRGs 459 and 460 are currently subject to the postacute care transfer policy. As a result of our review, these MS-DRGs, as proposed to be revised, would not qualify to be included on the list of MS-DRGs that are subject to the postacute care transfer policy. We therefore proposed to remove revised MS-DRGs 459 and 460 from the list of MS-DRGs that are subject to the postacute care transfer policy.

As discussed in section II.C. of the preamble of this final rule, we are finalizing these proposed changes to the MS-DRGs, with modification, to delete MS-DRGs 459 and 460 and renumber these MS-DRGs as MS-DRGs 450 and 451. We therefore have evaluated the renumbered MS-DRGs 450 and 451 in the updated analysis that follows.

Using the March 2024 update of the FY 2023 MedPAR file, we have developed the following chart which sets forth the most recent analysis of the postacute care transfer policy criteria completed for this final rule with respect to each of these new or revised MS-DRGs.

LIST OF NEW OR REVISED MS-DRGS SUBJECT TO REVIEW OF POSTACUTE CARE TRANSFER POLICY STATUS FOR FY 2025							
New or Revised MS-DRG	MS-DRG Title	Total Cases	Postacute Care Transfer Cases (55 th percentile: 1,054)	Short-Stay Postacute Care Transfer Cases	Percent of Short-Stay Postacute Care Transfers to all Cases (55 th percentile: 10.097%)	FY 2024 Postacute Transfer Policy Status	Proposed Postacute Care Transfer Policy Status
317	Concomitant Left Atrial Appendage Closure and Cardiac Ablation	1,815	313*	14	0.8%*	New	No
402	Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical	17,097	6,795	723	4.2%*	New	No
426	Multiple level combined anterior and posterior spinal fusion except cervical with MCC or Custom-Made Anatomically Designed Interbody Fusion Device	2,952	2,379	764	27.7%	New	Yes
427	Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with CC	13,205	7,996	2,313	17.4%	New	Yes
428	Multiple Level Combined	8,363	3,494	329	3.0%*	New	Yes**

	Anterior and Posterior Spinal Fusion Except Cervical without CC/MCC						
429	Combined Anterior and Posterior Cervical Spinal Fusion with MCC	623	485*	170	27.3%	New	No
430	Combined Anterior and Posterior Cervical Spinal Fusion without MCC	1,883	970*	128	6.8%*	New	No
447	Multiple Level Spinal Fusion Except Cervical with MCC or Custom-Made Anatomically Designed Interbody Fusion Device	2,248	1,843	797	35.5%	New	Yes
448	Multiple Level Spinal Fusion Except Cervical without MCC	15,552	8,396	1,663	10.7%	New	Yes
450	Single Level Spinal Fusion Except Cervical with MCC	1,216	915*	302	24.8%	Yes (as 459)	No
451	Single Level Spinal Fusion Except Cervical without MCC	14,852	6,364	751	5.1%*	Yes (as 460)	No
850	Acute Leukemia with Other Procedures	385	140*	46	12%	New	No

* Indicates a current postacute care transfer policy criterion that the MS-DRG did not meet.

** As described in the policy at 42 CFR 412.4(d)(3)(ii)(D), MS-DRGs that share the same base MS-DRG will all qualify under the postacute care transfer policy if any one of the MS-DRGs that share that same base MS-DRG qualifies.

During our annual review of proposed new or revised MS-DRGs and analysis of the December 2023 update of the FY 2023 MedPAR file, we reviewed the list of proposed revised or new MS-DRGs that qualify to be included on the list of MS-DRGs subject to the postacute care

transfer policy for FY 2025 to determine if any of these MS-DRGs would also be subject to the special payment methodology policy for FY 2025.

Based on our analysis of the proposed changes to MS-DRGs included in the proposed rule, we determined that proposed new MS-DRGs 426, 427, and 447 meet the criteria for the MS-DRG special payment methodology. As described in the regulations at § 412.4(f)(6)(iv), MS-DRGs that share the same base MS-DRG will all qualify under the MS-DRG special payment policy if any one of the MS-DRGs that share that same base MS-DRG qualifies. We proposed that MS-DRGs 426, 427, 428, 447, 448, would be subject to the MS-DRG special payment methodology, effective for FY 2025. For this final rule, we updated this analysis using data from the March 2024 update of the FY 2023 MedPAR file.

LIST OF NEW OR REVISED MS-DRGs SUBJECT TO REVIEW OF SPECIAL PAYMENT POLICY STATUS FOR FY 2025						
New or Revised MS-DRG	MS-DRG Title	Geometric Mean Length of Stay	Average Charges of 1-Day Discharges	50 Percent of Average Charges for all Cases within MS-DRG	FY 2024 Special Payment Policy Status	Proposed Special Payment Policy Status
426	Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with MCC	7.6	\$261,045	\$235,444	New	Yes
427	Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with CC	4	\$212,068	\$310,913	New	Yes
428	Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical without CC/MCC	2.6	\$215,932	\$116,596	New	Yes*
447	Multiple Level Spinal Fusion Except Cervical with MCC	8	\$213,457	\$145,905	New	Yes
448	Multiple Level Spinal Fusion Except Cervical without MCC	3.2	\$149,395	\$89,058	New	Yes*

* As described in the policy at 42 CFR 412.4(f)(6)(iv), MS-DRGs that share the same base MS-DRG will all qualify under the special payment transfer policy if any one of the MS-DRGs that share that same base MS-DRG qualifies.

Comment: We received a comment stating that the new MS-DRGs proposed as eligible for the postacute care policy are all related to spinal fusions. The commenter stated that these MS-DRGs have extremely high upfront costs. The commenter stated that CMS should not adopt this proposal due to the negative impact on hospitals that provide these services.

Response: The spinal fusion MS-DRGs that were proposed to be added to the list of MS-DRGs subject to the postacute care transfer policy were also proposed to be added to the special payment policy. Under this policy, the transferring hospital would receive 50 percent of the full MS-DRG payment, plus a single per diem payment, for the first day of the stay, as well as a per

diem payment for subsequent days (up to the full MS–DRG payment). The intent of the special payment policy is specifically to address MS–DRGs with high initial costs. We believe the proposed addition of MS– DRGs 426, 427, 428, 447, and 448 to the special payment policy adequately addresses the specific concerns expressed by the commenter.

After consideration of the comment we received, we are finalizing our proposal to add MS–DRGs 426, 427, 428, 447, and 448 to the list of MS-DRGs subject to the postacute care and special payment policies. As noted, we proposed to remove MS-DRGs 459 and 460 from the list of MS-DRGS subject to the postacute care policy. These MS-DRGs are being deleted and renumbered to MS-DRGs 450 and 451, which will not be added to the postacute care policy list.

The postacute care transfer and special payment policy status of these MS–DRGs is reflected in Table 5 associated with this final rule, which is listed in section VI. of the Addendum to this final rule and available on the CMS website.

B. Changes in the Inpatient Hospital Update for FY 2025 (§ 412.64(d))

1. FY 2025 Inpatient Hospital Update

In accordance with section 1886(b)(3)(B)(i) of the Act, each year we update the national standardized amount for inpatient hospital operating costs by a factor called the “applicable percentage increase.” For FY 2025, we stated in the proposed rule that we are setting the applicable percentage increase by applying the adjustments listed in this section in the same sequence as we did for FY 2024. (We note that section 1886(b)(3)(B)(xii) of the Act required an additional reduction each year only for FYs 2010 through 2019.) Specifically, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we stated that we are setting the applicable percentage increase by applying the following adjustments in the following sequence. The applicable percentage increase under the IPPS for FY 2025 is equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to all of the following:

- A reduction of one-quarter of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act.
- A reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals not considered to be meaningful EHR users in accordance with section 1886(b)(3)(B)(ix) of the Act.
- An adjustment based on changes in economy-wide multifactor productivity (MFP) (the productivity adjustment).

Section 1886(b)(3)(B)(xi) of the Act, as added by section 3401(a) of the Affordable Care Act, states that application of the productivity adjustment may result in the applicable percentage increase being less than zero.

As published in the FY 2006 IPPS final rule (70 FR 47403), in accordance with section 404 of Public Law 108–173, CMS determined a new frequency for rebasing the hospital market basket of every 4 years. In compliance with section 404 of the of Public Law 108–173, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45204), we replaced the 2014-based IPPS operating and capital market baskets with the rebased and revised 2018-based IPPS operating and capital market baskets beginning in FY 2022. Consistent with our established frequency of rebasing the IPPS market basket every 4 years, we plan on proposing to rebase and revise the IPPS market basket in the FY 2026 IPPS/LTCH PPS proposed rule. We note that our preliminary evaluation of more recent Medicare cost report data for IPPS hospitals for 2022 indicates that the major IPPS market basket cost weights (particularly the compensation and drug cost weights) are similar to those finalized in the 2018-based IPPS market basket.

We proposed to base the FY 2025 market basket update used to determine the applicable percentage increase for the IPPS on IHS Global Inc.’s (IGI’s) fourth quarter 2023 forecast of the 2018-based IPPS market basket rate-of-increase with historical data through third quarter 2023, which was estimated to be 3.0 percent. We also proposed that if more recent data subsequently became available (for example, a more recent estimate of the market basket update), we would use such data, if appropriate, to determine the FY 2025 market basket update in the final rule.

Comment: Several commenters expressed concerns that the proposed FY 2025 market basket update does not adequately reflect the rising inflation and costs that hospitals have faced over the last few years. Commenters stated that economy-wide inflation grew by 12.4 percent from 2021 through 2023 (as measured by the Consumer Price Index (CPI)), more than two times faster than Medicare reimbursement for hospital inpatient care, which increased by 5.2 percent during the same time. Several commenters noted that the most recent CPI for March 2024 reported nationwide inflation at 3.5 percent and inpatient hospital services inflation of 6.9 percent, outpacing Medicare’s reimbursement.

Many commenters stated that rapid and sustained growth in labor costs have put persistent cost pressure on hospitals. They also noted increases in drug prices, citing a recent study and a report by the Health and Human Services (HHS) Assistant Secretary for Planning and Evaluation which found that in 2022 and 2023, prices for nearly 2,000 drugs increased faster than the rate of general inflation, with an average price increase of 15.2 percent. Several commenters also stated that hospitals have seen significant growth in administrative costs due to what they described as inappropriate practices by large commercial health insurers, including Medicare Advantage and Medicaid managed care plans, such as automatic claim denials and onerous prior authorization requirements. Several commenters also discussed the continued costs of addressing past and preventing future cyberattacks and a commenter stated they have seen significant increases in capital costs, particularly since the pandemic. A commenter stated that recently increased tariffs on imported supplies from China will result in substantial price increase for gloves, masks, needles, and other supplies. A commenter stated private equity firms continue to achieve greater penetration across healthcare markets and the costs of contracting with specialties such as physician practices has skyrocketed, which the commenter stated is not factored into CMS' payments. Commenters urged CMS to consider the changing health care environment which they state is putting enormous financial strain on hospitals and health systems and is expected to continue through 2025. A commenter stated that the net market basket update is too low, and that the budget neutrality impact of the low wage policy will exacerbate the insufficient market basket update for high wage areas.

Several commenters proposed CMS apply a payment increase of at least 4.1 percent which is aligned with MedPAC's March 2024 Report to Congress, which recommended a 1.5 percentage points increase over the FY 2025 payment update. These commenters noted that this was the second year that MedPAC made a recommendation of increasing the market basket update. A commenter stated that, while they fully understand the need to protect the Medicare Hospital Insurance Trust Fund, they requested CMS review data beyond normal data and

consider increasing the market basket amount to at least 3.5 percent to more realistically reflect inflation. Several commenters suggested various higher market basket increases, which they believe better reflects hospitals' input prices and the contract labor staffing challenge. A commenter encouraged CMS to consider, at a minimum, matching the 3.7 percent increase that the commenter stated Medicare Advantage will receive. A commenter supported an annual inflation-based payment update based on the full Medicare Economic Index.

Several commenters recommended CMS look to alternative data sources that they asserted better reflect true labor and input cost increases in a timely manner. The commenters stated that the proposed payment update does not recognize these challenges, nor does it factor in the realities of inflation impacting operating costs. Commenters also stated CMS must use data that better reflects the input price inflation that hospitals have experienced and are projected to experience in FY 2025. A commenter stated that they did not understand why the FY 2025 market basket increase is lower than FY 2024. A commenter recommended CMS use more recent data to update adjustments to 2025 IPPS rates.

Several commenters requested that CMS use its "special exceptions and adjustments" authority to implement a market basket adjustment that is more consistent with the significant cost increases that are being experienced by hospitals. They urged CMS to revisit its assumptions and focus on appropriately accounting for recent and future trends in inflationary pressure and cost increases in the hospital payment update, which they stated is essential to ensure that Medicare payments for acute care services more accurately reflect the cost of providing hospital care. A commenter urged CMS to adjust its methodology for calculating the annual payment update for FY 2025 to ensure it provides a robust payment update that adequately incorporates the effects of inflation and rising workforce costs on hospitals. A commenter asked that CMS, at a minimum, reconsider the proposed labor expense calculations to provide a more appropriate update based on growing and unsustainable costs. Several commenters recommended a comprehensive evaluation of the current rate-setting methodology to accurately capture the true

costs of care delivery and provide a fair and sustainable reimbursement framework. A commenter stated it was unacceptable that CMS' payment update does not factor in changes in hospital admissions, case-mix intensity, or the mandatory 2 percent sequestration adjustment reductions.

Many commenters noted their financial pressures due to the PHE, aging, more complex patients, negative Medicare margins of -12.7 percent as estimated by MedPAC, and reliance on public payers. Several commenters noted that historically, hospitals mitigated losses incurred from serving underinsured patients by negotiating higher payment rates from commercial payors; however, due to high inflation and an increasing deficit generated by serving governmental payor patients, they stated hospitals can no longer rely on commercial payors to offset those losses. Several commenters urged CMS to consider and assess the financial position of hospitals, particularly those with low margins. A commenter advocated for a comprehensive review of the Medicare margins and asked CMS increase rates to cover the cost of care for Medicare Advantage and Medicaid patients. Some commenters stated that hospitals will continue to face increased costs due to the Change Healthcare cyberattack, such as interest costs on loan payments for loans acquired during the cyberattack, expected denials that will require additional administrative costs, and manual processing of claims.

Response: Section 1886(b)(3)(B)(iii) of the Act states the Secretary shall update IPPS payments based on a market basket percentage increase, which is defined as the percentage, estimated by the Secretary before the beginning of the period or fiscal year, by which the cost of the mix of goods and services (including personnel costs but excluding nonoperating costs) comprising routine, ancillary, and special care unit inpatient hospital services, based on an index of appropriately weighted indicators of changes in wages and prices which are representative of the mix of goods and services included in such inpatient hospital services, for the period or fiscal year will exceed the cost of such mix of goods and services for the preceding 12-month cost reporting period or fiscal year. We believe that the 2018-based IPPS market basket is consistent

with the statute as it is a fixed-weight, Laspeyres-type price index that measures the change in price, over time, while maintaining a mix of goods and services purchased by hospitals consistent with a base period. Therefore, the market basket is designed to measure price inflation for IPPS hospitals and would not reflect increases in costs associated with changes in the volume or intensity of input goods and services (such as the quantity of labor used). Regarding the commenter who stated that the budget neutrality adjustment from the low wage policy would exacerbate the inadequate market basket update, we note that the market basket update does not consider the impact of budget neutrality adjustments. We refer the reader to section IV.D. of the preamble of this final rule where we respond to comments about the low wage policy.

CMS understands that the market basket updates may differ from other overall inflation indexes such as the topline CPI; however, we would reiterate that these topline indexes are not comparable since they measure different mixes of products, services, or wages than the legislatively defined CMS IPPS hospital market basket. In addition, the CPI for hospital inpatient services does not reflect the input price inflation facing hospitals, and in some instances can reflect hospital charges or list prices.

We would highlight that the market basket percentage increase is a forecast of the price pressures that hospitals are expected to face in FY 2025. We also note that when developing its forecast for the ECI for hospital workers, IGI considers overall labor market conditions (including rise in contract labor employment due to tight labor market conditions) as well as trends in contract labor wages, which both have an impact on wage pressures for workers employed directly by the hospital. As projected by IGI and other independent forecasters, compensation growth and upward price pressures are expected to slow in 2025 relative to 2023 and 2024.

As is our general practice, we proposed that if more recent data became available, we would use such data, if appropriate, to derive the final FY 2025 IPPS market basket update for

the final rule. We appreciate the commenters' concern regarding inflationary pressure and other rising costs and the request to use more recent data to determine the FY 2025 IPPS market basket update. For this final rule, we are using an updated forecast of the price proxies underlying the market basket that incorporates more recent historical data and reflects a revised outlook regarding the U.S. economy, including compensation and inflationary pressures.

Based on the more recent IGI second quarter 2024 forecast with historical data through the first quarter of 2024, the projected 2018-based IPPS market basket increase factor for FY 2025 is 3.4 percent, which is 0.4 percentage point higher than the projected FY 2025 market basket increase factor in the proposed rule and reflects an increase in compensation prices of 3.9 percent. We would note that the 10-year historical average (2014-2023) growth rate of the 2018-based IPPS market basket is 2.8 percent with compensation prices increasing 2.8 percent.

For these reasons, we believe that the 2018-based IPPS market basket continues to appropriately reflect IPPS cost structures, and we believe the price proxies used (such as those from BLS that reflect wage and benefit price growth) are an appropriate representation of price changes for the inputs used by hospitals in providing services. Given that we believe the 2018-based IPPS market basket reflects an index of appropriately weighted indicators of changes in wages and prices that are representative of the mix of goods and services included in such inpatient hospital services and the percentage change of the 2018-based IPPS market basket is based on IGI's more recent forecast reflecting the prospective price pressures for FY 2025, we do not believe it would be appropriate to use our exceptions and adjustment authority to create a separate payment that would have the effect of modifying the current law update.

Comment: Many commenters expressed concerns with the Employment Cost Index (ECI) used to measure changes in labor compensation in the market basket, which they state may no longer accurately capture the changing composition and cost structure of the hospital labor market given the large increases in short-term contract labor use and its growing costs. The commenters stated labor costs have increased by more than 18 percent from CY 2020 to

CY 2023. They attributed this increase to expensive contract labor costs (as a result of higher utilization rates and higher costs per hour) and faster growth in salaries for employed workers (reflecting sign-on and retention bonuses). They further stated that while salaries for contract nurses have decreased some from a peak in certain geographical areas, they still remained nearly 60 percent higher at the end of FY 2023 compared to the start of FY 2020. They further stated that CMS recognizes that the ECI does not capture shifts in composition of labor, and the commenters stated that by design, the ECI is not capturing the shifts that have occurred as hospitals have had to turn to contract labor to meet patient demand. Several commenters recommended that CMS use its exceptions and adjustments authority to adopt new or supplemental data sources, to ensure labor costs are adequately reflected in the payment update in the final rule. They further requested CMS utilize supplemental data sources to evaluate the accuracy of the ECI proxy and to modify methodologies, including adopting new or supplemental data, to calculate the payment update if its analysis determines that the ECI is not adequately capturing labor costs.

Response: We believe that the ECI for wages and salaries for hospital workers is accurately reflecting the price change associated with the labor used to provide hospital care. The ECI appropriately does not reflect other factors that might affect the rate of price changes associated with labor costs, such as a shift in the occupations that may occur due to increases in case-mix or shifts in hospital purchasing decisions (for instance, to hire or to use contract labor). We believe that the prices of employed staff and contract labor are influenced by the same factors and should generally grow at similar rates. In most periods when there are not significant occupational shifts or significant shifts between employed and contract labor, the data has shown that the growth in the ECI for wages and salaries for hospital workers has generally been consistent with overall hospital wage trends. For example, our analysis of the Medicare cost report data shows from 2011 to 2019 the compound annual growth rate of both IPPS Medicare allowable salaries per hour and contract labor costs per hour was 2.5 percent, near the 2.0 percent

growth rate of the ECI for wages and salaries for hospital workers over the same period (note the ECI would not reflect skill mix change whereas the salaries data would reflect these changes).

From 2019 to 2022, however, as noted by the commenters, contract labor utilization increased and IPPS Medicare allowable salaries and contract labor costs per hour increased faster than prior historical periods. We note there has likely been a shift to higher-skilled occupations for the 2019 to 2022 period associated with a 6.5-percent increase in case mix for inpatient hospital services, with notable increases of 3.8 percent in 2020 and 2.9 percent in 2021 (see table IV.A.1. of the 2024 Medicare Trustees Report²¹⁶); by comparison, case mix for inpatient hospital services increased 3.2 percent cumulatively from 2016 to 2019. The likely shift to more skilled occupations associated with the faster case mix increase over the last several years would also account for a portion of the difference between the growth in the ECI for wages and salaries for hospital workers and the growth in combined hospital salaries and contract labor costs per hour over this period.

For this final rule, based on the more recent IGI second quarter 2024 forecast with historical data through the first quarter of 2024, the projected 2018-based IPPS market basket increase factor for FY 2025 reflects a projected increase in compensation prices of 3.9 percent, which is 1.1 percentage points faster than the 10-year historical average (2014-2023) growth rate of compensation prices.

Comment: A commenter recommended that CMS reevaluate the data sources it uses for rebasing its market basket and calculating the annual market basket update, including labor costs. They strongly encouraged CMS to adopt new or supplemental data sources in future rulemaking that more accurately reflect the costs to hospitals, such as through use of more real time data from the hospital community. They stated that they believe that the current market basket does not account for the higher costs of contract labor, which has become more common in hospitals in an era of clinical labor shortages. A commenter requested that CMS rebase the market baskets

²¹⁶ <https://www.cms.gov/oact/tr/2024>

more frequently and at least every 3 years to ensure the market basket reflects the appropriate mix of services provided to Medicare beneficiaries.

Response: We appreciate the commenter's request to rebase more frequently. Section 404 of Public Law 108-173 states the Secretary shall establish a frequency for revising the cost weights of the IPPS market basket more frequently than once every 5 years. We established a rebasing frequency of every 4 years, in part because the cost weights obtained from the Medicare cost reports typically do not indicate much of a change in the weights from year to year. The most recent rebasing of the IPPS market basket was for the FY 2022 payment update and reflected a base year of 2018 costs. We also regularly monitor the Medicare cost report data to assess whether a rebasing is technically appropriate, and we will continue to do so in the future. Based on preliminary analysis of the Medicare cost report data for IPPS hospitals for 2022 that became available for this final rule, there are small observed differences in the cost weights for 2022, as the IPPS compensation cost weight is estimated to be within roughly 1 percentage point of the 2018-based IPPS market basket compensation cost weight of 53.0 percent (and reflects a combined decrease in the salary and benefit cost weights that is larger than the increase in the contract labor cost weight). In addition, there is an estimated increase in the cost weight for home office contract labor compensation cost weight of roughly 0.5 percentage point. As stated in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36186), consistent with our established frequency of rebasing the IPPS market basket every 4 years, we anticipate proposing to rebase and revise the IPPS market basket in the FY 2026 IPPS/LTCH PPS proposed rule.

We believe the Medicare cost report data is the most complete, timely and relevant data source for the development of the cost weights. We also welcome information on alternative publicly available data sources.

Comment: Commenters stated that since the COVID-19 PHE, IGI has shown a consistent 3-year trend of under-forecasting the market basket growth and expressed concern this may indicate a more systematic issue with IGI's forecasting. They stated that these missed

forecasts are permanently established in the standard payment rate for IPPS and will continue to compound, which they estimate to be \$4 billion.

Several commenters, including many associations, urged CMS to use its special exceptions and adjustments authority under section 1886(d)(5)(I)(i) of the Act to implement a retrospective one-time adjustment for FY 2025 to account for the underestimation of the market basket updates over the last several years. Commenters recommended that CMS implement various one-time adjustments to account for underpayments in 1 or more years between FY 2021 and FY 2023 as well as for forecasted underpayments for FY 2024. The commenters stated the underestimation is, in large part, because the market basket is a time-lagged estimate that cannot fully account for unexpected changes that occur, such as historic inflation and increased labor and supply costs. They stated this is exactly what occurred at the end of the CY 2021 into CY 2022, which resulted in a large forecast error in the FY 2022 market basket update.

Several commenters noted that CMS currently implements a capital IPPS market basket forecast error adjustment as well as SNF PPS market basket forecast error adjustment policy which resulted in FY 2024 and FY 2025 SNF forecast error adjustments of 3.6 percentage points and 1.7 percentage points, respectively. They stated while CMS has not developed an analogous policy for the IPPS operating update, they believe such a forecast error adjustment to the FY 2025 IPPS operating update could be adopted under CMS' existing authority. They noted the forecast errors for FY 2021 through FY 2023 for IPPS exceeded the 0.5 percentage point threshold that is used for the SNF forecast error adjustment policy. A commenter recommended CMS establish a forecast error threshold of 1.5 percentage points, and retroactively adjust payments for that year.

Many commenters noted financial hardships, particularly in 2022 with high inflation and workforce shortages. They noted that MedPAC found that all-payment operating and overall Medicare margins both fell to record lows, estimating Medicare hospital margins for FY 2022 of negative 12.7 percent. MedPAC's FY 2024 recommendation was to increase the market basket

update by one percentage point and for FY 2025 recommended that Congress increase the acute hospital market basket by 1.5 percentage points over current law. A commenter stated that, understanding the caveat that MedPAC was created specifically to advise Congress on issues impacting the Medicare program, it is disappointing that, following MedPAC's recommendation that Congress increase the IPPS market basket by an additional 1.5 percent, CMS proposed a smaller payment update than last year's 2.8 percent. Commenters further stated that margins at this level are simply unsustainable, and that hospitals in rural and underserved communities continue to close, with nine closing in FY 2023 despite a new Medicare provider type that allows them to convert to a rural emergency hospital. Commenters also stated that the missed forecasts have a significant and permanent impact on hospitals as they are permanently established in the standard payment rate for IPPS and absent action from CMS will continue to compound.

Response: While the projected IPPS hospital market basket updates have been under forecast (actual increases less forecasted increases were positive) for this most recent period, over longer periods the forecasts have generally averaged close to the historical measures (for instance, from FY 2014 through FY 2023 the cumulative forecast error was 0.0 percentage point). CMS will continue to monitor the methods associated with the market basket forecasts to ensure there are not underlying systematic issues in the forecasting approach.

We note that the under forecast of the IPPS market basket increase in the recent time period was largely due to unanticipated inflationary and labor market pressures as the economy emerged from the COVID-19 PHE. However, an analysis of the forecast error of the IPPS market basket over a longer period of time shows the forecast error has been both positive and negative. Only considering the forecast error for years when the final hospital market basket update was lower than the actual market basket update does not consider the full experience and impact of forecast error, in particular the numerous years that providers benefited from the forecast error. Relatedly, as we discussed in the FY 2024 IPPS/LTCH PPS final rule in response to similar comments (88 FR 59034), the capital IPPS and SNF PPS forecast error adjustments

were adopted very early in both payment systems and, unlike what commenters are requesting here for the IPPS, forecast errors over many years have been consistently addressed within each of the Capital IPPS and SNF PPS.

For these reasons, we continue to believe it is not appropriate to include adjustments to the market basket update for future years based on the difference between the actual and forecasted market basket increase in prior years. We thank the commenters for their comments. After consideration of the comments received and consistent with our proposal, we are finalizing to use more recent data to determine the FY 2025 market basket update for the final rule. Specifically, based on more recent data available, we determined final applicable percentage increases to the standardized amount for FY 2025, as specified in the table that appears later in this section.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51689 through 51692), we finalized our methodology for calculating and applying the productivity adjustment. As we explained in that rule, section 1886(b)(3)(B)(xi)(II) of the Act, as added by section 3401(a) of the Affordable Care Act, defines this productivity adjustment as equal to the 10-year moving average of changes in annual economy-wide, private nonfarm business MFP (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, calendar year, cost reporting period, or other annual period). The U.S. Department of Labor's Bureau of Labor Statistics (BLS) publishes the official measures of private nonfarm business productivity for the U.S. economy. We note that previously the productivity measure referenced in section 1886(b)(3)(B)(xi)(II) of the Act was published by BLS as private nonfarm business multifactor productivity. Beginning with the November 18, 2021, release of productivity data, BLS replaced the term multifactor productivity (MFP) with total factor productivity (TFP). BLS noted that this is a change in terminology only and will not affect the data or methodology. As a result of the BLS name change, the productivity measure referenced in section 1886(b)(3)(B)(xi)(II) of the Act is now published by BLS as private nonfarm business total factor productivity. However, as mentioned,

the data and methods are unchanged. Please see www.bls.gov for the BLS historical published TFP data. A complete description of IGI's TFP projection methodology is available on the CMS website at <https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information>. In addition, we note that beginning with the FY 2022 IPPS/LTCH PPS final rule, we refer to this adjustment as the productivity adjustment rather than the MFP adjustment, to more closely track the statutory language in section 1886(b)(3)(B)(xi)(II) of the Act. We note that the adjustment continues to rely on the same underlying data and methodology.

For FY 2025, we proposed a productivity adjustment of 0.4 percent. Similar to the proposed market basket rate-of-increase, for the proposed rule, the estimate of the proposed FY 2025 productivity adjustment was based on IGI's fourth quarter 2023 forecast. As noted previously, we proposed that if more recent data subsequently became available, we would use such data, if appropriate, to determine the FY 2025 productivity adjustment for the final rule.

Comment: Several commenters expressed concerns about the application of the productivity adjustment particularly given the extreme pressures in which hospital and health systems operate. They stated the use of the private nonfarm business TFP is meant to capture gains from new technologies, economies of scale, business acumen, managerial skills and changes in productions. Thus, they stated this measure effectively assumes the hospital sector can mirror productivity gains from the private nonfarm business sector. They stated, however, in an economy marked by great uncertainty due to the PHE and labor and other productivity shocks, this assumption is significantly flawed. They further stated these assumed gains do not consider the impact of additional regulation and requirements on productivity. A commenter recommended CMS revisit the methodology for calculating the productivity adjustment or remove the measure entirely. Commenters requested CMS use its "special exceptions and adjustments" authority to eliminate the productivity adjustment for FY 2025. A commenter stated they do not understand why the productivity adjustment is higher than for FY 2024, and

recommended CMS implement a productivity adjustment of no more than the 0.2 percentage point adjustment in FY 2024.

Response: Section 1886(b)(3)(B)(xi) of the Act requires the application of the productivity adjustment. As required by statute, the FY 2025 productivity adjustment is derived based on the 10-year moving average growth in economy-wide productivity for the period ending FY 2025.

As stated in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36204) and described previously, BLS publishes the official measures of annual economy-wide, private nonfarm business total factor productivity. IGI forecasts total factor productivity (TFP) consistent with BLS methodology by forecasting the detailed components of TFP. (As noted previously, a complete description of IGI's TFP projection methodology is available on the CMS website at <https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information>.) We believe our methodology for the productivity adjustment is consistent with the statute which states the productivity adjustment is equal to the 10-year moving average of changes in annual economy-wide private nonfarm business multi-factor productivity (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, year, cost reporting period, or other annual period).

The proposed FY 2025 productivity adjustment of 0.4 percent was based on IGI's forecast of the 10-year moving average of annual economy-wide private nonfarm business TFP, reflecting historical data through 2022 as published by BLS and forecasted TFP growth for 2023 through 2025. Based on more recent data available, the final FY 2025 productivity adjustment of 0.5 percent is based on IGI's forecast of the 10-year moving average of annual economy-wide private nonfarm business TFP, reflecting historical data through 2023 as published by BLS and forecasted TFP growth for 2024 through 2025. The higher productivity adjustment for FY 2025 (0.5 percent for the final rule) compared to FY 2024 (0.2 percent) is primarily a result of incorporating BLS's revised historical data through 2022 and a preliminary historical growth rate

in TFP for 2023, as well as an updated forecast for TFP growth for 2024 reflecting higher expected growth in economic output.

We thank the commenters for their comments. After consideration of the comments received and consistent with our proposal, we are finalizing as proposed to use more recent data to determine the FY 2025 productivity adjustment for the final rule.

In summary, based on more recent data available for this FY 2025 IPPS/LTCH PPS final rule (that is, IGI’s second quarter 2024 forecast of the 2018-based IPPS market basket rate-of-increase with historical data through the first quarter of 2024), we estimate that the FY 2025 market basket update used to determine the applicable percentage increase for the IPPS is 3.4 percent. Based on more recent data available for this FY 2025 IPPS/LTCH PPS final rule (that is, IGI’s second quarter 2024 forecast of the productivity adjustment), the current estimate of the productivity adjustment for FY 2025 is 0.5 percentage point. Based on these data, we have determined four applicable percentage increases to the standardized amount for FY 2025, as specified in the following table:

FY 2025 APPLICABLE PERCENTAGE INCREASES FOR THE IPPS

FY 2025	Hospital Submitted Quality Data and is a Meaningful EHR User	Hospital Submitted Quality Data and is NOT a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User
Market Basket Rate-of-Increase	3.4	3.4	3.4	3.4
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	-0.85	-0.85
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	-2.55	0.0	-2.55
Productivity Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.5	-0.5	-0.5	-0.5
Applicable Percentage Increase Applied to Standardized Amount	2.9	0.35	2.05	-0.5

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42344), we revised our regulations at 42 CFR 412.64(d) to reflect the current law for the update for FY 2020 and subsequent fiscal years. Specifically, in accordance with section 1886(b)(3)(B) of the Act, we added paragraph

(d)(1)(viii) to § 412.64 to set forth the applicable percentage increase to the operating standardized amount for FY 2020 and subsequent fiscal years as the percentage increase in the market basket index, subject to the reductions specified under § 412.64(d)(2) for a hospital that does not submit quality data and § 412.64(d)(3) for a hospital that is not a meaningful EHR user, less a productivity adjustment.

As discussed in section V.F. of the preamble of this final rule, section 4102 of the Consolidated Appropriations Act (CAA), 2023 (Pub. L. 117-328) extended the MDH program through FY 2024 (that is, for discharges occurring on or before September 30, 2024). Subsequently, section 307 of the Consolidated Appropriations Act, 2024 (CAA, 2024) (Pub. L. 118-42), enacted on March 9, 2024, further extended the MDH program for FY 2025 discharges occurring before January 1, 2025. Prior to enactment of the CAA, 2024, the MDH program was only to be in effect through the end of FY 2024. Under current law, the MDH program will expire for discharges on or after January 1, 2025. We refer readers to section V.F. of the preamble of this final rule for further discussion of the MDH program.

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase to the hospital-specific rates for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Therefore, the update to the hospital-specific rates for SCHs and MDHs also is subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act.

For FY 2025, we proposed the following updates to the hospital-specific rates applicable to SCHs and MDHs: A proposed update of 2.6 percent for a hospital that submits quality data and is a meaningful EHR user; a proposed update of 0.35 percent for a hospital that submits quality data and is not a meaningful EHR user; a proposed update of 1.85 percent for a hospital that fails to submit quality data and is a meaningful EHR user; and a proposed update of -0.4 percent for a hospital that fails to submit quality data and is not an meaningful EHR user. As

previously discussed, we proposed that if more recent data subsequently became available (for example, a more recent estimate of the market basket update and the productivity adjustment), we would use such data, if appropriate, to determine the market basket update and the productivity adjustment in the final rule.

We did not receive any public comments on our proposed updates to hospital-specific rates applicable to SCHs and MDHs. The general comments we received on the proposed FY 2025 update (including the proposed market basket update and productivity adjustment) are discussed earlier in this section. For FY 2025, we are finalizing the proposal to determine the update to the hospital specific rates for SCHs and MDHs in this final rule using the more recent available data, as previously discussed.

For this final rule, based on more recent available data, we are finalizing the following updates to the hospital specific rates applicable to SCHs and MDHs: An update of 2.9 percent for a hospital that submits quality data and is a meaningful EHR user; an update of 2.05 percent for a hospital that fails to submit quality data and is a meaningful EHR user; an update of 0.35 percent for a hospital that submits quality data and is not a meaningful EHR user; and an update of -0.5 percent for a hospital that fails to submit quality data and is not a meaningful EHR user.

2. FY 2025 Puerto Rico Hospital Update

Section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that subsection (d) Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016. In addition, section 1886(n)(6)(B) of the Act was amended to specify that the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act apply to subsection (d) Puerto Rico hospitals that are not meaningful EHR users, effective beginning FY 2022. Accordingly, for FY 2022, section 1886(b)(3)(B)(ix) of the Act in conjunction with section 602(d) of Public Law 114–113 requires that any subsection (d) Puerto Rico hospital that is not a meaningful EHR user as defined in section 1886(n)(3) of the Act and not subject to an exception under section

1886(b)(3)(B)(ix) of the Act will have “three-quarters” of the applicable percentage increase (prior to the application of other statutory adjustments), or three-quarters of the applicable market basket rate-of-increase, reduced by $33^{1/3}$ percent. The reduction to three-quarters of the applicable percentage increase for subsection (d) Puerto Rico hospitals that are not meaningful EHR users increases to $66^{2/3}$ percent for FY 2023, and, for FY 2024 and subsequent fiscal years, to 100 percent. (We note that section 1886(b)(3)(B)(viii) of the Act, which specifies the adjustment to the applicable percentage increase for “subsection (d)” hospitals that do not submit quality data under the rules established by the Secretary, is not applicable to hospitals located in Puerto Rico.) The regulations at 42 CFR 412.64(d)(3)(ii) reflect the current law for the update for subsection (d) Puerto Rico hospitals for FY 2022 and subsequent fiscal years. In the FY 2019 IPPS/LTCH PPS final rule, we finalized the payment reductions (83 FR 41674).

For FY 2025, consistent with section 1886(b)(3)(B) of the Act, as amended by section 602 of Public Law 114–113, we are setting the applicable percentage increase for Puerto Rico hospitals by applying the following adjustments in the following sequence. Specifically, the applicable percentage increase under the IPPS for Puerto Rico hospitals will be equal to the rate of-increase in the hospital market basket for IPPS hospitals in all areas, subject to a reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for Puerto Rico hospitals not considered to be meaningful EHR users in accordance with section 1886(b)(3)(B)(ix) of the Act, and then subject to the productivity adjustment at section 1886(b)(3)(B)(xi) of the Act. As noted previously, section 1886(b)(3)(B)(xi) of the Act states that application of the productivity adjustment may result in the applicable percentage increase being less than zero.

In the FY 2025 IPPS/LTCH PPS proposed rule, based on IGI’s fourth quarter 2023 forecast of the 2018-based IPPS market basket update with historical data through third quarter 2023, in accordance with section 1886(b)(3)(B) of the Act, as discussed previously, for Puerto

Rico hospitals we proposed a market basket update of 3.0 percent less a productivity adjustment of 0.4 percentage point. For FY 2025, depending on whether a Puerto Rico hospital is a meaningful EHR user, there are two possible applicable percentage increases that could be applied to the standardized amount. Based on these data, we determined the following proposed applicable percentage increases to the standardized amount for FY 2025 for Puerto Rico hospitals:

- For a Puerto Rico hospital that is a meaningful EHR user, we proposed a FY 2025 applicable percentage increase to the operating standardized amount of 2.6 percent (that is, the FY 2025 estimate of the proposed market basket rate-of-increase of 3.0 percent less 0.4 percentage point for the proposed productivity adjustment).
- For a Puerto Rico hospital that is not a meaningful EHR user, we proposed a FY 2025 applicable percentage increase to the operating standardized amount of 0.35 percent (that is, the FY 2025 estimate of the proposed market basket rate-of-increase of 3.0 percent, less an adjustment of 2.25 percentage points (the proposed market basket rate-of-increase of 3.0 percent \times 0.75 for failure to be a meaningful EHR user), and less 0.4 percentage point for the proposed productivity adjustment).

As noted previously, we proposed that if more recent data subsequently became available, we would use such data, if appropriate, to determine the FY 2025 market basket update and the productivity adjustment for the FY 2025 IPPS/LTCH PPS final rule. We did not receive any public comments on our proposed updates to the standardized amount for FY 2025 for Puerto Rico hospitals. The general comments we received on the proposed FY 2025 update (including the proposed market basket update and productivity adjustment) are discussed in greater detail earlier in this section. For FY 2025, we are finalizing the proposal to determine the update to the standardized amount for FY 2025 for Puerto Rico hospitals in this final rule using the more recent available data, as previously discussed.

As previously discussed in section V.A.1. of the preamble of this final rule, based on

more recent data available for this final rule (that is, IGI’s second quarter 2024 forecast of the 2018-based IPPS market basket rate-of-increase with historical data through the first quarter of 2024), we estimate that the FY 2025 market basket update used to determine the applicable percentage increase for the IPPS is 3.4 percent and a productivity adjustment of 0.5 percent. For FY 2025, depending on whether a Puerto Rico hospital is a meaningful EHR user, there are two possible applicable percentage increases that can be applied to the standardized amount. Based on these data, in accordance with section 1886(b)(3)(B) of the Act, we determined the following applicable percentage increases to the standardized amount for FY 2025 for Puerto Rico hospitals:

- For a Puerto Rico hospital that is a meaningful EHR user, an applicable percentage increase to the operating standardized amount of 2.9 percent (that is, the FY 2025 estimate of the market basket rate-of-increase of 3.4 percent less an adjustment of 0.5 percentage point for the productivity adjustment).
- For a Puerto Rico hospital that is not a meaningful EHR user, an applicable percentage increase to the operating standardized amount of 0.35 percent (that is, the FY 2025 estimate of the market basket rate-of-increase of 3.4 percent, less an adjustment of 2.55 percentage point (the market basket rate-of-increase of 3.4 percent \times 0.75 for failure to be a meaningful EHR user), and less an adjustment of 0.5 percentage point for the productivity adjustment).

FY 2025 APPLICABLE PERCENTAGE INCREASES FOR PUERTO RICO HOSPITALS UNDER THE IPPS

FY 2025	Hospital is a Meaningful EHR User	Hospital is NOT a Meaningful EHR User
Market Basket Rate-of-Increase	3.4	3.4
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	-2.55
Productivity Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.5	-0.5
Applicable Percentage Increase Applied to Standardized Amount	2.9	0.35

C. Rural Referral Centers (RRCs) Annual Updates to Case-Mix Index (CMI) and Discharge Criteria (§ 412.96)

Under the authority of section 1886(d)(5)(C)(i) of the Act, the regulations at § 412.96 set forth the criteria that a hospital must meet in order to qualify under the IPPS as a rural referral center (RRC). RRCs receive special treatment under both the DSH payment adjustment and the criteria for geographic reclassification.

Section 402 of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (Pub. L. 108–173) raised the DSH payment adjustment for RRCs such that they are not subject to the 12-percent cap on DSH payments that is applicable to other rural hospitals. RRCs also are not subject to the proximity criteria when applying for geographic reclassification. In addition, they do not have to meet the requirement that a hospital’s average hourly wage must exceed, by a certain percentage, the average hourly wage of the labor market area in which the hospital is located.

Section 4202(b) of the Balanced Budget Act of 1997 (Pub. L. 105-33) states, in part, that any hospital classified as an RRC by the Secretary for FY 1991 shall be classified as such an RRC for FY 1998 and each subsequent fiscal year. In the August 29, 1997, IPPS final rule with comment period (62 FR 45999 through 46000), we reinstated RRC status for all hospitals that lost that status due to triennial review or MGCRB reclassification. However, we did not reinstate the status of hospitals that lost RRC status because they were now urban for all purposes because of the OMB designation of their geographic area as urban. Subsequently, in the August 1, 2000 IPPS final rule (65 FR 47087), we indicated that we were revisiting that decision. Specifically, we stated that we would permit hospitals that previously qualified as an RRC and lost their status due to OMB redesignation of the county in which they are located from rural to urban, to be reinstated as an RRC. Otherwise, a hospital seeking RRC status must satisfy all of the other applicable criteria. We use the definitions of “urban” and “rural” specified in subpart D of 42 CFR part 412. One of the criteria under which a hospital may qualify as an RRC

is to have 275 or more beds available for use (§ 412.96(b)(1)(ii)). A rural hospital that does not meet the bed size requirement can qualify as an RRC if the hospital meets two mandatory prerequisites (a minimum case-mix index (CMI) and a minimum number of discharges), and at least one of three optional criteria (relating to specialty composition of medical staff, source of inpatients, or referral volume). (We refer readers to § 412.96(c)(1) through (5) and the September 30, 1988, **Federal Register** (53 FR 38513) for additional discussion.) With respect to the two mandatory prerequisites, a hospital may be classified as an RRC if the hospital's--

- CMI is at least equal to the lower of the median CMI for urban hospitals in its census region, excluding hospitals with approved teaching programs, or the median CMI for all urban hospitals nationally; and
- Number of discharges is at least 5,000 per year, or, if fewer, the median number of discharges for urban hospitals in the census region in which the hospital is located. The number of discharges criterion for an osteopathic hospital is at least 3,000 discharges per year, as specified in section 1886(d)(5)(C)(i) of the Act.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45217), in light of the COVID-19 PHE, we amended the regulations at § 412.96(h)(1) to provide for the use of the best available data rather than the latest available data in calculating the national and regional CMI criteria. We also amended the regulations at § 412.96(c)(1) to indicate that the individual hospital's CMI value for discharges during the same Federal fiscal year used to compute the national and regional CMI values is used for purposes of determining whether a hospital qualifies for RRC classification. We also amended the regulations § 412.96(i)(1) and (2), which describe the methodology for calculating the number of discharges criteria, to provide for the use of the best available data rather than the latest available or most recent data when calculating the regional discharges for RRC classification.

1. Case-Mix Index (CMI)

Section 412.96(c)(1) provides that CMS establish updated national and regional CMI values in each year's annual notice of prospective payment rates for purposes of determining RRC status. The methodology we used to determine the national and regional CMI values is set forth in the regulations at § 412.96(c)(1)(ii). The national median CMI value for FY 2025 is based on the CMI values of all urban hospitals nationwide, and the regional median CMI values for FY 2025 are based on the CMI values of all urban hospitals within each census region, excluding those hospitals with approved teaching programs (that is, those hospitals that train residents in an approved GME program as provided in § 413.75). These values are based on discharges occurring during FY 2023 (October 1, 2022 through September 30, 2023), and include bills posted to CMS' records through March 2024. We believe that this is the best available data for use in calculating the national and regional median CMI values and is consistent with our use of the FY 2023 MedPAR claims data for FY 2025 ratesetting.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36206), we proposed that, in addition to meeting other criteria, if rural hospitals with fewer than 275 beds are to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2024, they must have a CMI value for FY 2023 that is at least--

- 1.7764 (national--all urban); or
- The median CMI value (not transfer-adjusted) for urban hospitals (excluding hospitals with approved teaching programs as identified in § 413.75) calculated by CMS for the census region in which the hospital is located. (We refer readers to the table set forth in the FY 2025 IPPS/LTCH PPS proposed rule at 89 FR 36207). In the proposed rule we stated that we intended to update the proposed CMI values in the FY 2025 IPPS/LTCH PPS final rule to reflect the updated FY 2023 MedPAR file, which contains data from additional bills received through March 2024.

Comment: Commenters supported our proposal to use FY 2023 data to calculate the national and regional median CMI values for FY 2025.

Response: We appreciate the commenters' support.

Therefore, based on the best available data (FY 2023 bills received through March 2024), in addition to meeting other criteria, if rural hospitals with fewer than 275 beds are to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2024, they must have a CMI value for FY 2023 that is at least:

- 1.7789 (national—all urban); or
- The median CMI value (not transfer-adjusted) for urban hospitals (excluding hospitals with approved teaching programs as identified in § 413.75) calculated by CMS for the census region in which the hospital is located.

The final CMI values by region are set forth in the following table.

Region	Case-Mix Index Value
1. New England (CT, ME, MA, NH, RI, VT)	1.49605
2. Middle Atlantic (PA, NJ, NY)	1.5554
3. East North Central (IL, IN, MI, OH, WI)	1.6382
4. West North Central (IA, KS, MN, MO, NE, ND, SD)	1.7271
5. South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	1.6315
6. East South Central (AL, KY, MS, TN)	1.5962
7. West South Central (AR, LA, OK, TX)	1.78235
8. Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	1.7742
9. Pacific (AK, CA, HI, OR, WA)	1.7888

A hospital seeking to qualify as an RRC should obtain its hospital-specific CMI value (not transfer-adjusted) from its MAC. Data are available on the Provider Statistical and Reimbursement (PS&R) System. In keeping with our policy on discharges, the CMI values are computed based on all Medicare patient discharges subject to the IPPS MS-DRG-based payment.

2. Discharges

Section 412.96(c)(2)(i) provides that CMS set forth the national and regional numbers of discharges criteria in each year's annual notice of prospective payment rates for purposes of determining RRC status. As specified in section 1886(d)(5)(C)(ii) of the Act, the national standard is set at 5,000 discharges. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR

36207), we proposed to update the regional standards based on discharges for urban hospitals' cost reporting periods that began during FY 2022 (that is, October 1, 2021 through September 30, 2022). Because this is the latest available cost reporting data, we believe that this is the best available data for use in calculating the median number of discharges by region and is consistent with our finalized data proposal to use cost report data from cost reporting periods beginning during FY 2022 for FY 2025 ratesetting. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36207), we proposed that, in addition to meeting other criteria, a hospital, if it is to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2024, must have, as the number of discharges for its cost reporting period that began during FY 2022, at least--

- 5,000 (3,000 for an osteopathic hospital); or
- If less, the median number of discharges for urban hospitals in the census region in

which the hospital is located. (We refer readers to the table set forth in the FY 2025 IPPS/LTCH PPS proposed rule at 89 FR 36207). In the proposed rule, we stated that we intended to update these numbers in the FY 2025 final rule based on the latest available cost report data.

Comment: Commenters supported our proposal to use FY 2022 data to calculate median number of discharges by region for FY 2025.

Response: We appreciate the commenters' support.

Therefore, based on the best available discharge data at this time, that is, for cost reporting periods that began during FY 2022, the final median number of discharges for urban hospitals by census region are set forth in the following table.

Region	Number of Discharges
1. New England (CT, ME, MA, NH, RI, VT)	8,606
2. Middle Atlantic (PA, NJ, NY)	9,811
3. East North Central (IL, IN, MI, OH, WI)	7,572
4. West North Central (IA, KS, MN, MO, NE, ND, SD)	6,603
5. South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	10,253
6. East South Central (AL, KY, MS, TN)	8,271
7. West South Central (AR, LA, OK, TX)	5,810
8. Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	7,721
9. Pacific (AK, CA, HI, OR, WA)	8,601

We note that because the median number of discharges for hospitals in each census region is greater than the national standard of 5,000 discharges, under this final rule, 5,000 discharges is the minimum criterion for all hospitals, except for osteopathic hospitals for which the minimum criterion is 3,000 discharges.

3. Qualification under the Discharge Criterion for Osteopathic Hospitals

Section 1886(d)(5)(C) of the Act sets forth certain criteria that must be met for a hospital to be classified as a rural referral center, including a discharge criterion specifying the hospital has at least 5,000 discharges a year or, if less, the median number of discharges in urban hospitals in the region in which the hospital is located. Section 9106 of the Consolidated Omnibus Budget Reconciliation Act of 1985 (Pub. L. 99-272) amended section 1886(d)(5)(C) of the Act to provide for a separate discharge criterion for an osteopathic hospital to qualify for classification as a rural referral center, effective for cost reporting periods beginning on or after January 1, 1986. To implement this statutory provision, in the FY 1987 IPPS final rule, we revised 42 CFR 412.96(c)(2) to specify that for cost reporting periods beginning on or after January 1, 1986 an osteopathic hospital, recognized by the American Osteopathic Hospital Association, that is located in a rural area must have at least 3,000 discharges during its most recently completed cost reporting period to meet the number of discharges criterion (51 FR 31471). In the FY 1996 IPPS final rule, in light of a name change of the American Osteopathic Hospital Association to the American Osteopathic Healthcare Association, we subsequently revised 42 CFR 412.96(c)(2) to specify that the osteopathic hospital must be recognized by the American Osteopathic Healthcare Association “(or any successor organization)” (60 FR 45810).

As we discussed in implementing the number of discharges criterion for osteopathic hospitals in the FY 1987 IPPS final rule, “[b]ecause section 1886(d)(5)(C)(i) of the Act specifically limits this qualification to osteopathic hospitals, we do not believe that this standard should apply to all hospitals” (51 FR 31473). Accordingly, to qualify under this lower number of discharges criterion, a hospital must be an osteopathic hospital. It has come to the attention of

CMS that the successor organization to the American Osteopathic Healthcare Association, namely the Accreditation Commission for Health Care, accredits acute care hospitals, including hospitals that are not osteopathic. Thus, a hospital receiving an accreditation letter or certificate from the successor organization is not necessarily an osteopathic hospital. Therefore, we proposed to revise the regulations at 42 CFR 412.96(c)(2) to clarify that, to qualify for RRC classification based on the lower discharge criterion for osteopathic hospitals, a hospital must be an osteopathic hospital and by itself recognition (such as an accreditation letter) by a successor organization to the American Osteopathic Healthcare Association is not necessarily sufficient to demonstrate that a hospital is an osteopathic hospital.

We proposed to amend our regulations at 42 CFR 412.96 by revising paragraph (c)(2)(ii) as follows: “(ii) For cost reporting periods beginning on or after January 1, 1986, an osteopathic hospital, recognized by the American Osteopathic Healthcare Association (or any successor organization), that is located in a rural area must have at least 3,000 discharges during its cost reporting period that began during the same fiscal year as the cost reporting periods used to compute the regional median discharges under paragraph (i) of this section to meet the number of discharges criterion. A hospital applying for rural referral center status under the number of discharges criterion in this paragraph must demonstrate its status as an osteopathic hospital.” Consistent with section 1886(d)(5)(C)(i) of the Act, evidence of osteopathic status may include, but is not limited to, the hospital’s scope of services and its mix of medical specialties. CMS will consider the totality of the information demonstrating whether an applicant hospital is an osteopathic hospital. We sought comment on additional types of evidence we should consider in the determination of a hospital’s osteopathic status.

Comment: We received one comment on our proposed revisions to the regulations at 42 CFR 412.96(c)(2). The commenter requested that CMS consider more definitive measures of determining osteopathic status but cautioned that determination of a hospital’s osteopathic status on the basis of offering osteopathic services or having osteopathic doctors on staff presents

threshold related challenges. CMS did not receive any specific recommendations regarding the appropriate scope of services, mix of medical specialties, or any other criterion for determining osteopathic status of a hospital applying for rural referral status under the reduced discharge criterion.

Response: We thank the commenter for their feedback on our proposed revisions to the regulation text. CMS may consider further refinements in future rulemaking, such as more definitive measures, as we gain further experience with the types of evidence used by applicant hospitals to demonstrate their osteopathic status.

After consideration of the comment received, we are finalizing our updates to the regulation text as proposed. CMS will determine osteopathic status of a hospital applying for rural referral status according to the totality of the information submitted.

D. Payment Adjustment for Low-Volume Hospitals (§ 412.101)

1. Background

Section 1886(d)(12) of the Act provides for an additional payment to each qualifying low-volume hospital under the IPPS beginning in FY 2005. The low-volume hospital payment adjustment is implemented in the regulations at 42 CFR 412.101. The additional payment adjustment to a low-volume hospital provided for under section 1886(d)(12) of the Act is in addition to any payment calculated under section 1886 of the Act and is based on the per discharge amount paid to the qualifying hospital. In other words, the low-volume hospital payment adjustment is based on total per discharge payments made under section 1886 of the Act, including capital, DSH, IME, and outlier payments. For SCHs and MDHs, the low-volume hospital payment adjustment is based in part on either the Federal rate or the hospital-specific rate, whichever results in a greater operating IPPS payment. The payment adjustment for low-volume hospitals is not budget neutral.

As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59041 through 59045), section 4101 of the CAA, 2023 (Pub. L. 117-328) extended through FY 2024 the modified definition of a low-volume hospital and the methodology for calculating the payment adjustment for low-volume hospitals in effect for FYs 2019 through 2022. The Consolidated Appropriations Act, 2024 (CAA, 2024) (Pub. L. 118-42), enacted on March 9, 2024, extended the temporary changes to the low-volume hospital qualifying criteria and payment adjustment under the IPPS for a portion of FY 2025. Specifically, section 306 of the CAA, 2024 further extended the modified definition of low-volume hospital and the methodology for calculating the payment adjustment for low-volume hospitals under section 1886(d)(12) through December 31, 2024. Beginning January 1, 2025, the low-volume hospital qualifying criteria and payment adjustment will revert to the statutory requirements that were in effect prior to FY 2011, and the preexisting low-volume hospital payment adjustment methodology and qualifying criteria, as implemented in FY 2005 and discussed later in this section, will resume. We discuss our proposals for the

payment policies for FY 2025, which we are finalizing as proposed after consideration of public comments, in section V.E.2. of the preamble of this final rule.

TABLE V.E.-01: LOW-VOLUME HOSPITAL QUALIFYING CRITERIA AND PAYMENT ADJUSTMENT FOR FYs 2019 AND SUBSEQUENT FYs

Fiscal Years	Road Miles	Total Discharges	Payment Adjustment
2019 through 2024 and 2025 discharges through 12/31/24	>15	<= 500	0.25
		> 500 < 3,800	$0.25 - [0.25/3300] \times (\text{number of total discharges} - 500) = (95/330) - (\text{number of total discharges}/13,200)$
2025 discharges beginning 1/1/25 and subsequent years	>25	< 200	0.25

2. Extension of Temporary Changes to Low-Volume Hospital Payment Definition and Payment Adjustment Methodology and Conforming Changes to Regulations

As discussed previously, section 4101 of the CAA, 2023 modified the definition of low-volume hospital and the methodology for calculating the payment adjustment for low-volume hospitals under section 1886(d)(12) of the Act through September 30, 2024. Prior to the enactment of the CAA, 2024 (Pub. L. 118-42), the temporary changes to the low-volume hospital qualifying criteria and payment adjustment provided by section 4101 of CAA, 2023 were set to expire on October 1, 2024. Section 306 of the CAA, 2024 extends the temporary changes to the low-volume hospital qualifying criteria and payment adjustment under the IPPS for the portion of FY 2025 beginning on October 1, 2024, and ending on December 31, 2024 (that is, for discharges occurring before January 1, 2025).

Under section 1886(d)(12)(C)(i) of the Act, as amended by P.L. 118-42, for FYs 2019 through 2024 and the portion of FY 2025 occurring before January 1, 2025, a subsection (d) hospital qualifies as a low-volume hospital if it is more than 15 road miles from another subsection (d) hospital and has less than 3,800 total discharges during the fiscal year. In accordance with the existing regulations at § 412.101(a), we define the term “road miles” to mean “miles” as defined at § 412.92(c)(1). Under section 1886(d)(12)(D) of the Act, as amended, for discharges occurring in FY 2019 through December 31, 2024, the Secretary

determines the applicable percentage increase using a continuous, linear sliding scale ranging from an additional 25 percent payment adjustment for low-volume hospitals with 500 or fewer discharges to a zero percent additional payment for low volume hospitals with more than 3,800 discharges in the fiscal year. Consistent with the requirements of section 1886(d)(12)(C)(ii) of the Act, the term “discharge” for purposes of these provisions refers to total discharges, regardless of payer (that is, Medicare and non-Medicare discharges).

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41399), we specified a continuous, linear sliding scale formula to determine the low volume payment adjustment, as reflected in the regulations at § 412.101(c)(3)(ii). Consistent with the statute, we provided that qualifying hospitals with 500 or fewer total discharges will receive a low-volume hospital payment adjustment of 25. For qualifying hospitals with fewer than 3,800 discharges but more than 500 discharges, the low-volume payment adjustment is calculated by subtracting from 25 percent the proportion of payments associated with the discharges in excess of 500. For qualifying hospitals with fewer than 3,800 total discharges but more than 500 total discharges, the low-volume hospital payment adjustment is calculated using the formula at § 412.101(c)(3)(ii) (which is shown in the Table V.E.-01). For this purpose, the term “discharge” refers to total discharges, regardless of payer (that is, Medicare and non-Medicare discharges). The hospital’s most recently submitted cost report is used to determine if the hospital meets the discharge criterion to receive the low volume payment adjustment in the current year (§ 412.101(b)(2)(iii)). The low-volume hospital payment adjustment for FYs 2019 through 2024 is set forth in the regulations at §412.101(c)(3).

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36209), consistent with the extension of the methodology for calculating the payment adjustment for low-volume hospitals through FY 2024, we proposed to continue using the previously specified continuous, linear sliding scale formula to determine the low-volume hospital payment adjustment for the portion of FY 2025 occurring before January 1, 2025. We also proposed to make conforming changes to

the regulation text in § 412.101 to reflect the extensions of the changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals in accordance with provisions of the CAA, 2024. Specifically, we proposed to make conforming changes to paragraphs (b)(2)(iii) and (c)(3) introductory text of § 412.101 to reflect that the low-volume hospital payment adjustment policy in effect for the portion of FY 2025 through December 31, 2024, is the same low-volume hospital payment adjustment policy in effect for FYs 2019 through 2024 (as described in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41398 through 41399) and in the FY 2024 IPPS/LTCH final rule (88 FR 59041 through 59045)). In addition, in accordance with the provisions of the CAA, 2024, we proposed to make conforming changes to paragraphs (b)(2)(i) and (c)(1) of § 412.101 to reflect that for the portion of FY 2025 beginning on January 1, 2025 and for subsequent fiscal years, the low-volume hospital payment adjustment policy will revert back to the low-volume hospital payment adjustment policy in effect for FYs 2005 through 2010, as described in section V.E.3. of the preamble of this final rule. We further proposed that if the temporary changes to the low-volume payment adjustment were extended through legislation beyond December 31, 2024, we would make the conforming changes to the regulations at § 412.101(b)(2)(i), (b)(2)(iii), (c)(1), and (c)(3) to reflect any further extension.

Comment: Commenters supported the legislative extension of the temporary changes to the definition and payment adjustment for low-volume hospitals through December 31, 2024, and expressed support for additional legislative extensions. Many commenters requested that CMS collaborate with Congress to extend or make permanent the temporary modifications to the low-volume hospital payment policy. A commenter asked CMS to clarify how it would handle any legislation that that would provide a continuation of the modified low-volume hospital payment policy beyond the end of the year. Another commenter urged CMS to expeditiously process claims and provide instructions to MACs for any subsequent extensions, especially in instances when extensions are made retroactively.

Response: We appreciate the commenters sharing their support for legislative extension. As we have said in the past, we make every effort to implement any extension of the low-volume hospital payment policy as expeditiously as possible, however we believe it would be premature to opine on exactly how any subsequent extension would be implemented. As with past extensions, we would continue work to implement any subsequent extensions as quickly and seamlessly as possible based on the s specific legislative requirements of the particular extension.

After consideration of the public comments we received regarding the temporary changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals through December 31, 2024, we are finalizing our proposals on the extension of these changes without modification, including our proposal to codify these extensions in the regulation text at § 412.101 without modification.

3. Payment Adjustment for the Portion of FY 2025 Beginning on January 1, 2025, and Subsequent Fiscal Years

In accordance with section 1886(d)(12) of the Act, as amended by section 306 of the CAA, 2024, beginning with FY 2025 discharges occurring on or after January 1, 2025, the low-volume hospital definition and payment adjustment methodology will revert to the statutory requirements that were in effect prior to the amendments made by the Affordable Care Act and subsequent legislation. Specifically, section 1886(d)(12)(B) of the Act requires, for discharges occurring in FYs 2005 through 2010, FY 2025 discharges occurring on or after January 1, 2025 and subsequent years, that the Secretary determine an applicable percentage increase for these low-volume hospitals based on the “empirical relationship” between the standardized cost-per-case for such hospitals and the total number of discharges of such hospitals and the amount of the additional incremental costs (if any) that are associated with such number of discharges. The statute thus mandates that the Secretary develop an empirically justifiable adjustment based on the relationship between costs and discharges for these low-volume hospitals.

Therefore, effective for the portion of FY 2025 beginning on January 1, 2025 and subsequent years, under current policy at § 412.101(b), to qualify as a low-volume hospital, a subsection (d) hospital must be more than 25 road miles from another subsection (d) hospital and have less than 200 discharges (that is, less than 200 discharges total, including both Medicare and non-Medicare discharges) during the fiscal year. For the portion of FY 2025 beginning on January 1, 2025, and subsequent years, the statute specifies that a low-volume hospital must have less than 800 discharges during the fiscal year. However, as required by section 1886(d)(12)(B)(i) of the Act, the Secretary has developed an empirically justifiable payment adjustment based on the relationship, for IPPS hospitals with less than 800 discharges, between the additional incremental costs (if any) that are associated with a particular number of discharges. Based on an analysis we conducted for the FY 2005 IPPS final rule (69 FR 49099 through 49102), a 25-percent low-volume adjustment to all qualifying hospitals with less than 200 discharges was found to be most consistent with the statutory requirement to provide relief for low-volume hospitals where there is empirical evidence that higher incremental costs are associated with low numbers of total discharges. (Under the policy we established in that same final rule, hospitals with between 200 and 799 discharges do not receive a low-volume hospital adjustment.)

As discussed previously, for FYs 2005 through 2010 and FY 2019 and subsequent years, the discharge determination is made based on the hospital's number of total discharges, that is, Medicare and non-Medicare discharges. The hospital's most recently submitted cost report is used to determine if the hospital meets the discharge criterion to receive the low-volume payment adjustment in the current year (§ 412.101(b)(2)(i)). We use cost report data to determine if a hospital meets the discharge criterion because this is the best available data source that includes information on both Medicare and non-Medicare discharges. We note that, for FYs 2011 through 2018, we used the most recently available MedPAR data to determine the

hospital's Medicare discharges because only Medicare discharges were used to determine if a hospital met the discharge criterion for those years.

In addition to the discharge criterion, a hospital must also meet the mileage criterion to qualify for the low-volume payment adjustment. As specified by section 1886(d)(12)(C)(i) of the Act, a low-volume hospital must be more than 25 road miles (or 15 road miles for FYs 2011 through 2024) from another subsection (d) hospital. Accordingly, for FY 2025 and subsequent fiscal years, in addition to the discharge criterion, the eligibility for the low-volume payment adjustment is also dependent upon the hospital meeting the mileage criterion at § 412.101(b)(2)(i), which specifies that a hospital must be located more than 25 road miles from the nearest subsection (d) hospital, consistent with section 1886(d)(12)(C)(i) of the Act. We define, at § 412.101(a), the term "road miles" to mean "miles" as defined at § 412.92(c)(1) (75 FR 50238 through 50275 and 50414). As previously noted, we proposed to make conforming changes to paragraphs (b)(2)(i) and (c)(1) of § 412.101 to reflect that for the portion of FY 2025 beginning on January 1, 2025, and subsequent fiscal years, the low-volume hospital payment adjustment policy is the same as that in effect for FYs 2005 through 2010.

On average, approximately 600 hospitals per year were eligible for the low-volume hospital payment adjustment for FYs 2019 through 2024 under the temporary changes in the low-volume hospital payment policy as amended by section 50204 of the Bipartisan Budget Act of 2018 (Pub. L. 115–123), and section 4101 of the Consolidated Appropriations Act, 2023 (CAA, 2023) (Pub. L. 117-328). As discussed previously, the CAA, 2024 further extended the modified definition of low-volume hospital and the methodology for calculating the payment adjustment for low-volume hospitals under section 1886(d)(12) through December 31, 2024. Therefore, for the portion of FY 2025 beginning on January 1, 2025 and for subsequent years the low-volume hospital qualifying criteria and payment adjustment will revert to the statutory requirements that were in effect prior to FY 2011. Based on historical data for hospitals that qualified during FYs 2005 – 2010, we estimate that fewer than 10 hospitals would qualify for the

low-volume hospital payment adjustment for the portion of FY 2025 beginning on January 1, 2025 under current law.

Comment: Many commenters urged CMS to collaborate with Congress to make permanent the modifications to the low-volume hospital payment policy. Some commenters requested CMS continue the temporary changes to the definition and the methodology for calculating the payment adjustment for low-volume hospitals for the portion of FY 2025 beginning on January 1, 2025 and subsequent years. Commenters stated that not continuing these temporary changes would result in significant reductions in payment that could impede the services hospitals, including those in rural communities, provide in the communities they serve.

Response: We appreciate the feedback from commenters on continuation of the enhanced low-volume hospital payment policy for the portion of FY 2025 beginning on January 1, 2025 and subsequent years. As previously discussed, the statute only extends those temporary changes to the low-volume hospital policy through December 31, 2024. Therefore, in absence of subsequent legislation, beginning on January 1, 2025, the low-volume hospital qualifying criteria and the amount of the payment adjustment to such hospitals will revert back to those policies that were in effect prior to the amendments made by recent legislation.

Comment: For the portion of FY 2025 beginning on January 1, 2025 and subsequent years, several commenters requested expanding low-volume hospital payment adjustment eligibility criteria to include hospitals with 200-799 discharges as provided by the statute. A commenter stated that under the originally established low-volume hospital adjustment policy only a small number of hospitals would qualify to receive the adjustment under the low-volume hospital payment policy beginning January 1, 2025. The impact, the commenter argued, would make nearly all rural hospitals ineligible to receive the low-volume hospital payment adjustment incurring a loss of several million dollars annually. The commenter stated that even if the low-volume hospital discharge criteria were expanded to less than 800 total discharges, more rural

hospitals would qualify for low-volume payment adjustment which will help those communities maintain access to care.

Response: As previously discussed, as required by section 1886(d)(12)(B)(i) of the Act, we developed an empirically justifiable payment adjustment based on the relationship, for IPPS hospitals with less than 800 discharges, between the additional incremental costs (if any) that are associated with a particular number of discharges. Based on our analysis, a 25-percent low-volume adjustment to all qualifying hospitals with less than 200 discharges was found to be most consistent with the statutory requirement to provide relief for low-volume hospitals where there is empirical evidence that higher incremental costs are associated with low numbers of total discharges (69 FR 49099 through 49102). In the future, we may reevaluate the low-volume hospital adjustment policy; that is, the definition of a low-volume hospital and the payment adjustment. However, we are not aware of any analysis or empirical evidence that would support expanding the originally established low-volume hospital adjustment policy. We further note that we did not make any proposals regarding the low-volume hospital payment adjustment for the portion of FY 2025 beginning on January 1, 2025 and subsequent years.

After consideration of the public comments we received, we are finalizing our proposals, without modification. Consistent with current law, effective beginning with the portion of FY 2025 beginning on January 1, 2025, the low-volume hospital definition and payment adjustment methodology will revert to the policy established under statutory requirements that were in effect prior to the amendments made by the Affordable Care Act and extended through subsequent legislation.

4. Process for Requesting and Obtaining the Low-Volume Hospital Payment Adjustment FY 2025

In the FY 2011 IPPS/LTCH PPS final rule (75 FR 50238 through 50275 and 50414) and subsequent rulemaking, most recently in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59044 through 59045), we discussed the process for requesting and obtaining the low-volume hospital

payment adjustment. Under this previously established process, a hospital makes a written request for the low-volume payment adjustment under § 412.101 to its MAC. This request must contain sufficient documentation to establish that the hospital meets the applicable mileage and discharge criteria. The MAC will determine if the hospital qualifies as a low-volume hospital by reviewing the data the hospital submits with its request for low-volume hospital status in addition to other available data. Under this approach, a hospital will know in advance whether or not it will receive a payment adjustment under the low-volume hospital policy. The MAC and CMS may review available data such as the number of discharges, in addition to the data the hospital submits with its request for low-volume hospital status, to determine whether or not the hospital meets the qualifying criteria. (For additional information on our existing process for requesting the low-volume hospital payment adjustment, we refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41399 through 41401).)

As explained earlier, for FY 2019 and subsequent fiscal years, the discharge determination is made based on the hospital's number of total discharges, that is, Medicare and non-Medicare discharges, as was the case for FYs 2005 through 2010. Under § 412.101(b)(2)(i) and (iii), a hospital's most recently submitted cost report is used to determine if the hospital meets the discharge criterion to receive the low-volume payment adjustment in the current year. As discussed in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41399 and 41400), we use cost report data to determine if a hospital meets the discharge criterion because this is the best available data source that includes information on both Medicare and non-Medicare discharges. (For FYs 2011 through 2018, the most recently available MedPAR data were used to determine the hospital's Medicare discharges because non-Medicare discharges were not used to determine if a hospital met the discharge criterion for those years.) Therefore, a hospital must refer to its most recently submitted cost report for total discharges (Medicare and non-Medicare) to decide whether or not to apply for low-volume hospital status for a particular fiscal year.

In addition to the discharge criterion, eligibility for the low-volume hospital payment adjustment is also dependent upon the hospital meeting the applicable mileage criterion specified in section 1886(d)(12)(C)(i) of the Act, which is codified at § 412.101(b)(2), for the fiscal year. Specifically, to meet the mileage criterion to qualify for the low-volume hospital payment adjustment for the portion of FY 2025 beginning October 1, 2024 through December 31, 2024, a hospital must be located more than 15 road miles from the nearest subsection (d) hospital, as reflected in proposed revised § 412.101(b)(2). Additionally, to meet the mileage criterion to qualify for the low-volume hospital payment adjustment for the portion of FY 2025 beginning January 1, 2025 through September 30, 2025, a hospital must be located more than 25 road miles from the nearest subsection (d) hospital. (We define in § 412.101(a) the term “road miles” to mean “miles” as defined in § 412.92(c)(1) (75 FR 50238 through 50275 and 50414).) For establishing that the hospital meets the mileage criterion, the use of a web-based mapping tool as part of the documentation is acceptable. The MAC will determine if the information submitted by the hospital, such as the name and street address of the nearest hospital(s), location on a map, and distance from the hospital requesting low-volume hospital status, is sufficient to document that it meets the mileage criterion. If not, the MAC will follow up with the hospital to obtain additional necessary information to determine whether or not the hospital meets the applicable mileage criterion.

In accordance with our previously established process, a hospital must make a written request for low-volume hospital status that is received by its MAC by September 1 immediately preceding the start of the Federal fiscal year for which the hospital is applying for low-volume hospital status in order for the applicable low-volume hospital payment adjustment to be applied to payments for its discharges for the fiscal year beginning on or after October 1 immediately following the request (that is, the start of the Federal fiscal year). For a hospital whose request for low-volume hospital status is received after September 1, if the MAC determines the hospital meets the criteria to qualify as a low-volume hospital, the MAC will apply the applicable

low-volume hospital payment adjustment to determine payment for the hospital's discharges for the fiscal year, effective prospectively within 30 days of the date of the MAC's low-volume status determination.

Consistent with this previously established process, for FY 2025, we proposed that a hospital must submit a written request for low-volume hospital status to its MAC that includes sufficient documentation to establish that the hospital meets the applicable mileage and discharge criteria (as described earlier). Specifically, for the portion of FY 2025 beginning October 1, 2024 through December 31, 2024, a hospital must make a written request for low-volume hospital status that is received by its MAC no later than September 1, 2024, in order for the low-volume, add-on payment adjustment to be applied to payments for its discharges beginning on or after October 1, 2024. If a hospital's written request for low-volume hospital status for the portion of FY 2025 beginning October 1, 2024 through December 31, 2024 is received after September 1, 2024, and if the MAC determines the hospital meets the criteria to qualify as a low-volume hospital, the MAC would apply the low-volume hospital payment adjustment to determine the payment for the hospital's FY 2025 discharges prior to January 1, 2025, effective prospectively within 30 days of the date of the MAC's low-volume hospital status determination.

Additionally, we proposed that a hospital must also submit a written request for low-volume hospital status to its MAC that includes sufficient documentation to establish that the hospital continues to meet the applicable mileage and discharge criteria for the portion of FY 2025 beginning on January 1, 2025 through September 30, 2025 (as described earlier). Specifically, for the portion of FY 2025 beginning on January 1, 2025, a hospital must make a written request for low-volume hospital status that is received by its MAC no later than December 1, 2024, in order for the 25-percent, low-volume, add-on payment adjustment to be applied to payments for its discharges beginning on or after January 1, 2025. If a hospital's written request for low-volume hospital status for the portion of FY 2025 beginning on

January 1, 2025 is received after December 1, 2024, and if the MAC determines the hospital meets the criteria to qualify as a low-volume hospital, the MAC would apply the low-volume hospital payment adjustment to determine the payment for the hospital's FY 2025 discharges on or after January 1, 2025, effective prospectively within 30 days of the date of the MAC's low-volume hospital status determination.

A hospital may choose to make a single written request for low-volume hospital status to its MAC for both the portion of FY 2025 beginning on October 1, 2024, and ending December 31, 2024, and the portion of FY 2025 beginning on January 1, 2025, through September 30, 2025, by the September 1, 2024, deadline discussed previously. Alternatively, a hospital may choose to submit separate written requests, one for the portion of FY 2025 beginning on October 1, 2024, and ending on December 31, 2024 (by the September 1, 2024, deadline discussed previously), and another for the portion of FY 2025 beginning on January 1, 2025, through September 30, 2025 (by the December 1, 2024 deadline discussed previously).

Under this process, a hospital that qualified for the low-volume hospital payment adjustment for FY 2024 may continue to receive a low-volume hospital payment adjustment for FY 2025 without reapplying if it meets both the discharge criterion and the mileage criterion applicable for FY 2025 (that is, the discharge criterion and mileage criterion for the period beginning October 1, 2024 through December 31, 2024, as well as the discharge criterion and mileage criterion for the period beginning on January 1, 2025 through September 30, 2025, respectively). As discussed previously, for the portion of FY 2025 beginning on January 1, 2025, the discharge and the mileage criteria are reverting to the statutory requirements that were in effect prior to FY 2011, and to the preexisting low-volume hospital qualifying criteria, as implemented in FY 2005 and specified in the existing regulations at § 412.101(b)(2)(i). As in previous years, we proposed that such a hospital must send written verification that is received by its MAC no later than September 1, 2024 or December 1, 2024,

respectively, stating that it meets the mileage criterion for the applicable portion(s) of FY 2025, as described previously. For example, for the portion of FY 2025 beginning October 1, 2024 through December 31, 2024, the hospital must state it is located more than 15 road miles from the nearest “subsection (d)” hospital. Similarly, for the portion of FY 2025 beginning on January 1, 2025, the hospital must state it is located more than 25 road miles from the nearest “subsection (d)” hospital. For FY 2025, we further proposed that this written verification must also state, based upon the most recently submitted cost report, that the hospital meets the discharge criterion for the applicable portion(s) of FY 2025, as described previously. For example, for the portion of FY 2025 beginning October 1, 2024 through December 31, 2024, the hospital must have less than 3,800 discharges total, including both Medicare and non-Medicare discharges. Similarly, for the portion of FY 2025 beginning on January 1, 2025, the hospital must have less than 200 discharges total, including both Medicare and non-Medicare discharges. If a hospital’s request for low-volume hospital status for FY 2025 is received after September 1, 2024, (or after December 1, 2024 for the portion of FY 2025 beginning on January 1, 2025) and if the MAC determines the hospital meets the criteria to qualify as a low-volume hospital, the MAC will apply the applicable low-volume add-on payment adjustment to determine the payment for the hospital’s discharges for the applicable portion(s) of FY 2025, effective prospectively within 30 days of the date of the MAC’s low-volume hospital status determination.

We did not receive any comments on our process for requesting and obtaining the low-volume payment adjustment for the portion of FY 2025 beginning October 1, 2024 through December 31, 2024 or the portion of FY 2025 beginning on January 1, 2025. Therefore, we are finalizing our proposals, without modification.

E. Changes in the Medicare-Dependent, Small Rural Hospital (MDH) Program (§ 412.108)

1. Background for the MDH Program

Section 1886(d)(5)(G) of the Act provides special payment protections, under the IPPS, to a Medicare-dependent, small rural hospital (MDH). (For additional information on the MDH program and the payment methodology, we refer readers to the FY 2012 IPPS/ LTCH PPS final rule (76 FR 51683 through 51684).) As discussed in section V.B. of the preamble of this final rule, section 307 of the Consolidated Appropriations Act, 2024 (CAA, 2024) (Pub. L. 118-42), enacted on March 9, 2024, extended the MDH program for FY 2025 discharges occurring before January 1, 2025. Prior to enactment of the CAA, 2024, the MDH program was only to be in effect through the end of FY 2024. Under current law, the MDH program provisions at section 1886(d)(5)(G) of the Act will expire for discharges on or after January 1, 2025. Beginning with discharges occurring on or after January 1, 2025, all hospitals that previously qualified for MDH status will be paid based on the Federal rate.

Since the extension of the MDH program through FY 2012 provided by section 3124 of the Affordable Care Act, the MDH program had been extended by subsequent legislation as follows: section 606 of the American Taxpayer Relief Act (Pub. L. 112–240) extended the MDH program through FY 2013 (that is, for discharges occurring before October 1, 2013). Section 1106 of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) extended the MDH program through the first half of FY 2014 (that is, for discharges occurring before April 1, 2014). Section 106 of the Protecting Access to Medicare Act (Pub. L. 113–93) extended the MDH program through the first half of FY 2015 (that is, for discharges occurring before April 1, 2015). Section 205 of the MACRA (Pub. L. 114–10) extended the MDH program through FY 2017 (that is, for discharges occurring before October 1, 2017). Section 50205 of the Bipartisan Budget Act (Pub. L. 115–123) extended the MDH program through FY 2022 (that is for discharges occurring before October 1, 2022). Section 102 of the Continuing Appropriations and Ukraine Supplemental Appropriations Act, 2023 (Pub. L. 117–180) extended the MDH program

through December 16, 2022. Section 102 of the Further Continuing Appropriations and Extensions Act, 2023 (Pub. L. 117–229) extended the MDH program through December 23, 2022. Section 4102 of the Consolidated Appropriations Act, 2023 (Pub. L. 117–328) extended the MDH program through FY 2024 (that is for discharges occurring before October 1, 2024). Lastly, under current law, section 307 of the CAA, 2024 (Pub. L. 118-42) extended the MDH program through December 31, 2024 (that is, for discharges occurring before January 1, 2025).

For additional information on the extensions of the MDH program after FY 2012, we refer readers to the following **Federal Register** documents: The FY 2013 IPPS/LTCH PPS final rule (77 FR 53404 through 53405 and 53413 through 53414); the FY 2013 IPPS notice (78 FR 14689); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50647 through 50649); the FY 2014 interim final rule with comment period (79 FR 15025 through 15027); the FY 2014 notice (79 FR 34446 through 34449); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50022 through 50024); the August 2015 interim final rule with comment period (80 FR 49596); the FY 2017 IPPS/LTCH PPS final rule (81 FR 57054 through 57057); the FY 2018 notice (83 FR 18303 through 18305); the FY 2019 IPPS/LTCH PPS final rule (83 FR 41429); and the FY 2024 IPPS/LTCH PPS final rule (88 FR 59045).

2. Implementation of Legislative Extension of MDH Program

Prior to the enactment of Public Law 118-42, under section 4102 of Public Law 117–328, the MDH program authorized by section 1886(d)(5)(G) of the Act was set to expire at the end of FY 2024. Section 307 of Public Law 118-42 amended sections 1886(d)(5)(G)(i) and 1886(d)(5)(G)(ii)(II) of the Act by striking “October 1, 2024” and inserting “January 1, 2025”. Section 307 of Public Law 118-42 also made conforming amendments to sections 1886(b)(3)(D)(i) and 1886(b)(3)(D)(iv) of the Act.

Therefore, in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36212), we proposed to make conforming changes to the regulations governing the MDH program at § 412.108(a)(1) and

(c)(2)(iii) and the general payment rules at § 412.90(j) to reflect the extension of the MDH program through December 31, 2024.

As a result of the extension of the MDH program through December 31, 2024 as provided by section 307 of Public Law 118-42, a provider that is classified as an MDH as of September 30, 2024, will continue to be classified as an MDH as of October 1, 2024, with no need to reapply for MDH classification.

3. Expiration of the MDH Program

Because section 307 of the CAA, 2024 extended the MDH program through December 31, 2024 only, beginning January 1, 2025, the MDH program will no longer be in effect. Since the MDH program is not authorized by statute beyond December 31, 2024, beginning January 1, 2025, all hospitals that previously qualified for MDH status under section 1886(d)(5)(G) of the Act will no longer have MDH status and will be paid based on the IPPS Federal rate. There are currently 173 MDHs, of which we estimate 117 would have been paid under the blended payment of the Federal rate and hospital-specific rate while the remaining 56 would have been paid based on the IPPS Federal rate. With the expiration of the MDH program, all these providers will all be paid based on the IPPS Federal rate beginning with discharges occurring on or after January 1, 2025.

When the MDH program was set to expire at the end of FY 2012, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53404 through 53405), we revised our sole community hospital (SCH) policies to allow MDHs to apply for SCH status in advance of the expiration of the MDH program and be paid as such under certain conditions. We codified these changes in the regulations at § 412.92(b)(2)(i) and (b)(2)(v). Specifically, the existing regulations at § 412.92(b)(2)(i) and (b)(2)(v) allow for an effective date of an approval of SCH status that is the day following the expiration date of the MDH program. We note that these same conditions apply to MDHs that intend to apply for SCH status with the expiration of the MDH program on December 31, 2024. Therefore, in order for an MDH to receive SCH status effective

January 1, 2025, the MDH must apply for SCH status at least 30 days before the expiration of the MDH program; that is, the MDH must apply for SCH status by December 2, 2024. The MDH also must request that, if approved as an SCH, the SCH status be effective with the expiration of the MDH program; that is, the MDH must request that the SCH status, if approved, be effective January 1, 2025, immediately after its MDH status expires with the expiration of the MDH program on December 31, 2024. We emphasize that an MDH that applies for SCH status in anticipation of the expiration of the MDH program would not qualify for the January 1, 2025 effective date for SCH status if it does not apply by the December 2, 2024 deadline. If the MDH does not apply by the December 2, 2024 deadline, the hospital would instead be subject to the usual effective date for SCH classification as specified at § 412.92(b)(2)(i); that is, as of the date the MAC receives the complete application from the provider.

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to make conforming changes to the regulations governing the MDH program at § 412.108(a)(1) and (c)(2)(iii) and the general payment rules at § 412.90(j) to reflect the extension of the MDH program through December 31, 2024. We further proposed that if the MDH program were to be extended by law beyond December 31, 2024, similar to how it was extended by prior legislation as described previously, we would, depending on timing of such legislation in relation to the final rule, modify our proposed conforming changes to the regulations governing the MDH program at § 412.108(a)(1) and (c)(2)(iii) and the general payment rules at § 412.90(j) to reflect any such further extension of the MDH program. We also noted that these modifications to our proposed conforming changes would only be made if the MDH program were to be extended by statute beyond December 31, 2024.

Comment: Many commenters expressed support for extending the MDH program or making the MDH program permanent and noted that they would continue supporting congressional efforts to protect the MDH program. Some commenters also expressed support for increasing the base year for these hospitals. Others supported an additional base year for

calculating MDH payments. Several state hospital associations expressed their concern that hospitals in their states would experience significant payment decreases as a result of the expiration of the MDH program. A few commenters urged CMS for action to be taken to ensure that the MDH program is extended.

Response: While we appreciate the commenters' concerns about the expiration of the MDH program and the financial impact to affected providers if the MDH program is not extended beyond CY 2024, CMS does not have the authority under current law to extend the MDH program beyond the December 31, 2024 statutory expiration date. Similarly, Section 1886(b)(3)(D) of the Act specifies the applicable base years or "target amounts" for hospitals classified as MDHs. These comments are similar to comments we received previously, prior to the statutory extension of the MDH program for FYs 2023 and 2024 provided by subsequent legislation, and discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49064).

Comment: Several commenters expressed support for CMS' policy that allows MDHs to apply for SCH status in advance of the expiration of the MDH program and be paid as such under certain conditions. A commenter requested that CMS clearly communicate this option to rural hospitals in the event the designation lapses. Some commenters also requested that CMS automatically reinstate MDH status to all previously qualifying hospitals, including hospitals that became SCHs and hospitals that cancelled rural status in anticipation of the MDH program expiration, if a retroactive extension to the MDH program is made.

Response: We appreciate the commenters' support of our policy allowing MDHs to apply for SCH status in advance of the expiration of the MDH program and to be paid as such under certain conditions and allow for a seamless transition from MDH classification to SCH classification. As we have done with prior legislative expirations of the MDH program, CMS will communicate this information to the provider community. In response to the suggestion that CMS provide former MDHs with ability to rescind their newly acquired SCH status and reinstate their MDH status in a seamless manner if a retroactive extension to the MDH program is made,

we understand the desire on the part of hospitals for certainty in the face of MDH program expiration and will consider for future rulemaking any potential mechanisms to further streamline such transitions in connection with legislative extensions of the MDH program. We note that under the current regulations at § 412.108(b)(4), the effective date for MDH classification is as of the date the MAC receives the complete application. A MDH that applied for and was classified as an SCH in advance of the MDH expiration per the regulations at § 412.92(b)(2)(v) could request a cancellation of its SCH status and simultaneously re-apply for MDH status if the MDH program were to be extended, and the MDH classification would be effective as of the date that the MAC receives the complete application. In response to the suggestion that CMS automatically reinstate MDH status to providers that cancelled their rural status in anticipation of the MDH program expiration, we note that per the regulations at § 412.103(g)(4), a hospital's cancellation of its rural classification is effective beginning with the next Federal fiscal year.

Comment: Commenters urged CMS to expedite restoration of MDH status, should Congress act to extend these programs. They requested that CMS move expeditiously to restore payments and act quickly to retroactively address a program lapse in the event that the program is extended after December 31, 2024. A commenter requested that CMS clarify how it might handle the continuation of the program, should Congress enact legislation to extend it. A few commenters expressed appreciation for CMS' most recent implementation of the extension of the MDH program. A commenter expressed support for the decision to not require MDHs to reapply for classification for the period of October 1, 2024 through December 31, 2024.

Response: We appreciate the commenters' support for CMS' implementation of the most recent MDH extensions. We also appreciate the commenters' sharing their concerns relating to a retroactive restoration of the MDH program. As with past extensions, CMS will evaluate enacted legislation to determine the most appropriate approach to implement changes to the law, including instructions to the MACs to reinstate MDH status to eligible hospitals. As in the past,

and as acknowledged by some of the commenters, we will make every effort to implement any extension of the MDH program as expeditiously as possible.

In summary, under current law, beginning January 1, 2025, all hospitals that previously qualified for MDH status will no longer have MDH status.

After consideration of the public comments we received, we are adopting as final the proposed conforming changes to the regulations text at §§ 412.90 and 412.108 to reflect the extension of the MDH program through December 31, 2024 in accordance with section 307 of the CAA, 2024 (Pub. L. 118-42). We are finalizing the proposed changes in paragraphs (a)(1) and (c)(2)(iii) of § 412.108 and paragraph (j) of § 412.90 without modification.

F. Payment for Indirect and Direct Graduate Medical Education Costs (§§ 412.105 and 413.75 through 413.83)

1. Background

Section 1886(h) of the Act, as added by section 9202 of the Consolidated Omnibus Budget Reconciliation Act (COBRA) of 1985 (Pub. L. 99-272) and as currently implemented in the regulations at 42 CFR 413.75 through 413.83, establishes a methodology for determining payments to hospitals for the direct costs of approved graduate medical education (GME) programs. Section 1886(h)(2) of the Act sets forth a methodology for the determination of a hospital-specific base-period per resident amount (PRA) that is calculated by dividing a hospital's allowable direct costs of GME in a base period by its number of full-time equivalent (FTE) residents in the base period. The base period is, for most hospitals, the hospital's cost reporting period beginning in FY 1984 (that is, October 1, 1983 through September 30, 1984). The base year PRA is updated annually for inflation. In general, Medicare direct GME payments are calculated by multiplying the hospital's updated PRA by the weighted number of FTE residents working in all areas of the hospital complex (and at nonprovider sites, when applicable), and the hospital's Medicare share of total inpatient days.

Section 1886(d)(5)(B) of the Act provides for a payment adjustment known as the indirect medical education (IME) adjustment under the IPPS for hospitals that have residents in an approved GME program, in order to account for the higher indirect patient care costs of teaching hospitals relative to nonteaching hospitals. The regulations regarding the calculation of this additional payment are located at 42 CFR § 412.105. The hospital's IME adjustment applied to the DRG payments is calculated based on the ratio of the hospital's number of FTE residents training in either the inpatient or outpatient departments of the IPPS hospital (and, for discharges occurring on or after October 1, 1997, at non-provider sites, when applicable) to the number of inpatient hospital beds.

The calculation of both direct GME payments and the IME payment adjustment is affected by the number of FTE residents that a hospital is allowed to count. Generally, the greater the number of FTE residents a hospital counts, the greater the amount of Medicare direct GME and IME payments the hospital will receive. In an attempt to end the implicit incentive for hospitals to increase the number of FTE residents, Congress established a limit on the number of allopathic and osteopathic residents that a hospital could include in its FTE resident count for direct GME and IME payment purposes in the Balanced Budget Act of 1997 (Pub. L. 105-33). Under section 1886(h)(4)(F) of the Act, for cost reporting periods beginning on or after October 1, 1997, a hospital's unweighted FTE count of residents for purposes of direct GME cannot exceed the hospital's unweighted FTE count for direct GME in its most recent cost reporting period ending on or before December 31, 1996. Under section 1886(d)(5)(B)(v) of the Act, a similar limit based on the FTE count for IME during that cost reporting period is applied, effective for discharges occurring on or after October 1, 1997. Dental and podiatric residents are not included in this statutorily mandated cap.

We received some IME and direct GME (DGME) related comments that were outside the scope of the proposed rule, including a comment related to the eligibility of SCHs paid under the hospital-specific rate and MDHs to receive IME payments. Because we consider these public comments to be outside the scope of the proposed rule, we are not addressing these comments in this final rule.

2. Distribution of Additional Residency Positions Under the Provisions of Section 4122 of Subtitle C of the Consolidated Appropriations Act, 2023 (CAA, 2023)

a. Overview

CMS has increased the overall number of slots available to teaching hospitals on several previous occasions. Notably, Congress authorized Medicare payment for one thousand additional FTE GME resident slots in section 126(a) of the Consolidated Appropriations Act, 2021, adding paragraph 1886(h)(9) to the Act.

Most recently, section 4122(a) of the CAA, 2023 amended section 1886(h) of the Act by adding a new section 1886(h)(10) of the Act requiring the distribution of additional residency positions (also referred to as slots) to hospitals. Section 1886(h)(10)(A) of the Act requires that for FY 2026, the Secretary shall initiate an application round to distribute 200 residency positions. At least 100 of the positions made available under section 1886(h)(10)(A) shall be distributed for psychiatry or psychiatry subspecialty residency training programs. The Secretary is required, subject to certain provisions in the law, to increase the otherwise applicable resident limit for each qualifying hospital that submits a timely application by the number of positions that may be approved by the Secretary for that hospital. The Secretary is required to notify hospitals of the number of positions distributed to them by January 31, 2026, and the increase is effective beginning July 1, 2026.

In determining the qualifying hospitals for which an increase is provided, section 1886(h)(10)(B)(i) of the Act requires the Secretary to take into account the “demonstrated likelihood” of the hospital filling the positions made available within the first 5 training years beginning after the date the increase would be effective, as determined by the Secretary.

Section 1886(h)(10)(B)(ii) of the Act requires a minimum distribution for certain categories of hospitals. Specifically, the Secretary is required to distribute at least 10 percent of the aggregate number of total residency positions available to each of four categories of hospitals. Stated briefly, and discussed in greater detail later in this final rule, the categories are as follows: (1) hospitals located in rural areas or that are treated as being located in a rural area (pursuant to sections 1886(d)(2)(D) and 1886(d)(8)(E) of the Act); (2) hospitals in which the reference resident level of the hospital is greater than the otherwise applicable resident limit; (3) hospitals in states with new medical schools or additional locations and branches of existing medical

schools; and (4) hospitals that serve areas designated as Health Professional Shortage Areas (HPSAs). Section 1886(h)(10)(F)(iii) of the Act defines a qualifying hospital as a hospital in one of these four categories.

Section 1886(h)(10)(B)(iii) of the Act further requires that each qualifying hospital that submits a timely application receive at least 1 (or a fraction of 1) of the residency positions made available under section 1886(h)(10) of the Act before any qualifying hospital receives more than 1 residency position.

Section 1886(h)(10)(C) of the Act places certain limitations on the distribution of the residency positions. First, a hospital may not receive more than 10 additional full-time equivalent (FTE) residency positions. Second, no increase in the otherwise applicable resident limit of a hospital may be made unless the hospital agrees to increase the total number of FTE residency positions under the approved medical residency training program of the hospital by the number of positions made available to that hospital. Third, if a hospital that receives an increase to its otherwise applicable resident limit under section 1886(h)(10) of the Act is eligible for an increase to its otherwise applicable resident limit under 42 CFR § 413.79(e)(3) (or any successor regulation), that hospital must ensure that residency positions received under section 1886(h)(10) of the Act are used to expand an existing residency training program and not for participation in a new residency training program.

b. Determinations Required for the Distribution of Residency Positions

(1) Determination that a Hospital has a “Demonstrated Likelihood” of Filling the Positions

Section 1886(h)(10)(B)(i) of the Act directs the Secretary to take into account the “demonstrated likelihood” of the hospital filling the positions made available within the first 5 training years beginning after the date the increase would be effective, as determined by the Secretary. In accordance with section 1886(h)(10)(A)(iv) of the Act, the increase would be

effective beginning July 1 of the fiscal year of the increase; therefore, additional residency positions under section 1886(h)(10) of the Act would be effective July 1, 2026.

Consistent with the application cycle established for section 126 of the CAA, 2021 (86 FR 73419 through 73445) we proposed that the application deadline for the additional positions made available for a fiscal year be March 31 of the prior fiscal year; that is, for FY 2026, the application deadline would be March 31, 2025.

Accordingly, all references in this section to the application deadline are references to the application deadline of March 31, 2025.

We proposed that a hospital show a “demonstrated likelihood” of filling the additional positions (sometimes equivalently referred to as slots) for which it applies by demonstrating that it does not have sufficient room under its current FTE resident cap(s) to accommodate a planned new program or expansion of an existing program. In order to be eligible for additional positions, the new program or expansion of an existing program could not begin prior to July 1, 2026, the effective date of the section 4122 residency positions.

In order to demonstrate that a hospital does not have sufficient room under its current FTE resident cap(s) for purposes of the prioritization discussed at section c.3. of this preamble, if applicable, we proposed that a hospital would be required to submit copies of its most recently submitted Worksheet E, Part A and Worksheet E-4 from the Medicare cost report (CMS-Form- 2552-10) as part of its application for an increase to its FTE resident cap(s). The hospital would demonstrate and attest to a planned new program or expansion of an existing program by meeting at least one of the following two “Demonstrated Likelihood” criteria:

- *“Demonstrated Likelihood” Criterion 1 (New Residency Program).* The hospital does not have sufficient room under its FTE resident cap, is not a rural hospital

eligible for an increase to its cap under 42 CFR 413.79(e)(3) (or any successor regulation), and intends to use the additional FTEs as part of a new residency program that it intends to establish on or after the date the increase would be effective (that is, a new program that begins training residents at any point within the hospital's first 5 training years beginning on or after the effective date of the increase). Under "Demonstrated Likelihood" Criterion 1, the hospital will be required to meet at least one of the following conditions as part of its application:

++ Application for accreditation of the new residency program has been submitted to the Accreditation Council for Graduate Medical Education (ACGME) (or application for approval of the new residency program has been submitted to the American Board of Medical Specialties (ABMS)) by the application deadline.

++ The hospital has received written correspondence from the ACGME (or ABMS) acknowledging receipt of the application for the new residency program, or other types of communication concerning the new program accreditation or approval process (such as notification of site visit) by the application deadline.

● *"Demonstrated Likelihood" Criterion 2 (Expansion of an Existing Residency Program)*. The hospital does not have sufficient room under its FTE resident cap, and the hospital intends to use the additional FTEs to expand an existing residency training program within the hospital's first 5 training years beginning on or after the date the increase would be effective. Under "Demonstrated Likelihood" Criterion 2, the hospital will be required to meet at least one of the following conditions as part of its application:

++ The hospital has received approval by the application deadline from an appropriate accrediting body (the ACGME or ABMS) to expand the number of FTE residents in the program.

++ The hospital has submitted a request by the application deadline for a

permanent complement increase of the existing residency program.

++ The hospital currently has unfilled positions in its residency program that have previously been approved by the ACGME and is now seeking to fill those positions.

Under “Demonstrated Likelihood” Criterion 2, the hospital is applying for an increase in its FTE resident cap because it is expanding an existing residency program. We proposed that as of the application deadline the hospital is either already training residents in this program, or, if the program exists at another hospital as of that date, the residents will begin to rotate to the applying hospital on or after the effective date of the increase. In addition, we note that section 1886(h)(10)(C)(ii) of the Act requires that if a hospital is awarded positions, that hospital must increase the number of its residency positions by the amount the hospital’s FTE resident cap increases, based on the newly awarded positions under section 4122 of CAA, 2023. Therefore, we proposed that a hospital must, as part of its application, attest to increasing the number of its residency positions by the amount of the hospital’s FTE resident cap increase based on any newly awarded positions, in accordance with the provisions of section 1886(h)(10)(C)(ii) of the Act.

In this section we present a summary of the public comments and our responses related to the proposal determining whether a hospital has a “demonstrated likelihood” of filling the positions awarded under section 4122 of the CAA, 2023.

Comment: A few commenters expressed concern that requiring a hospital to demonstrate that it does not have sufficient room under its current FTE cap to accommodate a program expansion or a new program would not benefit rural programs. The commenters stated that large academic medical centers generally have more resources and are better funded, thus they are able to take on additional residents above their Medicare FTE cap. The commenters stated that rural hospitals

are unlikely to be able to take on residents that are not funded through Medicare GME. As a result, rural hospitals would be disadvantaged because they would not be seen as “likely to fill” additional slots since most rural hospitals are not training above their cap due to limited resources.

A commenter asked that CMS reconsider the policy related to “demonstrated likelihood” and allow for exceptions for certain unique situations where a hospital may be training under its cap at the time of the application but would be training at or over its cap by the time the additional slots under section 4122 would be effective. The commenter provided the example of a hospital training residents in a new residency program. In this example the hospital is operating below its cap because it is currently building the program, but the hospital expects to be operating above its cap when the additional section 4122 slots would be effective. The commenter stated that such a hospital should be eligible for its full FTE request under section 4122.

Response: We appreciate the commenters’ concerns related to rural hospitals and hospitals with new programs potentially training below their FTE caps, and therefore being unable to demonstrate the need for an increase to their FTE caps. The comparison between a hospital’s FTE count and its adjusted FTE cap will be made where we distribute any slots remaining by HPSA score after we distribute the “up to 1.00 FTE” to each qualifying hospital. We did not propose to compare a hospital’s FTE count to its adjusted FTE cap when awarding up to 1.00 FTE to each qualifying hospital.

Specifically, in the proposed rule we stated that “in order to demonstrate that a hospital does not have sufficient room under its current FTE resident cap(s) for purposes of the prioritization discussed at section c.3. of this preamble, if applicable...” (89 FR 36214). Section c.3. referred to the section “Prioritization of Applications by HPSA Score”, this is a separate section from the discussion of

awarding each qualifying hospital up to 1.00 FTE, which was included at section c.2., “Pro Rata Distribution and Limitation on Individual Hospitals”. We note that if we prioritize the distribution of any remaining slots by HPSA score, we would only consider the FTE cap and count information included on the cost report submitted with the application; we would not consider a future cost report as the commenter suggests. In addition to providing a level of efficiency with respect to the section 4122 application reviews, we attempt to limit the need to have decision criteria based on future expectations versus cost report data, as the latter can be audited under existing processes.

Comment: One commenter requested clarification on the requirements to receive additional slots so that hospitals can accurately complete the application process. The commenter stated that guidance would be appreciated as to all program requirements, including specifically how hospitals can show a “demonstrated likelihood” that they will fill additional positions and that their current FTE caps leave insufficient room for new or expanded programs.

Response: We refer the commenters to section j. of this preamble which discusses the “Application Process for Receiving Increases in FTE Resident Caps”. This section lists the options for attesting to meeting Demonstrated Likelihood Criterion One or Two as part of the attestation that will be included with the section 4122 application module. Prior to the start of the application period, additional resources related to the section 4122 application process will be included on CMS’ Direct Graduate Medical Education (DGME) website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/direct-graduate-medical-education-dgme>.

After consideration of the comments received, we are finalizing our proposed policies related to the determination that a hospital has demonstrated a likelihood of

filling the positions for “Demonstrated Likelihood” Criterion 1 (New Residency Program) or for “Demonstrated Likelihood” Criterion 2 (Expansion of an Existing Residency Program), without modification.

(2) Determination that a Hospital is Located or Treated as Being Located in a Rural Area (Category One)

Section 1886(h)(10)(B)(ii) of the Act requires the Secretary to distribute not less than 10 percent of resident positions available for distribution to each of four categories of hospitals. Under section 1886(h)(10)(B)(ii)(I) of the Act, the first of these categories consists of hospitals that are located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or are treated as being located in a rural area (pursuant to section 1886(d)(8)(E) of the Act). We refer to this category as Category One. We note that the definition of Category One for purposes of section 4122 of the CAA, 2023 mirrors the definition of Category One included under section 1886(h)(9)(B)(ii)(I) for purposes of section 126 of the CAA, 2021. Therefore, we proposed to determine Category One eligibility as discussed in the final rule implementing section 126 of the CAA, 2021 (86 FR 73422 through 73424).

For purposes of determining whether a hospital is considered rural, we proposed to use the County to CBSA Crosswalk and Urban CBSAs and Constituent Counties for Acute Care Hospitals File, or successor files containing similar information, from the most recent FY IPPS final rule (or correction notice if applicable). This file will be available on the CMS website in approximately August 2024, the year prior to the year of the application deadline, March 31, 2025. Under the file’s current format, blank cells in Columns D and E indicate an area outside of a CBSA.

Under section 1886(d)(8)(E) of the Act, a subsection (d) hospital (that is, generally, an IPPS hospital) that is physically located in an urban area is treated as

being located in a rural area for purposes of payment under the IPPS if it meets criteria specified in section 1886(d)(8)(E)(ii) of the Act, as implemented in the regulations at § 412.103. Under these regulations, a hospital may apply to CMS to be treated as located in a rural area for purposes of payment under the IPPS. Given the fixed number of available residency positions, it is necessary to establish a deadline by which a hospital must be treated as being located in a rural area for purposes of Category One. We proposed to use Table 2, or a successor table containing similar information, posted with the most recent IPPS final rule, available on the CMS website in approximately August 2024, (or correction notice if applicable), to determine whether a hospital is reclassified to rural under § 412.103. If a hospital is not listed as reclassified to rural on Table 2, but has been subsequently approved by the CMS Regional Office to be treated as being located in a rural area for purposes of payment under the IPPS as of the March 31, 2025 application deadline, the hospital would submit its approval letter with its application in order to be treated as being located in a rural area for purposes of Category One.

In this section we present a summary of the public comments and our responses to the proposed determination of which hospitals are located in a rural area or are treated as being located in a rural area (Category One).

Comment: Several commenters stated that although not referenced in these proposed rules, a change in rural categorization to eliminate hospitals “treated as rural” that are not in fact geographically rural is essential to increasing the number of geographically rural hospitals gaining new positions, and hopefully that change can be made in legislation if not in rules.

A few commenters encouraged CMS to consider how to incentivize rural hospitals to apply for the section 4122 opportunity and award slots that will increase rural training.

Response: We agree with the commenters that increasing the number geographically rural hospitals that receive additional slots is an essential goal. We note that the law requires that both hospitals that are located in a rural area (as defined in section 1886(d)(2)(D) of the Act) and hospitals that are treated as being located in a rural area (pursuant to section 1886(d)(8)(E) of the Act), qualify as Category One hospitals.

In order to support geographically rural hospitals in the application process we anticipate continuing the outreach efforts that we have in place for the section 126 distribution, and adding outreach regarding the section 4122 distribution in these efforts. CMS has worked in conjunction with the Health Resources and Services Administration's (HRSA) Federal Office of Rural Health Policy to educate potential applicants about the section 126 application process. On February 13, 2023 and January 17, 2024, CMS participated with HRSA and Rural Residency Planning and Development – Technical Assistance Center (www.ruralgme.org) in webinars aimed at educating potential rural applicants about the section 126 application process. CMS has also participated in the rural health and hospital open door forums and is accessible to anyone who submits a question through our section 126 email inbox at CAA126application@cms.hhs.gov. In addition, background information regarding the section 126 application process and frequently asked questions are posted on CMS' DGME website, <https://www.cms.gov/Medicare/payment/prospective-payment-systems/acute-inpatient-pps/direct-graduate-medical-education-dgme>. The DGME website also provides instructions on how to submit a question directly to CMS using the Medicare Electronic Application Request Information System™ (MEARIS™), the application module that will be used for both the section 126 and section 4122 application processes. We will be updating the CMS DGME website to include similar resources and communication tools for the section 4122 application process

After consideration of the comments received, we are finalizing our policy with respect to Category One as proposed, without modification.

(3) Determination of Hospitals for which the Reference Resident Level of the Hospital is Greater than the Otherwise Applicable Resident Limit (Category Two)

Under section 1886(h)(10)(B)(ii)(II) of the Act, the second category consists of hospitals in which the reference resident level of the hospital (as specified in section 1886(h)(10)(F)(iv) of the Act) is greater than the otherwise applicable resident limit. We refer to this category as Category Two. We note the definition of Category Two under section 1886(h)(10)(B)(ii)(II) of the Act mirrors the definition of Category Two under section 1886(h)(9)(B)(ii)(II), section 126 of the CAA, 2021. Therefore, we proposed to determine Category Two eligibility as discussed in the final rule implementing section 126 of the CAA, 2021 (86 FR 73424 through 73425) with adjustments to consider the provisions of sections 126, 127, and 131 of the CAA, 2021, as discussed later.

Under section 1886(h)(10)(F)(iv) of the Act, the term “reference resident level” means, with respect to a hospital, the resident level for the most recent cost reporting period of the hospital ending on or before the date of enactment of section 1886(h)(10) of the Act, December 29, 2022, for which a cost report has been settled (or, if not, submitted (subject to audit)).

Under section 1886(h)(10)(F)(v) of the Act, the term “resident level” has the meaning given such term in paragraph (7)(C)(i). That section defines “resident level” as with respect to a hospital, the total number of full-time equivalent residents, before the application of weighting factors (as determined under paragraph (4)), in the fields of allopathic and osteopathic medicine for the hospital.

Under section 1886(h)(10)(F)(i) of the Act, the term “otherwise applicable

resident limit” means, “with respect to a hospital, the limit otherwise applicable under subparagraphs (F)(i) and (H) of paragraph (4) on the resident level for the hospital determined without regard to the changes made by this provision of the CAA, 2023, but taking into account section 1886(h)(7)(A), (7)(B), (8)(A), (8)(B), and (9)(A)” of the Act. These cross-referenced sub-paragraphs all address the distribution of positions and redistribution of unused positions.

As finalized for purposes of section 126 of the CAA, 2023, the “reference resident level” refers to a hospital’s allopathic and osteopathic FTE resident count for a specific period. The definition can vary based on what calculation is being performed to determine the correct allopathic and osteopathic FTE resident count (see, for example, 42 CFR 413.79(c)(1)(ii) (86 FR 73424)). As noted previously, section 4122 of the CAA, 2023, under new section 1886(h)(10)(F)(iv) of the Act defines the “reference resident level” as coming from the most recent cost reporting period of the hospital ending on or before the date of enactment of the CAA, 2023 (that is, December 29, 2022).

Under new section 1886(h)(10)(F)(i) of the Act, the term “otherwise applicable resident limit” is defined as “the limit otherwise applicable under subparagraphs (F)(i) and (H) of paragraph (4) on the resident level for the hospital determined without regard to this paragraph [that is, section 1886(h)(10) of the Act], but taking into account paragraphs (7)(A), (7)(B), (8)(A), (8)(B), and (9)(A).” In the FY 2022 IPPS/LTCH PPS final rule (86 FR 25505), we finalized for purposes of section 126 of the CAA, 2021, the definition of “otherwise applicable resident limit” as the hospital’s 1996 cap during its reference year, adjusted for the following: “new medical residency training programs” as defined at § 413.79(l); participation in a Medicare GME affiliation agreement as defined at §§ 413.75(b) and referenced at 413.79(f); participation in an Emergency Medicare GME affiliation agreement as defined at §

413.79(f); participation in a hospital merger; whether an urban hospital has a separately accredited rural training track program as defined at § 413.79(k); applicable decreases or increases under section 422 of the MMA, applicable decreases or increases under section 5503 of the Affordable Care Act, and applicable increases under section 5506 of the Affordable Care Act. For purposes of section 4122 of the CAA, 2023, we proposed to use this same definition of “otherwise applicable resident limit” and adding to this definition the following: applicable increases or adjustments under sections 126, 127, and 131 of the CAA, 2021.

Regarding the term “resident level”, in the CY 2011 OPSS final rule (75 FR 46391) we indicated that we generally refer to a hospital’s number of unweighted allopathic and osteopathic FTE residents in a particular period as the hospital’s resident level, which we proposed to define consistently with the definition in section 4122 of the CAA, 2023; that is, the “resident level” under section 1886(h)(7)(c)(i) of the Act, which is defined as the total number of full-time equivalent residents, before the application of weighting factors (as determined under paragraph 1886(h)(4) of the Act), in the fields of allopathic and osteopathic medicine for the hospital.

For the purposes of section 4122 of the CAA, 2023 we proposed that the definitions of the terms “otherwise applicable resident limit,” “reference resident level,” and “resident level” should be as similar as possible to the definitions those terms have in the regulations at §413.79(c), as initially set out in the CY 2011 OPSS rulemaking, as revised for purposes of section 126 of the CAA, 2021 (86 FR 73424) with adjustments made to the definition of “otherwise applicable resident limit” for sections 126, 127, and 131 of the CAA, 2021.

We did not receive any public comments on our proposal for determining whether a hospital’s reference resident level is greater than its otherwise applicable resident limit (Category Two). We are finalizing this policy as proposed.

(4) Determination of hospitals located in States with New Medical Schools, or
Additional Locations and Branch Campuses (Category Three)

The third category specified in section 1886(h)(10)(B)(ii)(III) of the Act, as added by section 4122 of CAA, 2023, consists of hospitals located in States with new medical schools that received “Candidate School” status from the Liaison Committee on Medical Education (LCME) or that received “Pre-Accreditation” status from the American Osteopathic Association (AOA) Commission on Osteopathic College Accreditation (the COCA) on or after January 1, 2000, and that have achieved or continue to progress toward “Full Accreditation” status (as such term is defined by the LCME) or toward “Accreditation” status (as such term is defined by the COCA); or additional locations and branch campuses established on or after January 1, 2000, by medical schools with “Full Accreditation” status (as such term is defined by LCME) or “Accreditation” status (as such term is defined by the COCA). We note that the statutory language is specific with respect to these definitions. We refer to this category as Category Three. We note that the definition of Category Three for purposes of section 4122 of the CAA, 2023, mirrors the definition of Category Three included under section 1886(h)(9)(B)(ii)(III) of the Act for purposes of section 126 of the CAA, 2021. Therefore, we proposed to determine Category Three eligibility as discussed in the final rule implementing section 126 of the CAA, 2021 (86 FR 73425 through 73426).

We proposed that the hospitals located in the following 35 States and one territory, referred to as Category Three States, would be considered Category Three hospitals: Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Illinois, Indiana, Kansas, Kentucky, Louisiana, Massachusetts, Michigan, Mississippi, Missouri, Nevada, New Jersey, New Mexico,

New York, North Carolina, Ohio, Oklahoma, Pennsylvania, Puerto Rico, South Carolina, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, and Wisconsin. If a hospital is located in a state not listed here, but it believes the state in which it is located should be on this list, the hospital may contact CMS through the MEARIS™ application module to make a change to this list, or must provide documentation with submission of its application to CMS that the state in which it is located has a medical school or additional location or branch campus of a medical school established on or after January 1, 2000. Pursuant to the statutory language, all hospitals in such states are eligible for consideration; the hospitals, themselves, do not need to meet the conditions of section 1886(h)(10)(B)(ii)(III)(aa) or (bb) of the Act in order to be considered.

In this section we present a summary of the public comments and our responses related to the proposal determining which hospitals are located in states with new medical schools or additional locations and branch campuses (Category Three).

Comment: We received several requests to add states to the list of Category Three states. A commenter stated Minnesota has an additional branch campus of a medical school established after January 1, 2000. The commenter stated that beginning in the 2025-2026 academic year and as notified November 27, 2023, the University of Minnesota Medical School CentraCare Regional Campus St. Cloud formally expanded as a new regional campus of the University of Minnesota Medical School. Another commenter stated that Minnesota should be added to the list of Category Three states due to expansion of the University of Minnesota Medical School, which accepted its first medical school applications at a branch campus in May 2024.

A commenter requested CMS amend the list of states where hospitals may qualify under Category Three to include Montana and Oregon. The commenter stated that colleges of osteopathic medicine locations in Montana and Oregon meet the

definition of “New Medical Schools, or Additional Locations and Branch Campuses”.

The commenter noted that Western University of Health Sciences/College of Osteopathic Medicine of the Pacific- Northwest in Lebanon, Oregon, began operation in 2011, Touro College of Osteopathic Medicine Montana opened in 2023, and Rocky Vista University Montana College of Osteopathic Medicine opened in 2023.

Response: We thank the commenters for notifying us that these states should be added to the list of Category Three states. We are adding Minnesota, Montana, and Oregon to the list of Category Three states for purpose of section 4122. In addition, since the list of Category Three states for section 4122 mirrors the list of Category Three states for section 126, these states will be added to the list of Category Three states for round 4 of section 126 (FY 2026) and future rounds. Therefore, for both section 4122 and round 4 of section 126 and future rounds, hospitals in the following 38 States and one territory, referred to as Category Three States, would be considered Category Three hospitals: Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Illinois, Indiana, Kansas, Kentucky, Louisiana, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nevada, New Jersey, New Mexico, New York, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Puerto Rico, South Carolina, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, and Wisconsin.

(5) Determination of Hospitals that Serve Areas Designated as Health Professional Shortage Areas under Section 332(a)(1)(A) of the Public Health Service Act (Category Four)

The fourth category specified in the law consists of hospitals that serve areas designated as HPSAs under section 332(a)(1)(A) of the Public Health Service Act (PHSA), as determined by the Secretary. Category Four for section 4122 of the CAA,

2023 mirrors the definition of Category Four included under section 1886(h)(9)(B)(ii)(IV) for purposes of implementing section 126 of the CAA, 2021.

Therefore, we proposed to determine Category Four eligibility as discussed in the final rule implementing section 126 of the CAA, 2021 (86 FR 73426 through 73430).

We proposed that an applicant hospital qualifies under Category Four if it participates in training residents in a program in which the residents rotate for at least 50 percent of their training time to a training site(s) physically located in a primary care or mental-health-only geographic HPSA. Specific to mental-health-only geographic HPSAs, we proposed that the program must be a psychiatry program or a subspecialty of psychiatry. In addition, a Category Four hospital must submit an attestation, signed and dated by an officer or administrator of the hospital who signs the hospital's Medicare cost report, that it meets the requirement that residents rotate for at least 50 percent of their training time to a training site(s) physically located in a primary care or mental-health-only geographic HPSA.

In this section we present a summary of the public comments and our responses related to determining which hospitals serve areas designated as HPSAs under section 332(a)(1)(A) of the PHSA (Category Four).

Comment: A commenter stated that CMS should adjust its definition of Category Four in light of the small number of programs that apply and meet this definition. The commenter stated that CMS should revise its requirement that at least 50 percent of the resident's training time must occur at facilities located in a HPSA. The commenter stated this change will provide programs with greater flexibility, particularly if some rotations are not located in a designated HPSA site.

Response: We appreciate the commenter's suggestion to add flexibility to the qualifying criterion for Category Four. However, the language at section 1886(h)(10)(B)(ii)(IV) of the Act states "[h]ospitals that *serve* areas designated as health professional shortage areas under section 332(a)(1)(A) of the Public Health Service Act" (emphasis added). We continue to believe that

the inclusion of eligibility Category Four was meant to support residency training programs that aim to provide a considerable amount of training in primary care or mental-health-only geographic HPSAs and that any amount less than 50 percent is not sufficiently indicative of a program that adequately serves the needs of residents of these HPSAs. After consideration of the comments received, we are finalizing our policy with respect to Category Four as proposed, without modification.

(6) Determination of a Qualifying Hospital

Section 1886(h)(10)(F)(iii) of the Act defines a “qualifying hospital” as “a hospital described in any of the subclauses (I) through (IV) of subparagraph (B)(ii).” As such, and consistent with the definition of “qualifying hospital” used for purposes of section 126 of the CAA, 2021 (86 FR 73430 through 73431), we proposed to define a qualifying hospital as a Category One, Category Two, Category Three, or Category Four hospital, or one that meets the definitions of more than one of these categories.

In this section we present a summary of the public comments and our responses related to determining whether a hospital is considered a qualifying hospital.

Comment: A few commenters expressed support for hospitals that are training over their caps being able to qualify for additional residency slots under section 4122. One commenter stated that they support the eligibility categories, particularly Category Two. The commenter stated that this category would be crucial for allotting slots to hospitals that truly need them, particularly since these hospitals bear an additional financial burden for investing in the healthcare workforce. The commenter stated that when these hospitals are in areas with new medical schools, the need for additional training positions would be even more critical in order to accommodate

growing the healthcare workforce.

Response: We appreciate the commenters' support.

After consideration of the comments received, we are finalizing our policy with respect to the definition of a qualifying hospital as proposed, without modification.

c. Number of Residency Positions Made Available to Hospitals and Limitation on Individual Hospitals

(1) Number of Residency Positions Made Available and Distribution for Psychiatry or Psychiatry Subspecialty Residencies

Section 1886(h)(10)(A)(ii) of the Act limits the aggregate number of total new residency positions made available in FY 2026 across all hospitals to no more than 200. Section 1886(h)(10)(A)(iii) of the Act further specifies that at least 100 of the positions made available under section 1886(h)(10) must be distributed for a psychiatry or psychiatry subspecialty residency. The phrase "psychiatry or psychiatry subspecialty residency" is defined at section 1886(h)(10)(F)(ii) of the Act to mean "a residency in psychiatry as accredited by the Accreditation Council for Graduate Medical Education (ACGME) for the purpose of preventing, diagnosing, and treating mental health disorders."

We proposed that of the total residency slots distributed under section 4122 of the CAA, 2023, at least 100 but not more than 200 slots would be distributed to hospitals applying for residency programs in psychiatry and psychiatry subspecialties. For purposes of determining which programs are considered psychiatry subspecialties, we proposed to refer to the list included on ACGME website at <https://www.acgme.org/> under the "Specialties" tab, currently: Addiction Medicine, Addiction Psychiatry, Brain Injury Medicine, Child and Adolescent Psychiatry,

Consultation-Liaison Psychiatry, Forensic Psychiatry, Geriatric Psychiatry, Hospice and Palliative Medicine, and Sleep Medicine. We note that the ACGME list of psychiatry subspecialties may change, and we proposed that the list of psychiatry subspecialties included on the ACGME website at the time of application submission would guide determination of which programs CMS would consider psychiatry subspecialties. In accordance with statute, the subspecialty would have to be accredited with psychiatry as a core specialty. We also proposed that the remaining non-psychiatric slots would be awarded to other approved medical residency programs under 42 CFR 413.75(b).

In this section we present a summary of public the comments and our responses related to the requirement that at least 100 but not more than 200 of the positions made available under section 4122 must be distributed for a psychiatry or psychiatry subspecialty residency.

Comment: One commenter stated that they applaud the proposals that focus on areas of known need in their rural and underserved communities, particularly the needs surrounding psychiatric health disorders. The commenter stated that they stand ready to meet the needs of their communities under any slot expansions, including providing substance use disorder care.

Response: We appreciate the commenter's support and their efforts in providing the necessary psychiatric health services to members of their community.

Comment: Commenters requested that CMS clarify how they would address the situation if fewer than 100 positions are awarded to psychiatry or psychiatry subspecialty residences, requested that other specialties be prioritized, and requested an equivalent increase to hospitals' IPF teaching adjustments.

A few commenters stated that CMS should consider scenarios under which the agency receives applications for fewer than 100 psychiatry FTEs for FY 2026. The

commenters requested that in the final rule, CMS address two scenarios: 1) Where fewer than 100 FTEs are awarded to psychiatry or psychiatry subspecialty programs; and 2) Where fewer than 200 positions are awarded in total. The commenters stated that they interpret the statutory language in section 4122 to mean that slots will become effective as of “July 1 of the fiscal year of the increase,” which should allow CMS to award positions through another application cycle if fewer than 100 positions are awarded to psychiatry programs or fewer than 200 positions are awarded in total.

Another commenter stated that it is not clear how CMS would proceed if it does not receive enough requests to allocate 100 slots to psychiatry or psychiatry subspecialty programs. The commenter stated that they recognize the need to train, recruit, and retain behavioral health providers, but believe that CMS should not reserve unfilled slots from this application round for any specialty for future rounds of distribution. As an example, if CMS receives applications for only 90 psychiatry slots, those 10 remaining slots should be allocated to other programs that have submitted applications and qualify under the proposed eligibility criteria. The commenter stated that withholding slots for certain specialties would ignore the growing urgency of physician shortages across all specialties and therefore asked CMS to clarify what it intends to do if the psychiatry slots are not filled in a single round.

Another commenter recommended that if CMS does not receive enough applications to distribute the 100 slots designated for psychiatry programs (or the full 200 slots more generally) in a single round, that CMS hold another application cycle to distribute the remaining slots.

Response: The language that the commenter is referring to “July 1 of the fiscal year of the increase,” refers to July 1, 2026, which is the effective date of the slots awarded under section 4122. However, we believe that while the statute only contemplates a single round for section 4122 occurring in FY 2026, the requirement

that 200 slots be distributed and that 100 of the slots go to psychiatry residencies or subspecialties of psychiatry takes precedence. Therefore, in the situation where we are unable to distribute 200 slots and/or fewer than 100 slots are going to psychiatry programs or subspecialties of psychiatry in FY 2026, we would initiate another round of section 4122 distributions in order to meet these statutory criteria.

Comment: A few commenters stated that the application for section 4122 mirrors the application for section 126 in that psychiatry programs are required to subtract the time residents rotate to inpatient psychiatric facilities (IPFs) from their IME FTE requests for awards. Resident time at IPFs is removed from the IME application because IPF facilities and units file a separate cost report under the IPF PPS and receive a facility-level payment adjustment for teaching status. The commenters stated that the amount of required training time for psychiatry residents in inpatient or outpatient settings is significant and noted that the Accreditation Council on Graduate Medical Education (ACGME) requires psychiatry residents to receive between 6 months and 16 months of inpatient psychiatry training and at least 12 months of outpatient psychiatry experience. The commenters stated that while IME FTEs are capped by the Balanced Budget Act of 1997, there is no statutory limitation on the number of FTE residents that CMS may reimburse IPFs for under the IPF PPS. The commenters stated that CMS has limited the number of residents that an IPF can count towards the teaching ratio, as a matter of policy, since the implementation of the IPF PPS in FY 2005.

The commenters stated that awards made under section 4122 would likely represent the largest increase in Medicare-funded psychiatry or psychiatry subspecialty training since Congress capped hospitals' FTE counts in 1997. The commenters requested that because psychiatry residents often spend a significant amount of time training at IPF hospitals and units, CMS should use its authority to increase the

number of FTEs at IPFs excluded from requests for increases for IPPS purposes, for slot distributions under section 4122 and section 126.

Response: We understand the commenters' request to receive additional payment under the IPF PPS for residency training time spent in psychiatry distinct party units or psychiatric hospitals since this time is not countable for IME payment purposes. However, we did not propose any increases to the IPF teaching adjustment for purposes of section 4122 and therefore consider these comments to be out of scope and are not responding to them in this final rule. We will consider the issue of increases to the IPF teaching adjustment for future rulemaking.

Comment: A commenter stated that they deeply appreciate CMS' focus on prioritizing the ongoing behavioral health crisis and on reducing disparities through its planned distribution of residency slots. The commenter stated that the COVID-19 pandemic emphasized the importance of mental health and having an adequate mental health care workforce. The commenter stated that addressing behavioral health workforce issues is critically important for those experiencing access issues, such as people living in rural areas, people of color, and people who identify as LGBTQ+. The commenter stated that the proposed rule helps address that shortage by increasing the number of GME slots dedicated to psychiatry and related specialties, with a particular emphasis on improving access in areas with provider shortages. The commenter stated that while they understand that the proposed rule is limited to the additional GME slots allocated through section 4122 of the CAA, 2023, they urge CMS to adopt additional training requirements for GME slots to ensure that all trained physicians are able to provide culturally responsive care.

Response: We appreciate the commenter's support related to the distribution of additional slots for psychiatry and subspecialties of psychiatry, with an emphasis on access to care in areas with provider shortages. We agree with the importance of

requiring that all physicians are trained in providing culturally responsive care which is why we are requiring for both section 126 and section 4122 (see section e. below) that all applicant hospitals for slots allocated under these provisions are required to attest that they meet the National CLAS Standards to ensure that these slot distributions broaden the availability of quality care and services to all individuals, regardless of preferred language, cultures, and health beliefs. The website <https://thinkculturalhealth.hhs.gov>, which provides guidance related to the National CLAS Standards, includes educational material designed to help providers provide culturally and linguistically appropriate services. Educational tools are provided for behavioral health services, which address all aspects of a provider's and client's cultural identity including geography, gender identity, race, and sexual orientation, see <https://thinkculturalhealth.hhs.gov/education/behavioral-health>.

Comment: A commenter stated that while they understand that it is a statutory requirement that 50 percent of the additional residency positions are dedicated to psychiatry and psychiatry subspecialties, they remind CMS that specialties such as pathology are experiencing significant workforce shortages that need to be addressed in future rules, particularly for rural areas. The commenter stated that physician shortages in specialty care are significant and often overlooked by policy makers, for example, in recent years, annual demand for pathologists in the US has far outstripped the number of new pathologists entering the workforce. The commenter stated that in 2023, only 30% of pathology practice leaders who were seeking to hire at least one or more pathologists reported that they expected to fill all open positions. The commenter stated they believe that the CMS has not done enough to address the issue of physician shortages in the proposed rule. The commenter provided many examples of the influence of pathologists' services on clinical decision-making and stated these services are pervasive and constitute the critical foundation for appropriate patient

care. The commenter urged CMS to create opportunities and incentives for the pathologist workforce to expand as needed to meet population growth and ageing.

Another commenter stated that they recognize that CMS is required to prioritize distribution to psychiatry specialties and subspecialties to improve access to critical mental health services, however, they urged CMS to ensure that an adequate number of slots go towards primary care and other specialties with well documented shortages, like internal medicine, family medicine, and pediatrics. The commenter stated that it is important to note that primary care physicians play a significant role in providing mental health care services. The commenter referred to a cross-sectional study using Medical Expenditure Panel Survey data, which found that during the COVID-19 pandemic, primary care physicians provided a significant proportion of care for people with mental health disorders – nearly 40 percent of visits for depression, anxiety, and any mental illness were performed by primary care physicians. The commenter stated that primary care physicians also provided over one-third of the care and wrote a quarter of the prescribed medications for patients with severe mental illness. Another commenter stated that the forecasted insufficiency of primary care physicians in the future health care workforce makes this a pressing concern for public health agencies to take immediate action to prioritize educating and training the next generation of primary care physicians and providing sufficient resources to training centers to competently supervise and instruct these scarce professionals. The commenter recommended that primary care be prioritized in the distribution of the remaining 100 GME slots.

A commenter stated that they support CMS' proposal to include Hospice and Palliative Medicine as a psychiatry subspecialty that may qualify for the reserved psychiatry GME positions under section 4122. The commenter stated that Hospice and Palliative Medicine is an important component of psychiatric care, and the

prioritization of this subspecialty will help to build a workforce capable of addressing the needs of patients with serious illness through a psychiatric lens. The commenter requested that as CMS contemplates final policies for allocating the remaining, non-psychiatry GME positions, CMS add a method for prioritizing specialties that offer high value and/or demonstrate significant shortage, such as Hospice and Palliative Medicine. The commenter stated that programs that maintain partnerships with Hospice and Palliative Medicine fellowship programs, for example, surgery residencies that include a paired Hospice and Palliative fellowship track, should also be prioritized. The commenter stated that these changes would help build a physician workforce closely aligned with the nation's evolving healthcare needs and improve care and quality of life for millions of Americans facing serious illness, along with their families and caregivers.

A commenter stated that CMS should enable applicants to tailor programs to support positions needed most in rural and underserved communities. The commenter stated that they commend the emphasis on behavioral health but that the dedication of at least one-half of the total number of positions to psychiatry or psychiatry subspecialty residencies may result in some slots going unused. The commenter stated that in Iowa and nationally, there are additional and significant specialty needs in family medicine, particularly in rural areas (but urban as well); OBGYN, and geriatrics, among others. The commenter stated that they discourage CMS from establishing a set-aside percentage for behavioral health and recommend that CMS defer to local needs.

A commenter stated that while they understand the requirement to distribute at least 100 slots to psychiatry is statutory, the commenter's psychiatry programs are not full, and psychiatrists are permitted to start their practices without completing their last year of residency training. The commenter stated that they have not experienced the

need for more slots to train psychiatry residents and requiring 100 slots to be dedicated to psychiatry means those slots cannot be allocated to other programs that are pushing hospitals over their caps.

A commenter stated that they support the provision that directs half of the resident slots towards psychiatry or psychiatry subspecialties, but there is no assurance that these slots will go to the areas that need them most. The commenter stated that CMS should create guardrails to ensure the lack of psychiatrists and related specialists in underserved areas throughout the country gets addressed. The commenter stated that if CMS is considering the allocation of GME FTE slots by specialty, it should implement this policy as a pilot project, gather validated data by specialty across the nation, then prioritize primary care physician and psychiatry shortages, and if successful, widely implement such a policy across all of GME.

Response: We understand the commenters' concerns related to physician shortages in specialties in addition to psychiatry and we appreciate the commenters' efforts to address these shortages. We note that the requirement under section 4122 to distribute at least 100 slots to psychiatry or psychiatry subspecialties is statutory and there is no statutory requirement for other specialties.

After consideration of the comments received, we are finalizing the policy to distribute at least 100 slots to psychiatry or subspecialties of psychiatry as proposed, without modification.

(2) Pro Rata Distribution and Limitation on Individual Hospitals

As noted earlier in this preamble, section 1886(h)(10)(B)(iii) of the Act requires that each qualifying hospital that submits a timely application under subparagraph 1886(h)(10)(A) of the Act would receive at least 1 (or a fraction of 1) of the positions made available under section 1886(h)(10) of the Act before any

qualifying hospital receives more than 1 of such positions. Section 1886(h)(10)(C)(i) of the Act limits a qualifying hospital to receiving no more than 10 additional FTEs from those authorized under section 1886(h)(10) of the Act. As stated earlier in this preamble, we proposed that a qualifying hospital is a Category One, Category Two, Category Three, or Category Four hospital, or one that meets the definitions of more than one of these categories. For purposes of distributing residency slots under section 4122 of the CAA, 2023, we proposed to first distribute slots by prorating the available 200 positions among all qualifying hospitals such that each qualifying hospital receives up to 1.00 FTE, that is, 1.00 FTE or a fraction of 1.00 FTE. We proposed that if residency positions are awarded based on a fraction of 1.00 FTE, each qualifying hospital would receive the same FTE amount. Consistent with the number of decimal places used for the FTE slots awards in other distributions such as section 126 of the CAA, 2021, we proposed to prorate the slot awards under section 4122 of the CAA, 2023, rounded to two decimal places. The table later in this section provides examples of how the 200 slots would be prorated based on the number of qualifying applicants. Given the limited number of residency positions available and the number of hospitals we expect to apply, we proposed that a hospital may not submit more than one application under section 4122 of the CAA, 2023.

Number of Qualifying Applicants	Pro Rata Share of 200 FTEs
180	1.00
200	1.00
350	0.57
1,000	0.20

We refer readers to further below in this section where we discuss an alternative we considered for the distribution of slots under section 4122 of the CAA, 2023 and present a summary of the public comments we received and our responses. We also refer readers to section I.O.6. of Appendix A of this final rule where we discuss the same alternative considered.

In this section we present a summary of the public comments and our responses related to

the requirement to distribute at least 1 (or a fraction of 1) of the positions made available under section 4122 of the CAA, 2023, before any qualifying hospital receives more than 1 position.

Comment: A few commenters supported the proposal to award each qualifying hospital up to 1.00 FTE. A commenter stated that unlike the formula for distribution of the 1,000 GME slots made available through the CAA, 2021, CMS did not propose a “super-prioritization” of HPSA-designated hospitals for the CAA, 2023. The commenter stated that they support the equitable distribution methodology proposed for the 200 slots created by the CAA, 2023, and encouraged CMS to take a similar approach with the slots created by the CAA, 2021. Another commenter stated that they believe the proposed methodology will allow for more participation from qualified providers versus a strictly HSPA-based approach.

Response: We appreciate the commenters’ support. We will not be applying this prorating methodology to section 126 of CAA, 2021 because the explicit instruction to award each qualifying hospital 1.00 FTE or a fraction of 1.00 is only included for purposes of the slot distribution under section 4122 of CAA, 2023.

Comment: Several commenters expressed concerns regarding the proposal to award each qualifying hospital up to 1.00 FTE. A commenter stated they continue to support awards being aligned with program lengths, so that for example a hospital applying to train residents in a three-year program can request up to three FTE residents per fiscal year, as is the case for the policy finalized for purposes of section 126 of the CAA, 2021. The commenter stated that they understand that for section 4122 of the CAA, 2023, subsection (B)(iii), “Pro Rata Application”, may prevent CMS from being able to align hospital GME awards with program lengths and that if this is the case, they recommend CMS award a minimum of 1.00 FTE to qualifying hospitals and not award fractional positions. The commenter stated that they believe anything less than 1.00 FTE would harm family medicine residencies – particularly small programs – as it would deter many programs from being able to expand. The commenter stated that while fractional FTE awards may be workable in large academic institutions where there are multiple funding options

available, these FTE awards would be a barrier for small residencies that do not have similarly deep resources. The commenter urged CMS to support the sustainability of small programs by distributing a minimum of 1.00 FTE to qualifying residency programs.

A few commenters expressed concern that awarding up to 1.00 FTE per hospital would dissuade rural programs from applying. The commenters noted that these programs are already deterred from applying for section 126 slots because of the HPSA score prioritization and that a disadvantageous pro rata distribution under section 4122 would add yet another barrier to applying. The commenters stated that some rural hospitals may not apply because they may not receive a full slot, or a full FTE. The commenters stated that one slot, or one FTE, covers the cost of training one resident for one year whereas a fraction of an FTE is not incentive enough for rural residency programs to apply because most of the resident's training would not be funded by Medicare. The commenter stated that rural residency programs are less able to shoulder unfunded training compared to large urban academic medical centers and that this situation makes CMS' decision on how to administer the pro rata distribution paramount.

Several commenters expressed concern related to hospitals having to self-fund additional FTEs under the scenario where each qualifying hospital would receive up to 1.00 FTE. Commenters stated that as part of the proposal for section 126, CMS attempted to award slots in a similar manner, limiting the award to each qualifying hospital to 1.00 FTE. The commenters stated that in this instance, there was also consensus from the GME community that the 1.00 FTE limitation on awards would not be a meaningful increase for institutions. The commenters stated that because of the longitudinal requirement to train residents over the course of several years, the limitation of 1.00 FTE would limit the development of a full complement in subsequent postgraduate years. The commenters stated that this policy would require hospitals awarded a pro-rata distribution of 1.00 FTE to self-fund full complement increases beyond the 1.00 FTE awarded.

A commenter stated they have significant concerns that CMS' proposed methodology

could result in many hospitals receiving only a 1.00 FTE (or less) cap slot, which does not support expanding or starting a new multi-year residency program. The commenter stated they recognize that the language within section 4122 mandating awarding every applicant hospital that applies with up to 1.00 FTE presents certain implementation challenges, however, the commenter requested that CMS consider the implications of not tying the initial pro rata distribution for hospitals to the distribution of remaining slots to those same hospitals. The commenter stated that residency programs typically expand by the length of their program. For example, if a hospital with a four-year psychiatry program currently training 16 residents applied to expand, it would normally do so for four positions (to become a 20-resident training program) or some multiple of four positions. The commenter stated that under CMS' proposal, if a hospital applied to expand a four-year psychiatry program and received only 1.00 FTE under section 4122, the hospital would not receive any reimbursement for the three FTEs required to expand the program by one resident each year. The commenter stated that the only specialty training programs that could reasonably be expected to expand by one resident are transitional year programs and one-year fellowship programs. The commenter stated that while these are important specialties to expand, they do not believe it was Congress's intent to incentivize training in just these programs. The commenter stated that the CMS proposal leaves little incentive for hospitals to apply for these slots for psychiatry, primary care, general surgery, geriatrics, or other shortage specialties if hospitals are likely to be responsible for most of the cost of expanding or starting these programs. The commenter stated that they note that in a separate section of the proposed rule, which discusses how to evaluate new residency programs for rural-based or small programs, CMS states, "[W]e solicit comment on defining a small residency program as a program accredited for 16 or fewer resident positions, because 16 positions would encompass the minimum number of resident positions required for accredited programs in certain specialties, such as primary care and general surgery, that have historically experienced physician shortages, and therefore have been prioritized by Congress and CMS for

receipt of slots under sections 5503 and 5506 of the Affordable Care Act [emphasis added].”

The commenter stated they agree with CMS that Congress has repeatedly prioritized these specialty programs, and they encourage CMS to use the implementation of section 4122 to continue to prioritize these and other shortage specialty programs.

Another commenter stated that if more than 200 applicants apply, the resulting award would be pro-rated FTEs and if the number of applicants exceed 400, the award would be virtually unworkable for many programs. The commenter stated that from a sustainability standpoint, it is operationally preferable to have CMS guarantee an award of at least 1.00 FTE, and ideally to fund entirely in 1.00 FTE increments. Another commenter requested that CMS provide a minimum of 1.0 FTE to each qualifying hospital.

Response: We understand the commenters’ concerns that a fraction of an FTE does not provide for the resources necessary to allow for a significant expansion or for the establishment of a new program without additional funding sources. However, we note that we are bound by the language of section 1886(h)(10)(B)(iii), which states “[t]he Secretary shall ensure that each qualifying hospital that submits a timely application under subparagraph (A) receives at least 1 (or a fraction of 1) of the positions made available under this paragraph before any qualifying hospital receives more than 1 of such positions.” Given that there are over 1,000 teaching hospitals and the likelihood that many of these hospitals qualify for additional slots under at least one eligibility category, committing to a prorated distribution that exceeds 1.00 FTE may conflict with the statutory requirement to distribute at least a fraction of an FTE to each qualifying hospital. In addition, while we acknowledge the challenges associated with finding alternative funding streams, we note that the Medicare GME program, as currently structured in the statute, is not intended to function as the only financing source for residency training.

After consideration of the comments received, we are finalizing our policies as proposed with respect to the pro rata distribution of slots under section 4122, without modification. Specifically, we will first distribute slots by prorating the available 200 positions among all

qualifying hospitals such that each qualifying hospital receives up to 1.00 FTE, that is, 1.00 FTE or a fraction of 1.00 FTE up to two decimal places. If residency positions are awarded based on a fraction of 1.00 FTE, each qualifying hospital would receive the same FTE amount.

The following section includes a summary of the comments and our responses related to the alternative considered for the prioritization of slots under section 4122 of the CAA, 2023. We considered an alternative approach to distributing the 200 residency slots under section 4122 of the CAA, 2023, which would place greater emphasis on the distribution of additional residency positions to hospitals that are training residents in geographic and population HPSAs. Under this approach, the statutory requirement that each qualifying hospital receive 1 slot or a fraction of 1 slot would be met by awarding each qualifying hospital 0.01 FTE. The remaining residency slots would be prioritized for distribution based on the HPSA score associated with the program for which each hospital is applying using the HPSA prioritization methodology we finalized for purposes of implementing section 126 of the CAA, 2021 (86 FR 73434 through 73440). To illustrate, if 1,000 qualifying hospitals were to apply under section 4122 of the CAA, 2023, we would first award each qualifying hospital 0.01 FTEs, resulting in the distribution of 10.00 FTEs (1,000 x 0.01). We would then distribute the remaining 190 slots (200 - 10) based on the HPSA prioritization method we finalized for implementation of section 126 of the CAA, 2021, such that applications associated with higher HPSA scores would receive priority.

We believed that under this alternative distribution methodology we would further the work achieved by section 126 of the CAA, 2021, by distributing residency slots to underserved areas in greatest need of additional physicians. Using this alternative distribution methodology, we would limit a qualifying hospital's total award under section 4122 of the CAA, 2023, to 10.00 additional FTEs consistent with section 1886(h)(10)(C)(i) of the Act. Consistent with the methodology we use for implementation of section 126 of the CAA, 2021, as part of determining eligibility for additional slots, we would compare the hospital's FTE resident count to its adjusted FTE resident cap on the cost report worksheets submitted with its application. If the

hospital's FTE count is below its adjusted FTE cap, the hospital would be ineligible for its full FTE request. We note that in calculating the adjusted FTE cap we do not consider adjustments for Medicare GME Affiliation Agreements, since these adjustments are temporary. We sought comment on this alternative proposal, including awarding each qualifying hospital 0.01 FTEs and use of HPSA scores to determine priority for remaining slots.

Comment: Several commenters did not support CMS' alternative distribution proposal. According to commenters the alternative distribution proposal would award FTEs to qualifying hospitals in an amount that would be too low to meaningfully increase residency training in qualifying hospitals, particularly during a period of time with significant projected workforce shortages and would result in an overreliance on the HPSA prioritization methodology. Commenters also noted that the alternative distribution proposal, if implemented, would create an administrative burden on hospitals as they would have to potentially account for an increase of 0.01 FTE on their cost reports. Additionally, commenters referenced the statutory language under 1886(h)(10)(C)(ii) which states that hospitals awarded slots under section 4122 agree to increase the total number of full-time equivalent residency positions under the approved medical residency training program of such hospital by the number of such positions made available by such increase under this paragraph. According to commenters, hospitals could be obligated to demonstrate an increase in the program's FTE resident count consistent with an award, even if the award was too minimal to represent a full FTE.

A few commenters stated that although they believe that the alternative distribution proposal would not benefit the expansion of rural residency programs, it would provide rural hospitals with a better chance of receiving new positions. The commenters explained that if a high number of hospitals apply for residency positions under section 4122, under the alternative distribution methodology, there would be more slots leftover to be distributed to each of the four categories, prioritized by HPSA score compared to the other proposed distribution method. According to a commenter, the alternative distribution method creates more potential for rural

hospitals to receive multiple slots whereas the other proposed distribution method would make it less likely that rural hospitals would receive more than 1.0 FTE if 200 or more hospitals apply. Commenters referenced round 1 of the distribution of residency positions under section 126, where 291 hospitals applied for residency positions, to support their projection that 200 or more hospitals were likely to apply for the distribution of section 4122 residency positions. The commenters stated that rural hospitals likely need to receive 3-5 residency positions to fully fund a resident for an entire residency and that the alternative distribution methodology gives these hospitals the best chance for that outcome, whereas the other distribution methodology would provide each qualifying hospital with about 0.68 FTE with no remaining residency positions available for distribution.

Response: We thank the commenters for their feedback on the prioritization method described in the “Alternatives Considered” portion of the proposed rule. For the commenters who stated that under the alternative considered rural hospitals may be able to receive more slots, we share the commenters’ goal of ensuring hospitals with residency programs that are serving HPSAs are able to experience opportunities to grow and better meet the healthcare needs of the communities they serve. We encourage rural applicants to reach out to CMS directly with any questions or concerns related to the section 4122 application process and as noted above, we will continue to engage with and provide outreach to potential rural applicants.

For the several commenters opposed to the alternative considered, we agree that an increase of only 0.01 FTE may not make a significant enough impact to allow a program to begin or expand. We also agree that there is significant burden associated with having to account for 0.01 FTE on a cost report and to attest that the hospital was able to meet the statutory requirement to increase the total number of FTE residency positions in their residency program by 0.01 FTE. Under the proposed methodology, applicants also have the potential to be awarded a fraction of an FTE, but that amount would likely be higher than 0.01 (based on the number of qualifying hospitals that apply), and therefore provide a relatively larger FTE cap increase. We

refer readers to the table earlier in this section which provides examples of how the 200 slots would be prorated based on the number of qualifying applicants.

After consideration of the comments received and the limited support for the alternative considered, we are not finalizing the alternative methodology.

(3) Prioritization of Applications by HPSA Score

We proposed that if any residency slots remain after distributing up to 1.00 FTE to each qualifying hospital, we would prioritize the distribution of the remaining slots based on the HPSA score associated with the program for which each hospital is applying. Taking an example from the table in the previous section, if 180 qualifying hospitals apply under section 4122 of the CAA, 2023, each qualifying hospital would receive 1.00 FTE and the 20 remaining residency positions would be prioritized for distribution based on the HPSA score associated with the program for which each hospital is applying. We proposed the HPSA prioritization methodology would be the methodology we finalized for purposes of section 126 of the CAA, 2021 (86 FR 73434 through 73440). We believe including such a prioritization would further support the training of residents in underserved and rural areas thereby helping to address physician shortages and the larger issue of health inequities in these areas. Using this HPSA prioritization method, we proposed to limit a qualifying hospital's total award under section 4122 of the CAA, 2023, to 10.00 additional FTEs, consistent with section 1886(h)(10)(C)(i) of the Act. Consistent with the methodology we use for implementing section 126 of the CAA, 2021, as part of determining eligibility for additional slots, we would compare the hospital's FTE resident count to its adjusted FTE resident cap on the cost report worksheets submitted with its application. If the hospital's FTE count is below its adjusted FTE cap, the hospital would be ineligible for its full FTE request, because the facility had not yet fully utilized the already-allotted slots. We note that in calculating the adjusted FTE cap we would not consider adjustments for Medicare GME Affiliation Agreements since these adjustments are temporary.

We proposed that as finalized under section 126 of the CAA, 2021 (86 FR 73435), for purposes of prioritization under section 4122 of the CAA, 2023, primary care and mental-health-only population and geographic HPSAs would apply. As discussed in the final rule implementing section 126 of the CAA, 2021, each year in November, prior to the beginning of the application period, CMS would request HPSA ID and score information from HRSA so that recent HPSA information is available for use for the application period. CMS would only use this HPSA information, HPSA ID's and their corresponding HPSA scores, in order to review and prioritize applications. To assist hospitals in preparing for their applications, the HPSA information received from HRSA will also be posted when the online application system becomes available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/DGME>. The information would also be posted on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/IPPS-Regulations-and-Notices>. Click on the link on the left side of the screen associated with the appropriate final rule home page or “Acute Inpatient—Files for Download” (86 FR 73445).

Given that residency slots under section 4122 of the CAA, 2023 are to be distributed in FY 2026, we proposed that the HPSA IDs and scores used for the prioritization of slots, if applicable, would be the same HPSA IDs and scores used for the prioritization of slots under round 4 of section 126 of the CAA, 2021. This group would include HPSAs that are in designated or proposed for withdrawal status at the time the HPSA information is received from HRSA. As noted in section j. of this preamble, CMS would request HPSA data from HRSA in November 2024 to be used for purposes of section 4122 of the CAA, 2023.

In this section we present a summary of the public comments and our responses related to prioritizing the distribution of slots by HPSA score for purposes of the section 4122, if any slots remain after awarding each qualifying hospital up to 1.00 FTE.

Comment: A few commenters supported the proposal to prioritize the distribution of slots

by HPSA score if any slots remain after awarding each qualifying hospital up to 1.00 FTE.

A commenter stated they advocated for and are deeply supportive of CMS' proposal to apply the same methodology for distributing the new slots that was finalized for the slots enacted by section 126 of the 2021 CAA, including the proposal to require hospitals that serve areas designated as HPSAs to have at least 50 percent of residents' training time occur at training locations within a primary care or mental health-only geographic HPSA in order to be able to apply for new GME slots. The commenter stated that they strongly believe continuing this equity-focused methodology would help mitigate health access disparities and more effectively address physician shortages.

Another commenter stated that they encourage CMS to prioritize the distribution of slots by awarding to primary care programs and that they support the proposal to prioritize the distribution of remaining slots by HPSA score. The commenter stated that they believe such a prioritization would ensure that an appropriate number of the new residency positions would go to the hospitals where they would have the greatest impact on access to care—where there were well-documented shortages in primary care and other internal medicine subspecialties. The commenter stated that this HPSA-based approach would not only address the current maldistribution of the physician workforce and mitigate workforce shortages in primary care, including general internal medicine, but also address health inequities and reach underserved populations.

Response: We appreciate the commenters' support. We note that while the law requires that at least half of the 200 slots be distributed to psychiatry programs or subspecialties of psychiatry, it does not limit the specialties or subspecialties that are eligible to apply for the remaining positions.

Comment: A commenter stated that they agree the HPSA designation would be useful for identifying underserved geographies and some patient populations that are disproportionately impacted by the addiction crisis, such as people experiencing homelessness and those who are

eligible for Medicaid. The commenter noted the exclusion of clinicians who specialize in treating substance use disorder (SUD) from the list of core health professionals used to define the current mental health HPSA designation. The commenter stated that this definition does not include addiction medicine physicians nor certified addiction registered nurses – advance practice (CARN-AP), despite areas with “a high degree of substance abuse” being included in the determination of “unusually high needs for mental health services” criterion. The commenter urged Federal agencies, including CMS, to work with HRSA to revise the mental health HPSA definition and related criterion to include clinicians that specialize in treating SUD, particularly addiction medicine physicians and CARN-APs. The commenter stated that including these clinicians would more accurately measure the SUD treatment workforce and allow residency positions and other funding opportunities to be better targeted to underserved areas with high SUD and overdose burdens but limited treatment access.

Response: We appreciate the commenter sharing their concerns related to the exclusion of clinicians who specialize in treating substance use disorder from the list of core health professionals used to define the current mental health HPSA designation. The list of core health professionals used to define the current mental health HPSA designation is outside the scope of this rulemaking, but we will share the commenter’s concerns with HRSA.

Comment: Numerous commenters expressed concern with the proposal to prioritize the distribution of slots by HPSA score if any slots remain after awarding each qualifying hospital up to 1.00 FTE. Commenters stated that the proposed HPSA prioritization is not consistent with legislative or statutory intent. A commenter stated that prioritizing hospitals located in HPSAs deviates from the statute, which states that slots are to be distributed to hospitals that serve HPSAs. The commenter stated that limiting distribution priority to hospitals located in HPSAs may inadvertently disqualify hospitals that disproportionately serve large numbers of low income and underserved individuals, particularly because HPSAs presumably do not have many access points for healthcare services.

A commenter stated that they do not believe that Congress intended for CMS to revert to the methodology used under section 126. The commenter stated that Congress newly added the pro rata distribution in section 4122 as a directive to CMS to not simply use the same methodology as was used in section 126. The commenter stated that the fact CMS is using that same methodology after implementing the pro rata distribution seems to fly in the face of how Congress deliberately modified the distribution methodology for section 4122 from what was included in section 126. The commenter stated that had Congress wished to create a “super prioritization” and focus on hospitals that train residents in HPSAs, it would have done so. The commenter stated that prioritization using HPSAs favors rural areas over urban areas and that according to their analysis, 75.4 percent of HPSAs are rural or partially rural, and rural and partially rural HPSAs are disproportionately represented among those HPSAs with the highest scores. The commenter stated they do not believe that it was the intention of section 4122 to prioritize rural applicants in this manner. Rather, Congress set up the prioritization among hospitals in creating the four categories of qualifying hospitals and specifying that a minimum of 10 percent of the slots must be distributed to hospitals in each of those four categories. The commenter stated that the only further prioritization needed for section 4122 was to determine how to prioritize applicant specialty programs as was done in section 5503 of the Affordable Care Act.

Several commenters conveyed their opposition to what they believe is CMS’ overreliance on HPSA scores in the distribution of slots and stated HPSAs should be used sparingly. The commenters stated the HPSA prioritization has no foundation in the enabling legislation and that it is inherently unfair to deserving hospitals that may qualify for new residency slots in the other three (nonHPSA) categories. The commenters stated that CMS noted in the past that its methodology does not intend to exclude hospitals that do not serve HPSAs from receiving new residency slots, but regardless of this intention, commenters argued this could ultimately be a result of continuing to rely so heavily on HPSAs. A few commenters referred to an analysis from

the Alliance of Safety Net Hospitals, which found that giving exclusive priority to applications from hospitals with high HPSA scores would have this effect and that time has proven this analysis to be accurate; they suggested that this has made vast parts of the country virtually ineligible for new residency slots. The commenters further stated that this outcome does not reflect Congress's intention when it authorized the new residency slots.

A commenter stated that for Pennsylvania, where HPSAs exist in all corners of the commonwealth but the individual HPSA scores are much lower than they are in other states, giving exclusive priority to applications from hospitals with high HPSA scores has the effect of excluding almost all Pennsylvania teaching hospitals from this program even when they meet the statutory criteria. The commenter stated that this outcome does not reflect Congress's intention when it authorized the new residency slots.

A commenter stated that Wisconsin has currently seen no new slots awarded, despite having multiple entities that fit at least one, if not more, of the four criteria in statute. Rather, they state that the majority of slots CMS awarded so far were not distributed to geographically rural hospitals, but rather, urban and suburban hospitals that serve rural patients, and notes that this is not following Congressional intent.

A commenter urged the agency to also consider the population and communities that a hospital system serves when awarding residency slots. The commenter stated that while it is headquartered in two small Wisconsin cities, its hospital system serves rural communities. The commenter stated that because of its headquarters, its hospital frequently does not score high enough to receive additional slots and requests CMS consider the hospital system's service area, not just the headquarters, when distributing the new residency positions.

Response: We thank the commenters for their comments. We remind readers that the HPSA prioritization does not require that the applicant hospital be located in a HPSA. Rather, at least 50 percent of the training time associated with the program for which the hospital is applying must occur at training sites located within the primary care or mental-health-only

population or geographic HPSA. Given the number of applications we have received under the first three rounds of section 126, which request a HPSA to be used for purposes of prioritization, we do not believe that there is a shortage of access points that can be used as training sites for purposes of meeting the 50 percent HPSA prioritization criterion.

In addition, we do not agree that the proposed methodology for the distribution of slots under section 4122 exhibits an overreliance on HPSA scores or is inconsistent with the law. The prioritization of HPSA scores is only part of the distribution process under section 4122 and applies after each qualifying hospital receives up to 1.00 FTE as required by statute, which means qualifying hospitals in states with limited HPSAs will still receive FTE cap increases under section 4122. As noted earlier, section 4122 added this requirement not found in section 126. There is no added provision of section 4122, which was enacted after our implementation of section 126, that precludes the use of HPSA scores for purposes of prioritization. If there are any remaining slots to be distributed after each qualifying hospital receives up to 1.00 FTE as required by statute, there needs to be some prioritization if the number of slots requested across all hospitals exceeds the number of slots authorized under section 4122. Allocation by the severity of the health professional shortage in a HPSA is a reasonable and transparent prioritization approach. If a program serving a particular HPSA, or programs serving HPSAs in a particular state, do not receive additional slots under section 4122 that does not mean that those areas have sufficient health professionals. Rather, it is a reflection that the number of slots authorized by section 4122 is less than the requested number of slots from applicant hospitals with teaching programs that serve HPSAs.

Comment: Several commenters expressed concern that prioritization of applications by HPSA score may negatively impact rural hospitals. A few commenters stated that such a prioritization removes from the distribution some rural hospitals that are ready and able to grow their residency programs.

A few commenters stated that during the first two rounds of the section 126 slot

distributions, only 7 geographically rural hospitals received slots. The commenters stated that they believe high HPSA scores serve as a barrier to entry for rural hospitals seeking slots because HPSA scores often do not prioritize or accurately reflect the needs of areas with small populations. The commenters noted that three primary factors are used in scoring criteria across primary care, mental health, and dental HPSAs: population-to-provider ratio; poverty rates; and travel distance or time to the nearest accessible source of care. They further noted that there is no measure to account for rurality or unique access problems associated with rural areas. Another commenter questioned whether all states comprehensively and accurately survey and present data to have HSPAs be the best measure for rural health care access.

Commenters opined that the health needs measured by HPSAs are not reflective of the needs of older populations. A commenter stated that the higher utilization of services by older adult populations in rural areas and their related risk factors are not accounted for in the current HPSA scoring methodology. Another commenter stated that the existing components that factor into a HPSA score are not reflective of access problems that many rural areas face. The commenter stated that the older adult populations of rural areas result in higher utilization of health services, and their respective risk factors are not accounted for in the existing HPSA formula. The commenter stated that unless the HPSA methodology is updated to reflect these concerns, they do not believe that basing distribution of the additional residency slots on the HPSA score alone will provide for GME funding to go to areas that could most use the additional resources from CMS.

A few commenters stated that if plans for section 4122 mirror section 126 there would be continued limits on allocations to geographically rural hospitals. Commenters stated that some geographically rural hospitals may have lower HPSA scores or be discouraged from applying when they are not located in a HPSA.

Commenters stated that updating rurality to CMS defined criteria (that is, non-metropolitan training sites) and allocating at least 10 percent of those slots to rural areas regardless of HPSA score may better align with legislative intent. Commenters stated that equally important is eliminating the application of HPSA prioritization from within the rural category. Commenters stated that many rural hospitals are saddled with low HPSA scores as an artifact of the methodology for calculating those scores and are thus eliminated from consideration even though they are serving communities most in need of new physicians. Commenters asked CMS to consider changing the definition of which hospitals qualify for “rural” categorization to eliminate hospitals “treated as rural” that are not in fact geographically rural and include in the “rural” categorization all hospitals located in rural geographic locations regardless of HPSA score. The commenters requested that if eliminating urban hospitals “treated as rural” is not possible, CMS continue the HPSA score prioritization for those urban hospitals.

Another commenter stated they are concerned that the proposal to prioritize slots based on HPSA score will unnecessarily end up excluding hospitals that no longer reside in HPSAs due to HRSA’s misguided shortage designation modernization project that, while well-intended, is exacerbating challenges for rural hospitals. The commenter stated that, for example, around 25 Wisconsin hospitals lost their HPSA designations at the start of 2024 due to the way the HRSA updated its HPSA renewal process. The commenter stated that some applicants have reported their concerns that relying too much on HPSA scores has unfairly led to the exclusion of their GME slot applications from consideration and has further discouraged other interested applicants from expending resources on an application that is unlikely to result in an award.

Another commenter stated that due to their smaller populations, rural communities that add new physicians as faculty and retain residents, can significantly shift their HPSA scores or lose their HPSA designation, which can prevent a hospital

in a rural area from receiving GME slots based on current CMS policy.

Response: We appreciate the detailed analysis submitted by the commenters regarding their concerns that prioritizing the distribution of slots by HPSA score may not benefit rural hospitals. We acknowledge that few geographically rural hospitals have submitted applications under rounds 1 and 2 of section 126. We believe, based on our experience to date under section 126, that the reasons for this may be more complex than the existence of the HPSA prioritization. For example, rural hospitals may be utilizing other opportunities to increase their FTE caps through section 127 of the CAA, 2021, which provides FTE cap increases for participation in rural training programs and the regulatory provision at section 413.79(e), which allows rural hospitals to receive an increase in their cap each time they participate in training residents in a new program. We acknowledge that rural hospitals may find these alternatives more worthwhile as they may allow for permanent FTE cap increases that exceed those available under section 126 and section 4122. We believe that continuing education and outreach regarding the opportunities available under both sections 126 and 4122, rather than abandoning the HPSA prioritization method which has successfully allocated slots to programs serving underserved communities and populations, is the appropriate course of action at this point. We will continue to monitor this issue. As stated previously, we encourage rural hospitals to reach out to CMS directly with questions they have about the section 4122 application process.

Comment: Several commenters stated that HPSAs are not necessarily the best measure of where residents should train. A commenter stated that HPSA scores were developed to determine priorities for the assignment of clinicians in a state, not to determine the ability of the hospitals in those states to train more residents or to provide care for patients who live in HPSAs. Another commenter stated that the HPSA designations are a measure of a shortage of providers but do not consider

whether a hospital can train residents through academic medical programs within the HPSA area. The commenter stated that CMS should recognize that there is an overall shortage of physicians, particularly in psychiatry. The commenter stated that it should only matter that additional physicians are available to meet demand, not where the physicians are trained and that incentives directed towards newly trained physicians to practice in a HPSA is a more effective method to address the particularly high portion of the physician shortage experienced by HPSAs. Another commenter stated that while HPSA scores may adequately indicate places in the country where there is a need for more providers, they may not be the best representation of where hospitals are prepared to provide the best and most complete training environment. The commenter stated that they applaud CMS for focusing on underserved areas and strongly encouraged the agency not to rely too heavily on a single metric and ensure residents are given the best opportunity for a well-rounded training experience. Another commenter stated that over the last two distribution cycles, it has heard from many frustrated institutions that are adjacent to a HPSA, but resident training time does not take place in a HPSA. These institutions need additional slots to expand training and treat HPSA populations but are not eligible to receive prioritization in the distribution of section 126 awards.

Response: We understand that training sites may be located adjacent to HPSAs and provide essential care for individuals living within those HPSAs. However, due to the limited number of FTE slots available under section 4122 that could be prioritized by HPSA score (after completion of the pro rata distribution requirement), we are choosing to prioritize training time in HPSAs in order to further support the likelihood of residents choosing to practice in these areas. While we disagree that hospitals located in HPSAs may not provide the best and most complete training environment, we note again that the applicant hospital itself is not required to be physically located

in the HPSA in order for the program to meet the 50 percent criterion for HPSA prioritization. Furthermore, we believe that increasing residency training in non-provider sites outside of hospitals, such as community health clinics located in HPSAs, is an important tool in addressing the shortage of primary care providers in underserved areas. We continue to welcome ideas for a clear and accessible prioritization methodology, which would include providers located adjacent to a HPSA that provide significant patient care to individuals living within the HPSA.

Comment: Commenters suggested that CMS consider alternatives to prioritizing slots based on HPSA score and advocated for relying more heavily on the other eligibility categories. A commenter stated that the HPSA construct is antiquated and that gaining HPSA status starts with a costly undertaking by state governments, and increasingly, state governments are proving reluctant to make this investment – and even when they do, the process is burdensome. The commenter stated that HPSA status depends in part on an area’s level of poverty, but this is an uneven playing field because it costs more to live in high-cost areas. The commenter stated that using HPSAs as a major part of the criteria consequently favors – unfairly – some areas over others and therefore should be used sparingly, if at all, and it significantly undermines the other three criteria for additional residency slots. The commenter urged CMS to withdraw this proposal and develop an alternative methodology for distributing residency slots that does not rely so heavily on HPSAs and gives greater weight to the other three criteria for new slots.

Several commenters stated that CMS should evaluate the application pool and, if able to meet the statutory distribution requirements, award all slots on a pro-rata basis. The commenters stated that if CMS is unable to meet the statutory requirements using this methodology, CMS should prioritize the remaining slots or pro rata slots to hospitals that meet all four qualifying categories listed above first; then hospitals that

meet three criteria and so forth, until all slots are distributed.

A commenter noted that they do not believe that training residents in HPSAs is an appropriate measure of reducing health inequities, which was CMS's stated goal in implementing this distribution methodology for section 126. The commenter stated that while they agree that HPSA designation is a good starting point for identifying an area that needs more physician services, the designation system for HPSAs is not without controversy. The commenter suggested that a more holistic approach to addressing the physician shortage would be to recognize medical education hubs such as those located in densely populated and diverse urban areas because training residents in densely populated urban areas with a diverse set of patients is the single best means of exposing physicians in training to the cultural complexities that CMS should want all physicians exposed to during their training to promote health equity. The commenter stated that CMS should review data indicating which areas of the country and which organizations are producing physicians for HPSAs. The commenter stated that New York's teaching hospitals for example are a major "feeder" for the rest of the nation's physician workforce and included data supporting their statement. The commenter stated that after the initial pro rata distribution is complete, CMS should prioritize making those applications more "whole" by awarding the applicant as many of the number of slots that is commensurate with their planned expansion of existing residency programs or establishment of new programs. The commenter stated that CMS should accomplish this process by prioritizing those hospitals that meet all four qualifying criteria first, and then hospitals that meet three criteria and so on until all slots are distributed. The commenter stated that if CMS determines that not enough slots remain to make all hospitals that received a pro rata distribution whole, it should prioritize doing so for psychiatry and psychiatry subspecialty programs. The commenter stated they believe that this approach would

more closely align with the intent of the legislation to prioritize residency slots for psychiatry programs while also operating within the requirements that each applicant receive at least one (or a fraction of one) of the residency positions made available. The commenter stated that if there are not enough slots to make all hospitals that received a pro rata distribution whole, CMS should allow these hospitals to apply for the number of slots that would make the program whole in round five of the section 126 distributions. These slots would be effective July 1, 2027. Using both distributions to make an application whole would allow hospitals to expand and start new programs more easily.

A commenter stated that Congress has voiced concerns about a shortage of physicians serving rural areas and referred to data from U.S. House Committee on Ways & Means. The commenter stated they agree with the findings of the Committee on Ways & Means and believe that physicians who participate in rural residency programs are more likely to practice in underserved rural areas. The commenter encouraged CMS to implement a process by which the first round of slots are granted to hospitals located in areas that truly are rural. Once those slots have been awarded, they recommend CMS distribute remaining slots as proposed.

A commenter recommended CMS consider distributing slots in areas where there are high rates of maternal mortality. The commenter stated that when considering residency and fellowship positions, they believe it would be beneficial to take this data into account, coupled with geographic areas with high rates of sickle cell diseases and other hemoglobinopathies. The commenter stated that this approach might not always align with traditional HPSA delineations, but they believe it is worth exploring given the serious hematologic needs of these patients.

A commenter stated that they do not believe CMS should finalize a distribution for new residency positions that incorporates a HPSA prioritization and, consistent

with their prior comments, they encourage CMS to work more closely with the GME community regarding distribution.

A commenter urged CMS to consider historical state-by-state distribution of GME slots. The commenter stated that the caps established through the Balanced Budget Act of 1997 created an inequity in states that did not have robust residency programs at the time but have had significant population growth since the 1997 caps were implemented. The commenter stated that it is critical to develop a workforce that can meet the needs of a state's population and that around two-thirds of doctors live in the state they train in. The commenter stated that Florida, which will have an expected shortage of more than 18,000 physicians by 2035, is one of the nation's fastest growing states, and has the second largest number of Medicare beneficiaries in the country. The commenter stated that it is in the interest of the Medicare program to ensure that Florida has enough physicians, and this requirement could be met by increasing the number of physicians trained in the state. The commenter stated that CMS should give preferential consideration to states that are historically underserved by the Medicare GME program and states that have a large Medicare population.

A commenter stated that CMS should prioritize the distribution of new resident slots to essential hospitals. The commenter stated that essential hospitals are committed to training the next generation of health professionals and equipping them with the necessary skills to provide culturally and linguistically competent care to all populations, including underrepresented and marginalized people. The commenter stated that because essential hospitals play such a unique and critical role in preparing health care professionals to care for underserved populations, prioritizing the distribution of residency slots to essential hospitals would help advance CMS' equity goals. Another commenter stated that it is not located in a primary care or mental health HPSA. The commenter stated that assuming that this situation is likely the case

for many other urban safety-net hospitals, these hospitals are categorically disadvantaged under the proposed distribution methodology. The commenter recommended that CMS adopt a distribution methodology that prioritizes hospitals that serve a high percentage of Medicare, Medicaid, and uninsured patients, or some other measure that accurately targets hospitals that serve low-income patients.

Response: We appreciate the commenters' suggestions of additional ways to prioritize the distribution of slots under section 4122. However, as stated in the final rule implementing section 126, we continue to believe that HPSA scores, while not a perfect measure, provide the best prioritization approach available at this time. They are transparent, widely used, publicly available, regularly updated, and have verifiable inputs for measuring the severity of a service area's need for additional providers (86 FR 73438). We believe the continued use of HPSA scores for prioritization is consistent with the Administration's policy objective to increase residency training and thereby increase the number of physicians practicing in underserved areas.

With respect to prioritizing by eligibility category such that the more eligibility categories the hospital meets the higher its prioritization, we do not believe that this methodology would provide a sufficient level of prioritization since our experience with section 126 to date indicates that many applicants would meet two or three out of the four eligibility categories.

While we agree with the comment suggesting that training residents in medical education hubs, located in densely populated and diverse urban areas, allows residents to gain experience caring for a diverse set of patients and promotes an understanding of cultural complexities necessary for well-rounded patient care, we believe that such a methodology would be limited in that it does not fully consider the advantages of training residents in rural areas.

With respect to making a program whole in round 5 of section 126 if it did not

receive all of the slots it was eligible for under section 4122, we do not believe there is any statutory language precluding a hospital from applying for unfilled slots under round 5 of section 126 if it applied for that same program under section 4122.

With respect to prioritizing geographically rural hospitals for the distribution of slots under section 4122, while our goal is to support rural hospitals in applying for additional slots under section 4122, we do not believe we have the authority to distinguish between geographically rural hospitals and hospitals that have reclassified as rural when awarding slots since the statute considers both types of hospitals to be Category One hospitals.

In response to the recommendation that CMS account for areas of high maternal mortality and areas with high rates of sickle cell diseases and other hemoglobinopathies in its prioritization, we agree that these geographic and population groups would benefit from an increased supply of physicians. We are currently unaware of a nationally defined measure that we could incorporate into the HPSA methodology to distribute any slots remaining after the pro-rata distribution of slots, and we welcome feedback on any available measures.

Lastly, we support the general goal of increasing residency training at essential hospitals and safety-net hospitals since they are often the primary means of accessing healthcare for underserved members of the population. However, a lack of a specific, generally accepted, and existing definition of an “essential hospital” or “safety-net hospital” for purposes of GME makes it challenging to concretely incorporate these concepts currently into slot distributions under section 4122.

After the consideration of the comments received, and for the reasons discussed above, we are finalizing our proposal without modification to prioritize the distribution of any remaining slots under section 4122 by HPSA score. Specifically, if any slots remain after awarding up to 1.00 FTE to each qualifying hospital, we will prioritize the

distribution of the remaining slots by the HPSA score associated with the program for which the hospital is applying. Primary care and mental-health-only geographic HPSAs are applicable for this prioritization. If a hospital is applying using a mental-health-only HPSA, it must apply for slots for a psychiatry program or a subspecialty of psychiatry. We continue to welcome comments from the GME community related to an alternative means for distributing slots under section 126 and for potential future slot distributions.

(4) Requirement for Rural Hospitals to Expand Programs

Section 1886(h)(10)(C)(iii) of the Act requires that if a hospital that receives an increase in the otherwise applicable resident limit under section 1886(h)(10) of the Act would be eligible for an adjustment to the otherwise applicable resident limit for participation in a new medical residency training program under 42 CFR section 413.79(e)(3) (or any successor regulation), the hospital shall ensure that any positions made available under this paragraph are used to expand an existing program of the hospital, and not be utilized for new medical residency training programs. Under the regulations at 42 CFR 413.79(e)(3), a rural hospital may receive an increase to its cap for participating in training residents in a new program, which is effective after a 5-year cap-building period for that new program. We note that if a rural hospital were to receive a cap increase for a new program under the 5-year cap-building period as well as a cap increase for the new program under section 4122 of the CAA, 2023, there may be duplicative awarding of cap slots for the same program. Therefore, we proposed to implement section 1886(h)(10)(C)(iii) of the Act by allowing rural hospitals to apply for slots to expand an existing program, but not for slots to begin a new program. We proposed that this policy apply to both geographically rural hospitals and hospitals that have reclassified as rural under 42 CFR 412.103, since both groups of hospitals are

considered rural under section 1886(h)(10)(B)(ii)(I), which we refer to as Category One hospitals. Only geographically urban hospitals that have not reclassified as rural under 42 CFR 412.103 would be permitted to apply for slots to begin a new program.

In this section we present a summary of the public comments and our responses related to the requirement that if a hospital is eligible for a cap increase under 42 CFR section 413.79(e)(3) (or any successor regulation), the hospital may only apply for section 4122 slots to expand an existing program.

Comment: A few commenters disagreed with CMS' proposal to allow hospitals that have reclassified as rural to receive slots to expand an existing program, but not for a new program.

A commenter stated that they support CMS' proposal that if a hospital is eligible for a cap adjustment for participation a new program (as is the case for rural hospitals and hospitals that have reclassified as rural), the hospital can only use awarded slots to expand an existing program and not for a new program. However, the commenter stated that they believe that this limitation should only apply to IME cap adjustments for urban hospitals that have reclassified as rural. The commenter referred to the language in the proposed rule that states, "We note that if a rural hospital were to receive a cap increase for a new program under the 5-year cap-building period as well as a cap increase for the new program under section 4122 of the CAA, 2023, there may be duplicative awarding of cap slots for the same program." The commenter stated that while they agree with this rationale, urban hospitals that have reclassified as rural only receive adjustments to their IME caps, not their DGME caps. The commenter recommended that CMS allow hospitals that have reclassified as rural to apply for new program slots, but to limit their application to only DGME slots. The commenter further stated that CMS' policy analysis also applies in the case of section 126 of the CAA, 2021. The commenter stated that while Congress did not explicitly state within section 126 that newly awarded slots cannot be used to establish new programs in rural hospitals, they also did not state that newly awarded slots can be used for these purposes. The commenter urged CMS to use its discretion to apply this policy equally to

the section 126 slot distribution.

Another commenter stated that they disagree with CMS' proposed limitation on rural reclassified hospitals to apply only for slots to expand an existing program, but not for slots to begin a new program. The commenter stated that while they concur with the potential overlap of cap adjustments for geographically rural hospitals, rural reclassified hospitals cannot generate cap slots for DGME under the regulations at 42 CFR 413.79(e)(3). The commenter encouraged CMS to allow rural reclassified hospitals to apply for new program slots, but to limit their application to only DGME slots, similar to the current methodology employed for section 126.

Response: We thank the commenters for their comments. The commenters are correct that hospitals that have reclassified as rural can receive IME but not DGME cap adjustments for new programs. The statutory provisions for both IME and rural reclassification are found at section 1886(d), whereas the statutory provision for DGME is included at section 1886(h). Therefore, hospitals that have reclassified as rural are considered rural for IME, but urban for DGME. However, we continue to believe that in including both geographically rural hospitals and hospitals that have reclassified as rural under Category One, the Congressional intent was to treat these two groups of hospitals in the same manner for purposes of cap increases under section 4122.

After consideration of the comments received, we are finalizing our policy as proposed without modification; that is, both geographically rural hospitals and hospitals that have reclassified as rural may apply for section 4122 slots for a program expansion, however, they may not apply for slots for a new program. We are not extending this policy to section 126 because the statutory language that is explicit in section 4122 is not included in section 126. We note that under both provisions, any hospital that is applying for slots for a new program must make sure that the slots for which they are applying are not duplicative of slots they will receive under the normal 5-year cap-building process.

d. Distributing At Least 10 Percent of Positions to Each of the Four Categories

Section 1886(h)(10)(B)(ii) of the Act requires the Secretary to distribute at least 10 percent of the aggregate number of total residency positions available to each of the following categories of hospitals discussed earlier. Given our experience with distributing slots under section 126 of the CAA, 2021, we expect many hospitals will meet the qualifications of more than one category. We proposed to collect information regarding qualification for all four categories in the distribution of slots under section 4122 of the CAA, 2023, to allow us to confirm that we have met this statutory requirement. Like the CAA, 2023 provision, section 1886(h)(9)(B)(ii) of the Act from 2021 also requires the Secretary to distribute at least 10 percent of the aggregate number of total residency positions available to the same four categories of hospitals. Section 126 of the CAA, 2021, makes available 1,000 residency positions and therefore, at least 100 residency positions must be distributed to hospitals qualifying in each of the four categories. In the final rule implementing section 126 of the CAA, 2021, we stated we would track progress in meeting all statutory requirements and evaluate the need to modify the distribution methodology in future rulemaking (86 FR 73441).

To date, we have completed the distribution of residency slots under rounds 1 and 2 of the section 126 distributions (refer to CMS' DGME webpage for links to the round 1 and 2 awards: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/direct-graduate-medical-education-dgme>). In tracking the statutory requirement that at least 10 percent of the aggregate number of total residency positions (100 out 1,000 slots) be distributed to hospitals qualifying in each of the four categories, we have determined that in rounds 1 and 2, only 12.76 DGME slots and 18.06 IME slots were distributed to hospitals qualifying under Category Four. For each of the other 3 categories based on the slots awarded in rounds 1 and 2,

we anticipate meeting the 10 percent requirement. For example, we have determined that in rounds 1 and 2, 374.59 DGME and 375.11 IME slots were distributed to hospitals qualifying under Category Three.

As discussed in the final rule implementing section 126 of the CAA, 2021, an applicant hospital qualifies under Category Four if it participates in training residents in a program in which the residents rotate for at least 50 percent of their training time to a training site(s) physically located in a primary care or mental-health-only geographic HPSA. Specific to mental-health-only geographic HPSAs, the program must be a psychiatric or a psychiatric subspecialty program (86 FR 73430). Given that only 12.76 DGME slots and 18.06 IME slots have been distributed to hospitals qualifying under Category Four, we proposed an amendment to our prioritization methodology for rounds 4 and 5 of section 126 of the CAA, 2021, to ensure that at least 100 residency slots are distributed to these hospitals. We did not propose an amendment to our prioritization methodology for round 3 because the application period for round 3 runs from January 9, 2024 to March 31, 2024, prior to the date any proposals in this rule might be finalized.

Our current methodology for distributing residency slots under section 126 prioritizes slot awards based on the HPSA score associated with the program for which the hospital is applying, with higher scores receiving priority (86 FR 73434 through 73440). We proposed that in rounds 4 and 5 of section 126 of the CAA, 2021, we would prioritize the distribution of slots to hospitals that qualify under Category Four, regardless of HPSA score. The remaining slots awarded under rounds 4 and 5 would be distributed using the existing methodology based on HPSA score (86 FR 73434 through 73440). That is, the remaining slots would be distributed to hospitals qualifying under Category One, Category Two, or Category Three, or hospitals that meet the definitions of more than one of these categories, based on the HPSA score

associated with the program for which each hospital is applying.

In this section we present a summary of the public comments and our responses related to 1) distributing at least 10 percent of the aggregate number of total residency positions available to each of the four eligibility categories under section 4122 of the CAA, 2023; and 2) prioritizing the distribution of slots to hospitals that qualify under Category Four, regardless of HPSA score, for rounds 4 and 5 of section 126 of the CAA, 2021.

Comment: A few commenters had concerns related to meeting the requirement that at least 10 percent of the total number of slots be distributed to each of the four eligibility categories under section 4122 of the CAA, 2023. Commenters stated that CMS has not addressed the structural shortcoming of the HPSA prioritization distribution methodology and has not established how the agency would meet the 10 percent statutory distribution requirement for section 4122 slots. Commenters stated that it is crucial for CMS to ensure that the distribution process is in full compliance with the law, as any deviation could have serious implications for the fairness and effectiveness of the program. A commenter emphasized the need to find another prioritization metric to avoid the maldistribution between categories of hospitals that occurred under section 126 when distributing section 4122 slots. Commenters stated that CMS' proposal to prioritize Category Four hospitals for rounds 4 and 5 of section 126 could have been avoided if CMS had considered factors beyond HPSA scores as part of the section 126 distribution prioritization. Commenters stated that CMS would likely face the same issue with the section 4122 slot distribution and that CMS should explain to stakeholders how the agency would ensure that 10 percent of slots are distributed to the four categories of qualifying hospitals.

Commenters stated that they were similarly concerned with CMS' proposal to prioritize hospitals serving HPSAs for rounds 4 and 5 of section 126. The commenters

urged CMS to prioritize slot distribution based solely on the four categories included in the law because they believe such an approach was consistent with the statute, which would be less burdensome, and offer a much clearer metric for qualifying hospitals.

Response: We thank the commenters for raising their concerns related to whether CMS can meet the statutory requirement to distribute at least 10 percent of section 4122 slots to each of the four categories of qualifying hospitals. We do not necessarily agree that we will be unable to meet this statutory requirement; the methodology for distributing section 4122 slots, as finalized in this rule, includes two parts—distributing up to 1.00 FTE to each qualifying hospital and then prioritizing the distribution of the remaining slots based on the HPSA score of the program for which the hospital is applying. However, in the event that we are unable to meet the statutory requirement in a single round, we would take a similar approach to the approach we are taking with section 126. We also note that we are not amending the prioritization methodology for rounds 4 and 5 of section 126 to consider the number of eligibility categories that a hospital meets. As stated above, we do not believe that this methodology would provide a sufficient level of prioritization since our experience with section 126 to date indicates that many applicants would meet two or three out of the four eligibility categories.

Comment: Several commenters generally supported the proposal to prioritize Category Four applicants in rounds 4 and 5 of section 126. A commenter stated that hospitals qualifying in the HPSA category (Category Four) have been left behind compared to hospitals that have qualified in the other categories. The commenter stated they appreciate CMS recognizing this discrepancy and prioritizing hospitals that qualify in this category regardless of their HSPA score for future distribution of residency slots. However, the commenter stated that they disagree with smaller

hospitals being prioritized over larger hospitals in case of a tie when prioritizing applications with equal HPSA scores. The commenter stated they believe prioritizing smaller hospitals is doing a disfavor to future residents because larger hospitals are usually the primary teaching sites for programs, are better able to add residency positions, and provide more diverse and comprehensive training environments, and thus more training opportunities for residents.

A few commenters suggested CMS prioritize applications from geographically rural hospitals regardless of HPSA score. One commenter stated that they appreciate CMS' careful tracking of the round 1 and 2 slot distributions related to section 126 of the CAA, 2021. The commenter stated that while it is unfortunate that Category Four hospitals did not have their slots filled during rounds 1 or 2, the commenter is broadly supportive of CMS' proposed amendment to their prioritization methodology for rounds 4 and 5. However, the commenter stated that although they support the proposal to prioritize Category Four hospitals, the current HPSA methodology limits the ability of many geographically rural hospitals to receive slots, as their HPSA scores are not high enough or they are not located in a HPSA. The commenter stated that to better align with legislative intent going forward, CMS should consider updating its definition of rural to align with other CMS-defined criteria (all people and territory in an area with less than 50,000 people) and using that parameter to allocate at least 10 percent of slots to rural areas, regardless of HPSA score. The commenter stated that they applaud the work CMS has undertaken in recent years to promote health and health equity in rural and underserved communities and believe this change would support goals of delivering better care where patients most need it. The commenter stated that evidence indicates that physicians typically practice within 100 miles of their residency program and therefore, the distribution of trainees in large academic hospitals leads to physician shortages in medically underserved and rural

areas. The commenter stated that family medicine is also facing a particularly critical workforce shortage and directing Medicare GME resources to underserved areas is an essential strategy for advancing health equity.

A commenter stated that the requirement that 10 percent of slots go to each of the four categories of qualifying hospitals helps to ensure appropriate distribution of training slots to the communities that need them, however, this goal should not be undermined by a policy design that results in positions being unallocated if there are insufficient applicants in a given category. The commenter stated they appreciate CMS modifying its methodology from the CAA 2021 to address this issue and they urge CMS to ensure that the policy finalized allows all funded slots to be distributed to programs. The commenter stated that they encourage CMS to perform a meaningful estimate of the future distribution of available slots to help ensure that another “catch-up” change in priorities is not needed and hospitals have a consistent and clear metric for applying for new slots.

Response: We thank the commenters for their support. In the FY 2022 IPPS final rule with comment, we finalized the policy of prioritizing hospitals with less than 250 beds in the event a tiebreaker is needed to distribute slots among hospitals with the same HPSA score (86 FR 73439). We included this provision in response to a commenter’s recommendation that we prioritize the distribution of slots among hospitals with less than 250 beds and hospitals with a single residency training program. Under this policy, we first distribute FTE slots to applications from hospitals with less than 250 beds. If there are insufficient FTE slots to distribute to applications from hospitals with less than 250 beds, we prorate among those applications. If there are sufficient slots to distribute to applications from hospitals with less than 250 beds, we prorate the remaining slots among the applications from hospitals with 250 beds or more. We are not considering a change in this methodology at this time because we

believe it may provide a benefit to small hospitals in rural and underserved areas that are seeking to expand their residency training.

Similarly, we are not considering updating our definition of “rural” for purposes of distributing slots under future rounds of section 126, as suggested by a commenter. The definition of rural that we use to implement section 126 is consistent with how that term is defined in the context of the Medicare statute, specifically section 1886(h)(9)(B)(ii)(I) of the Act, as added by section 126, which refers to the definition of a rural area at section 1886(d)(2)(D) of the Act. Furthermore, as we stated in the December 27, 2021 *Federal Register*, this definition of “rural” is consistent with our policy concerning designation of rural areas for other purposes, including the wage index (86 FR 73423).

In response to the comment recommending that CMS ensure the policy finalized allows all funded slots to be distributed and that CMS perform a meaningful estimate of the future distribution of available slots to help ensure that another change in priorities is not needed, we note that the requirement to distribute at least 10 percent of slots of hospitals in each eligibility category is statutory and we must therefore consider amending our distribution process if we anticipate that this requirement will not be met. However, as stated earlier, the section 4122 distribution methodology as finalized in this rule includes two processes for distributing slots and we do not believe we need to consider any further adjustments to the finalized methodologies at this time.

Comment: Several commenters referenced their comments on the FY 2022 IPPS proposed rule regarding the use of prioritizing by HPSA score for slot distributions under section 126 of the CAA. The commenters noted that they had urged the agency to prioritize slot distribution based solely on the four categories included in the law and give priority to hospitals that qualify in more than one, with

the highest priority given to hospitals qualifying in all four categories. The commenters stated that they had warned CMS in prior comments that if the agency prioritized distributions based on HPSA score, it may result in qualifying hospitals not meeting the 10 percent statutory requirement by category. The commenters stated they continue to urge their original approach and believe that it would be less burdensome and offer a much clearer metric for qualifying hospitals. The commenters stated that such a policy is consistent with the statutory criteria, which do not place any additional emphasis on HPSA service or scores, and still supports teaching hospitals serving underrepresented and historically marginalized populations. A commenter urged CMS to examine whether previous awardees fall into more than one category and how many awardees may already fall into Category Four for which the agency has not accounted. Another commenter stated that they understand CMS' proposed change related to prioritizing eligibility Category Four applicants in the context of meeting the requirements of the law and asked CMS to comment in the final rule on how this change might disadvantage hospitals that may qualify under the other three categories.

Response: We thank the commenters for continuing to note their concerns regarding prioritizing the distribution of section 126 awards by HPSA score. As noted previously, in most cases section 126 round 1 and round 2 awardees qualified for more than one eligibility category. We believe we have accounted for the section 126 round 1 and round 2 awardees that met eligibility Category Four as we verified the HPSAs each awardee selected to use for prioritization of their application with the HPSA Public ID and Score Information included on CMS' DGME website and the HPSA Find tool at <https://data.hrsa.gov/tools/shortage-area/hpsa-find>. We do not believe that prioritizing Category Four applicants regardless of HPSA score in rounds 4 and 5 of section 126 will disadvantage applicants who fall into other categories as it is unlikely that an applicant would only qualify under eligibility Category Four.

Comment: A commenter stated that it recognizes CMS' argument that (a) the statute mandates it shall distribute at least ten percent of new positions to each of the four categories, that (b) prior rounds did not achieve this requirement for Category Four, and therefore (c) the agency may deviate from the statutory criteria which assigns equal ranking to all categories by elevating Category Four for rounds 4 and 5. The commenter stated that, however, they do not believe the conclusion follows from the premises, as Congress (a) did not contemplate this scenario in the statute, and therefore (b) did not permit the agency to deviate from the prescribed methodology of four equal eligibility categories ranked by HPSA score. The commenter stated they would consider deviation from the prescribed methodology if CMS demonstrated that a failure to distribute slots to Category Four applicants was undermining the success of section 126 in achieving Congressional goals, that is, failing to increase GME residencies in underserved areas, but CMS does not make that case in the proposed rule. The commenter stated that absent other compelling arguments justifying the elevation of Category Four applicants above all others, they strongly recommend the agency withdraw the proposal and proceed with rounds 4 and 5 of section 126 following the same protocols deployed in rounds 1 through 3.

Response: We appreciate the commenter's analysis of the statutory requirements relative to section 126. While we do not believe that a failure to distribute slots to Category Four applicants is undermining the success of section 126 in achieving Congressional goals, we must adhere to the statutory requirement to distribute at least 10 percent of the total number of slots, or at least 100 slots, to hospitals qualifying in each eligibility category. While this requirement will most certainly be met with respect to the remaining three eligibility categories, under both rounds 1 and 2 of section 126, only 12.76 DGME slots and 18.06 IME slots have been distributed to hospitals qualifying under Category Four (89 FR 36218). As a result of

the small number of FTEs being distributed to Category Four hospitals to date, we believe it is necessary to take action now to ensure we meet the statutory 10 percent distribution requirement for Category Four upon completion of all rounds of section 126.

Comment: A commenter stated that they are concerned that CMS may have determined the number of slots that have been distributed to hospitals qualifying under Category Four based on incomplete data. The commenter stated that because hospitals are limited to selecting only one eligibility category (even if they qualify under multiple) when applying for section 126, CMS may not be considering the full population of hospitals that qualify for Category Four when calculating the number of slots that these hospitals have received. The commenter stated that CMS should provide additional detail regarding how it conducted the analysis to determine how many hospitals received slots under Category Four. The commenter stated that they suspect that some hospitals would have qualified under Category Four but self-identified their qualifying hospital status using other categories. The commenter stated that CMS itself acknowledges that it needs more information to accurately identify how many slots are distributed to each eligibility category. The commenter stated that in the proposed rule, CMS proposes to collect information regarding qualification for all four categories in the distribution of slots under section 4122 of the CAA, 2023, based on its experience with many hospitals qualifying under more than one category for section 126 slots. The commenter encouraged CMS to also collect this information in future rounds of section 126 slot distributions and provide data in the final rules detailing its progress in meeting the 10 percent threshold in each eligibility category. The commenter also encouraged CMS to analyze awardee information from section 126, rounds 1 to 3 to get a more accurate picture of how many hospitals that received slots based on qualifying in other categories also qualified under Category Four.

Response: We believe there may be a misunderstanding related to the section 126 application process. Hospitals are not limited to selecting a single eligibility category. In the MEARIS™ application module, the screen that includes eligibility category selections is titled “[w]hich eligibility category or categories does your hospital meet?” The following instruction is provided on the screen “[s]elect all eligibility categories that apply to your hospital.” We will further refine this instruction for future rounds of section 126 so that applicants understand that they are to select each eligibility category that applies to their application.

As noted above, in order to check Category Four eligibility, we verified the HPSAs each awardee selected to use for prioritization of their application with the HPSA Public ID and Score Information included on CMS’ DGME website and the HPSA Find tool at <https://data.hrsa.gov/tools/shortage-area/hpsa-find> . We are unsure what language the commenter is referring to when they state that CMS itself acknowledges that it needs more information to accurately identify how many slots are distributed to each eligibility category. In addition to verifying Category Four eligibility, we are able to verify that an applicant meets eligibility categories one through three by using Table 2 posted with the most recent IPPS final rule associated with the application period for the specific section 126 round, using the cost report worksheets submitted with the application, and referring to the list of states included in the December 27, 2021, Federal Register (86 73426). For rounds 1 and 2 of section 126, twelve awardee hospitals qualified under eligibility Category Four using the methodology noted above. Each of these hospitals qualified for at least one other eligibility category. For each section 126 awardee hospital we will continue to verify which eligibility categories the applicants qualify for instead of simply deferring to the selection made on the hospital’s application. We will also verify this information for section 4122 awardee hospitals.

Information regarding progress towards meeting the 10 percent requirement for each category will be available on the CMS DGME website.

Comment: Several commenters expressed concerns about the section 126 distribution process in general. Commenters stated that CMS created an overall prioritization that has significantly disadvantaged many New Jersey teaching hospitals that were otherwise positioned to receive GME slots based on the statutory eligibility criteria. The commenters urged CMS to prioritize slot distribution solely based on the four categories in the law. The commenters stated that the reliance on HPSAs minimizes Congress' other priorities to expand training slots for hospitals in rural areas, hospitals training above their cap, and states with new medical schools.

The commenters stated that the statute requires that 10 percent of the aggregate number of residency slots must go to each of the four eligible hospital categories, however, CMS' prioritization disproportionately impacts states like New Jersey in which the HPSA designation is not an accurate reflection of patient access to care. The commenters stated that as of March 2023, New Jersey has only one geographic HPSA and no population HPSAs while by comparison, it has 32 medically underserved areas and 5 medically underserved populations. The commenters urged CMS to prioritize slot distribution based solely on the four categories included in the law but if the agency chooses to continue the practice of super-prioritization for round 3, the commenter requested that CMS either: a) make exceptions for all-urban states for which a HPSA score is not an accurate measure of patient access; or b) use a substitute measure that considers the unique population characteristics of those states. A commenter stated that they believe CMS' contention that it is satisfying Congressional intent is misplaced and instead CMS achieved a minimum 10 percent in three categories by coincidence, rather than the intent to prioritize hospitals across each of the four enumerated categories. The commenter stated that they urge CMS to reassess its HPSA prioritization and rebalance its methodology for assessing resident cap slot applications prior to the awarding of round 3 slots.

A commenter stated that CMS not meeting the 10 percent statutory requirement for Category Four is likely due to CMS prioritizing applications based on both population and geographic HPSA scores. The commenter stated that in many cases it is easier to achieve a higher population HPSA score compared to a geographic HPSA score, therefore hospitals with a high HPSA score that have received slots are not serving a geographic HPSA because of how CMS is prioritizing applications. A few commenters stated that 7 geographically rural hospitals have received slots in the first two rounds of distribution of section 126 and that in the second round, only 3 programs that received slots trained for more than 50 percent of the time in a CMS or Federal Office of Rural Health Policy designated rural area. The commenters stated that these two programs include 2 geographically rural hospitals and 1 urban hospital serving as an urban partner in a Rural Track Program. The commenters stated that this analysis implies that reclassified hospitals are making up the bulk of those that receive slots set aside for rural hospitals. The commenters stated that limiting the rural set aside to geographically rural hospitals would align with the legislative intent of section 126 and the commenter stated they are committed to working with Congress and CMS on ensuring that rural hospitals receive future slots.

Response: We appreciate the commenters sharing their concerns about the section 126 prioritization process. Although we proposed to prioritize Category Four hospitals regardless of HPSA score when awarding slots under rounds 4 and 5 of section 126, we did not propose any additional changes to the section 126 prioritization process and therefore we consider these comments to be out of scope with respect to section 126 and we will consider them for future rulemaking. We note that the definition of Category One hospitals is statutory, and we do not have the authority to remove hospitals that have reclassified as rural from this eligibility category.

After consideration of the comments received, we are finalizing our policy as

proposed with respect to prioritizing hospitals that qualify under Category Four regardless of HPSA score for rounds 4 and 5 of section 126, without modification. The remaining slots awarded under rounds 4 and 5 will be distributed using the existing methodology based on HPSA score (86 FR 73434 through 73440). That is, the remaining slots will be distributed to hospitals qualifying under Category One, Category Two, or Category Three, or hospitals that meet the definitions of more than one of these categories, based on the HPSA score associated with the program for which each hospital is applying.

e. Hospital Attestation to National CLAS Standards

For section 126 of the CAA, 2021, we previously finalized a policy that all applicant hospitals be required to attest that they meet the National Standards for Culturally and Linguistically Appropriate Services in Health and Health Care (the National CLAS Standards) (86 FR 73441). This was to ensure that the section 126 distribution broadened the availability of quality care and services to all individuals, regardless of preferred language, cultures, and health beliefs. We stated in the final rule that the National CLAS standards are aligned with the Administration's commitment to addressing healthcare barriers, which include that residents are educated and trained in culturally and linguistically appropriate policies and practices. This continues to be the case today. Therefore, we proposed the same requirement for section 4122 of the CAA, 2023, that we adopted for section 126 of the CAA, 2021, for the same reason. Specifically, we proposed that in order to ensure that residents are educated and trained in culturally and linguistically appropriate policies and practices, all applicant hospitals for slots allocated under section 4122 of the CAA, 2023, would be required to attest that they meet the National CLAS Standards to ensure that the section 4122 distribution broadens the availability of quality care and services to all individuals, regardless of preferred

language, cultures, and health beliefs. (For more information on the CLAS standards, please refer to <https://thinkculturalhealth.hhs.gov/>)

We did not receive any public comments related to our proposal that all applicant hospitals be required to attest that they meet the National Standards for Culturally and Linguistically Appropriate Services in Health and Health Care (the National CLAS Standards). We are finalizing this policy as proposed.

f. Payment of Additional FTE Residency Positions Awarded Under Section 4122 of the CAA, 2023

Section 1886(h)(10)(D) requires that CMS pay a hospital for additional positions awarded under this paragraph using the hospital's existing direct GME nonprimary care PRAs consistent with the regulations at §413.77. We note that as specified in section 1886(h)(2)(D)(ii) of the Act, for cost reporting periods beginning on or after October 1, 1993, through September 30, 1995, each hospital's PRA for the previous cost reporting period was not updated for inflation for any FTE residents who were not either a primary care or an obstetrics and gynecology resident. As a result, hospitals with both primary care and obstetrics and gynecology residents and nonprimary care residents in FY 1994 or FY 1995 have two separate PRAs: one for primary care and obstetrics and gynecology and one for nonprimary care. Those hospitals that only trained primary care and/or obstetrics and gynecology residents and those that did not become teaching hospitals until after this 2-year period, have a single PRA for direct GME payment purposes. Therefore, we proposed that for purposes of direct GME payments for section 4122 of the CAA, 2023, if a hospital has both a primary care and obstetrics and gynecology PRA and a nonprimary care PRA, the nonprimary care PRA will be used, and if a hospital has a single PRA, that PRA will be used. Furthermore, similar to the policy finalized for purposes of direct GME payments under section 126 of the CAA, 2021 (86 FR 73441), we proposed that a

hospital that receives additional positions under section 4122 of the CAA, 2023, would be paid for the FTE residents counted under those positions using the PRAs for which payment is made for FTE residents subject to the 1996 FTE cap. We expect to revise Worksheet E-4 to add a line on which hospitals will report the number of FTEs by which the hospital's FTE caps were increased for direct GME positions received under section 4122 of the CAA, 2023.

We did not receive any public comments related to our proposal for payment of additional FTE residency positions awarded under section 4122 of the CAA, 2023. We are finalizing this policy as proposed.

g. Aggregation of Additional FTE Residency Positions Awarded Under Section 4122 of the CAA, 2023

Section 1886(h)(10)(E) of the Act states that the Secretary shall permit hospitals receiving additional residency positions attributable to the increase provided under 1886(h)(10) to, beginning in the fifth year after the effective date of such increase, apply such positions to the limitation amount under paragraph (4)(F) that may be aggregated pursuant to paragraph (4)(H) among members of the same affiliated group. Therefore, we proposed that FTE resident cap positions added under section 4122 of the CAA, 2023, may be used in a Medicare GME affiliation agreement beginning in the 5th year after the effective date of the FTE resident cap positions consistent with the regulations at 42 CFR 413.75(b) and 413.79(f). We proposed to amend paragraph (8) at 42 CFR 413.79(f) to state that FTE resident cap slots added under section 4122 of Public Law 117 – 328 may be used in a Medicare GME affiliation agreement beginning in the fifth year after the effective date of those FTE resident cap slots.

We did not receive any public comments related to our proposal for the aggregation of additional FTE residency positions awarded under section 4122 of the

CAA, 2023. We are finalizing this policy as proposed.

h. Conforming Regulation Amendments for 42 CFR 412.105 and 42 CFR 413.79

Section 4122 of the CAA, 2023, under subsection (b), amends section 1886(d)(5)(B) of the Act to provide for increases in FTE resident positions for IME payment purposes. Specifically, subsection (b) adds a new section 1886(d)(5)(B)(xiii) of the Act, which states that for discharges occurring on or after July 1, 2026, if additional payment is made for FTE resident positions distributed to a hospital for direct GME purposes under section 1886(h)(10) of the Act, the hospital will receive IME payments based on the additional residency positions awarded using the same IME adjustment factor used for the hospital's other FTE residents. We proposed conforming amendments to the IME regulations at 42 CFR 412.105(f)(1)(iv)(C)(4) to specify that effective for portions of cost reporting periods beginning on or after July 1, 2026, a hospital may qualify to receive an increase in its otherwise applicable FTE resident cap if the criteria specified in 42 CFR 413.79(q) are met. We expect to revise Worksheet E Part A to add a line on which hospitals will report the number of FTEs by which the hospital's FTE caps were increased for IME positions received under section 4122 of the CAA, 2023.

We also proposed to amend our regulations at 42 CFR 413.79 by adding a paragraph (q) to specify that for portions of cost reporting periods beginning on or after July 1, 2026, a hospital may receive an increase in its otherwise applicable FTE resident cap (as determined by CMS) if the hospital meets the requirements and qualifying criteria under section 1886(h)(10) of the Act and if the hospital submits an application to CMS within the timeframe specified by CMS.

We did not receive any public comments on our proposal related to the conforming amendments for 42 CFR 412.105 and 42 CFR 413.79. We are finalizing

this policy as proposed.

i. Prohibition on Administrative and Judicial Review

Section 4122 of the CAA, 2023, under subsection (c), prohibits administrative and judicial review of actions taken under section 1886(h)(10) of the Act. Specifically, subsection (c) amends section 1886(h)(7)(E) of the Act by inserting “paragraph (10),” after “paragraph (8),” adding to the that paragraph to the list of residency distributions not subject to review. Therefore, we proposed that the determinations and distribution of residency positions under sections 1886(d)(5)(B)(xiii) and 1886(h)(10) of the Act would be final and could not be subject to administrative or judicial review.

We did not receive any comments related to our proposal on the prohibition on administrative or judicial review. We are finalizing this policy as proposed.

j. Application Process for Receiving Increases in FTE Resident Caps

All qualifying hospitals seeking increases in their FTE resident caps must submit timely applications for this distribution by March 31, 2025. The completed application must be submitted to CMS using an online application system, the Medicare Electronic Application Request Information System™ (MEARIS™). The burden associated with this information collection requirement is the time and effort necessary to review instructions and register for MEARIS™ as well as the time and effort to gather, develop and submit various documents associated with a formal request of resident position increases from teaching hospitals to CMS. The aforementioned burden is subject to the Paperwork Reduction Act (PRA); and as discussed in section XII.B. of this final rule, the burden associated with these requests will be captured under OMB control number 0938-1417 (expiration date March 31, 2025). We will submit a revised information collection estimate to OMB for approval under OMB control number 0938-1417 (expiration date March 31, 2025).

We proposed that the following information be submitted as part of an application for the application to be considered complete:

- The name and Medicare provider number (CCN) of the hospital.
- The name of the Medicare Administrative Contractor to which the hospital submits its Medicare cost report.

- The residency program for which the hospital is applying to receive an additional position(s).

- FTE resident counts for direct GME and IME and FTE resident caps for direct GME and IME reported by the hospital in the most recent as-filed cost report.

(Including copies of Worksheet E, Part A, and Worksheet E-4).

- If the hospital qualifies under “Demonstrated Likelihood” Criterion 1 (New Residency Program), which of the following applies:

- ++ Application for accreditation of the new residency program has been submitted to the Accreditation Council for Graduate Medical Education (ACGME) (or application for approval of the new residency program has been submitted to the American Board of Medical Specialties (ABMS)) by March 31, 2025.

- ++ The hospital has received written correspondence from the ACGME (or ABMS) acknowledging receipt of the application for the new residency program, or other types of communication concerning the new program accreditation or approval process (such as notification of a site visit) by March 31, 2025.

- If the hospital qualifies under “Demonstrated Likelihood” Criterion 2 (Expansion of an Existing Residency Program), which of the following applies:

- ++ The hospital has received approval by March 31, 2025 from an appropriate accrediting body (the ACGME or ABMS) to expand the number of FTE residents in the program.

- ++ The hospital has submitted a request by March 31, 2025 for a permanent

complement increase of the existing residency training program.

++ The hospital currently has unfilled positions in its residency program that have previously been approved by the ACGME and is now seeking to fill those positions.

- Indication of the categories under section 1886(h)(10)(F)(iii) of the Act under which the hospital believes itself to qualify:

++ (I) The hospital is located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or is treated as being located in a rural area (pursuant to section 1886(d)(8)(E) of the Act).

++ (II) The reference resident level of the hospital (as specified in section 1886(h)(10)(F)(iv) of the Act) is greater than the otherwise applicable resident limit.

++ (III) The hospital is located in a State with a new medical school (as specified in section 1886(h)(10)(B)(ii)(III)(aa) of the Act), or with additional locations and branch campuses established by medical schools (as specified in section 1886(h)(10)(B)(ii)(III)(bb) of the Act) on or after January 1, 2000.

++ (IV) The hospital serves an area designated as a HPSA under section 332(a)(1)(A) of the Public Health Service Act, as determined by the Secretary.

- The HPSA (if any) served by the residency program for which the hospital is applying and the HPSA ID for that HPSA.

- An attestation, signed and dated by an officer or administrator of the hospital who signs the hospital's Medicare cost report, stating the following:

“I hereby certify that the hospital is a Qualifying Hospital under section 1886(h)(10)(F)(iii) of the Social Security Act, and that there is a “demonstrated likelihood” that the hospital will fill the position(s) made available under section 1886(h)(10) of the Act within the first 5 training years beginning after the date the increase would be effective.”

“I hereby certify that (choose if applicable):

___ If my application is for a currently accredited residency program, the number of full-time equivalent (FTE) positions requested by the hospital does not exceed the number of positions for which the program is accredited.

___ If my hospital currently has unfilled positions in its residency program that have previously been approved by the ACGME, the number of FTE positions requested by the hospital does not exceed the number of previously approved unfilled residency positions.

___ If my application is for a residency training program with more than one participating site, I am only requesting the FTE amount that corresponds with the training occurring at my hospital, and any FTE training occurring at nonprovider settings consistent with 42 CFR 412.105(f)(1)(ii)(E) and 413.78(g).”

“I hereby certify that the hospital agrees to increase the number of its residency positions by the amount the hospital’s FTE resident caps are increased under section 4122 of Subtitle C of the Consolidated Appropriations Act, 2023, if awarded positions under section 1886(h)(10)(C)(ii) of the Act.”

“I hereby certify that (choose one):

___ In the geographic HPSA the hospital is requesting that CMS use for prioritization of its application, at least 50 percent of the program’s training time based on resident rotation schedules (or similar documentation) occurs at training sites that treat the population of the HPSA and are physically located in the HPSA.

___ In the population HPSA the hospital is requesting that CMS use for prioritization of its application, at least 50 percent of the program’s training time based on resident rotation schedules (or similar documentation) occurs at training sites that treat the designated underserved population of the HPSA and are physically located in the HPSA.

___ In the geographic HPSA the hospital is requesting that CMS use for prioritization of its application, at least 5 percent of the program’s training time based on resident rotation schedules (or similar documentation) occurs at training sites that treat the population of the HPSA and are physically located in the HPSA, and the program’s training time at those sites plus the program’s training time at Indian or Tribal facilities located outside of the HPSA is at least 50 percent of the program’s training time.

___ In the population HPSA the hospital is requesting that CMS use for prioritization of its application, at least 5 percent of the program’s training time based on resident rotation schedules (or similar documentation) occurs at training sites that treat the designated underserved population of the HPSA and are physically located in the HPSA, and the program’s training time at those sites plus the program’s training time at Indian or Tribal facilities located outside of that HPSA is at least 50 percent of the program’s training time.

___ None of the above apply.”

“I hereby certify that the hospital meets the National Standards for Culturally and Linguistically Appropriate Services in Health and Health Care (the National CLAS Standards).”

“I hereby certify that I understand that misrepresentation or falsification of any information contained in this application may be punishable by criminal, civil, and administrative action, fine and/or imprisonment under Federal law. Furthermore, I understand that if services identified in this application were provided or procured through payment directly or indirectly of a kickback or where otherwise illegal, criminal, civil, and administrative action, fines and/or imprisonment may result. I also certify that, to the best of my knowledge and belief, it is a true, correct, and complete application prepared from the books and records of the hospital in accordance with applicable instructions, except as noted. I further certify that I am familiar with the

laws and regulations regarding Medicare payment to hospitals for the training of interns and residents.”

The completed application must be submitted to CMS using the online application system MEARIS™. A link to the online application system as well as instructions for accessing the system and completing the online application process will be made available on the CMS Direct GME website at:

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/DGME>.

We note that if the hospital is applying using a HPSA ID, the HPSA score associated with that ID will automatically populate in the application module. In preparing their applications for additional residency positions, hospitals should refer to HRSA’s Find Shortage Areas by Address (<https://data.hrsa.gov/tools/shortage-area/by-address>) to obtain the HPSA ID of the HPSA served by the program and include this ID in its application. Using this HPSA Find Shortage Areas by Address, applicants may enter the address of a training location (included on the hospital’s rotation schedule or similar documentation), provided the location chosen participates in training residents in a program where at least 50 percent (5 percent if an Indian and Tribal facility is included) of the training time occurs in the HPSA. In November 2024, prior to the beginning of the application period, CMS will request HPSA ID and score information from HRSA so that recent HPSA information is available for use for the application period. CMS will only use this HPSA information, HPSA IDs and their corresponding HPSA scores, in order to review and prioritize applications. To assist hospitals in preparing for their applications, the HPSA information received from HRSA will also be posted when the MEARIS™ application module becomes available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/DGME>.

The information will also be posted on the CMS website at:

[https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/IPPS-](https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/IPPS-Regulations-and-Notices)

[Regulations-and-Notices](#). Click on the link on the left side of the screen associated with the appropriate final rule home page or “Acute Inpatient—Files for Download.”

Comment: We did not receive any public comments with respect to the proposed application process for section 4122 of the CAA, 2023, and therefore we are finalizing the application process as proposed.

However, we did receive comments asking CMS to provide guidance regarding the interaction between round 4 of section 126 of the CAA, 2021 and section 4122 of the CAA, 2023, since slots for both of these provisions will be effective July 1, 2026. Specifically, commenters asked whether a hospital may: 1) apply for an increase through section 126 round 4 and section 4122; and 2) apply for increases in the same residency program for both section 126 round 4 and section 4122. Another commenter asked whether the same provider site could apply for pediatrics FTE(s) under section 4122 and internal medicine FTE(s) under round 4 of section 126. The commenter asked, if such an application is allowed, whether there would be any impact in prioritization in dual applications.

Response: We do not believe there is any language in the statute that precludes a hospital from applying for slots under both round 4 of section 126 and section 4122. However, the statute doesn't require us to, and we will not, award duplicative FTE cap slots for the same program under these provisions. We strongly recommend that if an applicant is applying for the same program (same ACGME accreditation number) under both round 4 of section 126 and section 4122, it submit with its application a note indicating as such. Lastly, if an applicant submits an application under both round 4 of section 126 and section 4122, there is no impact on prioritization as the prioritization for awards is performed separately for these two provisions.

3. Proposed Modifications to the Criteria for New Residency Programs and Requests for Information

a. Summary

Section 1886(h)(4)(H)(i) of the Act requires CMS to establish rules for applying the direct GME cap in the case of medical residency training programs established on or after January 1, 1995. Under section 1886(d)(5)(B)(viii) of the Act, this provision also applies for purposes of the IME adjustment. Accordingly, we issued regulations at §§ 413.79(e)(1) through (3) discussing the direct GME cap calculation for a hospital that begins training residents in a new medical residency training program(s) on or after January 1, 1995. The same regulations apply for purposes of the IME cap calculation at § 412.105(f)(1)(vii). CMS implemented these statutory requirements in the August 29, 1997 **Federal Register** (62 FR 46005) and in the May 12, 1998 **Federal Register** (63 FR 26333). The calculation of both the DGME cap and IME cap for new programs is discussed in the August 31, 2012 **Federal Register** (77 FR 53416).

Section 413.79(l) defines a new medical residency training program as “a medical residency that receives initial accreditation by the appropriate accrediting body or begins training residents on or after January 1, 1995.” In the August 27, 2009 **Federal Register** (74 FR 43908 through 43917), CMS clarified the definition of a “new” residency program and adopted supporting criteria regarding whether or not a residency program can be considered “new” for the purpose of determining if a hospital can receive additional direct GME and/or IME cap slots for that program. CMS adopted these criteria in part to prevent situations where a program at an existing teaching hospital would be transferred to a new teaching hospital, resulting in cap slots created for the same program at two different hospitals. To be considered a “new” program for which new cap slots would be created, a previously non-teaching hospital would have to ensure that the program meets three primary criteria (74 FR 43912):

- The residents are new, and
- The program director is new, and

- The teaching staff are new.

Over the years, we have received questions regarding the application of these criteria, such as whether CMS would still consider a program to be new for cap adjustment purposes if the three criteria were partially, but not fully, met. We have answered such questions by stating that, generally, a residency program's newness would not be compromised as long as the "overwhelming majority" of the residents or staff are not coming from previously existing programs in that same specialty.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36221), the question of what constitutes a "new" program for purposes of receiving additional Medicare-funded GME slots has taken on increasing significance in light of the ability of urban hospitals to reclassify as rural under 42 CFR 412.103 for IME purposes, and thus receive additional IME cap slots for any new program started. In the proposed rule, we stated that, to continue to ensure that newly funded cap slots are created appropriately, we ultimately would like to establish in rulemaking additional criteria for determining program newness. However, we also indicated that we were not yet certain about some of the criteria that should be proposed. Therefore, we proposed a policy for determining whether the residents in a program are genuinely new, while we solicited comments through a Request for Information (RFI) to gain additional clarity on best practices in other areas.

We received many comments in response to our proposed criterion for ensuring newness of residents, and to our RFIs regarding criteria for program directors, teaching staff, and other issues such as commingling of residents. With regard to the RFIs, we will carefully consider comments received and will take them into account for future rulemaking. We acknowledge that the vast majority of commenters opposed any restrictions on the program director, faculty, comingling of residents, and one hospital sponsoring two programs in the same specialty.

Regarding our proposed criterion for ensuring newness of residents, we received many wide-ranging comments and commenters did not arrive at a consensus on the best approach to

this issue. Accordingly, at this time, we are not finalizing our proposal that at least 90 percent of the individual resident trainees (not FTEs) must not have previous training in the same specialty as the new program. Instead, in an effort to achieve greater consensus on this issue, we are initiating another RFI particularly focused on the criterion regarding newness of residents. Commenters should review and consider all of the comments summarized below when formulating responses to this RFI. We look forward to receiving additional feedback from commenters after they have had the opportunity to review the comments and suggestions of others.

a. Newness of Residents

Generally, when a hospital is creating a new residency program, it recruits individuals that have recently graduated from medical school, have no previous residency training experience, and would be entering the program as first year (PGY1) residents. However, new programs sometimes receive inquiries from applicants that have training experience already, but for a variety of reasons need to transfer to another program. If the program that such a resident wishes to join is still within the 5-year cap building period, then, consistent with the criteria adopted in the August 27, 2009 final rule, the program director of this “new” program should be judicious with regard to accepting residents who have received previous training in the same specialty. In order to maintain the classification as a “new” residency program, the “overwhelming majority” of residents in the program must be new. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36222), we stated that we believe it would be useful for the provider community to have a concrete standard to refer to in determining whether the “overwhelming majority” of residents in a program are in fact new. Therefore, we proposed that, in order for a residency program to be considered new, at least 90 percent of the individual resident trainees (not FTEs) must not have previous training in the same specialty as the new program. For example, if there were 50 trainees (not FTEs) entering the program over the course of the 5-year cap building period, then at least 45 of the trainees (90 percent of 50) must enter the program as

brand new first year residents in that particular specialty. If more than 10 percent of the trainees (not FTEs) transferred from another program at a different hospital/sponsor in the same specialty, even during their first year of training, we proposed that this would render the program ineligible for new cap slots. (We noted that we would apply standard rounding when 90 percent of a number does not equal a whole number, rounding down to the nearest whole number when the remainder is less than 0.5, and rounding up to the nearest whole number when the remainder is 0.5 or above. For example, if there were 48 trainees (not FTEs) entering the program over the course of the 5-year cap building period, then at least 43 of the trainees (90 percent of 48 = 43.2, which rounds down to 43) must enter the program as brand new first year residents in that particular specialty. If there were 45 trainees (not FTEs) entering the program, then at least 41 of the trainees (90 percent of 45 = 40.5, which rounds up to 41) must enter the program as brand new first year residents in that particular specialty.)

For example, if a new program is in internal medicine, then, under our proposal, at least 90 percent of the entering residents must not have previously enrolled and trained in an internal medicine program. If a resident was formally enrolled in an internal medicine program (either preliminary or categorical), even if that resident switched programs during their first year of training, then we would consider that resident to have had previous training in that same specialty. Conversely, if an individual was a resident in a specialty other than internal medicine, and that resident switched into the new internal medicine program and began training in the new internal medicine program as a PGY1, then that resident would not be considered to have had previous training in the same specialty, and would be counted as a brand new resident. (Note, we are distinguishing between a resident that is not enrolled in an internal medicine program but may have done a rotation in internal medicine as part of the requirements for a different specialty, from a resident that actually was enrolled and participated in an internal medicine program, consistent with the definition of “resident” at 42 CFR 413.75(b). In this example, we are generally focusing on individuals who were accepted, enrolled, and participated in internal

medicine; we are generally not concerned with an individual that was enrolled, accepted, and participated in a program other than internal medicine but did a rotation in internal medicine.) We proposed that the proportion of brand new residents in a residency program would be determined by the MAC based on all the individuals (not FTEs) that enter the program as a whole at any point during the 5-year cap building period, after the end of the 5 years.

We proposed a threshold of 90 percent for new residents as that is generally consistent with the concept of an “overwhelming majority,” and because we have precedent for such a threshold in the regulations for section 5506 of the Affordable Care Act, which state that a hospital is considered to have taken over an “entire” program from a closed hospital if it can demonstrate that it took in 90 percent or more of the FTE residents in that program.

Accordingly, for a program to be considered “new” for the purpose of determining if a hospital can receive additional direct GME and/or IME cap slots for that program, we proposed that at least 90 percent of the individual resident trainees (not FTEs) in the program as a whole must not have had previous training in the same specialty as the new program. If more than 10 percent of the trainees (not FTEs) transferred from another program at a different hospital/sponsor in the same specialty, even during their first year of training, we proposed that this would render the program as a whole (but not the entire hospital or its other new programs, if applicable) ineligible for new cap slots.

In addition, we stated in the proposed rule that we understand that there may be certain challenges that are unique to small or rural-based programs in developing new residencies, and that meeting a proposed threshold of 90 percent of resident trainees with no previous training experience in the specialty may be more difficult for those programs. Accordingly, we solicited comments on what should be considered a “small” program and what percentage threshold or other approach regarding new resident trainees should be applied to these programs. We also solicited comment on defining a small residency program as a program accredited for 16 or fewer resident positions, because 16 positions would encompass the minimum number of

resident positions required for accredited programs in certain specialties, such as primary care and general surgery, that have historically experienced physician shortages, and therefore have been prioritized by Congress and CMS for receipt of slots under sections 5503 and 5506 of the Affordable Care Act.

b. Summary of Public Comments

Several commenters expressed general opposition to our proposal, and to the suggestions presented in our Requests for Information, stating that these policies would be administratively burdensome, ineffective at preventing the transfer of existing programs or the duplication of FTE cap slots, and detrimental to graduate medical education in general and in particular to small and rural residency programs. Other commenters, while supportive in principle of the need for implementing more concrete standards, nevertheless expressed concern that any new guidelines should not adversely affect the educational quality of new programs or impede the establishment of new programs, which are critical to addressing workforce shortages. Furthermore, a number of commenters generally opposed the consideration of individuals' prior training or employment history in the determination of program newness, stating that these factors are extraneous to CMS's central concerns about whether a program has been transferred and whether FTE cap slots may have been duplicated. Commenters also argued that many of the issues addressed in the proposed rule and suggested policies, including the transfer of residents and recruitment of faculty and program directors, are already regulated by entities such as the ACGME, the ABMS, and the National Resident Matching Program (NRMP), and urged CMS to defer to the judgment and expertise of those organizations. For example, several commenters recommended that CMS generally defer to the assessment of the accrediting body and that the determining question in establishing newness should be whether the program has received initial accreditation for the first time from the ACGME. In addition to receiving initial accreditation for the first time from the ACGME, some commenters suggested that CMS could address its concerns if it undertook a " cursory overview" of the program and/or required an attestation from the hospital that the

program has not been transferred and that it does not duplicate FTE cap slots associated with an existing program.

A few commenters supported our proposal that at least 90 percent of FTE residents must not have previous training in the same specialty as the new program, stating that this policy would ensure that cap adjustments are granted to genuinely new programs while still providing for the limited inclusion of experienced residents. In addition, several commenters expressed support for our proposed 90 percent threshold, but recommended that we make exceptions for small or mid-sized programs and for circumstances outside of a hospital's control (for example, situations in which departing residents are replaced by transfers from an existing program).

A few commenters recommended that newness of residents should be established if the program fills most resident positions at the PGY 1 level via a separate and distinct recruiting process (as evidenced, for example, by separate NRMP match numbers, or for fellowships, an applicable distinct process). However, commenters stressed that CMS should not penalize hospitals that attempt to fill PGY 1 positions via the National Resident Matching Program (NRMP), but that may need to fill positions in a different manner due to the results of the Match. Commenters recommended that in such cases the hospital should be allowed to submit documentation demonstrating a program's original intent to satisfy the 90 percent criterion.

A few commenters supported the approach of defining a minimum threshold for new residents, but recommended adopting a more lenient standard, such as 75 percent or 70 percent, whereas other commenters recommended that our proposed 90 percent threshold should apply only to residents in their first year of training (that is, PGY 1). Alternatively, some commenters suggested that, in order to address the concern about the transfer of existing programs (or "cannibalism"), CMS should focus on limiting the number of residents who all come from the same existing residency program. In addition, some commenters argued that the presence of experienced residents should not disqualify a program from being deemed new, but suggested that those residents could be excluded from the program's FTE cap calculation.

Several commenters also requested that CMS clarify the methodology for determining the proportions of new and experienced residents, with some commenters specifically recommending that CMS make this calculation based on a count of all residents training over the course of the entire five-year cap-building period. Another commenter recommended that if CMS adopts a new resident threshold, it should count residents on the basis of FTEs rather than individual trainees as proposed, since a program's count could be skewed by enrolling a high proportion of partial FTEs. A few commenters also requested confirmation that fellows in subspecialty programs, residents who have completed transitional or preliminary year programs, and residents from closed programs would not be considered to have prior experience training in the same specialty.

A number of commenters suggested alternative methods for assessing program newness that do not depend on the proportion of residents without previous experience training in the same specialty. Some commenters suggested that CMS consider the relationship between the "new" program and the program that appears to have been transferred or duplicated. For example, if the original program remains open for a minimum of one full academic year, then the second program should be considered genuinely "new."

A commenter recommended that CMS adopt a "totality of circumstances" approach in which we would assess various aspects of the program, such as its age and whether it has existed previously at another site, rather than focusing on rigid individual metrics. Another commenter stated that CMS should apply a "reasonable person" standard in determining whether a program is genuinely new. In addition, a few commenters stated that if CMS were to implement the proposed 90 percent threshold, then a program that fails to meet the threshold should be given the opportunity to demonstrate newness by other means, and that CMS should also consider mitigating factors such as the size of the program or matched residents who did not disclose prior training experiences.

In addition to the specific recommendations discussed above, commenters generally expressed concern that any criteria adopted should be objective, transparent and administratively feasible, especially given the significant costs and high financial stakes associated with developing a new residency program. A commenter also recommended that CMS should carry out periodic evaluations of newness during a program's five-year cap-building period to ensure that a hospital has time to make any changes necessary to bring the program into compliance.

Commenters generally agreed that CMS should create exceptions to the newness criteria for small and rural programs; several commenters also argued that we should give similar consideration to programs in urban underserved areas. In particular, commenters noted that many small programs would fail to meet our proposed 90 percent threshold if they admitted even one experienced resident. Several commenters also reported that it is common for new rural programs, including Rural Track Programs, to accept a higher proportion of non-PGY 1 residents as a means of "jump starting" the program and promoting stability. A few commenters indicated that small and rural or urban underserved programs should be exempted from any restrictions on the recruitment of experienced residents (as well as on the recruitment of faculty and program directors). Although commenters agreed that our proposed 90 percent new resident threshold would be too strict for such programs, there was no consensus as to a specific standard that would be appropriate: a few commenters recommended a much lower threshold of 25 percent, while others suggested that 50 percent of PGY 1 residents should be new, with no restrictions on non-PGY 1 residents. Several commenters agreed with our suggestion that a small program should be defined as one accredited for 16 or fewer resident positions; however, a few commenters stated that for purposes of determining exceptions to the newness criteria a small program should also be required to train residents for greater than half the time in a rural area or an urban underserved area. Other commenters recommended lower thresholds for defining small programs, with specific suggestions including 12, 10, 6 or 4 positions. A few commenters

recommended that the newness of small programs be evaluated on a case-by-case basis, taking into account the totality of a hospital's financial, geographic and other circumstances.

Several commenters stressed that any new policies should only apply to programs that begin training residents after the effective date of the final rule (that is, on or after October 1, 2024), so as not to adversely impact programs currently in their cap-building period.

Some commenters also objected to CMS's administration and interpretation of the newness criteria promulgated in the August 27, 2009 Federal Register (74 FR 43908 through 43917), describing CMS's approach as "unnecessarily cynical" and stating that the criteria for assessing program newness are not reflected in the statutes or regulations. Commenters also alleged that CMS has been interpreting the existing newness criteria in ways that differ substantially from how members of the provider community have been interpreting these policies. For example, a few commenters stated that it was not clear from August 27, 2009 Federal Register that teaching staff and program directors must have no prior experience in these roles for a program to be considered genuinely new.

c. Request for Information

Section 1886(h)(4)(H)(i) of the Act states that the Secretary shall, consistent with the principles of subparagraphs (F) {Initial Residency Period} and (G) {Period of Board Eligibility} and subject to paragraphs (7) {Redistribution of Unused Residency Positions} and (8) {Distribution of Additional Residency Positions}, prescribe rules for the application of such subparagraphs in the case of medical residency training programs established on or after January 1, 1995 (that is, new programs). In promulgating such rules for purposes of subparagraph (F), the Secretary shall give special consideration to facilities that meet the needs of underserved rural areas.

Thus, the Secretary has broad statutory authority to prescribe rules for counting residents in new programs.

As we stated at the beginning of this section, we received many wide-ranging comments and commenters did not arrive at a consensus on the best approach to the issue of the newness of residents. Accordingly, at this time, we are not finalizing our proposal that at least 90 percent of the individual resident trainees (not FTEs) must not have previous training in the same specialty as the new program. Instead, in an effort to achieve greater consensus on this issue, we are initiating another RFI seeking comment on the appropriate criterion regarding newness of residents. Commenters should review and consider the broad statutory authority provided to the Secretary in this area, our prior rulemaking on this issue, and all of the public comments on our proposal as summarized in Section F.3.b of this final rule when formulating responses to this RFI. We look forward to receiving additional feedback from commenters after they have had the opportunity to review the comments and suggestions of others. We also, in the interest of facilitating consensus, encourage commenters to provide feedback on what alternative to their primary recommended approach they would consider to be most acceptable among the different approaches suggested by commenters.

4. Technical fixes to the DGME Regulations

In the course of our ongoing implementation of policies concerning payment for graduate medical education, we have become aware of the existence of several technical errors in the direct GME regulations at 42 CFR 413.75 through 413.83. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36224 through 36225), we proposed to correct the following technical errors:

a. Correction of Cross-References to § 413.79(f)(7)

In the FY 2010 IPPS final rule (74 FR 43918 and 44001, August 27, 2009), we amended 42 CFR 413.79(f) by adding a new paragraph (f)(6) and redesignating existing paragraph (f)(6) as paragraph (f)(7). The new § 413.79(f)(6) sets forth requirements for participation in a Medicare GME affiliated group by a hospital that is new after July 1 and begins training

residents for the first time after the July 1 start date of an academic year, while the redesignated § 413.79(f)(7) contains the regulations pertaining to emergency Medicare GME affiliated groups.

We have discovered that, after redesignating the former § 413.79(f)(6) as § 413.79(f)(7), we inadvertently did not update the cross-references to this paragraph at §§ 413.75(b) and 413.78. Accordingly, in the proposed rule, we proposed to revise the language of the definition of “Emergency Medicare GME affiliated group” under § 413.75(b), as well as the language at §§ 413.78(e)(3)(iii) and (f)(3)(iii), by correcting the cross-references to read “§ 413.79(f)(7).”

b. Removal of Obsolete Regulations under § 413.79(d)(6)

Under 42 CFR 413.79(h), a hospital may receive a temporary adjustment to its FTE cap to reflect displaced residents added as a result of the closure of another hospital or residency training program. Furthermore, under § 413.79(d)(6)(i) (previously § 413.79(d)(6)), displaced residents counted under a temporary cap adjustment are added to the receiving hospital’s FTE count after application of the three-year rolling average for the duration of the time that the displaced residents are training at the receiving hospital.

In the November 24, 2010 final rule (75 FR 72212 through 72238), we implemented the provisions of section 5506 of the Affordable Care Act, which directs the Secretary to redistribute Medicare GME residency slots from teaching hospitals that close after March 23, 2008. A hospital that had previously accepted residents displaced by a teaching hospital closure and received a temporary cap adjustment for training those residents under § 413.79(h) may subsequently apply for a permanent cap increase under section 5506.

As part of the implementation of section 5506, we finalized several ranking criteria to prioritize applications, and specified the dates on which awards would become effective for hospitals that apply under each of those criteria. In particular, we finalized Ranking Criteria One and Three, which describe applicant hospitals that take over, respectively, an entire residency program(s) or part of a residency program(s) from the closed hospital. Consistent with the policy finalized in the November 24, 2010 final rule, a permanent cap increase awarded under Ranking

Criterion One or Three would generally override any temporary cap adjustment that the applying hospital may have received under § 413.79(h), with the result that those resident slots would immediately become subject to the three-year rolling average calculation (75 FR 72224).

We also stated, however, that we believed it would still be appropriate to allow a hospital that ultimately would qualify to receive slots permanently under any of the ranking criteria and that took in displaced residents to receive temporary cap adjustments and, in a limited manner, an exemption from the three-year rolling average. Therefore, we finalized a policy that, in the first cost reporting period in which the applying hospital takes in displaced residents and the hospital closure occurs, the applying hospital could receive a temporary cap adjustment and an exemption from the rolling average for the displaced residents. Then, effective beginning with the cost reporting period following the one in which the hospital closure occurred, the applying hospital's permanent cap increase would take effect, and there would be no exemption from the rolling average (75 FR 72225 and 72263).

Therefore, we amended § 413.79(d) by redesignating the existing paragraph (d)(6) as (d)(6)(i) and by adding new (d)(6)(ii), which states that if a hospital received a permanent increase in its FTE resident cap under § 413.79(o)(1) due to redistribution of slots from a closed hospital, the displaced FTE residents that the hospital received would be added to the FTE count after applying the averaging rules only in the first cost reporting period in which the receiving hospital trained the displaced FTE residents. In subsequent cost reporting periods, the displaced FTE residents would be included in the receiving hospital's rolling average calculation.

Subsequently, in the FY 2013 IPPS final rule (77 FR 53437 through 53443, August 31, 2012), we finalized revisions to our policy concerning the effective dates of section 5506 cap increases awarded under the various ranking criteria. In particular, we finalized a policy that slots awarded under Ranking Criteria One and Three become effective seamlessly with the expiration of temporary cap adjustments under § 413.79(h) (that is, on the day after the graduation date(s) of the displaced residents). As stated in that final rule, under this revised policy, permanent cap

increases under section 5506 would no longer “replace” temporary cap adjustments under § 413.79(h), and exemptions from the three-year rolling average would no longer be suspended as a consequence of the receipt of permanent slots (77 FR 53441).

Under the policy finalized in the FY 2013 IPPS final rule, there is no longer any need for the regulation at § 413.79(d)(6)(ii), which would apply in the situation where a permanent cap increase under section 5506 would otherwise have overridden a temporary cap adjustment for displaced residents under § 413.79(h). Instead, our policy is that displaced residents are excluded from the receiving hospital’s rolling average calculation for the duration of the time that they are training at the receiving hospital, as specified at § 413.79(d)(6)(i). However, we have discovered that we neglected to make the appropriate revisions to the regulations text to reflect our current policy.

Accordingly, we proposed to amend § 413.79(d)(6) by removing the no longer applicable paragraph (d)(6)(ii), and by redesignating existing (d)(6)(i) as (d)(6).

c. Correction of Typographical Errors at § 413.79(k)(2)(i)

In the final rule published on December 27, 2021, as part of the implementation of section 127 of the CAA, 2021 (Pub. L. 116-260), we finalized various changes throughout the regulations text at 42 CFR 413.79(k), “Residents training in rural track programs” (86 FR 73445 through 73457 and 73514 through 73515). We have discovered that the final sentence of § 413.79(k)(2)(i), as amended in that rule, incorrectly states, “For Rural Track Programs prior to the start of the urban or rural hospital’s cost reporting period that coincides with or follows the start of the sixth program year of the rural track’s existence...”

The beginning of the quoted sentence should instead refer to “cost reporting periods beginning on or after October 1, 2022,” and should otherwise be analogous to the similar text that appears at § 413.79(k)(1)(i). Accordingly, we proposed to revise § 413.79(k)(2)(i) to read as follows: “For cost reporting periods beginning on or after October 1, 2022, before the start of the urban or rural hospital’s cost reporting period that coincides with or follows the start of the sixth

program year of the Rural Track Program's existence, the rural track FTE limitation for each hospital will be the actual number of FTE residents training in the Rural Track Program at the urban or rural hospital and, subject to the requirements under § 413.78(g), at the rural nonprovider site(s)."

We did not receive any comments on our proposed technical revisions to the direct GME regulations. Therefore, we are finalizing the changes as proposed without modification.

5. Notice of Closure of Teaching Hospital and Opportunity to Apply for Available Slots

a. Background

Section 5506 of the Patient Protection and Affordable Care Act (Pub. L. 111–148), as amended by the Health Care and Education Reconciliation Act of 2010 (Pub. L. 111–152) (collectively, "Affordable Care Act"), authorizes the Secretary to redistribute residency slots after a hospital that trained residents in an approved medical residency program closes.

Specifically, section 5506 of the Affordable Care Act amended the Act by adding subsection (vi) to section 1886(h)(4)(H) of the Act and modifying language at section 1886(d)(5)(B)(v) of the Act, to instruct the Secretary to establish a process to increase the FTE resident caps for other hospitals based upon the full-time equivalent (FTE) resident caps in teaching hospitals that closed on or after a date that is 2 years before the date of enactment (that is, March 23, 2008). In the CY 2011 Outpatient Prospective Payment System (OPPS) final rule with comment period (75 FR 72264), we established regulations at 42 CFR 413.79(o) and an application process for qualifying hospitals to apply to CMS to receive direct GME and IME FTE resident cap slots from the hospital that closed. We made certain additional modifications to § 413.79 in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53434), and we made changes to the section 5506 application process in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50122 through 50134). The procedures we established apply both to teaching hospitals that closed on or after March 23, 2008, and on or before August 3, 2010, and to teaching hospitals that close after August 3, 2010 (75 FR 72215).

b. Notice of Closure of Sacred Heart Hospital Located in Eau Claire, WI, and the Application Process—Round 23

CMS has learned of the closure of Sacred Heart Hospital, located in Eau Claire, WI (CCN 520013). Accordingly, this notice serves to notify the public of the closure of this teaching hospital and initiate another round (“Round 23”) of the application and selection process. This round will be the 23rd round (“Round 23”) of the application and selection process. The table in this section of this rule contains the identifying information and IME and direct GME FTE resident caps for the closed teaching hospital, which are part of the Round 23 application process under section 5506 of the Affordable Care Act.

TABLE V.F.-02: SACRED HEART HOSPITAL FTE RESIDENT CAPS

CCN	Provider Name	City and State	CBSA Code	Terminating Date	IME FTE Resident Cap (including+/- MMA Sec. 422 ²¹⁷ and ACA Sec. 5503 ²¹⁸ adjustments)	Direct GME FTE Resident Cap (including+/- ACA Sec. 5503 adjustments)
520013	Sacred Heart Hospital	Eau Claire, WI	20740	March 22, 2024	9.00 – 0.50 sec. 422 reduction - 0.88 sec. 5503 reduction = 7.62 ²¹⁹	9.00 – 1.20 sec. 5503 reduction = 7.80 ²²⁰

1 Section 422 of the MMA, Public Law 108–173, redistributed unused IME and direct GME residency slots effective July 1, 2005.

2 Section 5503 of the Affordable Care Act of 2010, Public Law 111–148 and Public Law 111–152, redistributed unused IME and direct GME residency slots effective July 1, 2011.

3 Sacred Heart Hospital’s 1996 IME FTE resident cap is 9.00. Under section 422 of the MMA, the hospital received a reduction of 0.50 to its IME FTE resident cap, and under section 5503 of the Affordable Care Act, the hospital received a reduction of 0.88 to its IME FTE resident cap: 9.00 – 0.50 – 0.88 = 7.62.

4 Sacred Heart Hospital’s 1996 direct GME FTE resident cap is 9.00. Under section 5503 of the Affordable Care Act, the hospital received a reduction of 1.20 to its direct GME FTE resident cap: 9.00 – 1.20 = 7.80.

d. Application Process for Available Resident Slots

The application period for hospitals to apply for slots under section 5506 of the Affordable Care Act is 90 days following notice to the public of a hospital closure (77 FR 53436). Therefore, hospitals that wish to apply for and receive slots from the previously noted hospitals’ FTE resident caps must submit applications using the electronic application intake system, Medicare Electronic Application Request Information System™ (MEARIS™), with application submissions for Round 23 due no later than **insert date 90 days from date of filing**

for public inspection]. The Section 5506 application can be accessed at:

<https://mearis.cms.gov/public/home>.

CMS will only accept Round 23 applications submitted via MEARIS™. Applications submitted through any other method will not be considered. Within MEARIS™, we have built in several resources to support applicants:

- Please refer to the “Resources” section for guidance regarding the application submission process at: <https://mearis.cms.gov/public/resources>.
- Technical support is available under “Useful Links” at the bottom of the MEARIS™ webpage.
- Application related questions can be submitted to CMS using the form available under “Contact” at: <https://mearis.cms.gov/public/resources>.

Application submission through MEARIS™ will not only help CMS track applications and streamline the review process, but it will also create efficiencies for applicants when compared to a paper submission process.

We have not established a deadline by when CMS will issue the final determinations to hospitals that receive slots under section 5506 of the Affordable Care Act. However, we review all applications received by the application deadline and notify applicants of our determinations as soon as possible.

We refer readers to the CMS Direct Graduate Medical Education (DGME) website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/direct-graduate-medical-education-dgme>. Hospitals should access this website for a list of additional section 5506 guidelines for the policy and procedures for applying for slots, and the redistribution of the slots under sections 1886(h)(4)(H)(vi) and 1886(d)(5)(B)(v) of the Act.

6. Reminder of Core-Based Statistical Area (CBSA) Changes and Application to GME Policies

In section III.B. of the preamble of this final rule, we discuss the proposed changes to the most recent OMB standards for delineating statistical areas announced in the July 21, 2023 OMB

Bulletin No. 23-01. We refer to these statistical areas as Core-Based Statistical Areas (CBSAs). As a result of the new OMB delineations, some teaching hospitals may be redesignated from location in a rural CBSA to an urban CBSA, or from location in an urban CBSA to a rural CBSA. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50111, August 22, 2014), we last discussed the effects of the CBSA changes on IME and DGME payment policy, as at that time, we implemented the changes to the statistical areas resulting from the February 28, 2013, OMB Bulletin No. 13-01. We refer readers to the FY 2015 IPPS/LTCH PPS final rule to learn more about CMS' policies regarding changes to the CBSAs and how IME and DGME payments are impacted. We emphasize that we did not propose any additional policies as a result of the latest CBSA changes; we are merely providing a reference for readers that may have questions about our existing policies. As a general overview, the FY 2015 IPPS/LTCH PPS final rule discusses the effect on the FTE caps of a hospital that was located in a rural CBSA, either at the time that it started training residents in a new residency program, or was located in a rural area when it received accreditation for a new program, but either prior to actually starting the program or during the 5-year cap building period, the CBSA in which the hospital was located became an urban CBSA (79 FR 50111 through 50113). We also discussed what happens to a rural training track when a rural hospital that is participating as the rural site is redesignated as urban, either during the period when the rural track is being established, or after it has been established (79 FR 50113). (Note that under 42 CFR 413.75(b) and 413.79(k), we now refer to rural training tracks as Rural Training Programs (RTPs)). We provided for a transition period, wherein either the redesignated urban hospital must reclassify as rural under § 412.103 for purposes of IME payment only (in addition, this reclassification option only applies to IPPS hospitals (or CAHs under 42 CFR 412.103(a)(6)), not other nonprovider sites), or the "original" urban hospital must have found a new site in a geographically rural area that will serve as the rural site for purposes of the rural track in order for the "original" urban hospital to receive payment under §

413.79(k)(1) or (k)(2). Also see DGME regulations at 42 CFR 413.79(c)(6), 42 CFR 413.79(k)(7), and for IME, at 42 CFR 412.105(f)(1)(iv)(D).

Comment: We received one question related to DGME PRA determination of a hospital whose CBSA designation changes as a result of CBSA redesignations. The commenter noted that under 42 CFR 413.77, a new teaching hospital's PRA is determined based on the lower of the hospital's cost per FTE, or the weighted average PRA of other existing teaching hospitals in the same CBSA as the new teaching hospital. For a new teaching hospital whose CBSA changed status as a result of OMB changes, is the weighted average PRA based on the hospitals in the CBSA at the time the new teaching hospital first began training residents, or the CBSA in effect at the time the MAC audits and calculates the PRA?

Response: The relevant CBSA for the purpose of the weighted average PRA calculation is the CBSA in which the new teaching hospital was located during its PRA base period, under 42 CFR 413.77(e)(1)(i).

G. Reasonable Cost Payment for Nursing and Allied Health Education Programs (§413.85 and 413.87)

1. General

Under section 1861(v) of the Act, Medicare has historically paid providers for Medicare's share of the costs that providers incur in connection with approved educational activities. Approved nursing and allied health (NAH) education programs are those that are, in part, operated by a provider, and meet State licensure requirements, or are recognized by a national accrediting body. The costs of these programs are excluded from the definition of "inpatient hospital operating costs" and are not included in the calculation of payment rates for hospitals or hospital units paid under the IPPS, IRF PPS, or IPF PPS, and are excluded from the rate-of-increase ceiling for certain facilities not paid on a PPS. These costs are separately identified and "passed through" (that is, paid separately on a reasonable cost basis). Existing regulations on NAH education program costs are located at 42 CFR 413.85. The most recent

substantive rulemakings on these regulations were in the January 12, 2001 final rule (66 FR 3358 through 3374), and in the August 1, 2003, final rule (68 FR 45423 and 45434).

2. Medicare Advantage Nursing and Allied Health Education Payments

Section 541 of the Balanced Budget Refinement Act (BBRA) of 1999 provides for additional payments to hospitals for costs of nursing and allied health education associated with services to Medicare+Choice (now called Medicare Advantage (MA²²¹)) enrollees. Hospitals that operate approved nursing or allied health education programs and receive Medicare reasonable cost reimbursement for these programs may receive additional payments to account for MA enrollees. Section 541 of the BBRA limits total spending under the provision to no more than \$60 million in any calendar year (CY). (In this document, we refer to the total amount of \$60 million or less as the payment “pool”.) Section 541 of the BBRA also provides that direct graduate medical education (GME) payments for Medicare+Choice utilization are reduced to the extent that these additional payments are made for nursing and allied health education programs. This provision was effective for portions of cost reporting periods occurring in a CY, on or after January 1, 2000.

Section 512 of the Benefits Improvement and Protection Act (BIPA) of 2000 changed the formula for determining the additional amounts to be paid to hospitals for Medicare+Choice nursing and allied health costs. Under section 541 of the BBRA, the additional payment amount was determined based on the proportion of each individual hospital's nursing and allied health education payment to total nursing and allied health education payments made to all hospitals. However, this formula did not account for a hospital's specific Medicare+Choice utilization. Section 512 of the BIPA revised this payment formula to specifically account for each hospital's Medicare+Choice utilization. This provision was effective for portions of cost reporting periods occurring in a calendar year, beginning with CY 2001.

²²¹ The M+C program in Part C of Medicare was renamed the Medicare Advantage (MA) Program under the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA), which was enacted in December 2003.

The regulations at 42 CFR 413.87 codified both statutory provisions. We first implemented the BBRA NAH Medicare+Choice provision in the August 1, 2000 IPPS interim final rule with comment period (IFC) (65 FR 47036 through 47039), and subsequently implemented the BIPA provision in the August 1, 2001 IPPS final rule (66 FR 39909 and 39910). In those rules, we outlined the qualifying conditions for a hospital to receive the NAH Medicare+Choice payment, how we would calculate the NAH Medicare+Choice payment pool, and how a qualifying hospital would calculate its “share” of payment from that pool.

Determining a hospital's NAH Medicare+Choice payment essentially involves applying a ratio of the hospital-specific NAH Part A payments, total inpatient days, and Medicare+Choice inpatient days, to national totals of those same variables, from cost reporting periods ending in the fiscal year that is 2 years prior to the current calendar year. The formula is as follows:

$$\begin{aligned} &(((\text{Hospital NAH pass-through payment}/\text{Hospital Part A Inpatient Days}) * \\ &\text{Hospital MA}^{222} \text{ Inpatient Days})/((\text{National NAH pass-through payment}/ \\ &\text{National Part A Inpatient Days}) * \text{National MA Inpatient Days})) * \text{Current Year Payment Pool.} \end{aligned}$$

With regard to determining the total national amounts for NAH pass-through payment, Part A inpatient days, and Medicare+Choice inpatient days, we note that section 1886(1) of the Act, as added by section 541 of the BBRA, gives the Secretary the discretion to “estimate” the national components of the formula noted previously. For example, section 1886(1)(2)(A) of the Act states that the Secretary would estimate the ratio of payments for all hospitals for portions of cost reporting periods occurring in the year under subsection 1886(h)(3)(D) of the Act to total direct GME payments estimated for the same portions of periods under section 1886(h)(3) of the Act.

Accordingly, we stated in the August 1, 2000 IFC (65 FR 47038) that each year, we would determine and publish in a final rule the total amount of nursing and allied health education payments made across all hospitals during the fiscal year 2 years prior to the current

²²² Formerly Medicare+Choice

calendar year. We would use the best available cost reporting data for the applicable hospitals from the Hospital Cost Report Information System (HCRIS) for cost reporting periods in the fiscal year that is 2 years prior to the current calendar year (65 FR 47038).

To calculate the pool, in accordance with section 1886(l) of the Act, we stated that we would “estimate” a total amount for each calendar year, not to exceed \$60 million (65 FR 47038). To calculate the proportional reduction to Medicare+Choice (now MA) direct GME payments, we stated that the percentage is estimated by calculating the ratio of the Medicare+Choice nursing and allied health payment “pool” for the current calendar year to the projected total Medicare+Choice direct GME payments made across all hospitals for the current calendar year. We stated that the projections of Medicare+Choice direct GME and Part A direct GME payments are based on the best available cost report data from the HCRIS (for example, for calendar year 2000, the projections are based on the best available cost report data from HCRIS 1998), and these payment amounts are increased using the increases allowed by section 1886(h) of the Act for these services (using the percentage applicable for the current calendar year for Medicare+Choice direct GME and the Consumer Price Index (CPI-U) increases for Part A direct GME). We also stated that we would publish the applicable percentage reduction each year in the IPPS proposed and final rules (65 FR 47038).

Thus, in the August 1, 2000 IFC, we described our policy regarding the timing and source of the national data components for the NAH Medicare+Choice add-on payment and the percent reduction to the direct GME Medicare+Choice payments, and we stated that we would publish the rates for each calendar year in the IPPS proposed and final rules. While the rates for CY 2000 were published in the August 1, 2000 IFC (see 65 FR 47038 and 47039), the rates for subsequent CYs were only issued through Change Requests (CRs) (CR 2692, CR 11642, CR 12407). After recent issuance of the CY 2019 rates in CR 12407 on August 19, 2021, we reviewed our update procedures, and were reminded that the August 1, 2000 IFC states that we would publish the NAH Medicare+Choice rates and direct GME percent reduction every year in the IPPS rules.

Accordingly, for CY 2020 and CY 2021, we proposed and finalized the NAH MA add-on rates in the FY 2023 IPPS/LTCH PPS proposed and final rules. We stated that for CYs 2022 and after, we would similarly propose and finalize their respective NAH MA rates and direct GME percent reductions in subsequent IPPS/LTCH PPS rulemakings (see 87 FR 49073, August 10, 2022).

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed the rates for CY 2023. Consistent with the use of HCRIS data for past calendar years, we proposed to use data from cost reports ending in FY 2021 HCRIS (the fiscal year that is 2 years prior to CY 2023) to compile these national amounts: NAH pass-through payment, Part A Inpatient Days, MA Inpatient Days.

For the proposed rule (89 FR 36227 through 36228), we accessed the FY 2021 HCRIS data from the fourth quarterly HCRIS update of 2023. However, to calculate the “pool” and the direct GME MA percent reduction, we “project” Part A direct GME payments and MA direct GME payments for the current calendar year, which in the proposed rule and in this final rule is CY 2023, based on the “best available cost report data from the HCRIS” (65 FR 47038). Next, consistent with the method we described previously from the August 1, 2000 IFC, we increased these payment amounts from midpoint to midpoint of the appropriate calendar year using the increases allowed by section 1886(h) of the Act for these services (using the percentage applicable for the current calendar year for MA direct GME, and the Consumer Price Index-Urban (CPI-U) increases for Part A direct GME). For CY 2023, the direct GME projections are based on the fourth quarterly update of CY 2021 HCRIS, adjusted for the CPI-U and for increasing MA enrollment.

For CY 2023, the proposed national rates and percentages, and their data sources, are set forth in this table. We stated in the proposed rule that we intend to update these numbers in the FY 2025 final rule based on the latest available cost report data.

Proposed CY 2023 NAH MA Rates	Proposed CY 2023	SOURCE
NAH Pass-Through	\$281,138,358	Cost reports ending in FY 2021 HCRIS
Part A Inpatient Days	70,195,536	Cost reports ending in FY 2021HCRIS
MA Inpatient Days	13,699,344	Cost reports ending in FY 2021HCRIS
Part A Direct GME	\$2,925,379,833	CY 2021 HCRIS + CPI-U + MA enrollment
MA Direct GME	\$2,198,792,484	CY 2021 HCRIS + CPI-U + MA enrollment
Pool (not to exceed \$60 million)	\$60,000,000	((MA DGME /Part A DGME) * (NAH Pass-through))

Percent Reduction to MA DGME Payments	2.73%	Pool/MA direct GME
---------------------------------------	-------	--------------------

For this final rule, consistent with the use of HCRIS data for past calendar years, for CY 2023, we use data from cost reports ending in FY 2021 HCRIS (the fiscal year that is 2 years prior to CY 2023) to compile these national amounts: NAH pass-through payment, Part A Inpatient Days, MA Inpatient Days. For this final rule, we accessed the HCRIS data from the first quarterly HCRIS update of 2024. However, to calculate the “pool” and the direct GME MA percent reduction, we project Part A direct GME payments and MA direct GME payments for the current calendar year, which in this final rule is CY 2023, based on the best available cost report data. Next, consistent with the method we described previously from the August 1, 2000 IFC, we increased these payment amounts from midpoint to midpoint of the appropriate calendar year using the increases allowed by section 1886(h) of the Act for these services (using the percentage applicable for the current calendar year for MA direct GME, and the Consumer Price Index-Urban (CPI-U) increases for Part A direct GME). For CY 2023, the direct GME projections are based on FY 2021 HCRIS, and the final national rates and percentages, and their data sources, are set forth in this table.

Final CY 2023 NAH MA Rates	Final CY 2023	SOURCE
NAH Pass-Through	\$ 275,652,648	Cost reports ending in FY 2021 HCRIS
Part A Inpatient Days	70,195,738	Cost reports ending in FY 2021 HCRIS
MA Inpatient Days	13,712,419	Cost reports ending in FY 2021 HCRIS
Part A Direct GME	\$2,947,906,247	CY 2021 HCRIS + CPI-U + MA enrollment
MA Direct GME	\$2,191,025,717	CY 2021 HCRIS + CPI-U + MA enrollment
Pool (not to exceed \$60 million)	\$60,000,000	((MA DGME /Part A DGME) * (NAH Pass-through))
Percent Reduction to MA DGME Payments	2.74%	Pool/MA direct GME

We only received comments on this section that were out of the scope of the proposal. In summary, we are finalizing our proposal to use NAH MA add-on rates as well as the direct GME MA percent reductions for CY 2023, based on sufficient HCRIS data to develop the rates for these years. We expect to propose to issue the rates for CY 2024 in the FY 2026 IPPS/LTCH PPS proposed rule, when sufficient HCRIS data is available to develop the rates for CY 2024.

H. Payment Adjustment for Certain Clinical Trial and Expanded Access Use Immunotherapy Cases (§§ 412.85 and 412.312)

Effective for FY 2021, we created MS-DRG 018 for cases that include procedures describing CAR T-cell therapies, which were reported using ICD–10–PCS procedure codes XW033C3 or XW043C3 (85 FR 58599 through 58600). Effective for FY 2022, we revised MS-DRG 018 to include cases that report the procedure codes for CAR T-cell and non-CAR T-cell therapies and other immunotherapies (86 FR 44798 through 448106).

Effective for FY 2021, we modified our relative weight methodology for MS-DRG 018 in order to develop a relative weight that is reflective of the typical costs of providing CAR T-cell therapies relative to other IPPS services. Specifically, under our finalized policy we do not include claims determined to be clinical trial claims that group to MS-DRG 018 when calculating the average cost for MS-DRG 018 that is used to calculate the relative weight for this MS-DRG, with the additional refinements that: (a) when the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the claim will be included when calculating the average cost for MS DRG 018 to the extent such claims can be identified in the historical data; and (b) when there is expanded access use of immunotherapy, these cases will not be included when calculating the average cost for MS-DRG 018 to the extent such claims can be identified in the historical data (85 FR 58600). The term “expanded access” (sometimes called “compassionate use”) is a potential pathway for a patient with a serious or immediately life-threatening disease or condition to gain access to an investigational medical product (drug, biologic, or medical device) for treatment outside of clinical trials when, among other criteria, there is no comparable or satisfactory alternative therapy to diagnose, monitor, or treat the disease or condition (21 CFR 312.305)²²³.

Effective FY 2021, we also finalized an adjustment to the payment amount for applicable clinical trial and expanded access immunotherapy cases that group to MS–DRG 018 using the

²²³ <https://www.fda.gov/news-events/expanded-access/expanded-access-keywords-definitions-and-resources>

same methodology that we used to adjust the case count for purposes of the relative weight calculations (85 FR 58842 through 58844). (As previously noted, effective beginning FY 2022, we revised MS-DRG 018 to include cases that report the procedure codes for CAR T-cell and non-CAR T-cell therapies and other immunotherapies (86 FR 44798 through 448106).) Specifically, under our finalized policy we apply a payment adjustment to claims that group to MS-DRG 018 and include ICD-10-CM diagnosis code Z00.6, with the modification that when the CAR T-cell, non-CAR T-cell, or other immunotherapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the payment adjustment will not be applied in calculating the payment for the case. We also finalized that when there is expanded access use of immunotherapy, the payment adjustment will be applied in calculating the payment for the case. This payment adjustment is codified at 42 CFR 412.85 (for operating IPPS payments) and 42 CFR 412.312 (for capital IPPS payments), for claims appropriately containing Z00.6, as described previously, and reflects that the adjustment is also applied for cases involving expanded access use immunotherapy, and that the payment adjustment only applies to applicable clinical trial cases; that is, the adjustment is not applicable to cases where the CAR T-cell, non-CAR T-cell, or other immunotherapy product is purchased in the usual manner, but the case involves a clinical trial of a different product. The regulations at 42 CFR 412.85(c) also specify that the adjustment factor will reflect the average cost for cases to be assigned to MS-DRG 018 that involve expanded access use of immunotherapy or are part of an applicable clinical trial to the average cost for cases to be assigned to MS-DRG 018 that do not involve expanded access use of immunotherapy and are not part of a clinical trial (85 FR 58844).

For FY 2025, we proposed to continue to apply an adjustment to the payment amount for expanded access use of immunotherapy and applicable clinical trial cases that would group to MS-DRG 018, as calculated using the same methodology, as modified in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59062), that we proposed to use to adjust the case count for

purposes of the relative weight calculations, as described in section II.D. of the preamble of this final rule.

As discussed in the FY 2024 IPPS/LTCH PPS final rule, the MedPAR claims data now includes a field that identifies whether or not the claim includes expanded access use of immunotherapy. For the FY 2023 MedPAR data and for subsequent years, this field identifies whether or not the claim includes condition code 90. The MedPAR files now also include information for claims with the payer-only condition code “ZC”, which is used by the IPPS Pricer to identify a case where the CAR T-cell, non-CAR T-cell, or other immunotherapy product is purchased in the usual manner, but the case involves a clinical trial of a different product so that the payment adjustment is not applied in calculating the payment for the case (for example, see Change Request 11879, available at <https://www.cms.gov/files/document/r10571cp.pdf>). We refer the readers to section II.D. of the preamble of this final rule for further discussion of our methodology for identifying clinical trial claims and expanded access use claims in MS-DRG 018 and our methodology used to adjust the case count for purposes of the relative weight calculations, as modified in the FY 2024 IPPS/LTCH PPS final rule.

Using the same methodology that we proposed to use to adjust the case count for purposes of the relative weight calculations, we proposed to calculate the adjustment to the payment amount for expanded access use of immunotherapy and applicable clinical trial cases as follows:

- Calculate the average cost for cases assigned to MS-DRG 018 that either (a) contain ICD-10-CM diagnosis code Z00.6 and do not contain condition code “ZC” or (b) contain condition code “90”.
- Calculate the average cost for all other cases assigned to MS-DRG 018.
- Calculate an adjustor by dividing the average cost calculated in step 1 by the average cost calculated in step 2.

- Apply this adjustor when calculating payments for expanded access use of immunotherapy and applicable clinical trial cases that group to MS-DRG 018 by multiplying the relative weight for MS-DRG 018 by the adjustor.

We refer the readers to section II.D. of the preamble of this final rule for further discussion of our methodology.

Consistent with our calculation of the proposed adjustor for the relative weight calculations, for the proposed rule we proposed to calculate this adjustor based on the December 2023 update of the FY 2023 MedPAR file for purposes of establishing the FY 2025 payment amount. Specifically, in accordance with 42 CFR 412.85 (for operating IPPS payments) and 42 CFR 412.312 (for capital IPPS payments), for the proposed rule, we proposed to multiply the FY 2025 relative weight for MS-DRG 018 by a proposed adjustor of 0.34 as part of the calculation of the payment for claims determined to be applicable clinical trial or expanded use access immunotherapy claims that group to MS-DRG 018, which includes CAR T-cell and non-CAR T-cell therapies and other immunotherapies. We also proposed to update the value of the adjustor based on more recent data for the final rule.

We did not receive any comments specifically relating to the proposed payment adjustment for applicable clinical trial and expanded access use immunotherapy cases and are therefore finalizing our proposal without modification. We are also finalizing our proposal to update the value of this adjustor based on more recent data for this final rule. Therefore, using the March 2024 update of the FY 2023 MedPAR data, we are finalizing an adjustor of 0.33 for FY 2025, which will be multiplied by the final FY 2025 relative weight for MS-DRG 018 as part of the calculation of the payment for claims determined to be applicable clinical trial or expanded use access immunotherapy claims that group to MS-DRG 018.

I. Changes to the Calculation of the IPPS Add-On Payment for Certain End-Stage Renal Disease (ESRD) Discharges (§ 412.104)

Under existing regulations at § 412.104, we provide an additional payment to a hospital for inpatient services provided to certain Medicare beneficiaries with ESRD who receive a dialysis treatment during a hospital stay, if the hospital's ESRD Medicare beneficiary discharges, excluding discharges classified into the MS-DRGs listed at § 412.104(a), where the beneficiary received dialysis services during the inpatient stay, are 10 percent or more of its total Medicare discharges. The additional payment (referred to as the ESRD add-on payment) is intended to lessen the impact of the added costs for hospitals that deliver inpatient dialysis services to a high concentration of ESRD Medicare beneficiaries (76 FR 51692). The additional payment is based on the average length of stay for ESRD beneficiaries in the facility times a factor based on the average direct cost of furnishing dialysis services during a usual beneficiary stay (49 FR 34747). The payment to a hospital equals the average length of stay of ESRD beneficiaries in the hospital, expressed as a ratio to 1 week, times the estimated weekly cost of dialysis multiplied by the number of ESRD beneficiary discharges not excluded under § 412.104(a). The average direct cost of dialysis was determined from data obtained in connection with establishing the composite rate reimbursement for outpatient maintenance dialysis (49 FR 34747).

On January 1, 2011, we implemented the ESRD PPS, a case-mix adjusted, bundled PPS for renal dialysis services furnished by ESRD facilities as required by section 1881(b)(14) of the Act, as added by section 153(b) of the Medicare Improvements for Patients and Providers Act of 2008 (MIPPA) (Pub. L. 110-275). Section 1881(b)(14)(F) of the Act, as added by section 153(b) of MIPPA, and amended by section 3401(h) of the Patient Protection and Affordable Care Act (the Affordable Care Act) (Pub. L. 111-148), established that beginning CY 2012, and each subsequent year, the Secretary of the Department of Health and Human Services (the Secretary) shall annually increase payment amounts by an ESRD market basket percentage increase, reduced by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act

(74 FR 49927). The ESRD PPS replaced the basic case-mix adjusted composite rate payment system and the payment methodologies for separately billable outpatient renal dialysis items and services. Payment under Medicare Part B for outpatient renal dialysis services has been based entirely on the ESRD PPS since January 1, 2014 (78 FR 72160). The ESRD PPS pays ESRD facilities a case-mix-adjusted, bundled payment, which includes former composite rate services and ESRD-related drugs, laboratory services, and medical equipment and supplies (80 FR 68973). The ESRD PPS base rate is designed to reflect the average cost per-treatment of providing renal dialysis services.²²⁴ The per treatment payment amount (that is, the ESRD PPS base rate, subject to applicable adjustments)²²⁵ is typically applied to a regimen of three hemodialysis treatments per week. CMS updates the ESRD PPS base rate annually. We refer readers to the August 12, 2010, ESRD PPS final rule (75 FR 49030 through 49214) for additional details on the establishment of the ESRD PPS, including a discussion of the transition from the basic case-mix adjusted composite rate payment system to the ESRD PPS.

As described previously, under current regulations the ESRD add-on payment is based on the average direct cost of furnishing dialysis services determined from data obtained in connection with establishing the composite rate. Under the current regulations, the average cost of dialysis is reviewed and adjusted, if appropriate, at the time the composite rate reimbursement for outpatient dialysis is reviewed. The last time CMS updated the composite rate was in the CY 2013 ESRD PPS final rule (77 FR 67454), as this was the final year in which payments to ESRD facilities were based on a blend of the composite rate and the ESRD PPS. In light of the time that has passed since the last update to the composite rate, we proposed to change the methodology used to calculate the ESRD add-on payment under current regulations to the ESRD PPS base rate used under the ESRD PPS. In addition, since the renal dialysis services reflected in the ESRD PPS base rate do not include those services that are not essential for the delivery of

²²⁴ 42 CFR 413.215(a) and 413.220.

²²⁵ § 413.230.

maintenance dialysis (see § 413.171), using the ESRD PPS base rate to calculate the ESRD add-on payment would maintain consistency with the current calculation, which is based on the average costs determined to be directly related to the renal dialysis service, as determined from the composite rate.

As described previously, under § 412.104(b)(1), the ESRD add-on payment is based on the estimated weekly cost of dialysis and the average length of stay of ESRD beneficiaries for the hospital. In the FY2025 IPPS/LTCH PPS proposed rule (89 FR 35934), we proposed that effective for cost reporting periods beginning on or after October 1, 2024, the estimated weekly cost of dialysis would be calculated as the applicable ESRD PPS base rate (as defined in 42 CFR 413.171) multiplied by three, which represents the typical number of dialysis sessions per week. The ESRD PPS base rate is applicable for renal dialysis services furnished during the calendar year (CY) (that is, effective January 1 through December 31 each year) and updated annually (see § 413.196). In the FY 2025 IPPS/LTCH PPS proposed rule we proposed that the annual CY ESRD PPS base rate (as published in the applicable CY ESRD PPS final rule or subsequent corrections, as applicable) multiplied by three would be used to calculate the ESRD add-on payment for hospital cost reporting periods that begin during the Federal FY for the same year. For example, the CY 2025 ESRD PPS base rate would be used for all cost reports beginning during Federal FY 2025 (that is, for cost reporting periods starting on or after October 1, 2024, through September 30, 2025). The table that follows illustrates the applicable CY ESRD PPS base rate that would be used to determine the add-on amount for eligible discharges during the hospital's cost reporting periods beginning on or after October 1, 2024 (FY 2025) and on or after October 1, 2025 (FY 2026) under this methodology.

In the FY 2025 IPPS/LTCH PPS proposed rule, we noted that use of the applicable CY ESRD PPS base rate to determine the add-on payment amount for the hospital's discharges occurring during the entire cost reporting period based on the cost report's begin date would be

consistent with the determination of eligibility for the ESRD add-on payment, which occurs at cost report settlement and is based on the discharges that occur during that cost reporting period.

**FY COST REPORT PERIOD ALIGNMENT WITH CY ESRD PPS BASE RATE FOR
FYs 2025 and 2026**

FY IPPS Hospital Cost Report Period	Applicable ESRD PPS Base Rate
Cost reports beginning on or after October 1, 2024 through September 30, 2025 (FY 2025)	CY 2025 (January 1, 2025 – December 31, 2025)
Cost reports beginning on or after October 1, 2025 through September 30, 2026 (FY 2026)	CY 2026 (January 1, 2026 – December 31, 2026)

In the FY 2025 IPPS/LTCH PPS proposed rule, we stated that the payment to a hospital would continue to be calculated as the average length of stay of ESRD beneficiaries in the hospital, expressed as a ratio to 1 week, multiplied by the estimated weekly cost of dialysis multiplied by the number of applicable ESRD beneficiary discharges. Specifically, for cost reporting periods beginning on or after October 1, 2024, the payment to a hospital would equal the average length of stay of ESRD beneficiaries in the hospital, expressed as a ratio to 1 week, multiplied by the estimated weekly cost of dialysis (calculated as the applicable ESRD PPS base rate (as defined in 42 CFR 413.171), multiplied by 3) multiplied by the number of ESRD beneficiary discharges except for those excluded under § 412.104(a).

In the FY2025 IPPS/LTCH PPS proposed rule, we proposed to revise the regulations under 42 CFR 412.104(b) to reflect this proposed change to the calculation of the payment amount for cost reporting periods beginning on or after October 1, 2024. We proposed to revise § 412.104(b)(2) to specify that, effective for cost reporting periods beginning on or after October 1, 2024, the estimated weekly cost of dialysis is calculated as 3 dialysis sessions per week multiplied by the applicable ESRD PPS base rate (as defined in 42 CFR 413.171) that corresponds with the fiscal year in which the cost reporting period begins. For example, the CY 2025 ESRD PPS base rate (multiplied by 3 to determine the estimated weekly cost of dialysis, as described previously) would apply for all hospital cost reporting periods beginning during FY 2025 (that is, for cost reporting periods beginning on or after October 1, 2024, through September

30, 2025). We proposed to make conforming changes to § 412.104(b)(3) and § 412.104(b)(4) to reflect the proposed change in methodology for calculating the ESRD add-on payment amount for cost reporting periods beginning on or after October 1, 2024.

Comment: Commenters supported our proposal to update the ESRD add-on payment amount for cost reporting periods beginning on or after October 1, 2024 by using the applicable CY ESRD PPS base rate.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal, without modification, to update the ESRD add-on payment methodology effective for cost reporting periods beginning on or after October 1, 2024 to use the annual CY ESRD PPS base rate (as published in the applicable CY ESRD PPS final rule or subsequent corrections, as applicable) multiplied by three to calculate the ESRD add-on payment for hospital cost reporting periods that begin during the Federal FY for the same year. We are also revising §§ 412.104(b)(2), (b)(3), and § 412.104(b)(4), as proposed, to reflect the new methodology for calculating the ESRD add-on payment amount for cost reporting periods beginning on or after October 1, 2024.

J. Separate IPPS Payment for Establishing and Maintaining Access to Essential Medicines

1. Overview

As discussed in the CY 2024 OPPI/ASC proposed rule (88 FR 49867), on January 26, 2021, President Biden issued Executive Order 14001, “A Sustainable Public Health Supply Chain” (86 FR 7219), which launched a whole-of-government effort to strengthen the resilience of medical supply chains, especially for pharmaceuticals and simple medical devices. This effort was bolstered subsequently by Executive Orders 14005, 14017, and 14081 (86 FR 7475, 11849, and 25711, respectively). In June 2021, as tasked in Executive Order 14017 on “America’s Supply Chains,” the Department of Health and Human Services released a review of pharmaceuticals and active pharmaceutical ingredients, analyzing risks in these supply chains and recommending solutions to increase their reliability.²²⁶ In July 2021, as tasked in Executive Order 14001, the Biden–Harris Administration also released the *National Strategy for a Resilient Public Health Supply Chain*, which laid out a roadmap to support reliable access to products for public health in the future, including through prevention and mitigation of medical product shortages.²²⁷

Over the last several years, shortages for critical medical products have persisted, with the average drug shortage lasting about 1.5 years.²²⁸ For pharmaceuticals, even before the COVID-19 pandemic, nearly two-thirds of hospitals reported more than 20 drug shortages at any one time – from antibiotics used to treat severe bacterial infections to crash cart drugs necessary

²²⁶ Department of Health and Human Services, *Review of Pharmaceuticals and Active Pharmaceutical Ingredients* (pp. 207–250), June 2021: <https://www.whitehouse.gov/wp-content/uploads/2021/06/100-day-supply-chain-review-report.pdf>.

²²⁷ Department of Health and Human Services, *National Strategy for a Resilient Public Health Supply Chain*, July 2021: <https://www.hhs.gov/preparedness/legal/Documents/National-Strategy-for-Resilient-Public-Health-Supply-Chain.pdf>

to stabilize and resuscitate critically ill adults.²²⁹ The frequency and severity of these supply disruptions has only been exacerbated over the last few years.²³⁰

Recent data suggests that hospitals are estimated to spend more than 8.6 million personnel hours and \$360 million per year to address drug shortages,²³¹ which will likely further result in treatment delays and denials, changes in treatment regimens, medication errors,^{232, 233, 234} as well as higher rates of hospital-acquired infections and in-hospital mortality.^{235, 236} The additional time, labor, and resources required to navigate drug shortages and supply chain disruptions also increase health care costs.^{237, 238}

Hospitals' procurement preferences can be leveraged to help foster a more resilient supply of lifesaving drugs and biologicals. With respect to shortages, supply chain resiliency includes having sufficient inventory that can be leveraged in the event of a supply disruption or demand increase – as opposed to relying on “just-in-time” inventory-management efficiency at the manufacturer level that can leave supply chains vulnerable to shortage.^{239,240} This concept is

especially true for essential medicines, which generally comprise products that are medically necessary to have available at all times in an amount adequate to serve patient needs and in the appropriate dosage forms. A hospital's resilient supply can also include essential medicines from multiple manufacturers, including the availability of domestic pharmaceutical manufacturing capacity, to diversify the sourcing of essential medicines. We stated that we believe it is necessary to support practices that can mitigate the impact of pharmaceutical shortages of essential medicines and promote resiliency to safeguard and improve the care hospitals are able to provide to beneficiaries. Additionally, sustaining sources of domestically sourced medical supplies can help support continued availability in the event of public health emergencies and other disruptions. This concept is consistent with our current policy for domestic National Institute for Occupational Safety and Health (NIOSH) approved surgical N95 respirators (87 FR 72037). Hospitals, as major purchasers and users in the U.S. of essential medicines, can support the existence of domestic sources by sourcing domestically made essential medicines.

When hospitals have insufficient supply of essential medicines, such as during a shortage, care for Medicare beneficiaries can be negatively impacted. To mitigate negative care outcomes in the event of insufficient supply, hospitals can adopt procurement strategies that foster a consistent, safe, stable, and resilient supply of these essential medicines. Such procurement strategies can include provisions to maintain or otherwise provide for extra stock of product (for example, either to maintain or to hold directly at the hospital, arrange contractually for a distributor to hold off-site, or arrange contractually with a wholesaler for a manufacturer to hold product) which can act as a buffer in the event of an unexpected increase in product use or disruption to supply. In the event an essential medicine goes into shortage without existing procurement or substitution strategies for affected drugs, negative patient care outcomes can result in reduced quality of care and, in some instances, increased costs by the Medicare program

to provide payment for unnecessary services that could have been avoided had the drug been available to the hospital.

In the CY 2024 OPPI/ASC proposed rule (88 FR 49867), CMS requested public comments on a potential Medicare payment policy that would provide separate payment to hospitals under the IPPS for Medicare's share of the inpatient costs of establishing and maintaining access to a 3-month buffer stock of one or more of 86 essential medicines (referred to herein as the "CY 2024 Request for Comment"). Under this potential policy, the allowable costs would have included the hospital's reasonable costs of establishing and maintaining buffer stock(s) of the essential medicines but not the cost of the medicines themselves. We stated that we expected that the resources required to establish and maintain access to a buffer stock of essential medicines would generally be greater than the resources required to establish and maintain access to these medicines without such a buffer stock. While CMS did not finalize any policy regarding payment under the IPPS and OPPI for establishing and maintaining access to essential medicines, we stated we intended to propose new Conditions of Participation in forthcoming notice and comment rulemaking addressing hospital processes for pharmaceutical supply and that we would continue to consider policies related to buffer stock.

As discussed in the CY 2024 OPPI/ASC final rule, many commenters on the CY 2024 Request for Comment supported CMS's efforts to promote resiliency but expressed concerns regarding the potential for such a payment policy to induce or exacerbate drug shortages through demand shocks to the supply chain. Some commenters stated that a 3-month buffer stock may be inadequate to insulate hospitals from drug shortages, and that the policy may encourage hoarding behaviors and further fragment the existing supply of essential medicines, which would primarily disadvantage smaller, less resourced hospitals (88 FR 82129 through 82130). While commenters stated that a 3-month buffer stock may be inadequate to insulate hospitals from shortages given the duration of many drug shortages, some commenters further stated that even a 6-month buffer stock may not fully protect hospitals in the event of a shortage. Commenters cautioned that drug

shortages are difficult to predict and often due to problems at the manufacturer level, which can be compounded by panic buying and hoarding behaviors. Some commenters stated that any buffer stock would need to be sufficiently large to account for the ramp up time that manufacturers need to reestablish supply of a given drug in shortage.

As a first step in this initiative, and based on consideration of the comments we received on the CY 2024 Request for Comment, for cost reporting periods beginning on or after October 1, 2024, we proposed to establish a separate payment under the IPPS to small (100 beds or fewer), independent hospitals for the estimated additional resource costs of voluntarily establishing and maintaining access to 6 month buffer stocks of essential medicines to foster a more reliable, resilient supply of these medicines for these hospitals. This proposed separate payment could be provided biweekly or as a lump sum at cost report settlement. As discussed further in section V.J.3. of the preamble of this final rule, we focused this proposal on small, independent hospitals, many of which are rural, that may lack the resources available to larger hospitals and hospital chains to establish and maintain buffer stocks of essential medicines for use in the event of drug shortages. We stated that we believe we can also mitigate concerns raised by commenters regarding large demand driven shocks to the supply chain by limiting separate payment to smaller, independent hospitals.

As stated in the proposed rule, the appropriate time to establish a buffer stock for a drug is before it goes into shortage or after a shortage period has ended. To further mitigate any potential for the proposed policy to exacerbate existing shortages or contribute to commenters' concerns of hoarding, if an essential medicine is listed as "Currently in Shortage" on the FDA Drug Shortages Database,²⁴¹ we proposed that a hospital that *newly* establishes a buffer stock of that medicine while it is in shortage would not be eligible for separate buffer stock payment for that medicine for the duration of the shortage. However, if a hospital had *already* established

²⁴¹ <https://www.accessdata.fda.gov/scripts/drugshortages/default.cfm>

and was maintaining a buffer stock of that medicine prior to the shortage, we proposed that the hospital would continue to be eligible for separate buffer stock payment for that medicine for the duration of the shortage. We proposed that hospitals would continue to be eligible even if the number of months of supply of that medicine in the buffer stock were to drop to less than 6 months as the hospital draws down that buffer stock. We stated that once an essential medicine is no longer listed as “Currently in Shortage” in the FDA Drug Shortages Database, our proposed policy does not differentiate that essential medicine from other essential medicines and hospitals would be eligible to establish and maintain buffer stocks for the medicine as they would have before the shortage. We further stated that CMS will conduct provider education regarding additions and deletions to the publicly available FDA Drug Shortages Database to assist hospitals with this proposed policy.

As described in sections V.J.2. and .4. of the preamble of this final rule, we proposed that if the number of months of supply of medicine in the buffer stock were to drop to less than 6 months for a reason other than the essential medicine(s) actively being listed as “Currently in Shortage,” any separate payment to a hospital under this policy would be adjusted based on the proportion of the cost reporting period for which the hospital did maintain the 6-month buffer stock of that essential medicine.

We proposed to make this separate payment under the IPPS for the additional resource costs of establishing and maintaining access to buffer stocks of essential medicines under section 1886(d)(5)(I) of the Act, which authorizes the Secretary to provide by regulation for such other exceptions and adjustments to the payment amounts under section 1886(d) of the Act as the Secretary deems appropriate. We did not propose to make this payment adjustment budget neutral under the IPPS.

2. Proposed List of Essential Medicines

The report *Essential Medicines Supply Chain and Manufacturing Resilience Assessment*, as developed by the U.S. Department of Health and Human Services (HHS) Office of the

Assistant Secretary for Preparedness and Response (ASPR) with the Advanced Regenerative Manufacturing Institute's (ARMI's) Next Foundry for American Biotechnology, prioritized 86 essential medicines (hereinafter referred to as the "ARMI List" or "ARMI's List") from the Executive Order 13944 List of Essential Medicines, Medical Countermeasures, and Critical Inputs (hereinafter referred to as the "EO 13944 List"), as developed under the EO by the U.S. Food and Drug Administration (FDA).²⁴²

The ARMI List is a prioritized list of 86 medicines that are either critical for minimum patient care in acute settings or important for acute care with no comparable alternatives available. The medicines included in the ARMI List were considered, by consensus, to be most critically needed for typical acute patient care. In this context, acute patient care was defined as: rescue use or lifesaving use or both (that is, Intensive Care Units, Cardiac/Coronary Care Units, and Emergency Departments), stabilizing patients in hospital continued care to enable discharge, and urgent or emergency surgery.

Development of the ARMI List focused on assessing the clinical criticality and supply chains of small molecules and therapeutic biologics. The development of the ARMI List was informed by meetings with multiple key pharmaceutical supply chain stakeholders (for example, manufacturers, group purchasing organizations, wholesale distributors, providers, pharmacies), surveys and workshops with groups of clinicians and industry stakeholders, public feedback on the EO 13944 List (provided during a public comment period starting in October 2020), and other research.

We proposed that for purposes of the separate payment under the IPPS, the costs of buffer stocks that would be eligible for separate payment are the additional resource costs of establishing and maintaining access to a 6-month buffer stock for any eligible medicines on ARMI's List of 86 essential medicines, including any subsequent revisions to that list of

²⁴² <https://www.fda.gov/about-fda/reports/executive-order-13944-list-essential-medicines-medical-countermeasures-and-critical-inputs>

medicines. As previously discussed, the ARMI List represents a prioritized list of 86 medicines that were considered, by consensus, to be most critically needed for typical acute patient care. We stated that we believe that the ARMI List constitutes an appropriate set of medicines to initially prioritize under this proposed payment policy to help insulate small, independent hospitals, and the inpatient care they provide, from the negative effects of drug shortages.

As noted earlier, the appropriate time to establish a buffer stock for a drug is before it goes into shortage or after a shortage period has ended. If an essential medicine is listed as “Currently in Shortage” on the FDA Drug Shortages Database, we proposed that a hospital that *newly* establishes a buffer stock of that medicine while it is in shortage would not be eligible for separate buffer stock payment for that medicine for the duration of the shortage. However, if a hospital had *already* established and was maintaining a buffer stock of that medicine prior to the shortage, we proposed that the hospital would continue to be eligible for separate buffer stock payment for that medicine for the duration of the shortage as the hospital draws down that buffer stock even if the number of months of supply of that medicine in the buffer stock were to drop to less than 6 months. By proposing to limit eligibility in this way, we stated that we believed that we can both insulate smaller hospitals from short-term drug shortages and mitigate the potential for the proposed policy to exacerbate existing shortages or contribute to concerns of hoarding.

As an illustrative example, suppose a hospital established and maintained 6-month buffer stocks for five essential medicines. However, one of those essential medicines was subsequently listed as “Currently in Shortage” on the FDA Drug Shortages Database. The hospital would no longer be required to maintain a 6-month buffer stock of the essential medicine that is in shortage to receive separate payment for maintaining the buffer stock of that essential medicine during the period of shortage. The hospital would continue to be eligible for the separate payment from CMS for the buffer stock for that medicine during the period of shortage as it draws down its established buffer stock of the medicine in shortage as needed. However, the hospital would be

required to maintain buffer stocks of no less than 6 months for the other four essential medicines that are not in shortage to be eligible to receive separate payment for those four medicines.

Because medicine can remain on the FDA Drug Shortage Database for years, we requested comments on the duration that CMS should continue to pay hospitals for the maintenance of a less than 6-month buffer stock of the essential medicine if it is "Currently in Shortage." We also requested comments on if there is a quantity or dosage minimum floor where CMS should no longer pay to maintain a 6-month buffer stock of the essential medicine if it is "Currently in Shortage."

We proposed that if the ARMI List is updated to add or remove any essential medicines, all medicines on the updated list would be eligible for separate payment under this policy for the IPPS shares of the costs of establishing and maintaining access to 6-month buffer stocks as of the date the updated ARMI List is published. To the extent that in the future other medicines or lists are identified for eligibility in future iterations of this policy, we sought comment on the potential mechanism and timing for incorporating those updates. We stated that comments could consider, among other factors, medicines that were excluded from the ARMI List, the EO 13944 List, or both. For example, some categories from the EO 13944 List—including Blood and Blood Products, Fractionated Plasma Products, Vaccines, and Volume Expanders—were excluded from the ARMI List due to differences in their supply chains. Additionally, other categories were identified as not needed for routine/typical acute patient care (that is, Biological Threat Medical Countermeasures, Burn and Blast Injuries, Chemical Threat Medical Countermeasures, Pandemic Influenza Medical Countermeasures, Radiologic-Nuclear Threat Medical Countermeasures). The ARMI List does not include certain medicines that have recently been in shortage and that may be considered essential and are more prevalent in specific care settings other than an inpatient hospital, such as drugs used in oncology care on an outpatient basis. Further, there are medicines that are not included on the ARMI List nor the EO 13944 List, such as buprenorphine-based medications for treatment of substance use disorder. We

sought comment on whether eligibility for separate payment for the IPPS share of the costs of establishing and maintaining access to 6-month buffer stocks of essential medicines should include oncology drugs or other types of drugs not currently on the ARMI List.

We stated in the proposed rule that CMS would conduct provider education regarding additions and deletions to the publicly available FDA Drug Shortages Database to assist hospitals with this proposed policy.

3. Hospital Eligibility

Commenters on the CY 2024 Request for Comment (88 FR 82129 through 82130) raised a number of concerns relating to access to essential medicines for small hospitals and potential hoarding behaviors among better resourced hospitals. Commenters also cautioned against the potential for the policy to cause demand-driven shocks to the pharmaceutical supply chain, exacerbating pharmaceutical access issues for hospitals, which they claimed would disproportionately impact smaller hospitals due to their smaller purchasing power. As hospitals and hospital systems increase in size through expansion of bed count or consolidation or both and vertical integration with other hospitals and health systems, they accrue bargaining leverage for payment negotiations and thereby increase their purchasing power.²⁴³ Those smaller (and often rural) hospitals that lack this increased purchasing power are faced with potentially lower payments from payers and less operating capital.²⁴⁴ To address this concern, and attempt to better insulate these smaller, independent hospitals against future supply disruptions of essential medicines, we proposed to limit eligibility for separate payment for the resource costs of establishing and maintaining access to buffer stocks of essential medicines to small, independent hospitals that are paid under the IPPS, as defined later in this section. As many of these small, independent hospitals are located in rural areas, we stated that we also expect this policy to

²⁴³ U.S. Congress, U.S. House of Representatives Committee on Ways and Means, Subcommittee on Health, Health Care Consolidation: The Changing Landscape of the U.S. Health Care System, May 2023: https://www.rand.org/content/dam/rand/pubs/testimonies/CTA2700/CTA2770-1/RAND_CTA2770-1.pdf

²⁴⁴ American Hospital Association, Rural Hospital Closures Threaten Access: Solutions to Preserve Care in Local Communities, September 2022: <https://www.aha.org/system/files/media/file/2022/09/rural-hospital-closures-threaten-access-report.pdf>

support rural hospitals, in line with the rural health strategy of the Biden-Harris Administration.^{245,246}

We stated that we believe that by focusing eligibility on small, independent hospitals, we can both support these types of hospitals in their efforts to provide patient care during drug shortages and lessen any potential demand shocks to the pharmaceutical supply chain because the buffer stocks these hospitals would require are likely smaller compared to larger hospitals and hospital chains. As discussed further in the regulatory impact analysis associated with this proposed policy in section I.G.6. of Appendix A of the proposed rule, we initially identified 493 potentially eligible hospitals based on FY 2021 hospital cost report data. Of these hospitals, 249 were identified as geographically rural, 6 were identified as geographically urban but reclassified as rural (under our reclassification regulations at § 412.103), and 238 were identified as geographically urban without a reclassification as rural. These hospitals had 216,557 Medicare discharges in total and an average of 442 Medicare discharges per hospital for the FY 2021 cost reporting year.

Small Hospital: For the purposes of this policy, we proposed to define a small hospital as one with not more than 100 beds. This definition is consistent with the definition of a small hospital used for Medicare-dependent, small rural hospitals (MDH) in section 1886(d)(5)(G)(iv)(II) of the Act. Consistent with the MDH regulations at § 412.108(a)(1)(ii), we proposed that a hospital would need to have 100 or fewer beds as defined in § 412.105(b) during the cost reporting period for which it is seeking the payment adjustment to be considered a small hospital for purposes of this payment adjustment. We requested comment on using criteria other

²⁴⁵ The White House, *The Biden-Harris Administration is taking actions to improve the health of rural communities and help rural health care providers stay open*, November 2023: <https://www.hhs.gov/about/news/2023/11/03/departments-health-human-services-actions-support-rural-america-rural-health-care-providers.html>

²⁴⁶ The White House, *Fact Sheet: Biden Administration Takes Steps to Address Covid-19 in Rural America and Build Rural Health Back Better*, August 2021: <https://www.whitehouse.gov/briefing-room/statements-releases/2021/08/13/fact-sheet-biden-administration-takes-steps-to-address-covid-19-in-rural-america-and-build-rural-health-back-better/>

than the MDH bed size criterion to identify small hospitals for the purposes of this proposed payment policy.

Independent Hospital: For the purposes of this policy, we proposed to define an independent hospital as one that is not part of a chain organization, as defined for purposes of hospital cost reporting. A chain organization is defined as a group of two or more health care facilities which are owned, leased, or through any other device, controlled by one organization. This proposed definition is the definition of chain organization in CMS Pub 15-1, Provider Reimbursement Manual, Chapter 21, Cost Related to Patient Care §2150: “Home Office Costs – Chain Operations” and used by a hospital when completing its cost report.

Because this proposed definition is the definition of chain organization used by a hospital when filling out its cost report, to operationalize our proposed separate payment policy, we proposed that any hospital that appropriately answers “yes” (denoted “Y”) to line 140 column 1 or fills out any part of lines 141 through line 143 on Worksheet S-2, Part I, on Form CMS-2552-10 would be considered to be part of a chain organization and not independent, and therefore not eligible for separate payment under this proposal. Please see Table V.J.-01 for a partial example of this section of Form CMS-2552-10.

Table V.J.-01.: Lines 140-143 of Worksheet S-2, Part 1

All Providers		1	2
140	Are there any related organization or home office costs as defined in CMS Pub. 15-1, chapter 10? Enter “Y” for yes or “N” for no in column 1. If yes, and home office costs are claimed, enter in column 2 the home office chain number.	(“Y” or “N”)	(Home office chain number)
If this facility is part of a chain organization, enter on lines 141 through 143 the name and address of the home office and enter the home office contractor name and contractor number.			
141	Name:	Contractor’s Name:	Contractor’s Number:
142	Street:	P.O. Box:	
143	City:	State:	Zip Code:

Thus, we proposed that to be eligible for this separate payment, under this policy, a hospital would need to be a small hospital with 100 or fewer beds and meet the definition of

independent described previously. We sought comment on our proposed eligibility criteria and proposed definition of a small, independent hospital.

We note that critical access hospitals (CAHs) are paid for inpatient and outpatient services at 101 percent of Medicare's share of reasonable costs, including Medicare's share of the reasonable costs of establishing and maintaining access to buffer stocks of medicines. We sought comment on the use of buffer stocks by CAHs, including the medicines in the buffer stocks, the costs of establishing and maintaining the buffer stocks, whether CAHs tend to contract out this activity, and any barriers that CAHs may face in establishing and maintaining access to buffer stocks.

4. Size of the Buffer Stock

As summarized in the CY 2024 OPPI/ASC final rule and section V.J.1. of the preamble of this final rule, some commenters on the CY 2024 Request for Comment expressed concerns that a 3-month supply of essential medicines may not be sufficient to adequately insulate hospitals from the detrimental effects of future drug shortages. Commenters stated that drug shortages often persist for durations of time in excess of 3 months, such that a 3-month buffer stock may be inadequate to insulate hospitals from the longer-term effects of drug shortages. As noted in section V.J.1. of the preamble of this final rule, drug shortages generally persist for many months, and some research suggests that these shortages last for an average of 1.5 years. Accordingly, we stated in the proposed rule that we believe a buffer stock of at least 6 months would better support small, independent hospitals in contending with future shortages. To better address commenters' concerns and hospital needs during drug shortages, we proposed separate payment for the costs of establishing and maintaining access to a buffer stock that is sufficient for no less than a 6-month period of time for each of one or more essential medicines. As discussed in section V.J.5 of the preamble of this final rule, we also sought comments on whether a phase-in approach that, for example, would provide separate payment for establishing

and maintaining access to a 3-month supply for the first year in which the policy is implemented and a 6-month supply for all subsequent years would be appropriate.

We stated in the proposed rule that in estimating the amount of a buffer stock needed for each essential medicine, the hospital should consider that the amount needed to maintain a buffer stock could vary month to month and throughout the applicable months of the cost reporting period; that is, a hospital's historical use of a medicine may indicate that it is typically needed more often in January than June, for example. Accordingly, we stated the size of the buffer stock should reflect this anticipated variation and be based on a reasonable estimate of the hospital's need for that essential medicine in the upcoming 6-month period. We stated this estimate would be determined by the hospital and could be based on the historical usage of the essential medicine by the hospital for that 6-month period in a prior year, or another reasonable method to estimate its need for that upcoming period. We stated that if a hospital did not maintain a 6-month buffer stock of an essential medicine for an entire cost reporting period, any separate payment to the hospital under this policy would be adjusted based on the proportion of the cost reporting period for which the hospital did maintain the 6-month buffer stock of that essential medicine. As described in section V.J.2 of the preamble of this final rule, we stated in the proposed rule that in the event that a hospital is not able to maintain a buffer stock of at least 6 months due to one or more of their chosen medicine(s) being listed as "Currently in Shortage" on the FDA's Drug Shortage Database after establishment of the buffer stock under this policy, the hospital would continue to be eligible for the buffer stock payment for the medicine(s) in shortage as the hospital draws down the buffer stock even if the number of months of supply of that medicine in the buffer stock were to drop to less than 6 months. We stated that hospitals would be permitted to use multiple contracts to establish and maintain at least a 6-month buffer stock for any given essential medicine.

5. Separate Payment Under IPPS for Establishing and Maintaining Access to Buffer Stocks of Essential Medicines

As discussed in the CY 2024 Request for Comment, CMS requested public comments on a potential separate payment under the IPPS for the additional, reasonable costs of establishing and maintaining a 3-month buffer stock of one or more essential medicine(s). We stated that participating hospitals could establish and maintain their buffer stocks directly, or through contractual arrangements with pharmaceutical distributors, intermediaries, or manufacturers.

We received comments in response to the CY 2024 Request for Comment stating that hospitals that maintain buffer stocks of essential medicines typically do so through upstream entities, such as pharmaceutical group purchasing organizations and manufacturers. Furthermore, these commenters stated that hospitals typically lack the capacity to stockpile large quantities of essential medicines directly. Some of these commenters stated that any buffer stocks established under the potential policy should be maintained by upstream intermediaries or a neutral third party instead of directly maintained by hospitals, as they stated that these upstream intermediaries are generally better positioned and equipped to maintain these buffer stocks. While other commenters were receptive to directly maintaining their buffer stock(s) or indicated that they already maintained substantial buffer stocks of medicines, these commenters were generally larger, better resourced hospitals or hospital systems.

In this year's proposed rule, we stated that we agreed with commenters that pharmaceutical intermediaries and manufacturers are generally better positioned to establish and maintain larger (for example, 6-month or greater) buffer stocks of essential medicines, as small, independent hospitals may generally lack the space, staff, and specific equipment (like large-scale refrigeration and large, onsite storage) to directly maintain 6-month buffer stock(s) of essential medicine(s). While we stated that we anticipate that most hospitals that elect to establish and maintain buffer stocks under this policy will do so through contractual arrangements with pharmaceutical intermediaries, manufacturers, and distributors, we proposed that the additional resource costs associated with directly maintaining 6-month buffer stock(s) of essential medicine(s) would also be eligible for separate payment under this policy. Accordingly,

we proposed that for purposes of the proposed separate payment under the IPPS to small, independent hospitals for the estimated additional resource costs of voluntarily establishing and maintaining access to 6-month buffer stocks of essential medicines, those costs associated with establishing and maintaining access to 6-month buffer stocks either directly or through contractual arrangements with pharmaceutical manufacturers, intermediaries, or distributors would be eligible for additional payment under this policy. These costs do not include the cost of the medicines themselves which would continue to be paid in the current manner. We also noted that the proposed payment is only for the IPPS share of the costs of establishing and maintaining access to buffer stock(s) of one or more essential medicine(s).

We noted the costs associated with directly establishing and maintaining a buffer stock may include utilities like cold chain storage and heating, ventilation, and air conditioning, warehouse space, refrigeration, management of stock including stock rotation, managing expiration dates, and managing recalls, administrative costs related to contracting and record-keeping, and dedicated staff for maintaining the buffer stock(s). We requested comments on other types of costs intrinsic to directly establishing buffer stocks of essential medicines that should be considered eligible for purposes of separate payment under this policy. We also requested comment regarding whether staff costs would increase with the number of essential medicines in buffer stock, and whether there would be efficiencies if multiple hospitals elect to establish buffer stocks of essential medicines with the same pharmaceutical manufacturer, intermediary, or distributor.

We also requested comment on whether this proposed policy should be phased in by the size of the buffer stock to address concerns about infrastructure investments that may be needed to store and maintain the supply. We also referred readers to the Collection of Information Requirements in section XII.B.2. of the preamble of the proposed rule regarding the estimated burden associated with this policy proposal and sought comment on whether there are any other

potential methods for hospitals to report costs included under this policy besides the forthcoming supplemental cost reporting worksheet.

Currently, payment for the resources required to establish and maintain access to medically reasonable and necessary drugs and biologicals is generally part of the IPPS payment. As noted in section V.J.2. of the preamble of this final rule, we expect that the resources required to establish and maintain access to buffer stocks of essential medicines will generally be greater than the resources required to establish and maintain access to these medicines without such buffer stocks. Given these additional resource costs and our concern that small, independent hospitals may lack the resources available to larger hospitals and hospital chains to establish buffer stocks of essential medicines, we stated that we believe it is appropriate to propose to pay these hospitals separately for the additional resource costs associated with voluntarily establishing and maintaining access, either directly or through contractual arrangements, to buffer stocks of essential medicines. As also noted in section V.J.2 of the preamble of this final rule, we proposed that if the ARMI List is updated to add or remove any essential medicines, all medicines on the updated list would be eligible for separate payment under this policy for the IPPS shares of the costs of establishing and maintaining access to 6-month buffer stocks as of the date the updated ARMI List is published. Any medicine(s) that are removed from the ARMI List in any future updates to the list would no longer be eligible for separate payment under this policy for the IPPS shares of the costs of establishing and maintaining access to 6-month buffer stocks as of the date the updated ARMI List is published.

CMS proposed to base the IPPS payment under this policy on the IPPS shares of the additional reasonable costs of a hospital to establish and maintain access to its buffer stock. The use of IPPS shares in this payment adjustment would be consistent with the use of these shares for the payment adjustment for domestic NIOSH approved surgical N95 respirators, which is based on the IPPS and OPSS shares of the difference in cost between domestic and non-domestic NIOSH approved surgical N95 respirators for the cost reporting period in which costs are

claimed (87 FR 72037). We stated that the hospital would report these costs to CMS on the forthcoming supplemental cost reporting worksheet associated with this proposed policy. The hospital's costs may include costs associated with contractual arrangements between the hospital and a manufacturer, distributor, or intermediary or costs associated with directly establishing and maintaining buffer stock(s). We further stated that these costs would not include the costs of the essential medicine itself, which would continue to be paid in the current manner.

If a hospital establishes and maintains access to buffer stock(s) of essential medicine(s) through contractual arrangements with pharmaceutical manufacturers, intermediaries, or distributors, we stated that the hospital would be required to disaggregate the costs specific to establishing and maintaining the buffer stock(s) from the remainder of the costs present on the contract for purposes of reporting these disaggregated costs under this proposed policy. This disaggregated information, reported by the hospital on the new supplemental cost reporting worksheet, along with existing information already collected on the cost report, would be used to calculate a Medicare payment for the IPPS share of the hospital's costs of establishing and maintaining access to the buffer stock(s) of essential medicine(s).

If a hospital contracts with one or more manufacturers or wholesalers or other intermediaries to establish and maintain 6-month buffer stocks of one or more essential medicines, we stated that the hospital must clearly identify those costs separately from the costs of other provisions of the contract(s). As a simplified example for purposes of illustration, suppose a hospital has a \$500,000 contract with a pharmaceutical wholesaler. The contract is for pharmaceutical products, 50 of which are qualifying essential medicines. Additionally, the contract contains a provision for the wholesaler to establish and maintain 6-month buffer stocks of those 50 essential medicines on the hospital's behalf. The contract further specifies that \$10,000 of the \$500,000 is for the provision of the contract that establishes and maintains the 6-month buffer stocks of those 50 essential medicines. This \$10,000 amount does not include any costs to the hospital for the drugs themselves which, as previously noted, would continue to

be paid in the current manner. We explained that under this proposal, the hospital would report the \$10,000 cost for establishing and maintaining the 6-month buffer stocks of the 50 essential medicines on the supplemental cost reporting worksheet. That \$10,000 cost, in addition to other information already existing on the cost report, would be used to calculate the additional payment under this policy including the hospital-specific Medicare IPPS share percentage of this cost, expressed as the percentage of inpatient Medicare costs to total hospital costs. We stated that on average for the small, independent hospitals that are eligible for this policy, the Medicare IPPS share percentage is approximately 11 percent.

If a hospital chooses to directly establish and maintain buffer stock(s) of one or more essential medicines under this policy, we stated that the hospital would be required to report the additional costs associated with establishing and maintaining its buffer stock(s) on the supplemental cost reporting form. We stated that the hospital should clearly specify the total additional resource costs to establish and maintain its 6-month buffer stock(s) of essential medicine(s). As in the previous example, this amount should not include the cost of the essential medicine(s) themselves and would be used, along with other information already existing on the cost report, to calculate the additional payment under this policy.

Additionally, we stated that we would anticipate that when a hospital contracts with one or more manufacturers or wholesalers or other intermediaries to establish and maintain 6-month buffer stocks of one or more essential medicines, it would ensure that a discrete buffer stock is maintained for that hospital. For example, if two hospitals held contracts with a manufacturer arranging for 6-month buffer stocks of certain essential medicines, the hospitals would verify that the manufacturer is maintaining sufficient total buffer stock to account for the 6-month demand of both hospitals in aggregate.

We stated that we seek to support the establishment of buffer stocks when drugs are not currently in shortage to promote the overall resiliency of drug supply chains. As previously discussed, we proposed that buffer stocks for any of the essential medicines on the ARMI List

that are listed as “Currently in Shortage” on the FDA Drug Shortages Database would not be eligible for additional payment under this policy for a hospital’s cost reporting period unless the hospital had already established and was maintaining a buffer stock of that medicine prior to the shortage. Additionally, we proposed that any essential medicine(s) for which a hospital has successfully established and maintained a buffer stock(s) of at least 6 months that is subsequently listed as “Currently in Shortage” on the FDA Drug Shortages Database would be exempt from the requirement to maintain a 6-month supply of such essential medicine(s) for the duration of the period in which the medicine is in shortage. We stated that we are interested in public comments on the burden associated with hospitals’ monitoring of the FDA Drug Shortage Database, and excluding from the cost report any resource costs associated with maintaining a buffer stock of an essential medicine that was listed as “Currently in Shortage,” except where the hospital had already established and was maintaining a 6-month buffer stock of that medicine prior to the shortage. We stated that as of the date that medicine is no longer listed as “Currently in Shortage,” eligibility for separate payment to the hospital for the drug in shortage would be prospectively adjusted based on the proportion of the cost reporting period for which the hospital does maintain the 6-month buffer stock of that essential medicine. Once an essential medicine is no longer listed as “Currently in Shortage” in the FDA Drug Shortages Database, our proposed policy does not differentiate that essential medicine from other essential medicines. However, we also sought comment on whether some minimum period, such as 6 months, should elapse after a shortage of a given essential medicine is resolved before that medicine can become eligible for separate payment under this proposed policy.

We proposed to make separate payments for the IPPS shares of these additional resource costs of establishing and maintaining access to buffer stocks of essential medicines. Payment could be provided as a lump sum at cost report settlement or biweekly as interim lump-sum payments to the hospital, which would be reconciled at cost report settlement. In accordance with the principles of reasonable cost as set forth in section 1861(v)(1)(A) of the Act and in 42 CFR

413.1 and 413.9, Medicare could make a lump-sum payment for Medicare's share of these additional inpatient costs at cost report settlement. Alternatively, a provider may make a request for biweekly interim lump sum payments for an applicable cost reporting period, as provided under 42 CFR 413.64 (Payments to providers: Specific rules) and 42 CFR 412.116(c) (Special interim payments for certain costs). These payment amounts would be determined by the Medicare Administrative Contractor (MAC) consistent with existing policies and procedures. In general, interim payments are determined by estimating the reimbursable amount for the year using Medicare principles of cost reimbursement and dividing it into 26 equal biweekly payments. The estimated amount would be based on the most current cost data available, which will be reviewed and, if necessary, adjusted at least twice during the reporting period. (See CMS Pub 15-1 § 2405.2 for additional information). The MACs would determine the interim lump-sum payments based on the data the hospital may provide that reflects the information that would be included on the new supplemental cost reporting form. CMS is separately seeking comment through the Paperwork Reduction Act (PRA) process on a supplemental cost reporting form that would be used for this purpose. We stated that in future years, the MACs could determine the interim biweekly lump-sum payments utilizing information from the prior year's cost report, which may be adjusted based on the most current data available. This is consistent with the current policies for medical education costs, and bad debts for uncollectible deductibles and coinsurance paid on interim biweekly basis as noted in CMS Pub 15-1 § 2405.2. It is also consistent with the payment adjustment for domestically sourced NIOSH approved surgical N95 respirators (87 FR 72037).

We proposed to codify this payment adjustment in the regulations by adding new paragraph (g) to 42 CFR 412.113 to state the following:

- Essential medicines are the 86 medicines prioritized in the report *Essential Medicines Supply Chain and Manufacturing Resilience Assessment* developed by the U.S. Department of Health and Human Services Office of the Assistant Secretary for Preparedness and Response and

published in May of 2022, and any subsequent revisions to that list of medicines. A buffer stock of essential medicines for a hospital is a supply, for no less than a 6-month period, of one or more essential medicines.

- The additional resource costs of establishing and maintaining access to a buffer stock of essential medicines for a hospital are the additional resource costs incurred by the hospital to directly hold a buffer stock of essential medicines for its patients or arrange contractually for such a buffer stock to be held by another entity for use by the hospital for its patients. The additional resource costs of establishing and maintaining access to a buffer stock of essential medicines does not include the resource costs of the essential medicines themselves.

- For cost reporting periods beginning on or after October 1, 2024, a payment adjustment to a small, independent hospital for the additional resource costs of establishing and maintaining access to buffer stocks of essential medicines is made as described in paragraph (g)(4) of this section. For purposes of this section, a *small, independent hospital* is a hospital with 100 or fewer beds as defined in § 412.105(b) during the cost reporting period that is not part of a chain organization, defined as a group of two or more health care facilities which are owned, leased, or through any other device, controlled by one organization.

- The payment adjustment is based on the estimated reasonable cost incurred by the hospital for establishing and maintaining access to buffer stocks of essential medicines during the cost reporting period.

We also proposed to make conforming changes to 42 CFR 412.1(a) and 412.2(f) to reflect this proposed payment adjustment for small, independent hospitals for the additional resource costs of establishing and maintaining access to buffer stocks of essential medicines.

In summary, for cost reporting periods beginning on or after October 1, 2024, we proposed to establish a separate payment under the IPPS to small, independent hospitals for the additional resource costs involved in voluntarily establishing and maintaining access to 6-month buffer stocks of essential medicines, either directly or through contractual arrangements with a

manufacturer, distributor, or intermediary. We proposed that the costs of buffer stocks that are eligible for separate payment are the costs of buffer stocks for one or more of the medicines on ARMI's List of 86 essential medicines. The separate payment would be for the IPPS share of the additional costs and could be issued in a lump sum, or as biweekly payments to be reconciled at cost report settlement. We proposed that the separate payment would not apply to buffer stocks of any of the essential medicines on the ARMI List that are currently listed as "Currently in Shortage" on the FDA Drug Shortages Database unless a hospital had already established and was maintaining a 6-month buffer stock of that medicine prior to the shortage. Once an essential medicine is no longer listed as "Currently in Shortage" in the FDA Drug Shortages Database, we stated that our proposed policy does not differentiate that essential medicine from other essential medicines and hospitals would be eligible to establish and maintain buffer stocks for the medicine as they would have before the shortage. CMS is separately seeking comment through the PRA process on a supplemental cost reporting form for this proposed payment.

After consideration of the comments received on our proposal, which we summarize and respond to in the section that follows, we are finalizing the proposed separate payment under the IPPS to small, independent hospitals for the additional resource costs involved in voluntarily establishing and maintaining access to 6-month buffer stocks of essential medicines. In future years as we gain experience under this policy, we plan to assess the program's impact and consider revisions, where appropriate, to help ensure availability of essential medicines for patients.

6. Public Comments

Comment: Overall, the majority of commenters were generally supportive of our proposed separate payment for a hospital's cost to maintain buffer stock. Those that were opposed to the policy generally expressed concerns regarding potential "unintended consequences" that may arise from establishing separate stockpiles of essential medicines throughout the country. Commenters that were opposed to the policy generally echoed concerns

that they previously expressed in their comments on our prior Request for Comment in the CY 2024 OPPTS/ASC proposed rule, including that the proposed policy could contribute to fragmentation of the pharmaceutical supply chain and had the potential to induce new drug shortages or exacerbate existing shortages.

Many commenters requested that we expand or otherwise modify our eligibility requirements of small, independent hospitals of 100 beds or fewer that are not part of a chain organization. Some commenters had specific recommendations for provider types that should be made eligible for the proposed policy, regardless of bed size or independent status, with particular emphasis on CAHs, MDHs, SCHs, children's hospitals, and various outpatient facilities. Several commenters requested that we remove entirely the independent status eligibility requirement, stating that hospitals that are part of chain organizations also face substantial financial obstacles. Other commenters requested that we expand the policy to make all Medicare providers eligible. A commenter requested that we further restrict the pool of eligible providers to test the effects of the proposed policy on the pharmaceutical supply chain.

Some commenters, including MedPAC, indicated that Medicare payment policy is neither a sufficient, nor the best suited, mechanism to support adequate supplies of essential medicines. These commenters generally expressed support for broader policy initiatives beyond the Medicare program to address drug shortages.

Response: We appreciate all the comments received on our proposed policy. We also recognize the general concerns of some commenters that the current lack of resiliency in the pharmaceutical supply chain makes it potentially sensitive to fragmentation or significant demand shocks from additional pharmaceutical purchasing. However, we continue to believe that our pool of eligible hospitals is sufficiently small and has significantly less purchasing power than larger hospitals and hospital chains, such that the policy would not create such demand shocks or result in fragmentation that would cause or exacerbate shortages. HHS will

continue to monitor drug shortages²⁴⁷, and will propose as needed appropriate modifications to the policy, if any, in future rulemaking.

For similar reasons, we disagree with commenters who requested that we expand the pool of eligible hospitals now in this initial implementation of the new policy. Without the benefit of actual experience under the policy, expansion of the policy at this time to include hospitals with greater purchasing power than small, independent hospitals could risk inducing or exacerbating drug shortages. Similarly, we disagree that we should restrict the policy to exclude some hospitals with lesser purchasing power, as this policy is meant to assist these hospitals in responding to future drug shortages, and at the same time, we continue to believe that their purchasing power is such that it would not significantly increase the risk of inducing or exacerbating drug shortages, as compared to those hospitals with greater purchasing power. Accordingly, we believe the current scope of identified eligible hospitals is appropriate for purposes of the first year of this policy. As noted, we may consider any future modifications to the scope of eligible hospitals, including potential expansions to hospitals with larger bed counts or certain provider types, as we gain experience under this policy.

Furthermore, as stated in the proposed rule, we note that CAHs are already paid for inpatient and outpatient services at 101 percent of Medicare's share of reasonable costs, including Medicare's share of the reasonable costs of establishing and maintaining access to buffer stocks of medicines. We also note that MDHs and SCHs are not excluded from eligibility under this policy, provided they meet the bed size and independent status requirements. Children's hospitals are exempt from the IPPS and paid according to a hospital-specific target amount updated for inflation with the option to apply for a temporary or permanent adjustment to their target amount for the reasonable costs they incur in furnishing inpatient care to Medicare beneficiaries, including those costs attributable to buffer stocks of essential medicines.

²⁴⁷ <https://www.fda.gov/drugs/drug-safety-and-availability/drug-shortages>

After consideration of the comments received, we are finalizing our criteria for eligible hospitals without modification.

Comment: Some commenters asked that we shift the policy to a domestic add-on payment, similar to the domestic add-on payment for NIOSH-approved surgical N95 respirators. Commenters requested clarification on whether there is a domestic manufacturing requirement under this policy.

Response: We note that HHS has taken significant actions to enable investment in domestic manufacturing of essential medicines, medical countermeasures, and other critical inputs, and will continue to do so.²⁴⁸ We note that while we continue to be supportive of domestic manufacturing of essential medicines, we are not requiring at this time that hospitals exclusively establish and maintain buffer stocks of domestically manufactured essential medicines to be eligible for separate payment under this policy. As we gain experience under our policy and as the domestic manufacturing capacity of essential medicines increases, we may consider the comments regarding domestic manufacturing requirements for future rulemaking.

Comment: Many commenters suggested phasing in the size of the buffer stock, with a 3-month minimum buffer stock size in the first year of implementation and a 6-month minimum buffer stock size in all subsequent years. These commenters stated that phasing in the policy may ease the upfront costs of establishing buffer stocks, as the costs of establishing a smaller initial buffer stock (e.g., a 3-month or similarly sized buffer stock) would pose lesser costs than a 6-month buffer stock. These commenters also stated that phasing in the policy would lessen any potential impacts to the pharmaceutical supply chain and better allow manufacturers to ramp up production of essential medicines. Some commenters requested that we reduce the minimum buffer stock size to 3 months, stating that the small, independent hospitals that we targeted for eligibility would have higher upfront costs than most larger hospitals and hospital chains and

²⁴⁸ <https://www.hhs.gov/about/news/2023/11/27/biden-harris-administration-announces-actions-bolster-medical-supply-chain.html>

those upfront costs would be lower with a 3-month buffer stock. These commenters stated that small, independent hospitals would struggle to establish 6-month buffer stocks due to the associated costs. Several commenters suggested that we permit a range of buffer stock sizes, from 2- to 6-month buffer stocks for example, or that we permit hospitals to determine the appropriate size of buffer stock for their chosen essential medicines. Commenters also suggested that we consider implementing a cap on the total volume of an applicable generic that any one hospital may obtain under our proposed policy.

Response: We agree with commenters that there are multiple factors to consider in determining the appropriate size of the buffer stock for purposes of this policy. As stated in the preamble of the proposed rule and as emphasized by several commenters, a 6-month buffer stock is generally more effective at mitigating shortages than a 3-month buffer stock. A commenter also stated, and we agree, that buffer stocks are not necessarily meant to supply a hospital for the duration of a shortage, but are needed to give other manufacturers time to produce and deliver more of the affected medicine. As such, 6 months provides manufacturers more time to respond as compared to 3 months or some other, shorter period.

However, we also recognize the concerns raised by commenters who believe a smaller buffer stock size would be more appropriate because the costs of establishing and maintaining buffer stocks of 6 months are greater than the costs for 3 months or other shorter periods. In weighing these competing concerns, at the present time we believe that providing separate payment for the longer 6-month buffer stock is the most appropriate policy because a longer period of buffer stock would better serve to bridge a drug shortage and provide manufacturers with more time to increase production of an affected medicine. However, as we gain experience under this policy, including the extent to which the size of the buffer stock may affect hospital participation, we may revisit this issue in future rulemaking.

In response to commenters who suggested that we consider implementing a cap on the total volume of an applicable generic that any one hospital may obtain under our proposed

policy, given that the eligible hospitals are those with lesser purchasing power we do not think these hospitals would use their comparatively limited financial resources to establish buffer stocks of excessive size that would make the establishment of such a cap on the size of the applicable buffer stock for purposes of separate payment under this policy necessary at this time. However, although we do not believe this to be a likely outcome of our policy, we may further consider this issue for future rulemaking as we gain experience under this policy. We reiterate that establishment of one or more buffer stock(s) is purely voluntary on the part of eligible hospitals.

After consideration of the comments received, we are finalizing our proposal on the size of the buffer stock without modification.

Comment: Many commenters expressed concern about the administrative burden associated with the policy as proposed. Commenters stated that small, independent hospitals would likely have the highest relative costs associated with establishing and maintaining buffer stock(s) of essential medicines, including the administrative and staffing costs of separately tracking and maintaining buffer stock established under the proposed policy, as well as tracking the shortage status of eligible essential medicines. Commenters were generally opposed to the use of a supplemental cost reporting form to report the costs associated with establishing and maintaining a buffer stock, stating that this would increase administrative and recordkeeping costs for participating hospitals. Some commenters requested that we instead permit contracted manufacturers, distributors, and intermediaries to directly report the costs associated with establishing and maintaining a buffer stock for a hospital to CMS in lieu of the supplemental cost reporting form, or to base payment to hospitals on an attestation from contracted manufacturers, distributors, or intermediaries.

Response: We appreciate commenters' concerns regarding the administrative costs associated with separately reporting the costs of establishing and maintaining buffer stocks of essential medicines. However, as is the case for other Medicare payment policies based on

reasonable cost, we continue to believe that the Medicare cost report is presently the most feasible and least burdensome method of collecting and being able to audit this cost information. While some commenters suggested CMS require contracted manufacturers, distributors, and intermediaries to report these costs directly to CMS, they did not suggest a mechanism for doing so.

We also appreciate commenters sharing their concerns regarding the administrative burden of tracking shortage status of eligible essential medicines. To help mitigate concerns of added administrative burden associated with tracking the shortage status of a given essential medicine, in connection with this final policy, the MACs will inform hospitals of all eligible medicines and their associated shortage status on a calendar quarter basis on or about the start of each quarter. The shortage status information that the MACs will provide to the hospital will be based on the shortage status of each essential medicine(s) as reported on the FDA's Drug Shortage Database. For example, hospitals will be informed by the MACs on or about January 1st each year which essential medicines are considered in shortage for purposes of this policy for the calendar year quarter starting January 1st. The MACs will similarly provide this information for the calendar year quarters beginning April 1st, July 1st, and October 1st.

After consideration of the comments received, we are finalizing without modification our approach of using a supplemental cost reporting form to report the costs associated with establishing and maintaining a buffer stock, subject to the Paperwork Reduction Act Review of the supplemental cost reporting form itself.

Comment: Commenters were divided on CMS's proposed approach to payment under this policy for buffer stocks of essential medicines in shortage. As stated in the preamble of the proposed rule, CMS would not pay for newly established buffer stocks of essential medicines that are listed as "Currently in Shortage" on the FDA's Drug Shortage Database. However, CMS would continue to pay for buffer stocks of essential medicines that had already been established under this policy prior to the medicine being listed as "Currently in Shortage," even if those

buffer stocks were drawn down to less than 6 months in size. While some commenters were supportive of these provisions in the proposed rule, some commenters stated that continuing to pay for any amount of a buffer stock after a drug is listed as “Currently in Shortage” incentivizes unnecessary retention of stock and potential for hoarding. Commenters stated that this incentive may adversely affect patient care, as hospitals may withhold medicines from patient care to maintain their 6-month stockpile of a given essential medicine.

Regarding our request for comments on the duration of time that CMS should continue to pay for a buffer stock of an essential medicine after that medicine is listed as “Currently in Shortage,” several commenters stated that we should not limit the amount of time that CMS will continue to pay for the buffer stock. Several of these commenters stated that not applying a limit would be consistent with pharmaceutical purchasing and may promote resiliency in the pharmaceutical supply chain. Other commenters stated that CMS should consider paying for essential medicines that enter shortage on a pro-rated basis. A commenter recommended that we limit payments to 6 months after the drug has entered shortage. A commenter requested that we clarify if a hospital will continue to be eligible for the separate payment for a drug that has entered shortage even if the hospital does not draw its buffer stock down below 6 months in size.

Response: We thank the commenters for their suggestions. We acknowledge the concerns of commenters regarding incentives for hospitals to stockpile a medicine during a shortage and thus potentially exacerbate that shortage. To reiterate, the intent of this buffer stock policy is to encourage hospitals to preventatively establish a buffer stock prior to a shortage occurring and then, in the event of a shortage, to draw down the buffer stock by administering needed drugs to patients. Further, similar to our earlier response to concerns raised more regarding the potential to induce or exacerbate shortages of essential medicines under this policy, we continue to believe that the pool of hospitals eligible for separate payment under this policy is sufficiently small, and has sufficiently less purchasing power than larger hospitals and hospital chains, that the ability of these hospitals to stockpile during a shortage is limited, and even if it were possible for them to

stockpile, their ability to significantly exacerbate a shortage is limited. Finally, we believe it is unlikely that a small, independent hospital would withhold essential medicines from patient care during a shortage to maintain a 6-month buffer stock. As a practical matter, we expect that small, independent hospitals may be more likely to be in a position where they would need to draw down their buffer stock below a 6-month supply during a shortage because these hospitals may lack sufficient purchasing power to readily obtain these drugs, as compared to larger hospitals and hospitals that are part of chains. Taking these factors into account, we agree with commenters who supported continuing to separately pay for the reasonable costs of maintaining an already established buffer stock after a drug enters shortage as an appropriate approach, even if the number of months of supply of that medicine in the buffer stock drops to less than 6 months during the shortage. For the same reasons, we also agree with commenters who indicated that CMS should not limit the amount of time that it will continue to pay for the reasonable costs of maintaining the buffer stock after an essential medicine is listed as “Currently in Shortage.” We believe that hospitals that voluntarily establish and maintain a buffer stock of essential medicines may continue to incur additional, reasonable costs for the maintenance of that buffer stock during a shortage, even if the size of the buffer stocks drops below 6 months. Accordingly, we believe that these hospitals should continue to be able to receive separate payment for the IPPS shares of these additional costs for the duration of the shortage. However, as we gain additional experience under the policy, we may consider adjusting the amount of time that hospitals may continue to receive separate payment for maintaining buffer stocks of essential medicines that are subsequently listed as “Currently in Shortage.” After consideration of the comments received, we are finalizing as proposed to continue to separately pay for maintaining an already established buffer stock after a drug enters shortage, even if the number of months of supply of that medicine in the buffer stock drops to less than 6 months during the shortage. We note that larger hospitals and hospitals that are part of chains may have a greater ability to avoid drawing down their buffer stocks during a shortage, though they may also face

some challenges. If we were to expand hospital eligibility in the future, we may revisit this aspect of the policy for these hospitals.

Comment: While most commenters were supportive of not permitting hospitals to newly establish buffer stocks for medicines in shortage, some commenters stated that permitting hospitals to establish buffer stocks of drugs regardless of shortage status may contribute to stability in pharmaceutical purchasing in a manner similar to continuing to pay for buffer stocks after medicines enter shortage. Commenters also noted that regulatory flexibility exists for other entities, such as compounding pharmacies, to produce drugs that are listed as “Currently in Shortage” on the FDA’s Drug Shortage Database. These commenters stated that, given the small pool of eligible hospitals, permitting hospitals to continue to establish buffer stocks of essential medicines in shortage would be unlikely to markedly exacerbate shortages.

Response: We disagree with commenters who suggested that a hospital that failed to establish a buffer stock before a drug entered shortage be allowed to receive separate payment for subsequently establishing such a buffer stock during the shortage. As we stated in the proposed rule and continue to believe, the appropriate time to establish a buffer stock for a drug is before it goes into shortage or after a shortage period has ended, but not during a shortage. As a general matter, this policy was developed to support hospitals in establishing a buffer stock before a drug enters shortage, so that medicines remain available to patients while the shortage is in effect. Given that small, independent hospitals are less likely to be able to establish a buffer stock after a drug enters shortage, or as robust of a buffer stock even taking into account the potentially limited ability of a small, independent hospital to avail itself of compounding²⁴⁹, not establishing a buffer stock of these medicines in advance of the shortage would generally mean that those drugs are not as available to their patients. Therefore, we continue to believe that the

²⁴⁹ We remind hospitals that the costs of establishing and maintaining a buffer stock of an essential medicine do not include the cost of the essential medicine itself, meaning that the cost of compounding would not be included in the cost for establishing and maintaining a buffer stock of an essential medicine.

separate payment should be available only where the buffer stock is established prior to an essential medicine entering shortage.

After consideration of the comments received, we are finalizing as proposed to not separately pay for a buffer stock newly established after a drug goes into shortage.

Comment: Many commenters supported the use of ASPR's "ARMI" list of essential medicines developed in 2022. Commenters stated that regular (for example, annual) review of this eligible medicines list, in consultation with stakeholders or under an established public-private partnership, would be crucial to identifying other essential medicines and providing updates. A few commenters suggested expanding participation requirements, while narrowing payment-eligible medicines to better ensure the most needed buffer inventories are developed and maintained by the most appropriate type of facility. Other commenters proposed other lists, such as the Executive Order (E.O.) 13944 List of Essential Medicines, Medical Countermeasures and Critical Inputs List developed in 2020 under the E.O. by the [U.S. Food and Drug Administration \(hereafter referred to as the EO 13944 List\)](#), the [World Health Organization's Essential Medicines List](#), [American Society of Health-System Pharmacists Drug Shortages List](#), [U.S. Pharmacopeia's Medicine Supply Map](#), and [Vizient's Essential Medications For High-Quality Patient Care](#). Some commenters stated the need to include certain products that are not included in the ARMI list (for example, oncology drugs; blood and blood products) and thus stated the EO 13944 List might better serve this proposal's interests and, according to such commenters, is the most recognized among healthcare providers. Others asserted that ASPR's ARMI List was limited, left out critical medicines, should be harmonized with the EO 13944 List, and included many medicines for which it is impractical for eligible hospitals to establish a buffer stock. Some commenters recommended the creation of a separate list for the outpatient setting, including outpatient cancer care, physicians' offices, and infusion centers.

Several commenters proposed the gradual expansion of eligible medicines that could be considered essential and provide care to unique patient populations that were otherwise not

included. A few commenters also recommended that essential medical devices be included. Others suggested expanded medicines including chemotherapy and other cancer treatment drugs. A commenter suggested excluding immune globulin because these products share the unique supply chain of the excluded fractionated plasma products.

Response: We appreciate the commenters' feedback and diverse clinical perspectives on defining an appropriate and effective list of essential medicines. As we discussed in the proposed rule, the ARMI List is a prioritized subset of 86 essential medicines from the EO 13944 List that are either critical for minimum patient care in acute settings or important for acute care with no comparable alternatives available. The medicines included in the ARMI List were considered, by consensus, to be most critically needed for typical acute patient care. In this context, acute patient care was defined as: rescue use or lifesaving use or both (that is, Intensive Care Units, Cardiac/Coronary Care Units, and Emergency Departments), stabilizing patients in hospital continued care to enable discharge, and urgent or emergency surgery. Development of the ARMI List focused on assessing the clinical criticality and supply chains of small molecules and therapeutic biologics. The development of the ARMI List was informed by expert input and perspectives from multiple key pharmaceutical supply chain stakeholders (material suppliers, pharmaceutical manufacturers, group purchasing organizations, wholesale distributors) and clinical stakeholders (doctors, nurses, pharmacists, and public health experts representing major hospital systems, professional societies, and government agencies serving underrepresented populations). This involved conducting and analyzing data from more than 80 surveys, conducting more than 40 interviews, holding 4 workshops that combined clinical and industry expertise, and consulting more than 100 sources to clarify inputs from interview, surveys, and workshops. The ARMI List was also informed by public feedback on the EO 13944 List provided during a public comment period starting in October 2020

Further, while the EO 13944 List includes blood and blood products, this policy is not intended to include medicines that would be used for longer-term chronic management,

including those needed to cure a condition through weeks or months of outpatient treatment in the outpatient setting or chronic care (for example, oncology).

Based on the comprehensive assessment and process followed to develop the ARMI List, as well as the inclusion of a variety of inputs and perspectives across the pharmaceutical supply chains—from industry to clinical community and the public at large—we believe that use of the ARMI List to identify essential medicines for purposes of this policy is appropriate to promote supply chain resilience. at this juncture. After consideration of the comments received, we are finalizing as proposed our use of the ARMI List.

Comment: Commenters expressed concerns regarding the use of the FDA’s Drug Shortage Database as a means of establishing the shortage status of a given essential medicine. Specifically, commenters stated that the list is not sensitive to regional shortages, such that it is possible that hospitals may have to draw down their buffer stock(s) below 6 months in size for a regional shortage, despite the medicine not being listed as “Currently in Shortage” on the FDA’s Drug Shortage Database. Commenters also stated that the FDA’s Drug Shortage Database tends to only capture the most extreme of shortages and may not be sensitive to other supply challenges that hospitals face. Commenters further stated that the FDA’s Drug Shortage List tends to lag alternative sources of drug shortage status, such as the American Society of Health-System Pharmacists’ (ASHP’s) Drug Shortages List. For these reasons, commenters recommended that CMS consider modifying its proposal to adopt the ASHP Drug Shortages List as its source for determining shortage status of a given essential medicine.

Commenters requested clarification on whether all formulations of a drug will be removed from eligibility if a common Active Pharmaceutical Ingredient (API) enters shortage.

Response: We thank commenters for their feedback regarding our use of the FDA’s Drug Shortage Database. We recognize that the purpose, audience, scope, source of information, methodology and timing for determining shortage status differs between the FDA’s Drug Shortage Database and the ASHP’s Drug Shortages List. These differences are also documented

by researchers, ASHP, and others, and were reviewed by CMS in developing this policy.²⁵⁰

251,252,253

As described on the FDA’s Drug Shortage Database website,²⁵⁴ the FDA Drug Shortage Database is maintained by a dedicated team within the agency and manufacturers are required to report drug shortages to the FDA. FDA defines a shortage as a period of time when the demand for a drug in the United States exceeds supply. FDA’s definition considers the entire United States market supply from all manufacturers combined based on manufacturer reporting of their inventory and production for the potentially medically necessary use(s) at the patient level. FDA receives information from manufacturers about their ability to supply the market and uses this information to track shortages at the national level. Manufacturers provide FDA most drug shortage information, and FDA works closely with them to prevent or reduce the impact of shortages. When a shortage is listed as current on the FDA Drug Shortage Database, FDA is aware of the supply situation and works on efforts to mitigate the supply disruption. FDA also works with manufacturers on shortage prevention efforts for drugs not yet listed on the Drug Shortage Database.²⁵⁵

By contrast, CMS understands the American Society of Health-System Pharmacists (ASHP) list defines a shortage as a supply issue that affects how a pharmacy prepares or dispenses a drug product, and would post a shortage if one manufacturer was out of stock even if the other manufacturers are able to cover the supply gap. This often leads to more drugs being declared in ‘shortage’ by ASHP when compared to FDA’s definition of a shortage. For these reasons, we believe that the FDA’s Drug Shortage Database is the most appropriate source for determining the shortage status of our eligible essential medicines for purposes of this policy.

²⁵⁵ <https://www.fda.gov/drugs/drug-safety-and-availability/drug-shortages>

As discussed previously, in conjunction with this final policy, CMS will conduct provider outreach on a quarterly basis regarding essential medicines that are in shortage. We intend to make it clear to hospitals on or about the start of each calendar year quarter which drugs are or are not in shortage for the purposes of eligibility for separate payment for the costs of establishing or maintaining their respective buffer stocks. As discussed, we believe this provider outreach will help to mitigate concerns regarding the administrative burden on hospitals of tracking when a drug is considered in shortage under our policy.

After consideration of the public comments received, we are finalizing as proposed our use of the FDA Drug Shortages Database as the basis for determining when an essential medicine is in shortage.

Comment: Some commenters noted that some of the 86 essential medicines eligible under our policy are controlled substances. These commenters asked that CMS work with the Drug Enforcement Agency (DEA) to ensure that hospitals are able to adequately establish and maintain buffer stocks of these medicines under the policy.

Response: All applicable DEA requirements with respect to any controlled substances that are essential medicines are unaltered by our policy and continue to apply. Changes to any DEA requirements are outside of the scope of this rulemaking. As we gain additional experience under the policy we may consider unique aspects, if any, of its applicability to controlled substances in future rulemaking.

Comment: Some commenters also requested that CMS delay the effective date beyond October 1, 2024, to allow manufacturers to ramp up production.

Response: As noted in our earlier responses, we continue to believe that our pool of eligible hospitals is sufficiently small, and that these hospitals have sufficiently less purchasing power than larger hospitals and hospital chains, such that the policy would not create demand shocks that would cause or exacerbate shortages. As such, we do not believe there is a need to delay the policy to permit manufacturers to increase production. We also note that the policy is

entirely voluntary on the part of eligible hospitals and does not permit separate payment for newly establishing buffer stocks for drugs that are already in shortage.

After consideration of the public comments received, we are finalizing as proposed the effective date of October 1, 2024.

Comment: Some commenters requested we clarify if Medicare Advantage costs will be included as eligible costs for establishing the Medicare share of hospital costs.

Response: The separate payment for establishing and maintaining access to essential medicines under this policy is for the costs that are currently bundled into the IPPS payments. Those IPPS payments do not include Medicare Advantage payments. Therefore, the Medicare inpatient share of costs under this policy appropriately does not include Medicare Advantage.

Comment: Commenters requested that we clarify if eligible hospitals will be permitted to establish a shared buffer stock, or if each hospital will have to separately establish and maintain their respective buffer stock(s).

Response: Eligible hospitals that elect to maintain a shared buffer stock of essential medicines with other eligible hospitals may receive separate payment for establishing and maintaining the shared buffer stock only if all of the requirements for payment under this policy are met independently by each hospital (for example, there is sufficient buffer stock that each hospital has access to a 6-month supply for itself if all the hospitals begin to access the buffer stock at the same time in the event of a shortage), and the costs associated with establishing and maintaining the shared buffer stock are reasonably allocated to each hospital without duplication of those costs (for example, the total costs reported to Medicare—in accordance with the principles of reasonable cost as set forth in section 1861(v)(1)(A) of the Act and in 42 CFR § 413.9—across the hospitals for establishing and maintaining that shared buffer stock must equal the total costs of establishing and maintaining that buffer stock). If one or more of the buffer stock(s) of essential medicines that comprise the established shared buffer stock are subsequently listed as “Currently in Shortage” on the FDA’s Drug Shortage Database, the buffer stock(s) of

those essential medicines in shortage may remain eligible for separate payment under this policy for the duration of the shortage. Eligibility for separate payment for essential medicines that are “Currently in Shortage” will be maintained consistent with the manner in which individual buffer stocks of essential medicines remain eligible for payment after being listed as “Currently in Shortage,” as described previously.

Comment: A commenter asked if internal compounding of an essential medicine in shortage will be permitted to build up a buffer stock of an essential medicine.

Response: The appropriate clinical use of compounding and all applicable regulations and requirements associated with compounding are beyond the scope of this rulemaking. We remind hospitals, however, that the costs of establishing and maintaining a buffer stock of an essential medicine do not include the cost of the essential medicine itself, meaning that the cost of compounding would not be included in the cost for establishing and maintaining a buffer stock of an essential medicine.

Comment: A commenter requested that we use Average Daily Census (ADC) data for the beginning of the cost reporting period to determine a given hospital’s bed count.

Response: We proposed to use the hospital bed count as established in accordance with § 412.105(b), which is consistent with how bed count is established for other IPPS payment purposes. We do not see the need to establish an alternative methodology for determining hospital bed count specific to this policy. We are finalizing this aspect of the policy as proposed.

Comment: A commenter requested that we clarify if CMS will provide an Explanation of Benefits with specific codes relevant to the payment adjustment.

Response: There is no additional payment required of a beneficiary who, during their IPPS inpatient stay, receives an essential medicine from a hospital that receives separate payment for establishing and maintaining a buffer stock of that essential medicine under the IPPS. Information on which hospitals receive separate payment under the policy will be publicly available as part of the cost report information reported by hospitals.

Comment: We received a number of comments requesting broader policy actions. Many commenters stated that addressing drug shortages will require actions beyond the Medicare program, including actions directed at pharmaceutical suppliers. Commenters asked that we seek legislative authority to make additional payments, including any potential expansion to the outpatient setting, in a non-budget neutral manner. Several commenters requested that we convene a technical workgroup to consult on the policy, with both federal and private-sector members. A commenter requested that we require drug manufacturers to equitably disburse medicines to smaller hospitals, as these smaller hospitals often face difficulties in purchasing medicines. Commenters requested that we require drug manufacturers to produce more stock above and beyond their purchase demand, or that we directly pay distributors, manufacturers, or wholesalers to hold a national buffer supply for disbursement to hospitals. Some commenters requested that we establish measures to prevent hospitals participating in this policy from contracting with manufacturers that have outstanding pharmaceutical quality issues at their facilities. A commenter requested that we shift to stockpiling Active Pharmaceutical Ingredients (API) instead of Finished Drug Form (FDF) pharmaceuticals. Commenters requested that we direct Medicare Advantage, Medicaid Managed Care Organizations, and Children's Health Insurance Program Plans to release guidance waiving prior authorization for suitable alternatives to drugs in shortage.

Response: We thank commenters for their feedback regarding broader policy actions to address drug shortages and supply chain resiliency, which we note are beyond the scope of this rulemaking.

7. Policy Summary

After consideration of the public comments we received, we are finalizing our policy as proposed. In summary, for cost reporting periods beginning on or after October 1, 2024, we are establishing a separate payment under the IPPS to small, independent hospitals for the additional resource costs involved in voluntarily establishing and maintaining access to 6-month buffer

stocks of essential medicines, either directly or through contractual arrangements with a manufacturer, distributor, or intermediary. The costs of buffer stocks that are eligible for separate payment are the costs of buffer stocks for one or more of the medicines on ARMI's List of 86 essential medicines. The separate payment will be for the IPPS share of the additional costs and could be issued in a lump sum, or as biweekly payments to be reconciled at cost report settlement. The separate payment will not apply to buffer stocks of any of the essential medicines on the ARMI List that are listed as "Currently in Shortage" on the FDA Drug Shortages Database, as communicated to hospitals by the MACs on a quarterly basis, unless a hospital had already established and was maintaining a 6-month buffer stock of that medicine prior to the shortage. Once an essential medicine is no longer in shortage, as communicated by the MACs for the calendar quarter, our policy does not differentiate that essential medicine from other essential medicines, and hospitals would be eligible to establish and maintain buffer stocks for the medicine as they would have before the shortage. We are also finalizing our proposal to codify this payment adjustment in the regulations by adding new paragraph (g) to 42 CFR 412.113, as well as our proposed conforming changes to 42 CFR 412.1(a) and 412.2(f), without modification. In future years as we gain additional experience under this policy, we plan to assess the program's impact and consider revisions.

K. Hospital Readmissions Reduction Program

1. Regulatory Background

Section 3025 of the Patient Protection and Affordable Care Act, as amended by section 10309 of the Patient Protection and Affordable Care Act, added section 1886(q) to the Act, which establishes the Hospital Readmissions Reduction Program effective for discharges from applicable hospitals beginning on or after October 1, 2012. Under the Hospital Readmissions Reduction Program, payments to applicable hospitals may be reduced to account for certain excess readmissions. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49530 through 49543) and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38221 through 38240) for a general overview of the Hospital Readmissions Reduction Program. We also refer readers to 42 CFR 412.152 through 412.154 for codified Hospital Readmissions Reduction Program requirements. Additionally, we refer readers to the CY 2025 OPSS/ASC proposed rule where we are soliciting input on potential future methodological modifications regarding the Safety of Care measure group within the Overall Hospital Quality Star Rating (89 FR 59509 through 59515).

2. Notice of No Program Proposals or Updates

There were no proposals or updates in the FY 2025 IPPS/LTCH PPS proposed rule for the Hospital Readmissions Reduction Program (89 FR 36238). We refer readers to section I.G.7. of Appendix A of the final rule for an updated estimate of the financial impact of using the proportion of dually eligible beneficiaries, ERRs, and aggregate payments for each condition/procedure and all discharges for applicable hospitals from the FY 2025 Hospital Readmissions Reduction Program applicable period (that is, July 1, 2020, through June 30, 2023).

L. Hospital Value-Based Purchasing (VBP) Program

1. Background

a. Overview

For background on the Hospital VBP Program, we refer readers to the CMS website at: <https://www.cms.gov/medicare/quality/initiatives/hospital-quality-initiative/hospital-value-based-purchasing>. We also refer readers to our codified requirements for the Hospital VBP Program at 42 CFR 412.160 through 412.168. Additionally, we refer readers to the CY 2025 OPPS/ASC proposed rule where we are soliciting input on potential future methodological modifications regarding the Safety of Care measure group within the Overall Hospital Quality Star Rating (89 FR59509 through 59515).

b. FY 2025 Program Year Payment Details

Under section 1886(o)(7)(C)(v) of the Act, the applicable percent for the FY 2025 program year is 2.00 percent. Using the methodology we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53571 through 53573), we estimate that the total amount available for value-based incentive payments for FY 2025 is approximately \$1.67 billion, based on the March 2024 update of the FY 2023 MedPAR file.

As finalized in the FY 2013 IPPS/ LTCH PPS final rule (77 FR 53573 through 53576), we will utilize a linear exchange function to translate this estimated amount available into a value-based incentive payment percentage for each hospital, based on its Total Performance Score (TPS). We published proxy value-based incentive payment adjustment factors in Table 16 associated with the FY 2025 IPPS/LTCH PPS proposed rule (which is available via the internet on the CMS website). We are publishing updated proxy value-based incentive payment adjustment factors in Table 16A associated with this final rule (which is available via the CMS website) to reflect changes based on the March 2024 update to the FY 2023 MedPAR file. We note that these updated proxy adjustment factors will not be used to adjust hospital payments. These updated proxy adjustment factors were calculated using the historical baseline and

performance periods for the FY 2024 Hospital VBP Program. These updated proxy adjustment factors were calculated using the March 2024 update to the FY 2023 MedPAR file. The slope of the linear exchange function used to calculate these proxy factors was 4.7264532378, and the estimated amount available for value-based incentive payments to hospitals for FY 2025 is approximately \$1.67 billion. We will add a new table, Table 16B to display the actual value-based incentive payment adjustment factors, exchange function slope, and estimated amount available for the FY 2025 Hospital VBP Program. We expect that Table 16B will be posted on the CMS website in the fall of 2024.

2. Previously Adopted Quality Measures for the Hospital VBP Program

We refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49110 through 49111) for summaries of previously adopted measures for the FY 2025 and FY 2026 program years and to the FY 2024 IPPS/LTCH PPS final rule for summaries of previously adopted measures beginning with the FY 2026 program year (88 FR 59081 through 59083). We did not propose any new measure adoptions or removals to the measure set in the FY 2025 IPPS/LTCH PPS proposed rule. Table V.L.-01 summarizes the previously adopted Hospital VBP Program measure set for the FY 2025 program year.

TABLE V.L.-01: SUMMARY OF PREVIOUSLY ADOPTED MEASURES FOR THE FY 2025 PROGRAM YEAR

Measure Short Name	Domain/Measure Name	CBE #
Person and Community Engagement Domain		
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS)	0166 (0228)
Safety Domain		
CAUTI	National Healthcare Safety Network (NHSN) Catheter Associated Urinary Tract Infection (CAUTI) Outcome Measure	0138
CLABSI	National Healthcare Safety Network (NHSN) Central Line Associated Bloodstream Infection (CLABSI) Outcome Measure	0139
Colon and Abdominal Hysterectomy SSI	American College of Surgeons Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure	0753
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility wide Inpatient Hospital onset Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Bacteremia Outcome Measure	1716
CDI	National Healthcare Safety Network (NHSN) Facility wide Inpatient Hospital onset <i>Clostridioides difficile</i> Infection (CDI) Outcome Measure	1717
Clinical Outcomes Domain		
MORT-30-AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization	0230
MORT-30-HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure (HF) Hospitalization	0229
MORT-30-PN (updated cohort)	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization	0468
MORT-30-COPD	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization	1893
MORT-30-CABG	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery	2558
COMP-HIP-KNEE	Hospital Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA)	1550
Efficiency and Cost Reduction Domain		
MSPB	Medicare Spending Per Beneficiary (MSPB) Hospital	2158

As discussed in section IX.B.2.g(2) of this final rule, we are finalizing the adoption of the updates to the HCAHPS Survey measure beginning with the FY 2030 program year. We are also finalizing the adoption of the updates to the HCAHPS Survey measure in the Hospital Inpatient Quality Reporting (IQR) Program, beginning with the FY 2027 program year, as described in section IX.B.2.e. of this final rule. Additionally, we are finalizing the modification to the Hospital VBP Program’s scoring of the HCAHPS Survey measure for the FY 2027 through FY 2029 program years to score hospitals on only those dimensions of the survey that will remain unchanged from the current version, as described in section IX.B.2.f. of this final

rule. Lastly, we are also finalizing the modification to the Hospital VBP Program’s scoring of the HCAHPS Survey measure beginning in FY 2030 to account for the adoption of the modifications to the survey, which will result in a total of nine survey dimensions for the updated HCAHPS Survey measure in the Hospital VBP Program, as described in section IX.B.2.g(3) of this final rule. Table V.L.-02 summarizes the previously adopted Hospital VBP Program measures for the FY 2026 through FY 2030 program years.

TABLE V.L.-02: SUMMARY OF PREVIOUSLY ADOPTED MEASURES FOR THE FY 2026 THROUGH FY 2030 PROGRAM YEARS

Measure Short Name	Domain/Measure Name	CBE #

MSPB	Medicare Spending Per Beneficiary (MSPB) Hospital	2158

* In sections IX.B.2.f and IX.B.2.g of this final rule, we are finalizing several updates with regard to the HCAHPS Survey in the Hospital VBP Program, including modifying scoring while the updated version of the measure is adopted in the Hospital IQR Program for the FY 2027 through FY 2029 program years. We are also finalizing the adoption of the updated version of the measure and the modification of scoring to account for the updates in the Hospital VBP Program beginning with the FY 2030

program year. We refer readers to Table IX.B.2-03 in section IX.B.2.g(2) of this final rule for the timelines for current and newly finalized HCAHPS Survey dimensions for the Hospital VBP Program.

3. Baseline and Performance Periods for the FY 2026 Through FY 2030 Program Years

a. Background

We refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 59084 through 59087) for previously adopted baseline and performance periods for the FY 2025 through FY 2029 program years. We also refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56998) in which we finalized a schedule for all future baseline and performance periods for all measures.

b. Summary of Baseline and Performance Periods for the FY 2026 through FY 2030 Program Years

Tables V.L.-03, V.L.-04, V.L.-05, V.L.-06, and V.L.-07 summarize the baseline and performance periods that we have previously adopted.

TABLE V.L.-03: BASELINE AND PERFORMANCE PERIODS FOR THE FY 2026 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS	January 1, 2022 – December 31, 2022	January 1, 2024 – December 31, 2024
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT-30-COPD, MORT-30-CABG, MORT-30-PN (updated cohort))	July 1, 2016 – June 30, 2019	July 1, 2021 – June 30, 2024

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS*	January 1, 2023 – December 31, 2023	January 1, 2025 – December 31, 2025
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT-30-COPD, MORT-30-CABG, MORT-30-PN (updated cohort))	July 1, 2017 – June 30, 2020**	July 1, 2022 – June 30, 2025
COMP-HIP-KNEE	April 1, 2017 – March 31, 2020**	April 1, 2022 – March 31, 2025
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2023 – December 31, 2023	January 1, 2025 – December 31, 2025
SEP-1	January 1, 2023 – December 31, 2023	January 1, 2025 – December 31, 2025
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2023 – December 31, 2023	January 1, 2025 – December 31, 2025

* In section IX.B.2.f of this final rule, we are finalizing that for the FY 2027 program year, we will only score on the six dimensions of the HCAHPS Survey that will remain unchanged from the current version.

**These baseline periods are impacted by the ECE granted by CMS on March 22, 2020. Qualifying claims will be excluded from the measure calculations for January 1, 2020–March 31, 2020 (Q1 2020) and April 1, 2020–June 30, 2020 (Q2 2020) from the claims-based complication, mortality, and CMS PSI 90 measures. For more detailed information, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45297 through 45299).

TABLE V.L.-05: BASELINE AND PERFORMANCE PERIODS FOR THE FY 2028 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS*	January 1, 2024 – December 31, 2024	January 1, 2026 – December 31, 2026
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT3-0-COPD, MORT-30-CABG, MORT-30-PN (updated cohort))	July 1, 2018 – June 30, 2021**	July 1, 2023 – June 30, 2026
COMP-HIP-KNEE	April 1, 2018 – March 31, 2021**	April 1, 2023 – March 31, 2026
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2024 – December 31, 2024	January 1, 2026 – December 31, 2026
SEP-1	January 1, 2024 – December 31, 2024	January 1, 2026 – December 31, 2026
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2024 – December 31, 2024	January 1, 2026 – December 31, 2026

* In section IX.B.2.f of this final rule, we are finalizing that for the FY 2028 program year, we will only score on the six dimensions of the HCAHPS Survey that will remain unchanged from the current version.

** These baseline periods are impacted by the Extraordinary Circumstance Exception (ECE) granted by CMS on March 22, 2020 due to the COVID-19 public health emergency (PHE). Qualifying claims will be excluded from the measure calculations for January 1, 2020–March 31, 2020 (Q1 2020) and April 1, 2020–June 30, 2020 (Q2 2020) from the claims-based complication and mortality measures. For more detailed information, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45297 through 45299).

TABLE V.L.-06: BASELINE AND PERFORMANCE PERIODS FOR THE FY 2029 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS*	January 1, 2025 – December 31, 2025	January 1, 2027 – December 31, 2027

Clinical Outcomes Domain		
Mortality measures (MOR-T30-AMI, MORT-30-HF, MORT-30-COPD, MORT-30-CABG, MORT-30-PN (updated cohort))	July 1, 2019 – June 30, 2022**	July 1, 2024 – June 30, 2027
COMP-HIP-KNEE	April 1, 2019 – March 31, 2022**	April 1, 2024 – March 31, 2027
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2025 – December 31, 2025	January 1, 2027 – December 31, 2027
SEP-1	January 1, 2025 – December 31, 2025	January 1, 2027 – December 31, 2027
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2025 – December 31, 2025	January 1, 2027 – December 31, 2027

* In section IX.B.2.f. of this final rule, we are finalizing that for the FY 2029 program year, we will only score on the six dimensions of the HCAHPS Survey that will remain unchanged from the current version.

**These baseline periods are impacted by the ECE granted by CMS on March 22, 2020. Qualifying claims will be excluded from the measure calculations for January 1, 2020–March 31, 2020 (Q1 2020) and April 1, 2020–June 30, 2020 (Q2 2020) from the claims-based complication, mortality, and CMS PSI 90 measures. For more detailed information, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45297 through 45299).

TABLE V.L.-07: BASELINE AND PERFORMANCE PERIODS FOR THE FY 2030 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS*	January 1, 2026 – December 31, 2026	January 1, 2028 – December 31, 2028
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT3-0-COPD, MORT-30-CABG, MORT-30-PN (updated cohort))	July 1, 2020 – June 30, 2023	July 1, 2025 – June 30, 2028
COMP-HIP-KNEE	April 1, 2020 – March 31, 2023	April 1, 2025 – March 31, 2028
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2026 – December 31, 2026	January 1, 2028 – December 31, 2028
SEP-1	January 1, 2026 – December 31, 2026	January 1, 2028 – December 31, 2028
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2026 – December 31, 2026	January 1, 2028 – December 31, 2028

* In section IX.B.2.g. of this final rule, we are finalizing the adoption of the substantive updates to the HCAHPS Survey beginning with the FY 2030 program year.

4. Performance Standards for the Hospital VBP Program

a. Background

We refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49115 through 49118) for previously established performance standards for the FY 2025 program year. We also refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 59089 through 59090) for the previously established performance standards for the FY 2026 program year. We refer readers to the FY 2021 IPPS/LTCH PPS final rule for further discussion on performance

standards for which the measures are calculated with lower values representing better performance (85 FR 58855).

b. Previously and Newly Estimated Performance Standards for the FY 2027 Program Year

We have adopted certain measures for the Safety domain, Clinical Outcomes domain, and the Efficiency and Cost Reduction domain for future program years to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45294 through 45295), we established performance standards for the FY 2027 program year for the Clinical Outcomes domain measures (MORT-30-AMI, MORT-30-HF, MORT-30-PN (updated cohort), MORT-30-COPD, MORT-30-CABG, and COMP-HIP-KNEE) and the Efficiency and Cost Reduction domain measure (MSPB). We note that the performance standards for the MSPB Hospital measure are based on performance period data. Therefore, we are unable to provide numerical equivalents for the standards at this time. The previously established and newly estimated performance standards for the FY 2027 program year are set out in Tables V.L.-08 and V.L.-09.

TABLE V.L.-08: PREVIOUSLY ESTABLISHED AND NEWLY ESTIMATED PERFORMANCE STANDARDS FOR THE FY 2027 PROGRAM YEAR

TABLE V.L.-08: PREVIOUSLY ESTABLISHED AND NEWLY ESTIMATED PERFORMANCE STANDARDS FOR THE FY 2027 PROGRAM YEAR		
Measure Short Name	Achievement Threshold	Benchmark
Safety Domain		
CAUTI***	0.5	0
CLABSI***	0.608	0
CDI*	0.351	0
MRSA Bacteremia*	0.65	0
Colon and Abdominal Hysterectomy SSI*	0.735 0.884	0
SEP-1***	0.618251	0.860833
Clinical Outcomes Domain #		
MORT-30-AMI	0.877824	0.893133
MORT-30-HF	0.887571	0.913388
MORT-30-PN (updated cohort)	0.844826	0.877204
MORT-30-COPD	0.917395	0.932640
MORT-30-CABG	0.971149	0.980752
COMP-HIP-KNEE*	0.023322	0.017018
Efficiency and Cost Reduction Domain		

MSPB*	Median Medicare Spending per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending per Beneficiary ratios across all hospitals during the performance period.
-------	--	--

* Lower values represent better performance.

** We note that the numerical values for the performance standards for the Healthcare-Associated Infection measures in this final rule represent estimates based on the most recently available data. These estimates are based on CY 2023 data.

*** We note that the numerical values for the performance standards for the SEP-1 measure in this final rule represent estimates based on the most recently available data. These estimates are based on CY 2023 data.

As discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 5297 through 45299), we did not include data from Q1 and Q2 of CY 2020 in the calculation of these performance standards.

As discussed in section IX.B.2.f. of this final rule, we are finalizing a modification to the scoring of the HCAHPS Survey for the FY 2027 through FY 2029 program years while the updates to the survey are adopted and publicly reported under the Hospital IQR Program. Scoring will be modified to only score hospitals on the six Hospital VBP Program dimensions of the HCAHPS Survey that will remain unchanged from the current version. These six dimensions of the HCAHPS Survey for the Hospital VBP Program will be:

- “Communication with Nurses,”
- “Communication with Doctors,”
- “Communication about Medicines,”
- “Discharge Information,”
- “Cleanliness and Quietness,” and
- “Overall Rating.”

We are finalizing the proposal to exclude the “Responsiveness of Hospital Staff” and “Care Transition” dimensions from scoring in the Hospital VBP Program’s HCAHPS Survey measure in the Person and Community Engagement domain for the FY 2027 through FY 2029 program years. This will allow hospitals to be scored on only those dimensions of the survey in the Hospital VBP Program that will remain unchanged from the current version of the survey while the updated HCAHPS Survey is publicly reported on under the Hospital IQR Program for one year as required by statute. We are also finalizing the proposal to adopt the updated version of the HCAHPS Survey measure for use in the Hospital VBP Program beginning in FY 2030 as outlined in section IX.B.2.g. of this final rule.

Scoring will be modified such that for each of the six dimensions listed previously, Achievement Points (0–10 points) and Improvement Points (0–9 points) will be calculated, the larger of which will be summed across these six dimensions to create a pre-normalized HCAHPS Base Score of 0–60 points (as compared to 0–80 points with the current eight dimensions). The pre-normalized HCAHPS Base Score will then be multiplied by 8/6 (1.3333333) and rounded according to standard rules (values of 0.5 and higher are rounded up, values below 0.5 are rounded down) to create the normalized HCAHPS Base Score. Each of the six dimensions will be of equal weight, so that, as currently scored, the normalized HCAHPS Base Score will range from 0 to 80 points. HCAHPS Consistency Points will be calculated in the same manner as the current method and will continue to range from 0 to 20 points. Like the Base Score, the Consistency Points Score will consider scores across the six unchanged dimensions of the Person and Community Engagement domain. The final element of the scoring formula, which will remain unchanged from the current formula, will be the sum of the HCAHPS Base Score and the HCAHPS Consistency Points Score for a total score that ranges from 0 to 100 points. The method for calculating the performance standards for the six dimensions will remain unchanged. We refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513) for our methodology for calculating performance standards. The estimated performance standards for the six dimensions that are finalized to be scored on for the FY 2027 program year are set out in Table V.L.-09.

TABLE V.L.-09: ESTIMATED PERFORMANCE STANDARDS FOR THE FY 2027 PROGRAM YEAR: PERSON AND COMMUNITY ENGAGEMENT DOMAIN

TABLE V.L.-09: ESTIMATED PERFORMANCE STANDARDS FOR THE FY 2027 PROGRAM YEAR: PERSON AND COMMUNITY ENGAGEMENT DOMAIN			
HCAHPS Survey Dimension*¹	Floor (minimum)	Achievement Threshold (50th percentile)	Benchmark (mean of top decile)
Communication with Nurses	51.40	77.32	86.30
Communication with Doctors	51.59	77.53	86.29
Responsiveness of Hospital Staff**	X	X	X
Communication about Medicines	35.92	58.08	70.11
Hospital Cleanliness & Quietness	38.41	63.37	77.73
Discharge Information	67.47	86.02	91.48
Care Transition**	X	X	X
Overall Rating of Hospital	34.52	68.79	83.97

¹ Includes IPSS hospitals with 100+ completed surveys from patients discharged between January 2023 and December 2023 (2,756 hospitals).

*The newly established performance standards displayed in this table were calculated using CY 2023 data. Data include IPPS hospitals with 100+ completed surveys from patients discharged between January 2023 and December 2023.

** For FY 2027, we are finalizing the proposal to only score on the six dimensions of the HCAHPS Survey measure that will remain unchanged from the current version until the updates to the survey measure are adopted beginning with FY 2030. Therefore, we are not reporting estimated performance standards for dimensions that will not be scored.

We invited public comment on this proposal in the FY 2025 IPPS/LTCH PPS proposed rule and have summarized all comments and responses in section IX.B.2. of this final rule.

c. Previously Established Performance Standards for Certain Measures for the FY 2028 Program Year

We have adopted certain measures for the Safety domain, Clinical Outcomes domain, and the Efficiency and Cost Reduction domain for future program years to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In the FY 2023 IPPS/LTCH PPS final rule (86 FR 49118), we established performance standards for the FY 2028 program year for the Clinical Outcomes domain measures (MORT-30-AMI, MORT-30-HF, MORT-30-PN (updated cohort), MORT-30-COPD, MORT-30-CABG, and COMP-HIP-KNEE) and the Efficiency and Cost Reduction domain measure (MSPB Hospital). We note that the performance standards for the MSPB Hospital measure are based on performance period data. Therefore, we are unable to provide numerical equivalents for the standards at this time. The previously established performance standards for these measures are set out in Table V.L.-10.

TABLE V.L.-10: PREVIOUSLY ESTABLISHED PERFORMANCE STANDARDS FOR THE FY 2028 PROGRAM YEAR

TABLE V.L.-10: PREVIOUSLY ESTABLISHED PERFORMANCE STANDARDS FOR THE FY 2028 PROGRAM YEAR		
Measure Short Name	Achievement Threshold	Benchmark
Clinical Outcomes Domain**		
MORT-30-AMI	0.877260	0.893229
MORT-30-HF	0.885427	0.910649
MORT-30-PN (updated cohort)	0.831776	0.866166
MORT-30-COPD	0.913752	0.929652
MORT-30-CABG	0.971052	0.980570
COMP-HIP-KNEE*	0.029758	0.022002
Efficiency and Cost Reduction Domain		

MSPB*	Median Medicare Spending per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending per Beneficiary ratios across all hospitals during the performance period.
-------	--	--

* Lower values represent better performance.

** We note that these performance standards are calculated using the baseline period from July 1, 2018 to June 30, 2021, which includes CY 2020 and CY 2021 data that was included in the COVID-19 PHE. However, these performance standards have been calculated using the updated technical specifications described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49106 through 49110), which excludes patients diagnosed with COVID-19 and risk-adjusts for history of COVID-19 for these measures.

d. Previously Established Performance Standards for Certain Measures for the FY 2029

Program Year

We have adopted certain measures for the Safety domain, Clinical Outcomes domain, and the Efficiency and Cost Reduction domain for future program years to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In the FY 2024 IPPS/LTCH PPS final rule (88 FR 59091 through 59092), we established performance standards for the FY 2029 program year for the Clinical Outcomes domain measures (MORT-30-AMI, MORT-30-HF, MORT-30-PN (updated cohort), MORT-30-COPD, MORT-30-CABG, and COMP-HIP-KNEE) and the Efficiency and Cost Reduction domain measure (MSPB Hospital). We note that the performance standards for the MSPB Hospital measure are based on performance period data. Therefore, we are unable to provide numerical equivalents for the standards at this time. The previously established performance standards for these measures are set out in Table V.L.-11.

TABLE V.L.-11: PREVIOUSLY ESTABLISHED PERFORMANCE STANDARDS FOR THE FY 2029 PROGRAM YEAR

TABLE V.L.-11: PREVIOUSLY ESTABLISHED PERFORMANCE STANDARDS FOR THE FY 2029 PROGRAM YEAR		
Measure Short Name	Achievement Threshold	Benchmark
Clinical Outcomes Domain**		
MORT-30-AMI	0.874856	0.893101
MORT-30-HF	0.880089	0.9072
MORT-30-PN (updated cohort)	0.814736	0.853996
MORT-30-COPD	0.905916	0.924829
MORT-30-CABG	0.971027	0.979822
COMP-HIP-KNEE*	0.025024	0.018708
Efficiency and Cost Reduction Domain		

MSPB*	Median Medicare Spending per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending per Beneficiary ratios across all hospitals during the performance period.
-------	--	--

* Lower values represent better performance.

** We note that these performance standards are calculated using the baseline period from July 1, 2019 to June 30, 2022, which includes CY 2020 and CY 2021 data that was included in the COVID-19 PHE. However, these performance standards have been calculated using the updated technical specifications described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49106 through 49110), which excludes patients diagnosed with COVID-19 and risk adjusts for history of COVID-19 for these measures.

e. Newly Established Performance Standards for Certain Measures for the FY 2030 Program

Year

As discussed previously, we have adopted certain measures for the Clinical Outcomes domain (MORT-30-AMI, MORT-30-HF, MORT-30-PN (updated cohort), MORT-30-COPD, MORT-30-CABG, and COMP-HIP-KNEE) and the Efficiency and Cost Reduction domain (MSPB Hospital) for future program years to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In accordance with our methodology for calculating performance standards discussed more fully in the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513), which is codified at 42 CFR 412.160, we are establishing the following performance standards for the FY 2030 program year for the Clinical Outcomes domain and the Efficiency and Cost Reduction domain. We note that the performance standards for the MSPB Hospital measure are based on performance period data. Therefore, we are unable to provide numerical equivalents for the standards at this time. The newly established performance standards for these measures are set out in Table V.L.-12.

TABLE V.L.-12: NEWLY ESTABLISHED PERFORMANCE STANDARDS FOR THE FY 2030 PROGRAM YEAR

TABLE V.L.-12: NEWLY ESTABLISHED PERFORMANCE STANDARDS FOR THE FY 2030 PROGRAM YEAR		
Measure Short Name	Achievement Threshold	Benchmark
Clinical Outcomes Domain**		
MORT-30-AMI	0.873975	0.89371
MORT-30-HF	0.878881	0.90929
MORT-30-PN (updated cohort)	0.81782	0.858688
MORT-30-COPD	0.903404	0.924332
MORT-30-CABG	0.972219	0.9815
COMP-HIP-KNEE*	0.028252	0.019993

Efficiency and Cost Reduction Domain		
MSPB*	Median Medicare Spending per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending per Beneficiary ratios across all hospitals during the performance period.

* Lower values represent better performance.

** We note that these performance standards are calculated using the baseline period from July 1, 2020 to June 30, 2023, which includes CY 2020 and CY 2021 data that was included in the COVID-19 PHE. However, these performance standards have been calculated using the updated technical specifications described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49106 through 49110), which excludes patients diagnosed with COVID-19 and risk adjusts for history of COVID-19 for these measures.

M. Hospital-Acquired Condition (HAC) Reduction Program

1. Regulatory Background

We refer readers to the FY 2014 IPPS/ LTCH PPS final rule (78 FR 50707 through 50709) for a general overview of the HAC Reduction Program and a detailed discussion of the statutory basis for the Program. We also refer readers to 42 CFR 412.170 through 412.172 for codified HAC Reduction Program requirements. Additionally, we refer readers to the CY 2025 OPSS/ASC proposed rule where we are soliciting input on potential future methodological modifications regarding the Safety of Care measure group within the Overall Hospital Quality Star Rating (89 FR 59509 through 59515).

2. Measures for FY 2025 and Subsequent Years in the HAC Reduction Program

The previously finalized measures for the HAC Reduction Program are shown in table V.M.-01. Technical specifications for the CMS PSI 90 measure can be found on the QualityNet website available at: <https://qualitynet.cms.gov/inpatient/measures/psi/resources>. Technical specifications for the CDC National Healthcare Safety Network (NHSN) healthcare-associated infection (HAI) measures can be found at the CDC's NHSN website at <http://www.cdc.gov/nhsn/acute-care-hospital/index.html> and on the QualityNet website available at: <https://qualitynet.cms.gov/inpatient/measures/hai/resources>. These webpages provide measure updates and other information necessary to guide hospitals participating in the collection of HAC Reduction Program data.

TABLE V.M.-01: HAC REDUCTION PROGRAM MEASURES FOR FY 2025 AND SUBSEQUENT YEARS

Short Name	Measure Name	Consensus-Based Entity (CBE)#
CMS PSI 90	CMS Patient Safety and Adverse Events Composite (CMS PSI 90)	0531
CAUTI	CDC NHSN Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure	0138
CDI	CDC NHSN Facility-wide Inpatient Hospital-onset <i>Clostridium difficile</i> Infection (CDI) Outcome Measure	1717
CLABSI	CDC NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure	0139

Colon and Abdominal Hysterectomy SSI	American College of Surgeons – Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure	0753
MRSA Bacteremia	CDC NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Bacteremia Outcome Measure	1716

We did not make any proposals or policy updates for the HAC Reduction Program in the FY 2025 IPPS/LTCH PPS proposed rule. We refer readers to section I.G.9. of Appendix A of this final rule for an updated estimate of the impact of the Program policies on the proportion of hospitals in the worst performing quartile of the Total HAC Scores for the FY 2025 HAC Reduction Program.

While we did not make any proposals or policy updates to the HAC Reduction Program, we did receive comments from interested parties.

Comment: Many commenters provided recommendations for program improvements and potential future measures, including the Hospital Harm – Falls with Injury electronic clinical quality measure (eCQM), a hospital-onset COVID-19 measure, the NHSN Hospital-Onset Bacteremia and Fungemia Outcome Measure, and endoscope-associated infection eCQMs. Many commenters recommended including a hospital-acquired COVID-19 measure within the HAC Reduction Program to incentivize facilities to adopt mitigation approaches and prevent the transmission of COVID-19 in healthcare settings. Many commenters recommended that hospital-onset COVID should be defined as infections diagnosed after 5+ days of admission. Many commenters recommended providing financial support to hospitals for hospital-onset COVID-19 reporting efforts. Many commenters also recommended timely and accurate public reporting of hospital-onset COVID-19 data, aggregated by state and facility name, to aid patients in making informed decisions on where to receive care. Many commenters recommended incentivizing healthcare settings to implement preventative measures to reduce COVID-19 transmission, including requiring universal mask wearing, universal screening testing, and improved air quality. Many commenters expressed concern about COVID-19 as a health equity

issue disproportionately impacting populations at higher risk, including people with disabilities, populations that have been historically marginalized, and communities that are under-resourced; and recommended aggregating the data by demographics, socio-economic status, and disability status.

Response: We thank the commenters for these recommendations on potential future measures to include in the HAC Reduction Program and will consider them for future program years.

N. Rural Community Hospital Demonstration Program

1. Introduction

The Rural Community Hospital Demonstration was originally authorized by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108-173). The demonstration has been extended three times since the original 5-year period mandated by the MMA, each time for an additional 5 years. These extensions were authorized by sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111-148), section 15003 of the 21st Century Cures Act (Pub. L. 114-255) (Cures Act) enacted in 2016, and most recently, by section 128 of the Consolidated Appropriations Act of 2021 (Pub. L. 116-260). In this final rule, we summarize the status of the demonstration program, and the current methodologies for implementation and calculating budget neutrality.

We are also finalizing the amount to be applied to the national IPPS payment rates to account for the costs of the demonstration in FY 2025, incorporating the reconciled amount of demonstration costs for FY 2019 into the total offset the national IPPS payment rates for FY 2025.

2. Background

Section 410A(a) of Public Law 108-173 required the Secretary to establish a demonstration program to test the feasibility and advisability of establishing rural community hospitals to furnish covered inpatient hospital services to Medicare beneficiaries. The demonstration pays rural community hospitals under a reasonable cost-based methodology for Medicare payment purposes for covered inpatient hospital services furnished to Medicare beneficiaries. A rural community hospital, as defined in section 410A(f)(1) of Public Law 108-173, is a hospital that--

- Is located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or is treated as being located in a rural area under section 1886(d)(8)(E) of the Act;

- Has fewer than 51 beds (excluding beds in a distinct part psychiatric or rehabilitation unit) as reported in its most recent cost report;
- Provides 24-hour emergency care services; and
- Is not designated or eligible for designation as a CAH under section 1820 of the Act.

Our policy for implementing the 5-year extension period authorized by Public Law 116-260 (the Consolidated Appropriations Act of 2021) follows upon the previous extensions under the ACA (Pub. L. 111-148) and the Cures Act (Pub. L. 114-255). Section 410A of Public Law 108-173 (MMA) initially required a 5-year period of performance. Subsequently, sections 3123 and 10313 of Public Law 111-148 required the Secretary to conduct the demonstration program for an additional 5-year period, to begin on the date immediately following the last day of the initial 5-year period. In addition, Public Law 111-148 limited the number of hospitals participating to no more than 30. Section 15003 of the Cures Act required a 10-year extension period in place of the 5-year extension period under the ACA, thereby extending the demonstration for another 5 years. Section 128 of Public Law 116-260, in turn, revised the statute to indicate a 15-year extension period, instead of the 10-year extension period mandated by the Pub. L. 114-159 (Cures Act). Please refer to the FY 2023 IPPS proposed and final rules (87 FR 28454 through 28458 and 87 FR 49138 through 49142, respectively) for an account of hospitals entering and withdrawing from the demonstration with these re-authorizations. There are currently 22 hospitals participating in the demonstration.

2. Budget Neutrality

a. Statutory Budget Neutrality Requirement

Section 410A(c)(2) of Public Law 108-173 requires that, in conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount that the Secretary would have

paid if the demonstration program under this section was not implemented. This requirement is commonly referred to as “budget neutrality.” Generally, when we implement a demonstration program on a budget neutral basis, the demonstration program is budget neutral on its own terms; in other words, the aggregate payments to the participating hospitals do not exceed the amount that would be paid to those same hospitals in the absence of the demonstration program. We note that the payment methodology for this demonstration, that is, cost-based payments to participating small rural hospitals, makes it unlikely that increased Medicare outlays will produce an offsetting reduction to Medicare expenditures elsewhere. Therefore, in the IPPS final rules spanning the period from FY 2005 through FY 2016, we adjusted the national inpatient PPS rates by an amount sufficient to account for the added costs of this demonstration program, thus applying budget neutrality across the payment system as a whole rather than merely across the participants in the demonstration program. (We applied a different methodology for FY 2017, with the demonstration expected to end prior to the Cures Act extension). As we discussed in the FYs 2005 through 2017 IPPS/LTCH PPS final rules (69 FR 49183; 70 FR 47462; 71 FR 48100; 72 FR 47392; 73 FR 48670; 74 FR 43922, 75 FR 50343, 76 FR 51698, 77 FR 53449, 78 FR 50740, 77 FR 50145; 80 FR 49585; and 81 FR 57034, respectively), we believe that the statutory language of the budget neutrality requirements permits the agency to implement the budget neutrality provision in this manner.

We resumed this methodology of offsetting demonstration costs against the national payment rates in the IPPS final rules from FY 2018 through FY 2024. Please see the FY 2024 IPPS final rule for an account of how we applied the budget neutrality requirement for these fiscal years (88 FR 59114 through 59116).

b. General Budget Neutrality Methodology

We have generally incorporated two components into the budget neutrality offset amounts identified in the final IPPS rules in previous years. First, we have estimated the costs of the demonstration for the upcoming fiscal year, generally determined from historical, “as submitted” cost reports for the hospitals participating in that year. Update factors representing nationwide trends in cost and volume increases have been incorporated into these estimates, as specified in the methodology described in the final rule for each fiscal year. Second, as finalized cost reports became available, we determined the amount by which the actual costs of the demonstration for an earlier, given year differed from the estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year, and incorporated that amount into the budget neutrality offset amount for the upcoming fiscal year. If the actual costs for the demonstration for the earlier fiscal year exceeded the estimated costs of the demonstration identified in the final rule for that year, this difference was added to the estimated costs of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for the upcoming fiscal year. Conversely, if the estimated costs of the demonstration set forth in the final rule for a prior fiscal year exceeded the actual costs of the demonstration for that year, this difference was subtracted from the estimated cost of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for the upcoming fiscal year.

We note that we have calculated this difference for FYs 2005 through 2018 between the actual costs of the demonstration as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years.

c. Budget Neutrality Methodology for the Extension Period Authorized by Pub. L

For the most-recently enacted extension period, under the Consolidated Appropriations Act of 2021, we have continued upon the general budget neutrality methodology used in previous years, as described above in the citations to earlier IPPS final rules. Based on the methodology outlined in the FY 2025 proposed rule, we are finalizing the calculation of the offset amount to be applied to the national IPPS payment rates for FY 2025.

(1) Methodology for Estimating Demonstration Costs for FY 2025

Consistent with the general methodology from previous years, we are estimating the costs of the demonstration for the upcoming fiscal year and incorporating this estimate into the budget neutrality offset amount to be applied to the national IPPS rates for the upcoming fiscal year, that is, FY 2025. We are conducting this estimate for FY 2025 based on the 22 currently participating hospitals. The methodology for calculating this amount for FY 2025 proceeds according to the following steps:

Step 1: For each of these 22 hospitals, we identify the reasonable cost amount calculated under the reasonable cost-based methodology for covered inpatient hospital services, including swing beds, as indicated on the “as submitted” cost report for the most recent cost reporting period available. For each of these hospitals, the “as submitted” cost report is that with cost report period end date in CY 2022. We sum these hospital-specific amounts to arrive at a total general amount representing the costs for covered inpatient hospital services, including swing beds, across the total 22 hospitals eligible to participate during FY 2025.

Then, we multiply this amount by the FYs 2023, 2024, and 2025 IPPS market basket percentage increases, which are calculated by the CMS Office of the Actuary. (We are using the market basket percentage increase for FY 2025, which can be found at section II.B. of the preamble of this final rule). The result for the 22 hospitals is the

general estimated reasonable cost amount for covered inpatient hospital services for FY 2025.

Consistent with our methods in previous years for formulating this estimate, we are applying the IPPS market basket percentage increases for FYs 2023 through 2025 to the applicable estimated reasonable cost amount (previously described) in order to model the estimated FY 2025 reasonable cost amount under the demonstration. We believe that the IPPS market basket percentage increases appropriately indicate the trend of increase in inpatient hospital operating costs under the reasonable cost methodology for the years involved.

Step 2: For each of the participating hospitals, we identify the estimated amount that would otherwise be paid in FY 2025 under applicable Medicare payment methodologies for covered inpatient hospital services, including swing beds (as indicated on the same set of “as submitted” cost reports as in Step 1), if the demonstration were not implemented. We sum these hospital-specific amounts, and, in turn, multiply this sum by the FYs 2023, 2024, and 2025 IPPS applicable percentage increases. (For FY 2025, we are using the applicable percentage increase, per section V.B. of the preamble of this final rule). This methodology differs from Step 1, in which we apply the market basket percentage increases to the hospitals’ applicable estimated reasonable cost amount for covered inpatient hospital services. We believe that the IPPS applicable percentage increases are appropriate factors to update the estimated amounts that generally would otherwise be paid without the demonstration. This is because IPPS payments constitute the largest part of the payments that would otherwise be made without the demonstration and the applicable percentage increase is the factor used under the IPPS to update the inpatient hospital payment rates.

Step 3: We subtract the amount derived in Step 2 from the amount derived in Step 1. According to our methodology, the resulting amount indicates the total difference

for the 22 hospitals (for covered inpatient hospital services, including swing beds), which will be the general estimated amount of the costs of the demonstration for FY 2025.

For this final rule, the resulting amount is \$49,914,526, to be incorporated into the budget neutrality offset adjustment for FY 2025. This estimated amount is based on the specific assumptions regarding the data sources used, that is, recently available “as submitted” cost reports and revised historical update factors for cost and payment for the FY 2025 IPPS final rule.

(2) Reconciling Actual and Estimated Costs of the Demonstration for Previous Years

As described earlier, we have calculated the difference for FYs 2005 through 2018 between the actual costs of the demonstration, as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years.

At this time, for the FY 2025 final rule, all of the finalized cost reports are available for the 27 hospitals that completed cost report periods beginning in FY 2019 under the demonstration payment methodology. We have determined the actual costs of the demonstration for FY 2019 based on these cost reports to be \$40,429,606. (We note that the Medicare Administrative Contractors (MACs) have corrected the calculation of cost amounts under the demonstration for several of the participating hospitals, and that, although the MACs have not issued the final revised cost reports, we have included these revised cost amounts for these specific hospitals in our determination of the total cost amount for FY 2019).

The estimated amount for the demonstration costs for FY 2019 that was incorporated into the finalized budget neutrality offset amount in the 2019 IPPS final rule was \$70,929,313. (83 FR 41504). Therefore, the actual costs of the demonstration for FY 2019 as determined from finalized cost reports fell short of this estimated amount by \$30,499,707. In keeping with previous policy, we are subtracting the amount of this

difference for the prior year (that is, \$30,499,707) for FY 2019) from the estimated amount of the costs of the demonstration for the upcoming fiscal year, (that is, \$49,914,526 for FY 2025) in determining the total budget neutrality offset amount for FY 2025

(3) Total Budget Neutrality Offset Amount for FY 2025

Therefore, for this FY 2025 IPPS/LTCH PPS final rule, the final budget neutrality offset amount for FY 2025 is the difference between: (1) \$49,914,526, which is the amount determined under section II.A.4.h. of the Addendum of this final rule, representing the difference applicable to FY 2025 between the sum of the estimated reasonable cost amounts that would be paid under the demonstration for covered inpatient services to the 22 hospitals eligible to participate in the fiscal year and the sum of the estimated amounts that would generally be paid if the demonstration had not been implemented; and (2) \$30,499,707, which is the difference between the estimated costs for the demonstration for FY 2019, which was incorporated into the finalized budget neutrality offset amount for 2019, and the actual costs of the demonstration for FY 2019, determined from finalized cost reports for the 27 hospitals that participated in FY 2019. This difference between (1) and (2) is \$19,414,819, representing the budget neutrality offset amount to be applied to the national IPPS payment rates for FY 2025.

Comment: The parent company for two of the participating hospitals expressed support for the continuation of the of the Rural Community Hospital Demonstration program, while noting that it does not offer long-term financial stability needed to maintain health care access in rural areas. The commenter requests that the demonstration be made a permanent program, and, in addition, that CMS institute an application process to ensure the demonstration meets program capacity. Furthermore, the commenter requests several technical adjustments to the administration of the demonstration that may enhance stability in the payment to the participating hospitals.

Response: We appreciate the comments. We have conducted the demonstration program in accordance with Congressional mandates. Title XVIII does not extend authority to make the demonstration a permanent program. With regard to any further actions, we intend to work with the commenter and other rural stakeholders to examine the issues involved.

VI. Changes to the IPPS for Capital-Related Costs

A. Overview

Section 1886(g) of the Act requires the Secretary to pay for the capital-related costs of inpatient acute hospital services in accordance with a prospective payment system established by the Secretary. Under the statute, the Secretary has broad authority in establishing and implementing the IPPS for acute care hospital inpatient capital-related costs. We initially implemented the IPPS for capital-related costs in the FY 1992 IPPS final rule (56 FR 43358). In that final rule, we established a 10-year transition period to change the payment methodology for Medicare hospital inpatient capital-related costs from a reasonable cost-based payment methodology to a prospective payment methodology (based fully on the Federal rate).

FY 2001 was the last year of the 10-year transition period that was established to phase in the IPPS for hospital inpatient capital-related costs. For cost reporting periods beginning in FY 2002, capital IPPS payments are based solely on the Federal rate for almost all acute care hospitals (other than hospitals receiving certain exception payments and certain new hospitals). (We refer readers to the FY 2002 IPPS final rule (66 FR 39910 through 39914) for additional information on the methodology used to determine capital IPPS payments to hospitals both during and after the transition period.)

The basic methodology for determining capital prospective payments using the Federal rate is set forth in the regulations at 42 CFR 412.312. For the purpose of calculating capital payments for each discharge, the standard Federal rate is adjusted as follows:

(Standard Federal Rate) x (DRG Weight) x (Geographic Adjustment Factor (GAF) x (COLA for hospitals located in Alaska and Hawaii) x (1 + Capital DSH Adjustment Factor + Capital IME Adjustment Factor, if applicable).

In addition, under § 412.312(c), hospitals also may receive outlier payments under the capital IPPS for extraordinarily high-cost cases that qualify under the thresholds established for each fiscal year.

B. Additional Provisions

1. Exception Payments

The regulations at 42 CFR 412.348 provide for certain exception payments under the capital IPPS. The regular exception payments provided under § 412.348(b) through (e) were available only during the 10-year transition period. For a certain period after the transition period, eligible hospitals may have received additional payments under the special exceptions provisions at § 412.348(g). However, FY 2012 was the final year hospitals could receive special exceptions payments. For additional details regarding these exceptions policies, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).

Under § 412.348(f), a hospital may request an additional payment if the hospital incurs unanticipated capital expenditures in excess of \$5 million due to extraordinary circumstances beyond the hospital's control. Additional information on the exception payment for extraordinary circumstances in § 412.348(f) can be found in the FY 2005 IPPS final rule (69 FR 49185 and 49186).

2. New Hospitals

Under the capital IPPS, the regulations at 42 CFR 412.300(b) define a new hospital as a hospital that has operated (under previous or current ownership) for less than 2 years and lists examples of hospitals that are not considered new hospitals. In accordance with § 412.304(c)(2), under the capital IPPS, a new hospital is paid 85 percent of its allowable Medicare inpatient hospital capital related costs through its first 2 years of operation, unless the new hospital elects to receive full prospective payment based on 100 percent of the Federal rate. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725) for additional information on payments to new hospitals under the capital IPPS.

3. Payments for Hospitals Located in Puerto Rico

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57061), we revised the regulations at 42 CFR 412.374 relating to the calculation of capital IPPS payments to hospitals located in

Puerto Rico beginning in FY 2017 to parallel the change in the statutory calculation of operating IPPS payments to hospitals located in Puerto Rico, for discharges occurring on or after January 1, 2016, made by section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114-113). Section 601 of Public Law 114-113 increased the applicable Federal percentage of the operating IPPS payment for hospitals located in Puerto Rico from 75 percent to 100 percent and decreased the applicable Puerto Rico percentage of the operating IPPS payments for hospitals located in Puerto Rico from 25 percent to zero percent, applicable to discharges occurring on or after January 1, 2016. As such, under revised § 412.374, for discharges occurring on or after October 1, 2016, capital IPPS payments to hospitals located in Puerto Rico are based on 100 percent of the capital Federal rate.

C. Annual Update for FY 2025

The annual update to the national capital Federal rate, as provided for in 42 CFR 412.308(c), for FY 2025 is discussed in section III. of the Addendum to this FY 2025 IPPS/LTCH PPS final rule.

Comment: A commenter encouraged CMS to expand capital DSH eligibility to geographically rural hospitals. The commenter believes this would bolster the rural health care safety net. The commenter cited negative capital margins at geographically rural hospitals, low occupancy rates in geographically rural hospitals, as well as recent closure of geographically rural hospitals as reasons why expanding capital DSH eligibility to geographically rural hospitals would be justified.

Response: We believe this comment is out of scope of this rulemaking. We thank the commenter for this suggestion and may consider it in future rulemaking. We note that the capital DSH payment adjustments were finalized in the FY 1992 IPPS final rule (56 FR 43377 through 43379) based on a cost regression analysis.

Comment: A commenter stated that the cost of capital improvements required to reduce the spread of airborne infections should be included under the capital IPPS.

Response: We appreciate the commenter's interest in capital project investments related to airborne infections. The regulations on capital-related costs can be found in subpart G of part 413 of Title 42 of the CFR. In general, we believe these regulations do not preclude such costs as being considered allowable capital-related costs. As described previously, the statute requires capital-related costs of inpatient acute hospital services be paid under a prospective payment system established by the Secretary. The basic methodology for determining prospective payments under the capital IPPS is set forth in the regulations at 42 CFR 412.312.

VII. Changes for Hospitals Excluded from the IPPS

A. Rate-of-Increase in Payments to Excluded Hospitals for FY 2025

Certain hospitals excluded from a prospective payment system, including children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling. A per discharge limit (the target amount, as defined in § 413.40(a) of the regulations) is set for each hospital based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage. For each cost reporting period, the updated target amount is multiplied by total Medicare discharges during that period and applied as an aggregate upper limit (the ceiling as defined in § 413.40(a)) of Medicare reimbursement for total inpatient operating costs for a hospital's cost reporting period. In accordance with § 403.752(a) of the regulations, religious nonmedical health care institutions (RNHCIs) also are subject to the rate-of-increase limits established under § 413.40 of the regulations discussed previously. Furthermore, in accordance with § 412.526(c)(3) of the regulations, extended neoplastic disease care hospitals also are subject to the rate-of-increase limits established under § 413.40 of the regulations discussed previously.

As explained in the FY 2006 IPPS final rule (70 FR 47396 through 47398), beginning with FY 2006, we have used the percentage increase in the IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, and RNHCIs.

Consistent with the regulations at §§ 412.23(g) and 413.40(a)(2)(ii)(A) and (c)(3)(viii), we also have used the percentage increase in the IPPS operating market basket to update target amounts for short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. In the FY 2018 IPPS/LTCH PPS final rule, we rebased and revised the IPPS operating market basket to a 2014 base year, effective for FY 2018

and subsequent fiscal years (82 FR 38158 through 38175), and finalized the use of the percentage increase in the 2014-based IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2018 and subsequent fiscal years. As discussed in section IV. of the preamble of the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45207), we rebased and revised the IPPS operating market basket to a 2018 base year. Therefore, we used the percentage increase in the 2018-based IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2022 and subsequent fiscal years.

For the FY 2025 IPPS/LTCH PPS proposed rule, based on IGI's 2023 fourth quarter forecast, we estimated that the 2018-based IPPS operating market basket percentage increase for FY 2025 would be 3.0 percent (that is, the estimate of the market basket rate-of-increase). Based on this estimate, the FY 2025 rate-of-increase percentage that we proposed to apply to the FY 2024 target amounts in order to calculate the FY 2025 target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa was 3.0 percent, in accordance with the applicable regulations at 42 CFR 413.40. However, we proposed that if more recent data became available for the FY 2025 IPPS/LTCH PPS final rule, we would use such data, if appropriate, to calculate the final IPPS operating market basket update for FY 2025. Based on more recent data available (IGI's second quarter 2024 forecast), we estimate that the 2018-based IPPS operating market basket percentage increase for FY 2025 is 3.4 percent (that is, the estimate of the market basket rate-of-increase). Based on this estimate, the FY 2025 rate-of-increase percentage that we will apply to the FY 2024 target amounts in order to calculate the FY 2025 target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term

acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is 3.4 percent, in accordance with the applicable regulations at 42 CFR 413.40.

In addition, payment for inpatient operating costs for hospitals classified under section 1886(d)(1)(B)(vi) of the Act (which we refer to as “extended neoplastic disease care hospitals”) for cost reporting periods beginning on or after January 1, 2015, is to be made as described in 42 CFR 412.526(c)(3), and payment for capital costs for these hospitals is to be made as described in 42 CFR 412.526(c)(4). (For additional information on these payment regulations, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38321 through 38322).) Section 412.526(c)(3) provides that the hospital’s Medicare allowable net inpatient operating costs for that period are paid on a reasonable cost basis, subject to that hospital’s ceiling, as determined under § 412.526(c)(1), for that period. Under § 412.526(c)(1), for each cost reporting period, the ceiling was determined by multiplying the updated target amount, as defined in § 412.526(c)(2), for that period by the number of Medicare discharges paid during that period. Section 412.526(c)(2)(i) describes the method for determining the target amount for cost reporting periods beginning during FY 2015. Section 412.526(c)(2)(ii) specifies that, for cost reporting periods beginning during fiscal years after FY 2015, the target amount will equal the hospital’s target amount for the previous cost reporting period updated by the applicable annual rate-of-increase percentage specified in § 413.40(c)(3) for the subject cost reporting period (79 FR 50197).

For FY 2025, in accordance with §§ 412.22(i) and 412.526(c)(2)(ii) of the regulations, for cost reporting periods beginning during FY 2025, the proposed update to the target amount for extended neoplastic disease care hospitals (that is, hospitals described under § 412.22(i)) is the applicable annual rate-of-increase percentage specified in § 413.40(c)(3), which was estimated to be the percentage increase in the 2018-based IPPS operating market basket (that is, the estimate of the market basket rate-of-increase). Accordingly, the proposed update to an extended neoplastic disease care hospital’s target amount for FY 2025 was 3.0 percent, which

was based on IGI's fourth quarter 2023 forecast. Furthermore, we proposed that if more recent data became available for the FY 2025 IPPS/LTCH PPS final rule, we would use such data, if appropriate, to calculate the IPPS operating market basket rate of increase for FY 2025. Based on more recent data available (IGI's second quarter 2024 forecast), we estimate that the 2018-based IPPS operating market basket percentage increase for FY 2025 is 3.4 percent (that is, the estimate of the market basket rate-of-increase). Accordingly, the FY 2025 rate-of-increase percentage that we will apply to the FY 2024 target amounts in order to calculate the FY 2025 target amounts to an extended neoplastic disease care hospital is 3.4 percent, which is based on IGI's second quarter 2024 forecast.

We received no comments on this proposal and therefore are finalizing this provision without modification. Incorporating more recent data available for this final rule, as we proposed, we are adopting a 3.4 percent update for FY 2025.

B. Report on Adjustment (Exception) Payments

Section 4419(b) of Public Law 105–33 requires the Secretary to publish annually in the **Federal Register** a report describing the total amount of adjustment payments made to excluded hospitals and hospital units by reason of section 1886(b)(4) of the Act during the previous fiscal year.

The process of requesting, reviewing, and awarding an adjustment payment is likely to occur over a 2-year period or longer. First, generally, an excluded hospital must file its cost report for the fiscal year in accordance with § 413.24(f)(2) of the regulations. The MAC reviews the cost report and issues a notice of provider reimbursement (NPR). Once the hospital receives the NPR, if its operating costs are in excess of the ceiling, the hospital may file a request for an adjustment payment. After the MAC receives the hospital's request in accordance with applicable regulations, the MAC or CMS, depending on the type of adjustment requested, reviews the request and determines if an adjustment payment is warranted. This determination is sometimes not made until more than 180 days after the date the request is filed because there are

times when the request applications are incomplete and additional information must be requested in order to have a completed request application. However, in an attempt to provide interested parties with data on the most recent adjustment payments for which we have data, we are publishing data on adjustment payments that were processed by the MAC or CMS during FY 2023.

The table that follows includes the most recent data available from the MACs and CMS on adjustment payments that were adjudicated during FY 2023. As indicated previously, the adjustments made during FY 2023 only pertain to cost reporting periods ending in years prior to FY 2023. Total adjustment payments made to IPPS-excluded hospitals during FY 2023 are \$98,720,259.00. The table depicts for each class of hospitals, in the aggregate, the number of adjustment requests adjudicated, the excess operating costs over the ceiling, and the amount of the adjustment payments.

Class of Hospital	Number	Excess Cost Over Ceiling	Adjustment Payments
Cancer Hospitals	11	\$285,044,869	\$96,054,746
Children's Hospitals	4	\$4,472,925	\$2,315,097
RNHCI's	1	\$371,175	\$298,667
Psychiatric Hospitals	1	\$51,749	\$51,749
Total	17	\$289,940,718	\$98,720,259

B. Critical Access Hospitals (CAHs)

1. Background

Section 1820 of the Act provides for the establishment of Medicare Rural Hospital Flexibility Programs (MRHFPs), under which individual States may designate certain facilities as critical access hospitals (CAHs). Facilities that are so designated and meet the CAH conditions of participation under 42 CFR part 485, subpart F, will be certified as CAHs by CMS. Regulations governing payments to CAHs for services to Medicare beneficiaries are located in 42 CFR part 413.

2. Frontier Community Health Integration Project Demonstration

a. Introduction

The Frontier Community Health Integration Project Demonstration was originally authorized by section 123 of the Medicare Improvements for Patients and Providers Act of 2008 (Pub. L. 110-275). The demonstration has been extended by section 129 of the Consolidated Appropriations Act, 2021 (Pub. L. 116-260) for an additional 5 years. In this final rule, we are summarizing the status of the demonstration program, and the ongoing methodologies for implementation and budget neutrality for the demonstration extension period.

b. Background and Overview

As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59119 through 59122), section 123 of the Medicare Improvements for Patients and Providers Act of 2008, as amended by section 3126 of the Affordable Care Act, authorized a demonstration project to allow eligible entities to develop and test new models for the delivery of health care services in eligible counties to improve access to and better integrate the delivery of acute care, extended care and other health care services to Medicare beneficiaries. The demonstration was titled “Demonstration Project on Community Health Integration Models in Certain Rural Counties,” and commonly known as the Frontier Community Health Integration Project (FCHIP) Demonstration.

The authorizing statute stated the eligibility criteria for entities to be able to participate in the demonstration. An eligible entity, as defined in section 123(d)(1)(B) of Public Law 110–275, as amended, is a Medicare Rural Hospital Flexibility Program (MRHFP) grantee under section 1820(g) of the Act (that is, a CAH); and is located in a state in which at least 65 percent of the counties in the state are counties that have 6 or less residents per square mile.

The authorizing statute stipulated several other requirements for the demonstration. In addition, section 123(g)(1)(B) of Public Law 110–275 required that the demonstration be budget neutral. Specifically, this provision stated that, in conducting the demonstration project, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project under the section were not implemented. Furthermore, section 123(i) of Public Law 110–275 stated that the Secretary may waive such requirements of titles XVIII and XIX of the Act as may be necessary and appropriate for the purpose of carrying out the demonstration project, thus allowing the waiver of Medicare payment rules encompassed in the demonstration. CMS selected CAHs to participate in four interventions, under which specific waivers of Medicare payment rules would allow for enhanced payment for telehealth, skilled nursing facility/nursing facility beds, ambulance services, and home health services. These waivers were formulated with the goal of increasing access to care with no net increase in costs.

Section 123 of Pub L. 110-275 initially required a 3-year period of performance. The FCHIP Demonstration began on August 1, 2016, and concluded on July 31, 2019 (referred to in this section of the final rule as the “initial period”). Subsequently, section 129 of the Consolidated Appropriations Act, 2021 (Pub. L. 116-260) extended the demonstration by 5 years (referred to in this section of the final rule as the “extension period”). The Secretary is required to conduct the demonstration for an additional 5-year period. CAHs participating in the demonstration project during the extension period began such participation in their cost reporting year that began on or after January 1, 2022.

As described in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59119 through 59122), 10 CAHs were selected for participation in the demonstration initial period. The selected CAHs were located in three states – Montana, Nevada, and North Dakota – and participated in three of the four interventions identified in the FY 2024 IPPS/LTCH PPS final rule. Each CAH was allowed to participate in more than one of the interventions. None of the selected CAHs were participants in the home health intervention, which was the fourth intervention.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), CMS concluded that the initial period of the FCHIP Demonstration (covering the performance period of August 1, 2016, to July 31, 2019) had satisfied the budget neutrality requirement described in section 123(g)(1)(B) of Pub L. 110-275. Therefore, CMS did not apply a budget neutrality payment offset policy for the initial period of the demonstration.

Section 129 of Public Law 116-260, stipulates that only the 10 CAHs that participated in the initial period of the FCHIP Demonstration are eligible to participate during the extension period. Among the eligible CAHs, five have elected to participate in the extension period. The selected CAHs are located in two states – Montana and North Dakota – and are implementing three of the four interventions. The eligible CAH participants elected to change the number of interventions and payment waivers they would participate in during the extension period. CMS accepted and approved the CAHs intervention and payment waiver updates. For the extension period, five CAHs are participants in the telehealth intervention, three CAHs are participants in the skilled nursing facility/nursing facility bed intervention, and three CAHs are participants in the ambulance services intervention. As with the initial period, each CAH was allowed to participate in more than one of the interventions during the extension period. None of the selected CAHs are participants in the home health intervention, which was the fourth intervention.

c. Intervention Payment and Payment Waivers

As described in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59119 through 59122), CMS waived certain Medicare rules for CAHs participating in the demonstration initial period to allow for alternative reasonable cost-based payment methods in the three distinct intervention service areas: telehealth services, ambulance services, and skilled nursing facility/nursing facility (SNF/NF) beds expansion. The payments and payment waiver provisions only apply if the CAH is a participant in the associated intervention. CMS Intervention Payment and Payment Waivers for the demonstration extension period consist of the following:

(1) Telehealth Services Intervention Payments

CMS waives section 1834(m)(2)(B) of the Act, which specifies the facility fee to the originating site for Medicare telehealth services. CMS modifies the facility fee payment specified under section 1834(m)(2)(B) of the Act to make reasonable cost-based reimbursement to the participating CAH where the participating CAH serves as the originating site for a telehealth service furnished to an eligible telehealth individual, as defined in section 1834(m)(4)(B) of the Act. CMS reimburses the participating CAH serving as the originating site at 101 percent of its reasonable costs for overhead, salaries and fringe benefits associated with telehealth services at the participating CAH. CMS does not fund or provide reimbursement to the participating CAH for the purchase of new telehealth equipment.

CMS waives section 1834(m)(2)(A) of the Act, which specifies that the payment for a telehealth service furnished by a distant site practitioner is the same as it would be if the service had been furnished in-person. CMS modifies the payment amount specified for telehealth services under section 1834(m)(2)(A) of the Act to make reasonable cost-based reimbursement to the participating CAH for telehealth services furnished by a physician or practitioner located at distant site that is a participating CAH that is billing for the physician or practitioner professional services. Whether the participating CAH has or has not elected Optional Payment Method II for outpatient services, CMS would pay the participating CAH 101 percent of reasonable costs for telehealth services when a physician or practitioner has reassigned their

billing rights to the participating CAH and furnishes telehealth services from the participating CAH as a distant site practitioner. This means that participating CAHs that are billing under the Standard Method on behalf of employees who are physicians or practitioners (as defined in section 1834(m)(4)(D) and (E) of the Act, respectively) would be eligible to bill for distant site telehealth services furnished by these physicians and practitioners. Additionally, CAHs billing under the Optional Method would be reimbursed based on 101 percent of reasonable costs, rather than paid based on the Medicare physician fee schedule, for the distant site telehealth services furnished by physicians and practitioners who have reassigned their billing rights to the CAH. For distant site telehealth services furnished by physicians or practitioners who have not reassigned billing rights to a participating CAH, payment to the distant site physician or practitioner would continue to be made as usual under the Medicare physician fee schedule. Except as described herein, CMS does not waive any other provisions of section 1834(m) of the Act for purposes of the telehealth services intervention payments, including the scope of Medicare telehealth services as established under section 1834(m)(4)(F) of the Act.

(2) Ambulance Services Intervention Payments

CMS waives 42 CFR 413.70(b)(5)(i)(D) and section 1834(l)(8) of the Act, which provides that payment for ambulance services furnished by a CAH, or an entity owned and operated by a CAH, is 101 percent of the reasonable costs of the CAH or the entity in furnishing the ambulance services, but only if the CAH or the entity is the only provider or supplier of ambulance services located within a 35-mile drive of the CAH, excluding ambulance providers or suppliers that are not legally authorized to furnish ambulance services to transport individuals to or from the CAH. The participating CAH would be paid 101 percent of reasonable costs for its ambulance services regardless of whether there is any provider or supplier of ambulance services located within a 35-mile drive of the participating CAH or participating CAH-owned and operated entity. CMS would not make cost-based payment to the participating CAH for any

new capital (for example, vehicles) associated with ambulance services. This waiver does not modify any other Medicare rules regarding or affecting the provision of ambulance services.

(3) SNF/NF Beds Expansion Intervention Payments

CMS waives 42 CFR 485.620(a), 42 CFR 485.645(a)(2), and section 1820(c)(2)(B)(iii) of the Act which limit CAHs to maintaining no more than 25 inpatient beds, including beds available for acute inpatient or swing bed services. CMS waives 1820(f) of the Act permitting designating or certifying a facility as a critical access hospital for which the facility at any time is furnishing inpatient beds which exceed more than 25 beds. Under this waiver, if the participating CAH has received swing bed approval from CMS, the participating CAH may maintain up to ten additional beds (for a total of 35 beds) available for acute inpatient or swing bed services; however, the participating CAH may only use these 10 additional beds for nursing facility or skilled nursing facility level of care. CMS would pay the participating CAH 101 percent of reasonable costs for its SNF/NF services furnished in the 10 additional beds.

d. Budget Neutrality

(1) Budget Neutrality Requirement

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), we finalized a policy to address the budget neutrality requirement for the demonstration initial period. As explained in the FY 2022 IPPS/LTCH PPS final rule, we based our selection of CAHs for participation in the demonstration with the goal of maintaining the budget neutrality of the demonstration on its own terms meaning that the demonstration would produce savings from reduced transfers and admissions to other health care providers, offsetting any increase in Medicare payments as a result of the demonstration. However, because of the small size of the demonstration and uncertainty associated with the projected Medicare utilization and costs, the policy we finalized for the demonstration initial period of performance in the FY 2022 IPPS/LTCH PPS final rule provides a contingency plan to ensure that the budget neutrality requirement in section 123 of Public Law 110-275 is met.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49144 through 49147), we adopted the same budget neutrality policy contingency plan used during the demonstration initial period to ensure that the budget neutrality requirement in section 123 of Public Law 110 275 is met during the demonstration extension period. If analysis of claims data for Medicare beneficiaries receiving services at each of the participating CAHs, as well as from other data sources, including cost reports for the participating CAHs, shows that increases in Medicare payments under the demonstration during the 5-year extension period are not sufficiently offset by reductions elsewhere, we would recoup the additional expenditures attributable to the demonstration through a reduction in payments to all CAHs nationwide.

As explained in the FY 2023 IPPS/LTCH PPS final rule, because of the small scale of the demonstration, we indicated that we did not believe it would be feasible to implement budget neutrality for the demonstration extension period by reducing payments to only the participating CAHs. Therefore, in the event that this demonstration extension period is found to result in aggregate payments in excess of the amount that would have been paid if this demonstration extension period were not implemented, CMS policy is to comply with the budget neutrality requirement finalized in the FY 2023 IPPS/LTCH PPS final rule, by reducing payments to all CAHs, not just those participating in the demonstration extension period.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49144 through 49147), we stated that we believe it is appropriate to make any payment reductions across all CAHs because the FCHIP Demonstration was specifically designed to test innovations that affect delivery of services by the CAH provider category. We explained our belief that the language of the statutory budget neutrality requirement at section 123(g)(1)(B) of Public Law 110–275 permits the agency to implement the budget neutrality provision in this manner. The statutory language merely refers to ensuring that aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project was not implemented and does not identify the range across which aggregate payments must be held equal.

In the FY 2023 IPPS/LTCH PPS final rule, we finalized a policy that in the event the demonstration extension period is found not to have been budget neutral, any excess costs would be recouped within one fiscal year. We explained our belief that this policy is a more efficient timeframe for the government to conclude the demonstration operational requirements (such as analyzing claims data, cost report data or other data sources) to adjudicate the budget neutrality payment recoupment process due to any excess cost that occurred as result of the demonstration extension period.

(2) FCHIP Budget Neutrality Methodology and Analytical Approach

As explained in the FY 2022 IPPS/LTCH PPS final rule, we finalized a policy to address the demonstration budget neutrality methodology and analytical approach for the initial period of the demonstration. In the FY 2023 IPPS/LTCH PPS final rule, we finalized a policy to adopt the budget neutrality methodology and analytical approach used during the demonstration initial period to ensure budget neutrality for the extension period. The analysis of budget neutrality during the initial period of the demonstration identified both the costs related to providing the intervention services under the FCHIP Demonstration and any potential downstream effects of the intervention-related services, including any savings that may have accrued.

The budget neutrality analytical approach for the demonstration initial period incorporated two major data components: (1) Medicare cost reports; and (2) Medicare administrative claims. As described in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), CMS computed the cost of the demonstration for each fiscal year of the demonstration initial period using Medicare cost reports for the participating CAHs, and Medicare administrative claims and enrollment data for beneficiaries who received demonstration intervention services.

In addition, to capture the full impact of the interventions, CMS developed a statistical modeling, Difference-in-Difference (DiD) regression analysis to estimate demonstration expenditures and compute the impact of expenditures on the intervention services by comparing

cost data for the demonstration and non-demonstration groups using Medicare administrative claims across the demonstration period of performance under the initial period of the demonstration. The DiD regression analysis would compare the direct cost and potential downstream effects of intervention services, including any savings that may have accrued, during the baseline and performance period for both the demonstration and comparison groups.

Second, the Medicare administrative claims analysis would be reconciled using data obtained from auditing the participating CAHs' Medicare cost reports. We would estimate the costs of the demonstration using "as submitted" cost reports for each hospital's financial fiscal year participation within each of the demonstration extension period performance years. Each CAH has its own Medicare cost report end date applicable to the 5-year period of performance for the demonstration extension period. The cost report is structured to gather costs, revenues and statistical data on the provider's financial fiscal period. As a result, we finalized a policy in the FY 2023 IPPS/LTCH PPS final rule that we would determine the final budget neutrality results for the demonstration extension once complete data is available for each CAH for the demonstration extension period.

e. Policies for Implementing the 5-year Extension and Provisions Authorized by Section 129 of the Consolidated Appropriations Act, 2021 (Pub. L. 116-260)

As stated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59119 through 59122), our policy for implementing the 5-year extension period for section 129 of Public Law 116-260 follows same budget neutrality methodology and analytical approach as the demonstration initial period methodology. While we expect to use the same methodology that was used to assess the budget neutrality of the FCHIP Demonstration during initial period of the demonstration to assess the financial impact of the demonstration during this extension period, upon receiving data for the extension period, we may update and/or modify the FCHIP budget neutrality methodology and analytical approach to ensure that the full impact of the demonstration is appropriately captured.

f. Total Budget Neutrality Offset Amount for FY 2025.

At this time, for the FY 2025 IPPS/LTCH PPS final rule, while this discussion represents our anticipated approach to assessing the financial impact of the demonstration extension period based on upon receiving data for the full demonstration extension period, we may update and/or modify the FCHIP Demonstration budget neutrality methodology and analytical approach to ensure that the full impact of the demonstration is appropriately captured.

Therefore, we did not propose to apply a budget neutrality payment offset to payments to CAHs in FY 2025. This policy would have no impact for any national payment system for FY 2025. We received no comments on this provision and therefore are finalizing this provision without modification.

VIII. Changes to the Long-Term Care Hospital Prospective Payment System (LTCH PPS) for FY 2025

A. Background of the LTCH PPS

1. Legislative and Regulatory Authority

Section 123 of the Medicare, Medicaid, and SCHIP (State Children's Health Insurance Program) Balanced Budget Refinement Act of 1999 (BBRA) (Pub. L. 106-113), as amended by section 307(b) of the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA) (Pub. L. 106-554), provides for payment for both the operating and capital-related costs of hospital inpatient stays in long-term care hospitals (LTCHs) under Medicare Part A based on prospectively set rates. The Medicare prospective payment system (PPS) for LTCHs applies to hospitals that are described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002.

Section 1886(d)(1)(B)(iv)(I) of the Act originally defined an LTCH as a hospital that has an average inpatient length of stay (as determined by the Secretary) of greater than 25 days.

Section 1886(d)(1)(B)(iv)(II) of the Act also provided an alternative definition of LTCHs ("subclause II" LTCHs). However, section 15008 of the 21st Century Cures Act (Pub. L. 114-255) amended section 1886 of the Act to exclude former "subclause II" LTCHs from being paid under the LTCH PPS and created a new category of IPPS-excluded hospitals, which we refer to as "extended neoplastic disease care hospitals," to be paid as hospitals that were formally classified as "subclause (II)" LTCHs (82 FR 38298).

Section 123 of the BBRA requires the PPS for LTCHs to be a "per discharge" system with a diagnosis-related group (DRG) based patient classification system that reflects the differences in patient resource use and costs in LTCHs.

Section 307(b)(1) of the BIPA, among other things, mandates that the Secretary shall examine, and may provide for, adjustments to payments under the LTCH PPS, including

adjustments to DRG weights, area wage adjustments, geographic reclassification, outliers, updates, and a disproportionate share adjustment.

In the August 30, 2002, **Federal Register** (67 FR 55954), we issued a final rule that implemented the LTCH PPS authorized under the BBRA and BIPA. For the initial implementation of the LTCH PPS (FYs 2003 through 2007), the system used information from LTCH patient records to classify patients into distinct long-term care-diagnosis-related groups (LTCDRGs) based on clinical characteristics and expected resource needs. Beginning in FY 2008, we adopted the Medicare severity-long-term care-diagnosis related groups (MS-LTC-DRGs) as the patient classification system used under the LTCH PPS. Payments are calculated for each MS-LTC-DRG and provisions are made for appropriate payment adjustments. Payment rates under the LTCH PPS are updated annually and published in the **Federal Register**.

The LTCH PPS replaced the reasonable cost-based payment system under the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) (Pub. L. 97248) for payments for inpatient services provided by an LTCH with a cost reporting period beginning on or after October 1, 2002. (The regulations implementing the TEFRA reasonable-cost-based payment provisions are located at 42 CFR part 413.) With the implementation of the PPS for acute care hospitals authorized by the Social Security Amendments of 1983 (Pub. L. 98-21), which added section 1886(d) to the Act, certain hospitals, including LTCHs, were excluded from the PPS for acute care hospitals and paid their reasonable costs for inpatient services subject to a per discharge limitation or target amount under the TEFRA system. For each cost reporting period, a hospital specific ceiling on payments was determined by multiplying the hospital's updated target amount by the number of total current year Medicare discharges. (Generally, in this section of the preamble of this final rule, when we refer to discharges, we describe Medicare discharges.) The August 30, 2002, final rule further details the payment policy under the TEFRA system (67 FR 55954).

In the August 30, 2002, final rule, we provided for a 5-year transition period from payments under the TEFRA system to payments under the LTCH PPS. During this 5-year transition period, an LTCH's total payment under the PPS was based on an increasing percentage of the Federal rate with a corresponding decrease in the percentage of the LTCH PPS payment that is based on reasonable cost concepts, unless an LTCH made a one-time election to be paid based on 100 percent of the Federal rate. Beginning with LTCHs' cost reporting periods beginning on or after October 1, 2006, total LTCH PPS payments are based on 100 percent of the Federal rate.

In addition, in the August 30, 2002, final rule, we presented an in-depth discussion of the LTCH PPS, including the patient classification system, relative weights, payment rates, additional payments, and the budget neutrality requirements mandated by section 123 of the BBRA. The same final rule that established regulations for the LTCH PPS under 42 CFR part 412, subpart O, also contained LTCH provisions related to covered inpatient services, limitation on charges to beneficiaries, medical review requirements, furnishing of inpatient hospital services directly or under arrangement, and reporting and recordkeeping requirements. We refer readers to the August 30, 2002, final rule for a comprehensive discussion of the research and data that supported the establishment of the LTCH PPS (67 FR 55954).

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623), we implemented the provisions of the Pathway for Sustainable Growth Rate (SGR) Reform Act of 2013 (Pub. L. 113-67), which mandated the application of the "site neutral" payment rate under the LTCH PPS for discharges that do not meet the statutory criteria for exclusion beginning in FY 2016. For cost reporting periods beginning on or after October 1, 2015, discharges that do not meet certain statutory criteria for exclusion are paid based on the site neutral payment rate. Discharges that do meet the statutory criteria continue to receive payment based on the LTCH PPS standard Federal payment rate. For more information on the statutory requirements of the Pathway for SGR Reform Act of 2013, we refer readers to the FY 2016 IPPS/LTCH PPS final

rule (80 FR 49601 through 49623) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57068 through 57075).

In the FY 2018 IPPS/LTCH PPS final rule, we implemented several provisions of the 21st Century Cures Act (“the Cures Act”) (Pub. L. 114-255) that affected the LTCH PPS. (For more information on these provisions, we refer readers to (82 FR 38299).)

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41529), we made conforming changes to our regulations to implement the provisions of section 51005 of the Bipartisan Budget Act of 2018 (Pub. L. 115-123), which extends the transitional blended payment rate for site neutral payment rate cases for an additional 2 years. We refer readers to section VII.C. of the preamble of the FY 2019 IPPS/LTCH PPS final rule for a discussion of our final policy. In addition, in the FY 2019 IPPS/LTCH PPS final rule, we removed the 25-percent threshold policy under 42 CFR 412.538, which was a payment adjustment that was applied to payments for Medicare patient LTCH discharges when the number of such patients originating from any single referring hospital was in excess of the applicable threshold for given cost reporting period.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42439), we further revised our regulations to implement the provisions of the Pathway for SGR Reform Act of 2013 (Pub. L. 113-67) that relate to the payment adjustment for discharges from LTCHs that do not maintain the requisite discharge payment percentage and the process by which such LTCHs may have the payment adjustment discontinued.

2. Criteria for Classification as an LTCH

a. Classification as an LTCH

i. General

Under the regulations at § 412.23(e)(1), to qualify to be paid under the LTCH PPS, a hospital must have a provider agreement with Medicare. Furthermore, § 412.23(e)(2)(i), which implements section 1886(d)(1)(B)(iv) of the Act, requires that a hospital have an average Medicare inpatient length of stay of greater than 25 days to be paid under the LTCH PPS. In

accordance with section 1206(a)(3) of the Pathway for SGR Reform Act of 2013 (Pub. L. 113-67), as amended by section 15007 of Public Law 114-255, we amended our regulations to specify that Medicare Advantage plans' and site neutral payment rate discharges are excluded from the calculation of the average length of stay for all LTCHs, for discharges occurring in cost reporting period beginning on or after October 1, 2015.

ii. Proposed Technical Clarification

As explained more fully previously, LTCHs are required to have an average length of stay (ALOS) of greater than 25 days. Prior to a hospital being classified as an LTCH, the hospital must first participate in Medicare as a hospital (typically a hospital paid under the IPPS) during which time ALOS data is gathered. This data is used to determine whether the hospital has an ALOS of greater than 25 days, which is required to be classified as an LTCH. We generally refer to the period during which a hospital seeks to establish the required ALOS as a "qualifying period." The qualifying period is the 6-month period immediately preceding the hospital's conversion to an LTCH, and it has been our policy that the requisite ALOS must be demonstrated based on patient data from at least 5 consecutive months of this period. For example, for a hospital seeking to become an LTCH effective January 1, 2025, the qualifying period would be July 1, 2024 through December 31, 2024 (that is, the 6 months immediately preceding the conversion to an LTCH). In order for the hospital to convert to an LTCH, the ALOS must be demonstrated for a period of at least 5 consecutive months (for example, July 1, 2024 through November 30, 2024 or July 15, 2024 to December 14, 2024) of the 6 month qualifying period.

It has been our general policy to allow a hospital to be classified as an LTCH after only the 6-month qualifying period (as opposed to requiring the completion of the more typical 12-month cost reporting period). We have also referred to the ability of a hospital to be classified as an LTCH after a 6-month qualifying period in preamble previously (73 FR 29705), and the Provider Reimbursement Manual at 3001.4 refers to using data from a 6-month period

for hospitals which have not yet filed a cost report. However, our regulations have never explicitly articulated how the qualifying period policy applies to a hospital seeking classification as an LTCH. Therefore, we proposed to revise our regulations at 42 CFR 412.23(e)(4) to explicitly state that a hospital that seeks to be classified as an LTCH may do so after completion of a 6-month qualifying period, provided that the hospital demonstrates an average length of stay (calculated under our existing regulations) of greater than 25 days during at least five consecutive months of the 6-month qualifying period (which is the same timeframe as the “cure period” for existing LTCHs). Specifically, we proposed to add new paragraph § 412.23(e)(4)(iv) to explain the qualifying period for hospitals seeking LTCH classification.

Further, we proposed to revise certain paragraphs and reorder certain paragraphs in § 412.23(e) to improve the clarity of the regulation by clarifying how provisions apply to existing LTCHs and which provisions apply to hospitals seeking classification as an LTCH. First, we proposed to revise paragraph § 412.23(e)(3)(i) to cross-reference new subparagraphs § 412.23(e)(4)(iv) and (e)(4)(v). Second, we proposed to revise paragraph § 412.23(e)(3)(iii) to clarify that it applies in cases of hospitals that have already obtained LTCH classification when the LTCH would not otherwise maintain an average Medicare inpatient length of stay of greater than 25 days. Third, we proposed to reserve § 412.23(e)(3)(iv) and move that text to new (e)(4)(v) to clarify that this regulation applies to hospitals seeking new LTCH classification. Fourth, we proposed to revise § 412.23(e)(4) to clarify that the provisions of paragraph (e)(3), with the exception of subparagraphs (e)(3)(iii) and (v), apply to hospitals seeking new LTCH classification. Fifth, we proposed to revise paragraph § 412.23(e)(4)(i) to reflect the addition of new § 412.23(e)(4)(iv) and (e)(4)(v) and clarify existing regulatory language.

We noted that none of these proposed revisions reflect a change to our existing policy; instead, we stated that we believe these revisions will improve the clarity of the regulatory text and better reflect our existing policy.

Comment: Several commenters objected to our use of the word “consecutive” in the

proposed regulatory text revisions to codify our existing policy regarding the qualifying period for hospitals seeking to become LTCHs. These commenters believed that the use of the word “consecutive” was both not in accordance with our historical policy and unnecessarily strict. Rather than finalizing the proposed revision, these commenters argued that we should finalize a policy under which, for the qualifying period, hospitals should be able to demonstrate compliance with the ALOS requirement using the average lengths of stay calculated for non-consecutive months.

Response: While we acknowledge the concerns raised by the commenters, we believe that they have misunderstood our proposal. Our reference to “at least five consecutive months” is a reference to one, single, continuous period for which the ALOS would be calculated, just like the ALOS for an existing LTCH is calculated based on the entire cost reporting period, not each individual month therein, and the cure period for an LTCH which falls below the ALOS threshold for a cost reporting period is based on a single, continuous period of at least consecutive five months and not each individual month within that period. Further, we note that our proposed revision to the regulations refers specifically to “*an average length of stay*” (emphasis added) and not “average *lengths* of stay,” which would be how the regulation text for the calculation such as that opposed by commenters would be phrased. Our proposed revisions to the regulation text were not meant to reflect a policy under which the ALOS would be calculated during 5 separate months and the ALOS for each month must be greater than 25 days, as described by some commenters. Our proposed regulatory language was meant to reflect our current policy, under which the ALOS for the entire qualifying period, which must be at least 5 consecutive months, must be greater than 25 days.

However, in considering this comment, we noticed that our existing regulation text at § 412.23(e)(3)(iii) (which describes the “cure period” policy for when an existing LTCH’s ALOS does not meet the greater than 25 days threshold for a cost reporting period), § 412.23(e)(4)(iii) (which describes the rules for provider based satellite facilities or remote

locations of LTCHs becoming separately participating hospitals), § 412.23(e)(4)(v) (which describes the rules for hospitals seeking to participate in Medicare as LTCHs which experience a change of ownership), as well as our proposed clarification to § 412.23(e)(3)(iii), § 412.23(e)(4)(iii), and § 412.23(e)(4)(v) inadvertently omit the word “consecutive” when describing the time period for the calculation. We believe that this may be the source of commenters’ confusion on our proposed regulatory language describing how the calculation is performed for the qualifying period; i.e., that by using the word “consecutive” in the proposed clarification for the qualifying period but not for the cure period, our policy for calculating the ALOS in these situations would not be the same and that the calculation for qualifying periods would be more stringent than our policy for cure periods, provider based facilities becoming separately participating hospitals, and hospitals seeking to participate in Medicare as LTCHs which experience a change of ownership. This was not our intention in making our proposed clarification; rather, our intention was to amend our regulations such that the policy for calculating the ALOS for the qualifying period for a hospital seeking LTCH classification would be consistent with our policy for calculating an existing LTCH’s ALOS in other contexts. Therefore, in the interest of making our ALOS regulations as clear as possible, we believe it would be appropriate to make a conforming change to our proposed revisions to § 412.23(e)(3)(iii) , § 412.23(e)(4)(iii), and § 412.23(e)(4)(v) to add the word “consecutive.” Additionally, in the case of § 412.23(e)(4)(iii), we are adding “the period of at least” to the regulation, consistent with our language at § 412.23(e)(3)(iii) and § 412.23(e)(4)(iv) and (v). With these additions, the regulation text will be consistent and, we believe, more fully and accurately reflect our current policy. We wish to reassure commenters that, just like the calculation of the ALOS for the qualifying period, this will not change our existing policy for calculating the ALOS for an LTCH’s cure period. The cure period calculation at § 412.23(e)(3)(iii) will continue to be based on one, single, continuous period that is at least 5 consecutive months long and there is no requirement for the ALOS in each individual month to

be greater than 25 days.

We believe that, consistent with the way the ALOS is calculated for existing LTCHs, whether for cost reporting periods or cure periods, the ALOS for a hospital's qualifying period should be calculated based on one, single, continuous period. For this reason, we believe that the inclusion of the word "consecutive" is both appropriate and necessary in the regulation text and are finalizing our proposed addition of new paragraph § 412.23(e)(4)(iv). Moreover, for consistency with language used in § 412.23(e)(3)(iii) and § 412.23(e)(4)(iii), we are also adding "the period of" to the text of the finalized regulation. Additionally, in the interest of making our regulations consistent with each other and current policy, as discussed previously, we are adding the word "consecutive" to § 412.23(e)(3)(iii) and § 412.23(e)(4)(iii), and § 412.23(e)(4)(v) as well as the words "the period of at least" to § 412.23(e)(4)(iii). We note, as stated previously, these changes do not represent a change from existing policy, and are instead merely a clarification of our existing policy. We will also clarify in our guidance subsequent to this rule that the requirement is that the ALOS for the qualifying period or cure period, as applicable, in its entirety needs to be greater than 25 days, however it is not necessary for the ALOS in each individual month of that period be greater than 25 days.

We received no other comments with respect to our proposed reordering of and revisions to other paragraphs in 412.23 and as such are finalizing those proposals without modification.

Comment: Some commenters requested that we change the method by which we calculate the ALOS by excluding certain discharges, such as deaths and discharges associated with model demonstrations, from the calculation.

Response: We consider these comments outside the scope of the proposed rule as we did not make any policy proposals related to the method by which the ALOS would be calculated; however, we will keep these comments in mind for future rulemaking.

b. Hospitals Excluded from the LTCH PPS

The following hospitals are paid under special payment provisions, as described in § 412.22(c) and, therefore, are not subject to the LTCH PPS rules:

- Veterans Administration hospitals.
- Hospitals that are reimbursed under State cost control systems approved under 42 CFR part 403.
- Hospitals that are reimbursed in accordance with demonstration projects authorized under section 402(a) of the Social Security Amendments of 1967 (Pub. L. 90-248) (42 U.S.C. 1395b-1), section 222(a) of the Social Security Amendments of 1972 (Pub. L. 92-603) (42 U.S.C. 1395b1 (note)) (Statewide-all payer systems, subject to the rate-of increase test at section 1814(b) of the Act), or section 3021 of the Patient Protection and Affordable Care Act (Pub. L. 111-148) (42 U.S.C. 1315a).
- Nonparticipating hospitals furnishing emergency services to Medicare beneficiaries.

3. Limitation on Charges to Beneficiaries

In the August 30, 2002 final rule, we presented an in-depth discussion of beneficiary liability under the LTCH PPS (67 FR 55974 through 55975). This discussion was further clarified in the RY 2005 LTCH PPS final rule (69 FR 25676). In keeping with those discussions, if the Medicare payment to the LTCH is the full LTC-DRG payment amount, consistent with other established hospital prospective payment systems, § 412.507 currently provides that an LTCH may not bill a Medicare beneficiary for more than the deductible and coinsurance amounts as specified under §§ 409.82, 409.83, and 409.87, and for items and services specified under § 489.30(a). However, under the LTCH PPS, Medicare will only pay for services furnished during the days for which the beneficiary has coverage until the short-stay outlier (SSO) threshold is exceeded. If the Medicare payment was for a SSO case (in accordance with § 412.529), and that payment was less than the full LTC-DRG payment amount because the beneficiary had insufficient coverage as a result of the remaining Medicare days, the LTCH also is currently permitted to charge the beneficiary for services delivered on those uncovered days

(in accordance with § 412.507). In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49623), we amended our regulations to expressly limit the charges that may be imposed upon beneficiaries whose LTCHs' discharges are paid at the site neutral payment rate under the LTCH PPS. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57102), we amended the regulations under §412.507 to clarify our existing policy that blended payments made to an LTCH during its transitional period (that is, an LTCH's payment for discharges occurring in cost reporting periods beginning in FYs 2016 through 2019) are considered to be site neutral payment rate payments.

Comment: A commenter requested that we provide additional payments for ESRD patients in LTCHs, similar to the ESRD add-on payment for IPPS hospitals.

Response: We consider this comment outside the scope of the proposed rule. We did not make any proposals related to additional payments for ESRD patients in LTCHs; however, we will keep the commenter's request in mind for future rulemaking.

B. Medicare Severity Long-Term Care Diagnosis-Related Group (MS-LTC-DRG)

Classifications and Relative Weights for FY 2025

1. Background

Section 123 of the BBRA required that the Secretary implement a PPS for LTCHs to replace the cost-based payment system under TEFRA. Section 307(b)(1) of the BIPA modified the requirements of section 123 of the BBRA by requiring that the Secretary examine the feasibility and the impact of basing payment under the LTCH PPS on the use of existing (or refined) hospital DRGs that have been modified to account for different resource use of LTCH patients.

Under both the IPPS and the LTCH PPS, the DRG-based classification system uses information on the claims for inpatient discharges to classify patients into distinct groups (for example, DRGs) based on clinical characteristics and expected resource needs. When the LTCH PPS was implemented for cost reporting periods beginning on or after October 1, 2002, we adopted the same DRG patient classification system utilized at that time under the IPPS. We referred to this patient classification system as the “long-term care diagnosis-related groups (LTC-DRGs).” As part of our efforts to better recognize severity of illness among patients, in the FY 2008 IPPS final rule with comment period (72 FR 47130), we adopted the MS-DRGs and the Medicare severity long-term care diagnosis-related groups (MS-LTC-DRGs) under the IPPS and the LTCH PPS, respectively, effective beginning October 1, 2007 (FY 2008). For a full description of the development, implementation, and rationale for the use of the MS-DRGs and MS-LTC-DRGs, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47141 through 47175 and 47277 through 47299). (We note that, in that same final rule, we revised the regulations at § 412.503 to specify that for LTCH discharges occurring on or after October 1, 2007, when applying the provisions of 42 CFR part 412, subpart O, applicable to LTCHs for policy descriptions and payment calculations, all references to LTC-DRGs would be considered a reference to MS-LTC-DRGs. For the remainder of this section, we present the

discussion in terms of the current MS-LTC-DRG patient classification system unless specifically referring to the previous LTC-DRG patient classification system that was in effect before October 1, 2007.)

Consistent with section 123 of the BBRA, as amended by section 307(b)(1) of the BIPA, and § 412.515 of the regulations, we use information derived from LTCH PPS patient records to classify LTCH discharges into distinct MS-LTC-DRGs based on clinical characteristics and estimated resource needs. As noted previously, we adopted the same DRG patient classification system utilized at that time under the IPPS. The MS-DRG classifications are updated annually, which has resulted in the number of MS-DRGs changing over time. For FY 2025, there will be 773 MS-DRG, and by extension, MS-LTC-DRG, groupings based on the changes, as discussed in section II.E. of the preamble of this final rule.

Although the patient classification system used under both the LTCH PPS and the IPPS are the same, the relative weights are different. The established relative weight methodology and data used under the LTCH PPS result in relative weights under the LTCH PPS that reflect the differences in patient resource use of LTCH patients, consistent with section 123(a)(1) of the BBRA. That is, we assign an appropriate weight to the MS-LTC-DRGs to account for the differences in resource use by patients exhibiting the case complexity and multiple medical problems characteristic of LTCH patients.

2. Patient Classifications into MS-LTC-DRGs

a. Background

The MS-DRGs (used under the IPPS) and the MS-LTC-DRGs (used under the LTCH PPS) are based on the CMS DRG structure. As noted previously in this section, we refer to the DRGs under the LTCH PPS as MS-LTC-DRGs although they are structurally identical to the MS-DRGs used under the IPPS.

The MS-DRGs are organized into 25 major diagnostic categories (MDCs), most of which are based on a particular organ system of the body; the remainder involve multiple organ systems

(such as MDC 22, Burns). Within most MDCs, cases are then divided into surgical DRGs and medical DRGs. Surgical DRGs are assigned based on a surgical hierarchy that orders operating room (O.R.) procedures or groups of O.R. procedures by resource intensity. The GROUPER software program does not recognize all ICD-10-PCS procedure codes as procedures affecting DRG assignment. That is, procedures that are not surgical (for example, EKGs) or are minor surgical procedures (for example, a biopsy of skin and subcutaneous tissue (procedure code 0JBH3ZX)) do not affect the MS-LTC-DRG assignment based on their presence on the claim.

Generally, under the LTCH PPS, a Medicare payment is made at a predetermined specific rate for each discharge that varies based on the MS-LTC-DRG to which a beneficiary's discharge is assigned. Cases are classified into MS-LTC-DRGs for payment based on the following six data elements:

- Principal diagnosis.
- Additional or secondary diagnoses.
- Surgical procedures.
- Age.
- Sex.
- Discharge status of the patient.

Currently, for claims submitted using the version ASC X12 5010 standard, up to 25 diagnosis codes and 25 procedure codes are considered for an MS-DRG assignment. This includes one principal diagnosis and up to 24 secondary diagnoses for severity of illness determinations. (For additional information on the processing of up to 25 diagnosis codes and 25 procedure codes on hospital inpatient claims, we refer readers to section II.G.11.c. of the preamble of the FY 2011 IPPS/LTCH PPS final rule (75 FR 50127).)

Under the HIPAA transactions and code sets regulations at 45 CFR parts 160 and 162, covered entities must comply with the adopted transaction standards and operating rules specified in subparts I through S of part 162. Among other requirements, on or after

January 1, 2012, covered entities are required to use the ASC X12 Standards for Electronic Data Interchange Technical Report Type 3--Health Care Claim: Institutional (837), May 2006, ASC X12N/005010X223, and Type 1 Errata to Health Care Claim: Institutional (837) ASC X12 Standards for Electronic Data Interchange Technical Report Type 3, October 2007, ASC X12N/005010X233A1 for the health care claims or equivalent encounter information transaction (45 CFR 162.1102(c)).

HIPAA requires covered entities to use the applicable medical data code sets when conducting HIPAA transactions (45 CFR 162.1000). Currently, upon the discharge of the patient, the LTCH must assign appropriate diagnosis and procedure codes from the International Classification of Diseases, 10th Revision, Clinical Modification (ICD-10-CM) for diagnosis coding and the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD-10-PCS) for inpatient hospital procedure coding, both of which were required to be implemented October 1, 2015 (45 CFR 162.1002(c)(2) and (3)). For additional information on the implementation of the ICD-10 coding system, we refer readers to section II.F.1. of the preamble of the FY 2017 IPPS/LTCH PPS final rule (81 FR 56787 through 56790) and section II.E.1. of the preamble of this final rule. Additional coding instructions and examples are published in the AHA's *Coding Clinic for ICD-10-CM/PCS*.

To create the MS-DRGs (and by extension, the MS-LTC-DRGs), base DRGs were subdivided according to the presence of specific secondary diagnoses designated as complications or comorbidities (CCs) into one, two, or three levels of severity, depending on the impact of the CCs on resources used for those cases. Specifically, there are sets of MS-DRGs that are split into 2 or 3 subgroups based on the presence or absence of a CC or a major complication or comorbidity (MCC). We refer readers to section II.D. of the preamble of the FY 2008 IPPS final rule with comment period for a detailed discussion about the creation of MS-DRGs based on severity of illness levels (72 FR 47141 through 47175).

Medicare Administrative Contractors (MACs) enter the clinical and demographic information submitted by LTCHs into their claims processing systems and subject this information to a series of automated screening processes called the Medicare Code Editor (MCE). These screens are designed to identify cases that require further review before assignment into a MS-LTC-DRG can be made. During this process, certain types of cases are selected for further explanation (74 FR 43949).

After screening through the MCE, each claim is classified into the appropriate MS-LTC-DRG by the Medicare LTCH GROUPER software on the basis of diagnosis and procedure codes and other demographic information (age, sex, and discharge status). The GROUPER software used under the LTCH PPS is the same GROUPER software program used under the IPPS. Following the MS-LTC-DRG assignment, the MAC determines the prospective payment amount by using the Medicare PRICER program, which accounts for hospital-specific adjustments. Under the LTCH PPS, we provide an opportunity for LTCHs to review the MS-LTC-DRG assignments made by the MAC and to submit additional information within a specified timeframe as provided in § 412.513(c).

The GROUPER software is used both to classify past cases to measure relative hospital resource consumption to establish the MS-LTC-DRG relative weights and to classify current cases for purposes of determining payment. The records for all Medicare hospital inpatient discharges are maintained in the MedPAR file. The data in this file are used to evaluate possible MS-DRG and MS-LTC-DRG classification changes and to recalibrate the MS-DRG and MS-LTC-DRG relative weights during our annual update under both the IPPS (§ 412.60(e)) and the LTCH PPS (§ 412.517), respectively.

b. Changes to the MS-LTC-DRGs for FY 2025

As specified by our regulations at § 412.517(a), which require that the MS-LTC-DRG classifications and relative weights be updated annually, and consistent with our historical practice of using the same patient classification system under the LTCH PPS as is used under the

IPPS, in this final rule, as we proposed, we updated the MS-LTC-DRG classifications effective October 1, 2024 through September 30, 2025 (FY 2025) consistent with the changes to specific MS-DRG classifications presented in section II.F. of the preamble of this final rule.

Accordingly, the MS-LTC-DRGs for FY 2025 are the same as the MS-DRGs being used under the IPPS for FY 2025. In addition, because the MS-LTC-DRGs for FY 2025 are the same as the MS-DRGs for FY 2025, the other changes that affect MS-DRG (and by extension MS-LTC-DRG) assignments under GROUPER Version 42, as discussed in section II.E. of the preamble of this final rule, including the changes to the MCE software and the ICD-10-CM/PCS coding system, are also applicable under the LTCH PPS for FY 2025.³

Development of the FY 2025 MS-LTC-DRG Relative Weights

a. General Overview of the MS-LTC-DRG Relative Weights

One of the primary goals for the implementation of the LTCH PPS is to pay each LTCH an appropriate amount for the efficient delivery of medical care to Medicare patients. The system must be able to account adequately for each LTCH's case-mix to ensure both fair distribution of Medicare payments and access to adequate care for those Medicare patients whose care is costlier (67 FR 55984). To accomplish these goals, we have annually adjusted the LTCH PPS standard Federal prospective payment rate by the applicable relative weight in determining payment to LTCHs for each case. Under the LTCH PPS, relative weights for each MS-LTC-DRG are a primary element used to account for the variations in cost per discharge and resource utilization among the payment groups (§ 412.515). To ensure that Medicare patients classified to each MS-LTC-DRG have access to an appropriate level of services and to encourage efficiency, we calculate a relative weight for each MS-LTC-DRG that represents the resources needed by an average inpatient LTCH case in that MS-LTC-DRG. For example, cases in an MS-LTC-DRG with a relative weight of 2 would, on average, cost twice as much to treat as cases in an MS-LTC-DRG with a relative weight of 1.

The established methodology to develop the MS-LTC-DRG relative weights is generally consistent with the methodology established when the LTCH PPS was implemented in the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55991). However, there have been some modifications of our historical procedures for assigning relative weights in cases of zero volume or nonmonotonicity or both resulting from the adoption of the MS-LTC-DRGs. We also made a modification in conjunction with the implementation of the dual rate LTCH PPS payment structure beginning in FY 2016 to use LTCH claims data from only LTCH PPS standard Federal payment rate cases (or LTCH PPS cases that would have qualified for payment under the LTCH PPS standard Federal payment rate if the dual rate LTCH PPS payment structure had been in effect at the time of the discharge). We also adopted, beginning in FY 2023, a 10-percent cap policy on the reduction in a MS-LTC-DRG's relative weight in a given year. (For details on the modifications to our historical procedures for assigning relative weights in cases of zero volume and nonmonotonicity or both, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47289 through 47295) and the FY 2009 IPPS final rule (73 FR 48542 through 48550). For details on the change in our historical methodology to use LTCH claims data only from LTCH PPS standard Federal payment rate cases (or cases that would have qualified for such payment had the LTCH PPS dual payment rate structure been in effect at the time) to determine the MS-LTC-DRG relative weights, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49614 through 49617). For details on our adoption of the 10-percent cap policy, we refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49152 through 49154).)

For purposes of determining the MS-LTC-DRG relative weights, under our historical methodology, there are three different categories of MS-LTC-DRGs based on volume of cases within specific MS-LTC-DRGs: (1) MS-LTC-DRGs with at least 25 applicable LTCH cases in the data used to calculate the relative weight, which are each assigned a unique relative weight; (2) low-volume MS-LTC-DRGs (that is, MS-LTC-DRGs that contain between 1 and 24

applicable LTCH cases that are grouped into quintiles (as described later in this section in Step 3 of our methodology) and assigned the relative weight of the quintile); and (3) no-volume MS-LTC-DRGs that are cross-walked to other MS-LTC-DRGs based on the clinical similarities and assigned the relative weight of the cross-walked MS-LTC-DRG (as described later in this section in Step 8 of our methodology). For FY 2025, we are continuing to use applicable LTCH cases to establish the same volume-based categories to calculate the FY 2025 MS-LTC-DRG relative weights.

b. Development of the MS-LTC-DRG Relative Weights for FY 2025

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36259 through 36266), we presented our proposed methodology for determining the MS-LTC-DRG relative weights for FY 2025.

We received several comments requesting that CMS modify certain high-volume MS-LTC-DRGs to better account for the variation in patient severity and costs among the cases grouped to these MS-LTC-DRGs. Since these comments were primarily focused on the impact these high-volume MS-LTC-DRGs have on the FY 2025 outlier fixed-loss amount, we have summarized and responded to these comments in section V.D.3. of the Addendum to this final rule. We also received comments requesting CMS to modify our ratesetting methodologies to account for the impact of COVID-19 on the ratesetting data. Since these comments were primarily focused on the specific use of FY 2023 data when determining the FY 2025 outlier fixed-loss amount, we also have summarized and responded to these comments in section V.D.3. of the Addendum to this final rule.

After consideration of the comments we received, we are finalizing, without modification, our proposed methodology for determining the MS-LTC-DRG relative weights for FY 2025. In the remainder of this section, we present our finalized methodology. We first list and provide a brief description of our steps for determining the FY 2025 MS-LTC-DRG relative weights. We then, later in this section, discuss in greater detail each step. We note that, as we

did in FY 2024, we used our historical relative weight methodology as described in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58898 through 58907), subject to a ten percent cap as described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49162).

- *Step 1—Prepare data for MS-LTC-DRG relative weight calculation.* In this step, we select and group the applicable claims data used in the development of the MS-LTC-DRG relative weights.

- *Step 2—Remove cases with a length of stay of 7 days or less.* In this step, we trim the applicable claims data to remove cases with a length of stay of 7 days or less.

- *Step 3—Establish low-volume MS-LTC-DRG quintiles.* In this step, we employ our established quintile methodology for low-volume MS-LTC-DRGs (that is, MS-LTC-DRGs with fewer than 25 cases).

- *Step 4—Remove statistical outliers.* In this step, we trim the applicable claims data to remove statistical outlier cases.

- *Step 5—Adjust charges for the effects of Short Stay Outliers (SSOs).* In this step, we adjust the number of applicable cases in each MS-LTC-DRG (or low-volume quintile) for the effect of SSO cases.

- *Step 6—Calculate the relative weights on an iterative basis using the hospital-specific relative weights methodology.* In this step, we use our established hospital-specific relative value (HSRV) methodology, which is an iterative process, to calculate the relative weights.

- *Step 7—Adjust the relative weights to account for nonmonotonically increasing relative weights.* In this step, we make adjustments that ensure that within each base MS-LTC-DRG, the relative weights increase by MS-LTC-DRG severity.

- *Step 8—Determine a relative weight for MS-LTC-DRGs with no applicable LTCH cases.* In this step, we cross-walk each no-volume MS-LTC-DRG to another MS-LTC-DRG for which we calculated a relative weight.

- *Step 9—Budget neutralize the uncapped relative weights.* In this step, to ensure budget neutrality in the annual update to the MS-LTC-DRG classifications and relative weights, we adjust the relative weights by a normalization factor and a budget neutrality factor that ensures estimated aggregate LTCH PPS payments will be unaffected by the updates to the MS-LTC-DRG classifications and relative weights.

- *Step 10—Apply the 10-percent cap to decreases in MS-LTC-DRG relative weights.* In this step we limit the reduction of the relative weight for a MS-LTC-DRG to 10 percent of its prior year value. This 10-percent cap does not apply to zero-volume MS-LTC-DRGs or low-volume MS-LTC-DRGs.

- *Step 11—Budget neutralize the application of the 10-percent cap policy.* In this step, to ensure budget neutrality in the application of the MS-LTC-DRG cap policy, we adjust the relative weights by a budget neutrality factor that ensures estimated aggregate LTCH PPS payments will be unaffected by our application of the cap to the MS-LTC-DRG relative weights.

We next describe each of the 11 steps for calculating the FY 2025 MS-LTC-DRG relative weights in greater detail.

Step 1—Prepare data for MS-LTC-DRG relative weight calculation

For the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36260), we obtained total charges from FY 2023 Medicare LTCH claims data from the December 2023 update of the FY 2023 MedPAR file and used proposed Version 42 of the GROUPER to classify LTCH cases. Consistent with our historical practice, we proposed that if better data become available, we would use those data and the finalized Version 42 of the GROUPER in establishing the FY 2025 MS-LTC-DRG relative weights in the final rule. Accordingly, for this final rule, we are establishing the FY 2025 MS-LTC-DRG relative weights based on updated FY 2023 Medicare LTCH claims data from the March 2024 update of the FY 2023 MedPAR file, which is the best

available data at the time of development of this final rule, and the finalized Version 42 of the GROUPER to classify LTCH cases.

To calculate the FY 2025 MS-LTC-DRG relative weights under the dual rate LTCH PPS payment structure, as we proposed, we continue to use applicable LTCH data, which includes our policy of only using cases that meet the criteria for exclusion from the site neutral payment rate (or would have met the criteria had they been in effect at the time of the discharge) (80 FR 49624). Specifically, we began by first evaluating the LTCH claims data in the March 2024 update of the FY 2023 MedPAR file to determine which LTCH cases would meet the criteria for exclusion from the site neutral payment rate under § 412.522(b) or had the dual rate LTCH PPS payment structure applied to those cases at the time of discharge. We identified the FY 2023 LTCH cases that were not assigned to MS-LTC-DRGs 876, 880, 881, 882, 883, 884, 885, 886, 887, 894, 895, 896, 897, 945, and 946, which identify LTCH cases that do not have a principal diagnosis relating to a psychiatric diagnosis or to rehabilitation; and that either—

- The admission to the LTCH was “immediately preceded” by discharge from a subsection (d) hospital and the immediately preceding stay in that subsection (d) hospital included at least 3 days in an ICU, as we define under the ICU criterion; or
- The admission to the LTCH was “immediately preceded” by discharge from a subsection (d) hospital and the claim for the LTCH discharge includes the applicable procedure code that indicates at least 96 hours of ventilator services were provided during the LTCH stay, as we define under the ventilator criterion. Claims data from the FY 2023 MedPAR file that reported ICD-10-PCS procedure code 5A1955Z were used to identify cases involving at least 96 hours of ventilator services in accordance with the ventilator criterion. (We note that section 3711(b)(2) of the CARES Act provided a waiver of the application of the site neutral payment rate for LTCH cases admitted during the COVID-19 PHE period. The COVID-19 PHE expired on May 11, 2023. Therefore, all LTCH PPS cases in FY 2023 with admission dates on or before the PHE expiration date were paid the LTCH PPS standard Federal rate regardless of whether the

discharge met the statutory patient criteria. However, for purposes of setting rates for LTCH PPS standard Federal rate cases for FY 2025 (including MS-LTC-DRG relative weights), we used FY 2023 cases that meet the statutory patient criteria without consideration to how those cases were paid in FY 2023.)

Furthermore, consistent with our historical methodology, we excluded any claims in the resulting data set that were submitted by LTCHs that were all-inclusive rate providers and LTCHs that are paid in accordance with demonstration projects authorized under section 402(a) of Public Law 90-248 or section 222(a) of Public Law 92-603. In addition, consistent with our historical practice and our policies, we excluded any Medicare Advantage (Part C) claims in the resulting data. Such claims were identified based on the presence of a GHO Paid indicator value of “1” in the MedPAR files.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49448), we discussed the abnormal charging practices of an LTCH (CCN 312024) in FY 2021 that led to the LTCH receiving an excessive amount of high cost outlier payments. In that rule, we stated our belief, based on information we received from the provider, that these abnormal charging practices would not persist into FY 2023. Therefore, we did not include their cases in our model for determining the FY 2023 outlier fixed-loss amount. In the FY 2024 IPPS/LTCH PPS final rule (88 FR 59127 through 59128), we stated that the FY 2022 MedPAR claims also reflect the abnormal charging practices of this LTCH. Therefore, we removed claims from CCN 312024 when determining the FY 2024 MS-LTC-DRG relative weights and from all other FY 2024 ratesetting calculations, including the calculation of the area wage level adjustment budget neutrality factor and the fixed-loss amount for LTCH PPS standard Federal payment rate cases. Given recent actions by the Department of Justice regarding CCN 312024 (see <https://www.justice.gov/opa/pr/new-jersey-hospital-and-investors-pay-united-states-306-million-alleged-false-claims-related>), as we proposed, we again removed claims from CCN 312024 when determining the FY 2025 MS-LTC-DRG relative weights and all other FY 2025 ratesetting calculations, including the

calculation of the area wage level adjustment budget neutrality factor and the fixed-loss amount for LTCH PPS standard Federal payment rate cases.

In summary, in general, we identified the claims data used in the development of the FY 2025 MS-LTC-DRG relative weights in this final rule by trimming claims data that were paid the site neutral payment rate or would have been paid the site neutral payment rate had the provisions of the CARES Act not been in effect. We trimmed the claims data of all-inclusive rate providers reported in the March 2024 update of the FY 2023 MedPAR file and any Medicare Advantage claims data. There were no data from any LTCHs that are paid in accordance with a demonstration project reported in the March 2024 update of the FY 2023 MedPAR file, but had there been any, we would have trimmed the claims data from those LTCHs as well, in accordance with our established policy. We also removed all claims from CCN 312024.

We used the remaining data (that is, the applicable LTCH data) in the subsequent steps to calculate the MS-LTC-DRG relative weights for FY 2025.

Step 2--Remove cases with a length of stay of 7 days or less.

The next step in our calculation of the FY 2025 MS-LTC-DRG relative weights is to remove cases with a length of stay of 7 days or less. The MS-LTC-DRG relative weights reflect the average of resources used on representative cases of a specific type. Generally, cases with a length of stay of 7 days or less do not belong in an LTCH because these stays do not fully receive or benefit from treatment that is typical in an LTCH stay, and full resources are often not used in the earlier stages of admission to an LTCH. If we were to include stays of 7 days or less in the computation of the FY 2025 MS-LTC-DRG relative weights, the value of many relative weights would decrease and, therefore, payments would decrease to a level that may no longer be appropriate. We do not believe that it would be appropriate to compromise the integrity of the payment determination for those LTCH cases that actually benefit from and receive a full course of treatment at an LTCH by including data from these very short stays. Therefore, as we proposed, consistent with our existing relative weight methodology, in determining the FY 2025

MS-LTC-DRG relative weights, we removed LTCH cases with a length of stay of 7 days or less from applicable LTCH cases. (For additional information on what is removed in this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 3--Establish low-volume MS-LTC-DRG quintiles

To account for MS-LTC-DRGs with low-volume (that is, with fewer than 25 applicable LTCH cases), consistent with our existing methodology, as we proposed, we are continuing to employ the quintile methodology for low-volume MS-LTC-DRGs, such that we grouped the “low-volume MS-LTC-DRGs” (that is, MS-LTC-DRGs that contain between 1 and 24 applicable LTCH cases into one of five categories (quintiles) based on average charges (67 FR 55984 through 55995; 72 FR 47283 through 47288; and 81 FR 25148)).

In this final rule, based on the best available data (that is, the March 2024 update of the FY 2023 MedPAR file), we identified 235 MS-LTC-DRGs that contained between 1 and 24 applicable LTCH cases. This list of MS-LTC-DRGs was then divided into 1 of the 5 low-volume quintiles. We assigned the low-volume MS-LTC-DRGs to specific low-volume quintiles by sorting the low-volume MS-LTC-DRGs in ascending order by average charge in accordance with our established methodology. Based on the data available for this final rule, the number of MS-LTC-DRGs with less than 25 applicable LTCH cases was evenly divisible by 5. Therefore, the quintiles each contained 47 MS-LTC-DRGs ($235/5 = 47$). Since the number of MS LTC DRGs with less than 25 applicable LTCH cases was evenly divisible by 5, it was unnecessary to employ our historical methodology of assigning each remainder low-volume MS-LTC-DRG to the low-volume quintile that contains an MS-LTC-DRG with an average charge closest to that of the remainder low-volume MS-LTC-DRG. In cases where these initial assignments of low-volume MS-LTC-DRGs to quintiles results in nonmonotonicity within a base-DRG, as we proposed, we adjusted the resulting low-volume MS-LTC-DRGs to preserve monotonicity, as discussed in Step 7 of our methodology.

To determine the FY 2025 relative weights for the low-volume MS-LTC-DRGs, consistent with our historical practice, we used the five low-volume quintiles described previously. We determined a relative weight and (geometric) average length of stay for each of the five low-volume quintiles using the methodology described in Step 6 of our methodology. We assigned the same relative weight and average length of stay to each of the low-volume MS-LTC-DRGs that make up an individual low-volume quintile. We note that, as this system is dynamic, it is possible that the number and specific type of MS-LTC-DRGs with a low-volume of applicable LTCH cases would vary in the future. Furthermore, we note that we continue to monitor the volume (that is, the number of applicable LTCH cases) in the low-volume quintiles to ensure that our quintile assignments used in determining the MS-LTC-DRG relative weights result in appropriate payment for LTCH cases grouped to low-volume MS-LTC-DRGs and do not result in an unintended financial incentive for LTCHs to inappropriately admit these types of cases.

For this final rule, we are providing the list of the composition of the low-volume quintiles for low-volume MS-LTC-DRGs in a supplemental data file for public use posted via the Internet on the CMS website for this final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html> to streamline the information made available to the public that is used in the annual development of Table 11.

Step 4--Remove statistical outliers.

The next step in our calculation of the FY 2025 MS-LTC-DRG relative weights is to remove statistical outlier cases from the LTCH cases with a length of stay of at least 8 days. Consistent with our existing relative weight methodology, as we proposed, we are continuing to define statistical outliers as cases that are outside of 3.0 standard deviations from the mean of the log distribution of both charges per case and the charges per day for each MS-LTC-DRG. These statistical outliers are removed prior to calculating the relative weights because we believe that they may represent aberrations in the data that distort the measure of average resource use.

Including those LTCH cases in the calculation of the relative weights could result in an inaccurate relative weight that does not truly reflect relative resource use among those MS-LTC-DRGs. (For additional information on what is removed in this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.) After removing cases with a length of stay of 7 days or less and statistical outliers, in each set of claims, we were left with applicable LTCH cases that have a length of stay greater than or equal to 8 days. In this final rule, we refer to these cases as “trimmed applicable LTCH cases.”

Step 5--Adjust charges for the effects of Short Stay Outliers (SSOs).

As the next step in the calculation of the FY 2025 MS-LTC-DRG relative weights, consistent with our historical approach, as we proposed, we adjusted each LTCH’s charges per discharge for those remaining cases (that is, trimmed applicable LTCH cases) for the effects of SSOs (as defined in § 412.529(a) in conjunction with § 412.503). Specifically, as we proposed, we made this adjustment by counting an SSO case as a fraction of a discharge based on the ratio of the length of stay of the case to the average length of stay of all cases grouped to the MS-LTC-DRG. This has the effect of proportionately reducing the impact of the lower charges for the SSO cases in calculating the average charge for the MS-LTC-DRG. This process produces the same result as if the actual charges per discharge of an SSO case were adjusted to what they would have been had the patient’s length of stay been equal to the average length of stay of the MS-LTC-DRG.

Counting SSO cases as full LTCH cases with no adjustment in determining the FY 2025 MS-LTC-DRG relative weights would lower the relative weight for affected MS-LTC-DRGs because the relatively lower charges of the SSO cases would bring down the average charge for all cases within a MS-LTC-DRG. This would result in an “underpayment” for non-SSO cases and an “overpayment” for SSO cases. Therefore, we are continuing to adjust for SSO cases under § 412.529 in this manner because it would result in more appropriate payments for all

LTCH PPS standard Federal payment rate cases. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 6--Calculate the relative weights on an iterative basis using the hospital-specific relative value methodology.

By nature, LTCHs often specialize in certain areas, such as ventilator-dependent patients. Some case types (MS-LTC-DRGs) may be treated, to a large extent, in hospitals that have, from a perspective of charges, relatively high (or low) charges. This nonrandom distribution of cases with relatively high (or low) charges in specific MS-LTC-DRGs has the potential to inappropriately distort the measure of average charges. To account for the fact that cases may not be randomly distributed across LTCHs, consistent with the methodology we have used since the implementation of the LTCH PPS, in this FY 2025 IPPS/LTCH PPS final rule, as we proposed, we are continuing to use a hospital-specific relative value (HSRV) methodology to calculate the MS-LTC-DRG relative weights for FY 2025. We believe that this method removes this hospital-specific source of bias in measuring LTCH average charges (67 FR 55985). Specifically, under this methodology, we reduced the impact of the variation in charges across providers on any particular MS-LTC-DRG relative weight by converting each LTCH's charge for an applicable LTCH case to a relative value based on that LTCH's average charge for such cases.

Under the HSRV methodology, we standardize charges for each LTCH by converting its charges for each applicable LTCH case to hospital-specific relative charge values and then adjusting those values for the LTCH's case-mix. The adjustment for case-mix is needed to rescale the hospital-specific relative charge values (which, by definition, average 1.0 for each LTCH). The average relative weight for an LTCH is its case-mix; therefore, it is reasonable to scale each LTCH's average relative charge value by its case-mix. In this way, each LTCH's relative charge value is adjusted by its case-mix to an average that reflects the complexity of the applicable LTCH cases it treats relative to the complexity of the applicable LTCH cases treated

by all other LTCHs (the average LTCH PPS case-mix of all applicable LTCH cases across all LTCHs). In other words, by multiplying an LTCH's relative charge values by the LTCH's case-mix index, we account for the fact that the same relative charges are given greater weight at an LTCH with higher average costs than they would at an LTCH with low average costs, which is needed to adjust each LTCH's relative charge value to reflect its case-mix relative to the average case-mix for all LTCHs. By standardizing charges in this manner, we count charges for a Medicare patient at an LTCH with high average charges as less resource-intensive than they would be at an LTCH with low average charges. For example, a \$10,000 charge for a case at an LTCH with an average adjusted charge of \$17,500 reflects a higher level of relative resource use than a \$10,000 charge for a case at an LTCH with the same case-mix, but an average adjusted charge of \$35,000. We believe that the adjusted charge of an individual case more accurately reflects actual resource use for an individual LTCH because the variation in charges due to systematic differences in the markup of charges among LTCHs is taken into account.

Consistent with our historical relative weight methodology, as we proposed, we calculated the FY 2025 MS-LTC-DRG relative weights using the HSRV methodology, which is an iterative process. Therefore, in accordance with our established methodology, for FY 2025, we continued to standardize charges for each applicable LTCH case by first dividing the adjusted charge for the case (adjusted for SSOs under § 412.529 as described in Step 5 of our methodology) by the average adjusted charge for all applicable LTCH cases at the LTCH in which the case was treated. The average adjusted charge reflects the average intensity of the health care services delivered by a particular LTCH and the average cost level of that LTCH. The average adjusted charge is then multiplied by the LTCH's case-mix index to produce an adjusted hospital-specific relative charge value for the case. We used an initial case-mix index value of 1.0 for each LTCH.

For each MS-LTC-DRG, we calculated the FY 2025 relative weight by dividing the SSO-adjusted average of the hospital-specific relative charge values for applicable LTCH cases for the

MS-LTC-DRG (that is, the sum of the hospital-specific relative charge value, as previously stated, divided by the sum of equivalent cases from Step 5 for each MS-LTC-DRG) by the overall SSO-adjusted average hospital-specific relative charge value across all applicable LTCH cases for all LTCHs (that is, the sum of the hospital-specific relative charge value, as previously stated, divided by the sum of equivalent applicable LTCH cases from Step 5 for each MS-LTC-DRG). Using these recalculated MS-LTC-DRG relative weights, each LTCH's average relative weight for all of its SSO-adjusted trimmed applicable LTCH cases (that is, its case-mix) was calculated by dividing the sum of all the LTCH's MS-LTC-DRG relative weights by its total number of SSO-adjusted trimmed applicable LTCH cases. The LTCHs' hospital-specific relative charge values (from previous) are then multiplied by the hospital-specific case-mix indexes. The hospital-specific case-mix adjusted relative charge values are then used to calculate a new set of MS-LTC-DRG relative weights across all LTCHs. This iterative process continued until there was convergence between the relative weights produced at adjacent steps, for example, when the maximum difference was less than 0.0001.

Step 7--Adjust the relative weights to account for nonmonotonically increasing relative weights.

The MS-DRGs contain base DRGs that have been subdivided into one, two, or three severity of illness levels. Where there are three severity levels, the most severe level has at least one secondary diagnosis code that is referred to as an MCC (that is, major complication or comorbidity). The next lower severity level contains cases with at least one secondary diagnosis code that is a CC (that is, complication or comorbidity). Those cases without an MCC or a CC are referred to as "without CC/MCC." When data do not support the creation of three severity levels, the base MS-DRG is subdivided into either two levels or the base MS-DRG is not subdivided. The two-level subdivisions may consist of the MS-DRG with CC/MCC and the MS-DRG without CC/MCC. Alternatively, the other type of two-level subdivision may consist of the MS-DRG with MCC and the MS-DRG without MCC.

In those base MS-LTC-DRGs that are split into either two or three severity levels, cases classified into the “without CC/MCC” MS-LTC-DRG are expected to have a lower resource use (and lower costs) than the “with CC/MCC” MS-LTC-DRG (in the case of a two-level split) or both the “with CC” and the “with MCC” MS-LTC-DRGs (in the case of a three-level split). That is, theoretically, cases that are more severe typically require greater expenditure of medical care resources and would result in higher average charges. Therefore, in the three severity levels, relative weights should increase by severity, from lowest to highest. If the relative weights decrease as severity increases (that is, if within a base MS-LTC-DRG, an MS-LTC-DRG with CC has a higher relative weight than one with MCC, or the MS-LTC-DRG “without CC/MCC” has a higher relative weight than either of the others), they are nonmonotonic. We continue to believe that utilizing nonmonotonic relative weights to adjust Medicare payments would result in inappropriate payments because the payment for the cases in the higher severity level in a base MS-LTC-DRG (which are generally expected to have higher resource use and costs) would be lower than the payment for cases in a lower severity level within the same base MS-LTC-DRG (which are generally expected to have lower resource use and costs). Therefore, in determining the FY 2025 MS-LTC-DRG relative weights, consistent with our historical methodology, as we proposed, we continued to combine MS-LTC-DRG severity levels within a base MS-LTC-DRG for the purpose of computing a relative weight when necessary to ensure that monotonicity is maintained. For a comprehensive description of our existing methodology to adjust for nonmonotonicity, we refer readers to the FY 2010 IPPS/RV 2010 LTCH PPS final rule (74 FR 43964 through 43966). Any adjustments for nonmonotonicity that were made in determining the FY 2025 MS-LTC-DRG relative weights by applying this methodology are denoted in Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS website.

Step 8--Determine a relative weight for MS-LTC-DRGs with no applicable LTCH cases.

Using the trimmed applicable LTCH cases, consistent with our historical methodology, we identified the MS-LTC-DRGs for which there were no claims in the March 2024 update of the FY 2023 MedPAR file and, therefore, for which no charge data was available for these MS-LTC-DRGs. Because patients with a number of the diagnoses under these MS-LTC-DRGs may be treated at LTCHs, consistent with our historical methodology, we generally assign a relative weight to each of the no-volume MS-LTC-DRGs based on clinical similarity and relative costliness (with the exception of “transplant” MS-LTC-DRGs, “error” MS-LTC-DRGs, and MS-LTC-DRGs that indicate a principal diagnosis related to a psychiatric diagnosis or rehabilitation (referred to as the “psychiatric or rehabilitation” MS-LTC-DRGs), as discussed later in this section of this final rule). (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55991 and 74 FR 43959 through 43960.)

Consistent with our existing methodology, as we proposed, we cross-walked each no-volume MS-LTC-DRG to another MS-LTC-DRG for which we calculated a relative weight (determined in accordance with the methodology as previously described). Then, the “no-volume” MS-LTC-DRG is assigned the same relative weight (and average length of stay) of the MS-LTC-DRG to which it was cross-walked (as described in greater detail in this section of this final rule).

Of the 773 MS-LTC-DRGs for FY 2025, we identified 426 MS-LTC-DRGs for which there were no trimmed applicable LTCH cases. The 426 MS-LTC-DRGs for which there were no trimmed applicable LTCH cases includes the 11 “transplant” MS-LTC-DRGs, the 2 “error” MS-LTC-DRGs, and the 15 “psychiatric or rehabilitation” MS-LTC-DRGs, which are discussed in this section of this rule, such that we identified 398 MS-LTC-DRGs that for which, we assigned a relative weight using our existing “no-volume” MS-LTC-DRG methodology (that is, $426 - 11 - 2 - 15 = 398$). As we proposed, we assigned relative weights to each of the 398 no-volume MS-LTC-DRGs based on clinical similarity and relative costliness to 1 of the remaining 347 ($773 - 426 = 347$) MS-LTC-DRGs for which we calculated relative weights based

on the trimmed applicable LTCH cases in the FY 2023 MedPAR file data using the steps described previously. (For the remainder of this discussion, we refer to the “cross-walked” MS-LTC-DRGs as one of the 347 MS-LTC-DRGs to which we cross-walked each of the 398 “no-volume” MS-LTC-DRGs.) Then, in general, we assigned the 398 no-volume MS-LTC-DRGs the relative weight of the cross-walked MS-LTC-DRG (when necessary, we made adjustments to account for nonmonotonicity).

We cross-walked the no-volume MS-LTC-DRG to a MS-LTC-DRG for which we calculated relative weights based on the March 2024 update of the FY 2023 MedPAR file, and to which it is similar clinically in intensity of use of resources and relative costliness as determined by criteria such as care provided during the period of time surrounding surgery, surgical approach (if applicable), length of time of surgical procedure, postoperative care, and length of stay. (For more details on our process for evaluating relative costliness, we refer readers to the FY 2010 IPPS/R Y 2010 LTCH PPS final rule (73 FR 48543).) We believe in the rare event that there would be a few LTCH cases grouped to one of the no-volume MS-LTC-DRGs in FY 2025, the relative weights assigned based on the cross-walked MS-LTC-DRGs would result in an appropriate LTCH PPS payment because the crosswalks, which are based on clinical similarity and relative costliness, would be expected to generally require equivalent relative resource use.

Then we assigned the relative weight of the cross-walked MS-LTC-DRG as the relative weight for the no-volume MS-LTC-DRG such that both of these MS-LTC-DRGs (that is, the no-volume MS-LTC-DRG and the cross-walked MS-LTC-DRG) have the same relative weight (and average length of stay) for FY 2025. We note that, if the cross-walked MS-LTC-DRG had 25 applicable LTCH cases or more, its relative weight (calculated using the methodology as previously described in Steps 1 through 4) is assigned to the no-volume MS-LTC-DRG as well. Similarly, if the MS-LTC-DRG to which the no-volume MS-LTC-DRG was cross-walked had 24 or less cases and, therefore, was designated to 1 of the low-volume quintiles for purposes of determining the relative weights, we assigned the relative weight of the applicable low-volume

quintile to the no-volume MS-LTC-DRG such that both of these MS-LTC-DRGs (that is, the no-volume MS-LTC-DRG and the cross-walked MS-LTC-DRG) have the same relative weight for FY 2025. (As we noted previously, in the infrequent case where nonmonotonicity involving a no-volume MS-LTC-DRG resulted, additional adjustments are required to maintain monotonically increasing relative weights.)

For this final rule, we are providing the list of the no-volume MS-LTC-DRGs and the MS-LTC-DRGs to which each was cross-walked (that is, the cross-walked MS-LTC-DRGs) for FY 2025 in a supplemental data file for public use posted via the Internet on the CMS website for this final rule at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html> to streamline the information made available to the public that is used in the annual development of Table 11.

To illustrate this methodology for determining the relative weights for the FY 2025 MS-LTC-DRGs with no applicable LTCH cases, we are providing the following example.

Example: There were no trimmed applicable LTCH cases in the FY 2023 MedPAR file that we are using for this final rule for MS-LTC-DRG 061 (Ischemic stroke, precerebral occlusion or transient ischemia with thrombolytic agent with MCC). We determined that MS-LTC-DRG 064 (Intracranial hemorrhage or cerebral infarction with MCC) is similar clinically and based on resource use to MS-LTC-DRG 061. Therefore, we assigned the same relative weight (and average length of stay) of MS-LTC-DRG 064 of 1.3008 for FY 2025 to MS-LTC-DRG 061 (we refer readers to Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS website).

Again, we note that, as this system is dynamic, it is entirely possible that the number of MS-LTC-DRGs with no volume would vary in the future. Consistent with our historical practice, as we proposed, we used the best available claims data to identify the trimmed applicable LTCH cases from which we determined the relative weights in the final rule.

For FY 2025, consistent with our historical relative weight methodology, as we proposed, we are establishing a relative weight of 0.0000 for the following transplant MS-LTC-DRGs: Heart Transplant or Implant of Heart Assist System with MCC (MS-LTC-DRG 001); Heart Transplant or Implant of Heart Assist System without MCC (MS-LTC-DRG 002); Liver Transplant with MCC or Intestinal Transplant (MS-LTC-DRG 005); Liver Transplant without MCC (MS-LTC-DRG 006); Lung Transplant (MS-LTC-DRG 007); Simultaneous Pancreas and Kidney Transplant (MS-LTC-DRG 008); Simultaneous Pancreas and Kidney Transplant with Hemodialysis (MS-LTC-DRG 019); Pancreas Transplant (MS-LTC-DRG 010); Kidney Transplant (MS-LTC-DRG 652); Kidney Transplant with Hemodialysis with MCC (MS-LTC-DRG 650), and Kidney Transplant with Hemodialysis without MCC (MS LTC DRG 651). This is because Medicare only covers these procedures if they are performed at a hospital that has been certified for the specific procedures by Medicare and presently no LTCH has been so certified. At the present time, we include these 11 transplant MS-LTC-DRGs in the GROUPER program for administrative purposes only. Because we use the same GROUPER program for LTCHs as is used under the IPPS, removing these MS-LTC-DRGs would be administratively burdensome. (For additional information regarding our treatment of transplant MS-LTC-DRGs, we refer readers to the RY 2010 LTCH PPS final rule (74 FR 43964).) In addition, consistent with our historical policy, we are establishing a relative weight of 0.0000 for the 2 “error” MS-LTC-DRGs (that is, MS-LTC-DRG 998 (Principal Diagnosis Invalid as Discharge Diagnosis) and MS-LTC-DRG 999 (Ungroupable)) because applicable LTCH cases grouped to these MS-LTC-DRGs cannot be properly assigned to an MS-LTC-DRG according to the grouping logic.

Additionally, we are establishing a relative weight of 0.0000 for the following “psychiatric or rehabilitation” MS-LTC-DRGs: MS-LTC-DRG 876 (O.R. Procedures with Principal Diagnosis of Mental Illness); MS-LTC-DRG 880 (Acute Adjustment Reaction & Psychosocial Dysfunction); MS-LTC-DRG 881 (Depressive Neuroses); MS-LTC-DRG 882

(Neuroses Except Depressive); MS-LTC-DRG 883 (Disorders of Personality & Impulse Control); MS-LTC-DRG 884 (Organic Disturbances & Intellectual Disability); MS-LTC-DRG 885 (Psychoses); MS-LTC-DRG 886 (Behavioral & Developmental Disorders); MS-LTC-DRG 887 (Other Mental Disorder Diagnoses); MS-LTC-DRG 894 (Alcohol, Drug Abuse or Dependence, Left AMA); MS-LTC-DRG 895 (Alcohol, Drug Abuse or Dependence with Rehabilitation Therapy); MS-LTC-DRG 896 (Alcohol, Drug Abuse or Dependence without Rehabilitation Therapy with MCC); MS-LTC-DRG 897 (Alcohol, Drug Abuse or Dependence without Rehabilitation Therapy without MCC); MS-LTC-DRG 945 (Rehabilitation with CC/MCC); and MS-LTC-DRG 946 (Rehabilitation without CC/MCC). We are establishing a relative weight of 0.0000 for these 15 “psychiatric or rehabilitation” MS-LTC-DRGs because the blended payment rate and temporary exceptions to the site neutral payment rate would not be applicable for any LTCH discharges occurring in FY 2025, and as such payment under the LTCH PPS would be no longer be made in part based on the LTCH PPS standard Federal payment rate for any discharges assigned to those MS-LTC-DRGs.

Step 9--Budget neutralize the uncapped relative weights.

In accordance with the regulations at § 412.517(b) (in conjunction with § 412.503), the annual update to the MS-LTC-DRG classifications and relative weights is done in a budget neutral manner such that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the MS-LTC-DRG classification and relative weight changes. (For a detailed discussion on the establishment of the budget neutrality requirement for the annual update of the MS-LTC-DRG classifications and relative weights, we refer readers to the RY 2008 LTCH PPS final rule (72 FR 26881 and 26882).

To achieve budget neutrality under the requirement at § 412.517(b), under our established methodology, for each annual update the MS-LTC-DRG relative weights are uniformly adjusted to ensure that estimated aggregate payments under the LTCH PPS would not be affected (that is,

decreased or increased). Consistent with that provision, as we proposed, we continued to apply budget neutrality adjustments in determining the FY 2025 MS-LTC-DRG relative weights so that our update of the MS-LTC-DRG classifications and relative weights for FY 2025 are made in a budget neutral manner. For FY 2025, as we proposed, we applied two budget neutrality factors to determine the MS-LTC-DRG relative weights. In this step, we describe the determination of the budget neutrality adjustment that accounts for the update of the MS-LTC-DRG classifications and relative weights prior to the application of the ten-percent cap. In steps 10 and 11, we describe the application of the 10-percent cap policy (step 10) and the determination of the budget neutrality factor that accounts for the application of the 10-percent cap policy (step 11).

In this final rule, to ensure budget neutrality for the update to the MS-LTC-DRG classifications and relative weights prior to the application of the 10-percent cap (that is, uncapped relative weights), under § 412.517(b), we continued to use our established two-step budget neutrality methodology. Therefore, in the first step of our MS-LTC-DRG update budget neutrality methodology, for FY 2025, we calculated and applied a normalization factor to the recalibrated relative weights (the result of Steps 1 through 8 discussed previously) to ensure that estimated payments are not affected by changes in the composition of case types or the changes to the classification system. That is, the normalization adjustment is intended to ensure that the recalibration of the MS-LTC-DRG relative weights (that is, the process itself) neither increases nor decreases the average case-mix index.

To calculate the normalization factor for FY 2025, we used the following three steps:

- (1.a.) use the applicable LTCH cases from the best available data (that is, LTCH discharges from the FY 2023 MedPAR file) and group them using the FY 2025 GROUPER (that is, Version 42 for FY 2025) and the recalibrated FY 2025 MS-LTC-DRG uncapped relative weights (determined in Steps 1 through 8 discussed previously) to calculate the average case-mix index;
- (1.b.) group the same applicable LTCH cases (as are used in Step 1.a.) using the FY 2024

GROUPER (Version 41) and FY 2024 MS-LTC-DRG relative weights in Table 11 of the FY 2024 IPPS/LTCH PPS final rule and calculate the average case-mix index; and (1.c.) compute the ratio of these average case-mix indexes by dividing the average case-mix index for FY 2024 (determined in Step 1.b.) by the average case-mix index for FY 2025 (determined in Step 1.a.). As a result, in determining the MS-LTC-DRG relative weights for FY 2025, each recalibrated MS-LTC-DRG uncapped relative weight is multiplied by the normalization factor of 1.27408 (determined in Step 1.c.) in the first step of the budget neutrality methodology, which produces “normalized relative weights.”

In the second step of our MS-LTC-DRG update budget neutrality methodology, we calculated a budget neutrality adjustment factor consisting of the ratio of estimated aggregate FY 2025 LTCH PPS standard Federal payment rate payments for applicable LTCH cases before reclassification and recalibration to estimated aggregate payments for FY 2025 LTCH PPS standard Federal payment rate payments for applicable LTCH cases after reclassification and recalibration. That is, for this final rule, for FY 2025, we determined the budget neutrality adjustment factor using the following three steps: (2.a.) simulate estimated total FY 2025 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the uncapped normalized relative weights for FY 2025 and GROUPER Version 42; (2.b.) simulate estimated total FY 2025 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the FY 2024 GROUPER (Version 41) and the FY 2024 MS-LTC-DRG relative weights in Table 11 of the FY 2024 IPPS/LTCH PPS final rule; and (2.c.) calculate the ratio of these estimated total payments by dividing the value determined in Step 2.b. by the value determined in Step 2.a. In determining the FY 2025 MS-LTC-DRG relative weights, each uncapped normalized relative weight is then multiplied by a budget neutrality factor of 0.9885836 (the value determined in Step 2.c.) in the second step of the budget neutrality methodology.

Step 10--Apply the 10-percent cap to decreases in MS-LTC-DRG relative weights.

To mitigate the financial impacts of significant year-to-year reductions in MS-LTC-DRGs relative weights, beginning in FY 2023, we adopted a policy that applies, in a budget neutral manner, a 10-percent cap on annual relative weight decreases for MS-LTC-DRGs with at least 25 applicable LTCH cases (§ 412.515(b)). Under this policy, in cases where CMS creates new MS-LTC-DRGs or modifies the MS-LTC-DRGs as part of its annual reclassifications resulting in renumbering of one or more MS-LTC-DRGs, the 10-percent cap does not apply to the relative weight for any new or renumbered MS-LTC-DRGs for the fiscal year. We refer readers to section VIII.B.3.b. of the preamble of the FY 2023 IPPS/LTCH PPS final rule with comment period for a detailed discussion on the adoption of the 10-percent cap policy (87 FR 49152 through 49154).

Applying the 10-percent cap to MS-LTC-DRGs with 25 or more cases results in more predictable and stable MS-LTC-DRG relative weights from year to year, especially for high-volume MS-LTC-DRGs that generally have the largest financial impact on an LTCH's operations. For this final rule, in cases where the relative weight for a MS-LTC-DRG with 25 or more applicable LTCH cases would decrease by more than 10-percent in FY 2025 relative to FY 2024, as we proposed, we limited the reduction to 10-percent. Under this policy, we do not apply the 10 percent cap to the low-volume MS-LTC-DRGs identified in Step 3 or the no-volume MS-LTC-DRGs identified in Step 8.

Therefore, in this step, for each FY 2025 MS-LTC-DRG with 25 or more applicable LTCH cases (excludes low-volume and zero-volume MS-LTC-DRGs) we compared its FY 2025 relative weight (after application of the normalization and budget neutrality factors determined in Step 9), to its FY 2024 MS-LTC-DRG relative weight. For any MS-LTC-DRG where the FY 2025 relative weight would otherwise have declined more than 10 percent, we established a capped FY 2025 MS-LTC-DRG relative weight that is equal to 90 percent of that MS-LTC-

DRG's FY 2024 relative weight (that is, we set the FY 2025 relative weight equal to the FY 2024 weight x 0.90).

In section II.E. of the preamble of this final rule, we discuss our changes to the MS-DRGs, and by extension the MS-LTC-DRGs, for FY 2025. As discussed previously, under our current policy, the 10-percent cap does not apply to the relative weight for any new or renumbered MS-LTC-DRGs. We did not propose any changes to this policy for FY 2025, and as such any new or renumbered MS-LTC-DRGs for FY 2025 were not eligible for the 10-percent cap.

Step 11--Budget neutralize application of the 10-percent cap policy.

Under the requirement at existing § 412.517(b) that aggregate LTCH PPS payments will be unaffected by annual changes to the MS-LTC-DRG classifications and relative weights, consistent with our established methodology, we continued to apply a budget neutrality adjustment to the MS-LTC-DRG relative weights so that the 10-percent cap on relative weight reductions (step 10) is implemented in a budget neutral manner. Therefore, we determined the budget neutrality adjustment factor for the 10-percent cap on relative weight reductions using the following three steps: (a) simulate estimated total FY 2025 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the capped relative weights for FY 2025 (determined in Step 10) and GROUPER Version 42; (b) simulate estimated total FY 2025 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the uncapped relative weights for FY 2025 (determined in Step 9) and GROUPER Version 42; and (c) calculate the ratio of these estimated total payments by dividing the value determined in step (b) by the value determined in step (a). In determining the FY 2025 MS-LTC-DRG relative weights, each capped relative weight is then multiplied by a budget neutrality factor of 0.9945741 (the value determined in step (c)) to achieve the budget neutrality requirement.

Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS website, lists the MS-LTC-DRGs and their respective relative

weights, geometric mean length of stay, and five-sixths of the geometric mean length of stay (used to identify SSO cases under § 412.529(a)) for FY 2025. We also are making available on the website the MS-LTC-DRG relative weights prior to the application of the 10 percent cap on MS-LTC-DRG relative weight reductions and corresponding cap budget neutrality factor.

C. Changes to the LTCH PPS Payment Rates and Other Changes to the LTCH PPS for FY 2025

1. Overview of Development of the LTCH PPS Standard Federal Payment Rates

The basic methodology for determining LTCH PPS standard Federal payment rates is currently set forth at 42 CFR 412.515 through 412.533 and 412.535. In this section, we discuss the factors that we use to update the LTCH PPS standard Federal payment rate for FY 2025, that is, effective for LTCH discharges occurring on or after October 1, 2024, through September 30, 2025. Under the dual rate LTCH PPS payment structure required by statute, beginning with discharges in cost reporting periods beginning in FY 2016, only LTCH discharges that meet the criteria for exclusion from the site neutral payment rate are paid based on the LTCH PPS standard Federal payment rate specified at 42 CFR 412.523. (For additional details on our finalized policies related to the dual rate LTCH PPS payment structure required by statute, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623).)

Prior to the implementation of the dual payment rate system in FY 2016, all LTCH discharges were paid similarly to those now exempt from the site neutral payment rate. That legacy payment rate was called the standard Federal rate. For details on the development of the initial standard Federal rate for FY 2003, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56027 through 56037). For subsequent updates to the standard Federal rate from FYs 2003 through 2015, and LTCH PPS standard Federal payment rate from FY 2016 through present, as implemented under 42 CFR 412.523(c)(3), we refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42445 through 42446).

In this FY 2025 IPPS/LTCH PPS final rule, we present our policies related to the annual update to the LTCH PPS standard Federal payment rate for FY 2025.

The update to the LTCH PPS standard Federal payment rate for FY 2025 is presented in section V.A. of the Addendum to this final rule. The components of the annual update to the LTCH PPS standard Federal payment rate for FY 2025 are discussed in this section, including

the statutory reduction to the annual update for LTCHs that fail to submit quality reporting data for FY 2025 as required by the statute (as discussed in section VIII.C.2.c. of the preamble of this final rule). As we proposed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36267), we also made an adjustment to the LTCH PPS standard Federal payment rate to account for the estimated effect of the changes to the area wage level for FY 2025 on estimated aggregate LTCH PPS payments, in accordance with 42 CFR 412.523(d)(4) (as discussed in section V.B. of the Addendum to this final rule).

2. FY 2025 LTCH PPS Standard Federal Payment Rate Annual Market Basket Update

a. Overview

Historically, the Medicare program has used a market basket to account for input price increases in the services furnished by providers. The market basket used for the LTCH PPS includes both operating and capital-related costs of LTCHs because the LTCH PPS uses a single payment rate for both operating and capital-related costs. We adopted the 2017-based LTCH market basket for use under the LTCH PPS beginning in FY 2021 (85 FR 58907 through 58909). As discussed in section VIII.D. of the preamble of this final rule, we are finalizing our proposal to rebase and revise the 2017-based LTCH market basket to reflect a 2022 base year. For additional details on the historical development of the market basket used under the LTCH PPS, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53476), and for a complete discussion of the LTCH market basket and a description of the methodologies used to determine the operating and capital-related portions of the 2017-based LTCH market basket, we refer readers to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58909 through 58926).

Section 3401(c) of the Affordable Care Act provides for certain adjustments to any annual update to the LTCH PPS standard Federal payment rate and refers to the timeframes associated with such adjustments as a “rate year.” We note that, because the annual update to the LTCH PPS policies, rates, and factors now occurs on October 1, we adopted the term “fiscal

year” (FY) rather than “rate year” (RY) under the LTCH PPS beginning October 1, 2010, to conform with the standard definition of the Federal fiscal year (October 1 through September 30) used by other PPSs, such as the IPPS (75 FR 50396 through 50397). Although the language of sections 3004(a), 3401(c), 10319, and 1105(b) of the Affordable Care Act refers to years 2010 and thereafter under the LTCH PPS as “rate year,” consistent with our change in the terminology used under the LTCH PPS from “rate year” to “fiscal year,” for purposes of clarity, when discussing the annual update for the LTCH PPS standard Federal payment rate, including the provisions of the Affordable Care Act, we use “fiscal year” rather than “rate year” for 2011 and subsequent years.

b. Annual Update to the LTCH PPS Standard Federal Payment Rate for FY 2025

As previously noted, for FY 2025, we are finalizing our proposal to rebase and revise the 2017-based LTCH market basket to reflect a 2022 base year. The 2022-based LTCH market basket is primarily based on the Medicare cost report data submitted by LTCHs and, therefore, specifically reflects the cost structures of LTCHs. As described in more detail in section VIII.D.1 of the preamble of this final rule, we used data from cost reporting periods beginning on and after April 1, 2021, and prior to April 1, 2022 because these data reflect the most recent information that are most representative of FY 2022. We believe that the 2022-based LTCH market basket appropriately reflects the cost structure of LTCHs, as discussed in greater detail in section VIII.D. of the preamble of this final rule. Therefore, in this final rule, as we proposed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36267), we use the 2022-based LTCH market basket to update the LTCH PPS standard Federal payment rate for FY 2025.

Section 1886(m)(3)(A) of the Act provides that, beginning in FY 2010, any annual update to the LTCH PPS standard Federal payment rate is reduced by the adjustments specified in clauses (i) and (ii) of subparagraph (A), as applicable. Clause (i) of section 1886(m)(3)(A) of the Act provides for a reduction, for FY 2012 and each subsequent rate year, by “the productivity adjustment” described in section 1886(b)(3)(B)(xi)(II) of the Act. Section 1886(b)(3)(B)(xi)(II)

of the Act, as added by section 3401(a) of the Affordable Care Act, defines this productivity adjustment as equal to the 10-year moving average of changes in annual economy-wide, private nonfarm business multifactor productivity (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, year, cost reporting period, or other annual period). The U.S. Department of Labor's Bureau of Labor Statistics (BLS) publishes the official measures of private nonfarm business productivity for the U.S. economy. We note that previously the productivity measure referenced in section 1886(b)(3)(B)(xi)(II) was published by BLS as private nonfarm business multifactor productivity. Beginning with the November 18, 2021 release of productivity data, BLS replaced the term multifactor productivity with total factor productivity (TFP). BLS noted that this is a change in terminology only and will not affect the data or methodology. As a result of the BLS name change, the productivity measure referenced in section 1886(b)(3)(B)(xi)(II) is now published by BLS as private nonfarm business total factor productivity. However, as mentioned, the data and methods are unchanged. Please see www.bls.gov for the BLS historical published TFP data. A complete description of IGI's TFP projection methodology is available on the CMS website at <https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information>. Clause (ii) of section 1886(m)(3)(A) of the Act provided for a reduction, for each of FYs 2010 through 2019, by the "other adjustment" described in section 1886(m)(4)(F) of the Act; therefore, it is not applicable for FY 2025.

Section 1886(m)(3)(B) of the Act provides that the application of paragraph (3) of section 1886(m) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year.

c. Adjustment to the LTCH PPS Standard Federal Payment Rate under the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

In accordance with section 1886(m)(5) of the Act, the Secretary established the Long-Term Care Hospital Quality Reporting Program (LTCH QRP). The reduction in the annual update to the LTCH PPS standard Federal payment rate for failure to report quality data under the LTCH QRP for FY 2014 and subsequent fiscal years is codified under 42 CFR 412.523(c)(4). The LTCH QRP, as required for FY 2014 and subsequent fiscal years by section 1886(m)(5)(A)(i) of the Act, requires that a 2.0 percentage points reduction be applied to any update under 42 CFR 412.523(c)(3) for an LTCH that does not submit quality reporting data to the Secretary in accordance with section 1886(m)(5)(C) of the Act with respect to such a year (that is, in the form and manner and at the time specified by the Secretary under the LTCH QRP) (42 CFR 412.523(c)(4)(i)). Section 1886(m)(5)(A)(ii) of the Act provides that the application of the 2.0 percentage points reduction may result in an annual update that is less than 0.0 for a year, and may result in LTCH PPS payment rates for a year being less than such LTCH PPS payment rates for the preceding year. Furthermore, section 1886(m)(5)(B) of the Act specifies that the 2.0 percentage points reduction is applied in a noncumulative manner, such that any reduction made under section 1886(m)(5)(A) of the Act shall apply only with respect to the year involved and shall not be taken into account in computing the LTCH PPS payment amount for a subsequent year. These requirements are codified in the regulations at 42 CFR 412.523(c)(4). (For additional information on the history of the LTCH QRP, including the statutory authority and the selected measures, we refer readers to section IX. of the preamble of this final rule.)

d. Annual Market Basket Update Under the LTCH PPS for FY 2025

Consistent with our historical practice, we estimate the market basket percentage increase and the productivity adjustment based on IHS Global Inc.'s (IGI's) forecast using the most recent available data. Based on IGI's fourth quarter 2023 forecast, the proposed FY 2025 market basket percentage increase for the LTCH PPS using the proposed 2022-based LTCH market

basket was 3.2 percent. The proposed productivity adjustment for FY 2025 based on IGI's fourth quarter 2023 forecast was 0.4 percentage point.

For FY 2025, section 1886(m)(3)(A)(i) of the Act requires that any annual update to the LTCH PPS standard Federal payment rate be reduced by the productivity adjustment, described in section 1886(b)(3)(B)(xi)(II) of the Act. Consistent with the statute, we proposed to reduce the FY 2025 market basket percentage increase by the FY 2025 productivity adjustment. To determine the proposed market basket update for LTCHs for FY 2025 we subtracted the proposed FY 2025 productivity adjustment from the proposed FY 2025 market basket percentage increase. (For additional details on our established methodology for adjusting the market basket percentage increase by the productivity adjustment, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771).) In addition, for FY 2025, section 1886(m)(5) of the Act requires that, for LTCHs that do not submit quality reporting data as required under the LTCH QRP, any annual update to an LTCH PPS standard Federal payment rate, after application of the adjustments required by section 1886(m)(3) of the Act, shall be further reduced by 2.0 percentage points.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36268), in accordance with the statute, we proposed to reduce the proposed FY 2025 market basket percentage increase of 3.2 percent (based on IGI's fourth quarter 2023 forecast of the proposed 2022-based LTCH market basket) by the proposed FY 2025 productivity adjustment of 0.4 percentage point (based on IGI's fourth quarter 2023 forecast). Therefore, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, consistent with 42 CFR 412.523(c)(3)(xvii), we proposed to establish an annual market basket update to the LTCH PPS standard Federal payment rate for FY 2025 of 2.8 percent (that is, the proposed LTCH PPS market basket percentage increase of 3.2 percent less the proposed productivity adjustment of 0.4 percentage point). For LTCHs that fail to submit quality reporting data under the LTCH QRP, under 42 CFR 412.523(c)(3)(xvii) in conjunction with 42 CFR 412.523(c)(4), we proposed to further

reduce the annual update to the LTCH PPS standard Federal payment rate by 2.0 percentage points, in accordance with section 1886(m)(5) of the Act. Accordingly, we proposed to establish an annual update to the LTCH PPS standard Federal payment rate of 0.8 percent (that is, the proposed 2.8 percent LTCH market basket update minus 2.0 percentage points) for FY 2025 for LTCHs that fail to submit quality reporting data as required under the LTCH QRP. Consistent with our historical practice, we proposed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36268) to use a more recent estimate of the market basket percentage increase and the productivity adjustment, if appropriate, to establish an annual update to the LTCH PPS standard Federal payment rate for FY 2025 in the final rule. We note that, consistent with historical practice, we also proposed to adjust the FY 2025 LTCH PPS standard Federal payment rate by an area wage level budget neutrality factor in accordance with 42 CFR 412.523(d)(4) (as discussed in section V.B.5. of the Addendum to the proposed rule).

Comment: Several commenters stated that the proposed LTCH PPS payment update is inadequate given that inflationary pressures persist and LTCHs are experiencing higher costs for items such as labor, medical supplies, drugs, cybersecurity, administrative burdens, and other operational costs. Commenters stated that the proposed payment increase falls below economywide inflation over the past year (3.5 percent) and below what Medicare Advantage plans will receive for 2025 (3.7 percent). A few commenters stated concerns regarding access to care for Medicare beneficiaries treated in LTCHs given the inadequate proposed update for FY 2025. Other challenges cited by commenters included the impact of the implementation of the LTCH dual-rate payment system and other market dynamics, including declines in patient volume, concentration of LTCH cases in fewer payment groupings, the growth in Medicare Advantage, and the resulting worsening financial situation.

A commenter urged CMS to consider the effects of changing health care system dynamics and the unlikelihood of these dynamics returning to “normal” trends, which they stated are straining and will continue to strain hospitals and health systems. For example, commenters

cited the disruption to the health care system from the cyberattack on Change Healthcare. The commenter urged CMS to focus on appropriately accounting for recent and future trends in inflationary pressures and cost increases in the hospital payment update, stating it is essential to ensure that Medicare payments for acute care services more accurately reflect the cost of providing hospital care.

Commenters stated that labor costs, especially for clinicians, are continuing to increase at rates that are faster than what CMS factored into the proposed market basket update. A commenter claimed that CMS did not fully account for the increased labor costs that LTCHs are bearing and stated it is important that CMS modify its customary LTCH PPS rate setting methodology to account for the effects of these unprecedented labor costs on the cost to care for Medicare beneficiaries in LTCHs. The commenter stated that its labor costs (for both employed and contract labor) have been increasing at high rates. The commenter stated that increases in its compensation and total operating expenses have been significantly higher than the market basket increases from FY 2020 through FY 2022. The commenter stated that these data as well as other studies and reports highlight the need for additional increases in payments to cover the significant increases in costs that LTCHs have been experiencing. A commenter requested that CMS provide for a “special” increase to the proposed market basket update to account for significantly higher labor and supply costs incurred by LTCHs in recent years and in FY 2025.

A commenter stated that the authorizing statutes for the LTCH PPS do not require or mention the use of an index for an annual update, therefore, CMS is not restrained by the use of the IGI price proxy forecasts or any index with similar data for an annual LTCH PPS rate update. In addition, the commenter noted the broad LTCH PPS authority in the statute to account for circumstances like higher labor and supply costs, stating that Congress would not have included this language in the statute if it did not expect CMS to make such adjustments when appropriate. According to the commenter it is entirely appropriate for CMS to use this broad authority to

increase the market basket update to account for high labor and supply costs after the end of the COVID-19 pandemic that LTCHs continue to experience.

Commenters stated that the cumulative impact of inflationary pressure coupled with the proposed low Medicare payment increases for FY 2025 will continue to have negative effects on LTCH PPS operating margins. The commenters urged CMS to use more current data that includes the recent inflationary increases in cost. In the absence of such data, they requested that CMS consider an alternative approach to better align the market basket increases with the rising cost of treating patients.

Response: CMS has historically used a market basket to account for input price increases in the services furnished by fee-for-service providers. Since the inception of the LTCH PPS, the LTCH PPS standard Federal payment rates (with the exception of statutorily mandated updates) have been updated based on a projection of a market basket percentage increase. The LTCH market basket (as well as other CMS market baskets) is a fixed-weight, Laspeyres type index that measures price changes over time and does not reflect increases in costs associated with changes in the volume or intensity of input goods and services until the index is rebased. As such, the LTCH market basket update reflects the prospective price pressures described by the commenters as increasing during a high inflation period (such as faster wage growth or higher energy prices), but does not inherently reflect other factors that might increase the level of costs, such as the quantity of labor used. However, the impact of changes in quantity or use of services on the market basket cost weights are captured when the market basket is rebased.

As discussed in section VIII. D. of this final rule, after consideration of public comments, we are finalizing our proposal to rebase and revise the LTCH market basket to reflect a 2022 base year. We appreciate the commenters' concern regarding inflationary pressure, including labor and supply costs, encountered by LTCHs. The compensation cost weight in the 2022-based LTCH market basket is 8.6 percentage points higher than the compensation cost weight in the 2017-based LTCH market basket, reflecting the faster labor cost growth relative to other

input costs as noted by the commenters. We note that the market basket percentage increase is a forecast of the price pressures that LTCHs are expected to face in FY 2025, and the final FY 2025 LTCH market basket percentage increase reflects IGI's (a nationally recognized economic and financial forecasting firm with which CMS contracts to forecast the price proxies of the market baskets) projected inflation and overall economic outlook. We also note that when developing its forecast for the ECI for hospital workers, IGI considers overall labor market conditions (including rise in contract labor employment due to tight labor market conditions) as well as trends in contract labor wages, both of which could potentially impact wages for workers employed directly by the hospital. As projected by IGI and other independent forecasters, compensation growth and upward price pressures are expected to slow in FY 2025 relative to FY 2023 and FY 2024.

As is our general practice, we proposed that if more recent data became available, we would use such data, if appropriate, to derive the final FY 2025 LTCH market basket update for the final rule. For this final rule, we are using an updated forecast of the price proxies underlying the market basket that incorporates more recent historical data and reflects a revised outlook regarding the U.S. economy, including compensation and inflationary pressures. Based on IGI's second quarter 2024 forecast with historical data through the first quarter of 2024, the projected 2022-based LTCH market basket percentage increase factor for FY 2025 is 3.5 percent, which is 0.3 percentage point higher than the projected FY 2025 LTCH market basket percentage increase factor in the proposed rule, and reflects a projected increase in compensation prices of 4.0 percent. As discussed earlier, we believe the LTCH market basket percentage increase appropriately reflects the input price growth (including compensation price growth) that LTCHs incur in providing medical services. We would note that the 10-year historical average (2014-2023) growth rate of the 2022-based LTCH market basket is 2.8 percent with compensation prices increasing 2.9 percent. For these reasons, as discussed previously, we believe the LTCH market basket is methodologically sound and uses the best available data for

FY 2025. Therefore, we disagree with the commenters that CMS should increase the market basket update or apply a “special” payment adjustment to the LTCH PPS rates to account for or offset higher labor and supply costs or unprecedented inflation.

Comment: Some commenters stated that since the COVID-19 PHE, IGI’s forecasted growth for the LTCH market basket has shown a consistent trend of under-forecasting actual market basket growth. They stated they were cognizant of the fact that forecasts will always be imperfect, but the commenters claimed that in the past, they have been more balanced. However, with four straight years of under-forecasts, the commenters were concerned that there is a more systemic issue with IGI’s forecasting. Many commenters stated that the missed forecasts have resulted in significant and permanent underpayments to LTCHs, through direct Medicare payments and through influence on other payers, and have improperly allowed Medicare to underpay LTCHs for the costs to care for Medicare beneficiaries for FY 2021 through FY 2024.

Many commenters urged CMS to use the broad LTCH PPS statutory authority to implement forecasting error adjustments in FY 2025 to account for the differences in the market basket forecasts and actual increases since FY 2021, based on the most recent data. Some commenters stated that adopting a one-time forecast error adjustment is necessary to address unprecedented circumstances surrounding the COVID-19 PHE. One commenter urged CMS to increase the market basket whenever CMS determines that the actual market basket percentage increase exceeds the forecasted market basket percentage increase. A few commenters noted that CMS has made forecasting error adjustments for payments to other types of health care providers in the past, stating it would be appropriate to do so for LTCHs as well. Other commenters claimed that CMS wrongly dismissed the option of applying a special payment adjustment to the LTCH PPS rates that accounts for forecast errors in the FY 2023 IPPS/LTCH PPS final rule and FY 2024 IPPS/LTCH PPS final rule leading to underpayments for LTCHs.

These commenters stated that a correction to the FY 2025 payment rate is required to prevent underpayments to LTCHs going forward.

Commenters specifically requested that a forecast error adjustment of 4.3 percentage points be added to the FY 2025 annual update to account for the combined understatement of the FY 2021 through FY 2023 LTCH market baskets. A few commenters also requested that, in addition to that estimated 4.3 percentage points forecast error adjustment, CMS also add an unspecified additional amount to compensate LTCHs for four years of underpayments. Other commenters requested that CMS add 3.0 percentage points to the FY 2025 annual update to account for the difference between the market basket update that was implemented for FY 2022 and the actual market basket for FY 2022. One commenter requested that this FY 2022 forecast error adjustment be applied retroactively to the FY 2024 update.

Response: In responding to similar comments in the FY 2023 and FY 2024 IPPS/LTCH PPS final rules (87 FR 49165, 88 FR 59136), we explained that under the law, the LTCH PPS is a per-discharge prospective payment system that uses a market basket percentage increase to set the annual update prospectively. This means that the update relies on a mix of both historical data for part of the period for which the update is calculated and forecasted data for the remainder. (For instance, the 2022-based LTCH market basket growth rate for FY 2025 in this final rule is based on IGI's second quarter 2024 forecast with historical data through the first quarter of 2024.) While there is currently no mechanism to adjust for market basket forecast error in the LTCH PPS payment update, the forecast error for a market basket update is equal to the actual market basket percentage increase for a given year less the forecasted market basket percentage increase. Due to the uncertainty regarding future price trends, forecast errors can be both positive and negative.

While the projected LTCH basket updates for FY 2021 through FY 2023 were under forecast (actual increases less forecasted increases were positive), this was largely due to unanticipated inflation and labor market pressures as the economy emerged from the COVID-19

PHE. However, an analysis of the forecast error of the LTCH market basket over a longer period of time shows the forecast error has been both positive and negative. The 10-year cumulative forecast error for FY 2014 to FY 2023 (excluding 2018 as the update was statutorily mandated) is +0.7 percent. In addition, for each fiscal year from 2012 through 2020, the forecasted LTCH market basket update implemented in the final rule was shown to be higher than the actual LTCH market basket update once historical data were available. Only considering the forecast error for years when the final LTCH market basket update is lower than the actual LTCH market basket update would not adequately reflect the full impact of forecast error over the past 10 years. For these reasons, we are not adopting the commenters' requests to implement an adjustment for FY 2025 to account for the difference between the actual and forecasted LTCH market basket updates for FYs 2021 through 2023, and, for the reasons stated previously, we disagree that we wrongly dismissed commenters' requests to apply an adjustment that accounts for forecast errors in the FY 2023 and FY 2024 IPPS/ LTCH PPS final rules.

Comment: A commenter stated it appreciated CMS' proposal to increase the market basket update by 3.2 percent for FY 2025. However, the commenter believed that LTCHs should be provided the full 3.2 percent amount without a productivity adjustment. Several commenters stated that CMS should at least temporarily suspend the productivity adjustment due to declines in hospital productivity. A commenter requested that CMS provide more transparency about how the productivity adjustment is calculated. The commenter stated that besides CMS stating that it estimates the productivity adjustment based on IGI's forecast using the most recent available data, CMS does not provide any more information about the data or how it used the data to calculate a 0.4 percentage point reduction to the market basket update. Some commenters urged CMS to eliminate the productivity adjustment for FY 2025.

A commenter stated that the private nonfarm business TFP is intended to allow for productivity gains resulting from new technologies, economies of scale and changes in production, but because the factor is a 10-year moving average, the status of the current

workforce is not appropriately reflected. The commenter further stated that hospitals continue to encounter staffing difficulties, such as obtaining nurses and nursing assistants to care for patients and actions to regulate staffing, which will lead to less efficiency, increased costs and recruitment difficulties and should be accounted for when determining a productivity factor. This commenter and other commenters urged CMS to use its broad LTCH PPS statutory authority to eliminate the productivity adjustment for FY 2025, particularly in light of inadequate market basket increases.

Response: As set forth in section 1886(b)(3)(B)(xi) of the Act, the FY 2025 productivity adjustment is derived based on the 10-year moving average growth in economy-wide productivity for the period ending in FY 2025. We recognize the concerns of the commenters regarding the appropriateness of the productivity adjustment; however, as we explained in response to similar comments in the FY 2023 and FY 2024 IPPS/LTCH PPS final rules, section 1886(m)(3)(A)(i) of the Act requires the application of the specific productivity adjustment described in section 1886(b)(3)(B)(xi) of the Act.

As stated in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36267), BLS publishes the official measures of annual economy-wide, private nonfarm business total factor productivity (TFP) (previously referred to as annual economy-wide, private nonfarm business multifactor productivity). IGI forecasts TFP consistent with BLS methodology by forecasting the detailed components of TFP. A complete description of IGI's TFP projection methodology is available on the CMS website at <https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information>. We believe our methodology for the productivity adjustment is consistent with section 1886(b)(3)(B)(xi) of the Act which states that the productivity adjustment is equal to the 10-year moving average of changes in annual economy-wide private nonfarm business multi-factor productivity (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, year, cost reporting period, or other annual period).

The FY 2025 proposed productivity adjustment of 0.4 percent was based on IGI's forecast of the 10-year moving average of annual economy-wide private nonfarm business TFP, reflecting historical data through 2022 as published by BLS and forecasted TFP growth for 2023 through 2025. The FY 2025 final productivity adjustment of 0.5 percent is based on IGI's forecast of the 10-year moving average of annual economy-wide private nonfarm business TFP, reflecting historical data through 2023 as published by BLS, and forecasted TFP growth for 2024 through 2025.

In response to commenters' request for more transparency regarding the productivity adjustment calculation, we have provided the following information on the CMS website and in the Federal Register regarding the general method for calculating the productivity adjustment. As stated in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36267), the most recent BLS historical TFP data can be downloaded from the BLS website at <https://www.bls.gov/productivity>. This allows interested parties to obtain TFP annual index levels for 1987 through 2023. The IGI projection model as described on the CMS website (<https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information>) is then used to derive annual TFP growth rates for 2024 and 2025, which are then applied to the historical BLS levels to obtain a projection of index levels for 2024 and 2025. As further described in the documentation on the CMS website at https://www.cms.gov/research-statistics-data-and-systems/statistics-trends-and-reports/medicareprogramratesstats/downloads/tfp_methodology.pdf, these annual index levels are then interpolated to quarterly levels. The FY 2025 productivity adjustment is equal to the percent change in the 40-quarter moving average projected level for the period ending September 30, 2025 relative to the 40-quarter moving average projected level for the period ending September 30, 2024. If there are specific questions regarding the methodology for deriving the productivity adjustment, the public may email CMS at the email address provided on the CMS

website (dnhs@cms.hhs.gov) to request clarification or more information on the market baskets and productivity adjustment calculations.

After consideration of public comments, we are finalizing the LTCH PPS payment rate update using the most recent forecast of the 2022-based LTCH market basket percentage increase and productivity adjustment. As such, based on IGI's second quarter 2024 forecast, the FY 2025 market basket percentage increase for the LTCH PPS using the 2022-based LTCH market basket is 3.5 percent. The current estimate of the productivity adjustment for FY 2025 based on IGI's second quarter 2024 forecast is 0.5 percentage point. Therefore, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, consistent with 42 CFR 412.523(c)(3)(xvii), we are establishing an annual market basket update to the LTCH PPS standard Federal payment rate for FY 2025 of 3.0 percent (that is, the most recent estimate of the LTCH PPS market basket percentage increase of 3.5 percent less the productivity adjustment of 0.5 percentage point). For LTCHs that fail to submit quality reporting data under the LTCH QRP, under 42 CFR 412.523(c)(3)(xvii) in conjunction with 42 CFR 412.523(c)(4), as we proposed, we are further reducing the annual update to the LTCH PPS standard Federal payment rate by 2.0 percentage points, in accordance with section 1886(m)(5) of the Act. Accordingly, we are establishing an annual update to the LTCH PPS standard Federal payment rate of 1.0 percent (that is, the 3.0 percent LTCH market basket update minus 2.0 percentage points) for FY 2025 for LTCHs that fail to submit quality reporting data as required under the LTCH QRP.

D. Rebasing of the LTCH Market Basket

1. Background

The input price index (that is, the market basket) that was used to develop the LTCH PPS for FY 2003 was the “excluded hospital with capital” market basket. That market basket was based on 1997 Medicare cost report data and included data for Medicare-participating IRFs, IPFs, LTCHs, cancer hospitals, and children’s hospitals. Although the term “market basket” technically describes the mix of goods and services used in providing hospital care, this term is also commonly used to denote the input price index (that is, cost category weights and price proxies combined) derived from that mix. Accordingly, the term “market basket,” as used in this section, refers to an input price index.

Since the LTCH PPS inception, the market basket used to update LTCH PPS payments has been rebased and revised to reflect more recent data. We last rebased and revised the market basket applicable to the LTCH PPS in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58909 through 58926), where we adopted a 2017-based LTCH market basket. References to the historical market baskets used to update LTCH PPS payments are listed in the FY 2021 LTCH PPS final rule (85 FR 58909 through 58910).

For the FY 2025 IPPS/LTCH proposed rule, we proposed to rebase and revise the 2017-based LTCH market basket to reflect a 2022 base year, which would maintain our historical frequency of rebasing the market basket every 4 years. The proposed 2022-based LTCH market basket is primarily based on Medicare cost report data for LTCHs for FY 2022, specifically for cost reporting periods beginning on and after April 1, 2021, and prior to April 1, 2022. For the 2017-based LTCH market, we used Medicare cost report data for LTCHs from cost reporting periods beginning on and after October 1, 2016, and before October 1, 2017, or reports that began in FY 2017. The majority of LTCHs have a cost report begin date of September 1 and so those LTCHs with a cost report begin date of September 1, 2021 have the majority of their expenses occurring in the FY 2022 time period. We proposed to use data from

cost reporting periods beginning on and after April 1, 2021, and prior to April 1, 2022 because these data reflected the most recent Medicare cost report data for LTCHs at the time of rulemaking where the majority of their costs are occurring in FY 2022 while still maintaining our historical frequency of rebasing the market basket every 4 years.

At the time of proposed rulemaking, we were unable to use data from the FY 2022 HCRIS file, which reflects cost reporting periods beginning on and after October 1, 2021 and prior to September 30, 2022, as most reporters have a begin date of September 1, so the dataset in the file was not yet complete. In the interest of utilizing the most recent, complete data available, we proposed to combine data from multiple HCRIS files to obtain a 2022 base year. We proposed to use a composite timeframe of cost reporting periods beginning on and after April 1, 2021 and prior to April 1, 2022, because April 1 reflects the middle of the fiscal year and this timeframe would allow data from 2022 to be included in this rebasing. Using this proposed method, the weighted average of costs occurring in FY 2022 (accounting for the distribution of providers by Medicare cost report begin date) is 82 percent. Therefore, we believe our proposed methodology of using Medicare cost report data based on cost reporting periods beginning on or after April 1, 2021 and prior to April 1, 2022 reflects the most recent information that is most representative of FY 2022.

As described in the FY 2023 IPPS/LTCH final rule (87 FR 49164 through 49165), we received comments on the FY 2023 IPPS/LTCH PPS proposed rule where stakeholders expressed concern that the proposed market basket update was inadequate relative to input price inflation experienced by LTCHs, particularly as a result of the COVID-19 PHE. These commenters stated that the PHE, along with inflation, has significantly driven up operating costs. Specifically, some commenters noted changes to the labor markets that led to the use of more contract labor. As described in more detail later in this section, we verified this trend when analyzing the Medicare cost reports submitted by LTCHs through 2022. Therefore, we believe it is appropriate to incorporate more recent data to reflect updated cost structures for LTCHs, and

so we proposed to use 2022 as the base year because we believe that the Medicare cost reports for this year represent the most recent, complete set of Medicare cost report data available for developing the proposed LTCH market basket at the time of this rulemaking. Given the recent trends in the major cost weights derived from the Medicare cost report data as discussed later in this section, we will continue to monitor these data going forward and any additional changes to the LTCH market basket will be proposed in future rulemaking.

In the following discussion, we provide an overview of the proposed LTCH market basket, describe the proposed methodologies for developing the operating and capital portions of the proposed 2022-based LTCH market basket, and provide information on the proposed price proxies. In each section, we describe any comments received, responses to these comments, and our final policies for this final rule. We received the following comments on our proposal to rebase the LTCH market basket to a 2022 base year.

Comment: A few commenters were supportive of CMS rebasing the market basket to reflect a 2022 base year. A commenter cited support for CMS' proposed approach of using Medicare cost report data for LTCHs collected between April 1, 2021 and April 1, 2022 stating that under this proposed approach, a significant portion of FY 2022 data would be included in this rebasing and CMS would be including the most recent and representative data in its rebasing process.

However, a commenter stated that for FY 2025 payment rates, CMS proposed to return to its standard pre-pandemic rate setting methodologies (FY 2023 MedPAR file and FY 2022 HCRIS file) without any discussion of what are the "best available" data for the FY 2025 rate setting. The commenter stated that CMS is making an exception for the revised and rebased LTCH market basket where it proposed to use cost reports for periods beginning on or after April 1, 2021, and prior to April 1, 2022 to obtain a cost report dataset that is representative of FY 2022. The commenter claimed that based on its own experiences and analysis of its LTCH data, it is clear that LTCH utilization during the pandemic was not representative of typical LTCH

utilization patterns. The commenter stated that the highest surge of COVID-19 hospitalizations occurred during FY 2022; therefore, CMS erred by not considering this when deciding which data to use for rate setting in FY 2025.

Response: As stated in the FY 2025 IPPS/LTCH proposed rule (89 FR 36268) and discussed previously in this final rule, the market basket used to update LTCH PPS payments has been periodically rebased and revised over the history of the LTCH PPS to reflect more recent data on LTCH cost structures. It has been our longstanding practice to rebase the market baskets using the most recent data that are available at the time of proposed rulemaking. For the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to rebase and revise the LTCH market basket using 2022 Medicare cost reports, defined as cost reports for periods beginning on or after April 1, 2021, and prior to April 1, 2022. Using this proposed method, the weighted average of costs occurring in FY 2022 (accounting for the distribution of providers by Medicare cost report begin date) is 82 percent. This allowed us to obtain a cost report dataset that was complete and representative of FY 2022, which is the most recent year of complete data available at the time of rulemaking. Data for 2023 are incomplete at this time. The Medicare cost report data showed an increase in the Compensation cost weight from 2017 to 2022, which is consistent with comments received on the FY 2024 IPPS/LTCH proposed rule (88 FR 59134) that stated the 2017-based LTCH market basket did not sufficiently account for the dramatic increases in labor costs that LTCHs were incurring. As we stated in that rule in response to public comments, we are continually monitoring the trends in the LTCH cost data to ensure the market basket reflects the costs faced by LTCHs in providing care. Thus, we believe it is more appropriate to update the base year cost weights to 2022 to reflect changes over this period rather than to delay the rebasing. It has been our longstanding practice to rebase the market basket on a regular basis to ensure it reflects the input cost structure of LTCHs. We will continue to monitor the Medicare cost report data as they become available and, if appropriate, propose any changes to the LTCH market basket in future rulemaking.

2. Overview of the 2022-Based LTCH Market Basket

Similar to the 2017-based LTCH market basket, the proposed 2022-based LTCH market basket is a fixed-weight, Laspeyres-type price index. A Laspeyres price index measures the change in price, over time, of the same mix of goods and services purchased in the base period. Any changes in the quantity or mix (that is, intensity) of goods and services purchased over time relative to the base period are not measured. The index itself is constructed using three steps. First, a base period is selected (in the proposed rule, we proposed to use 2022 as the base period) and total base period costs are estimated for a set of mutually exclusive and exhaustive spending categories, with the proportion of total costs that each category represents being calculated. These proportions are called cost weights. Second, each cost category is matched to an appropriate price or wage variable, referred to as a “price proxy.” In almost every instance, these price proxies are derived from publicly available statistical series that are published on a consistent schedule (preferably at least on a quarterly basis). Finally, the cost weight for each cost category is multiplied by the level of its respective price proxy. The sum of these products (that is, the cost weights multiplied by their price index levels) for all cost categories yields the composite index level of the market basket in a given period. Repeating this step for other periods produces a series of market basket levels over time. Dividing an index level for a given period by an index level for an earlier period produces a rate of growth in the input price index over that timeframe. As previously noted, the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to furnish hospital services. The effects on total costs resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. For example, a hospital hiring more nurses to accommodate the needs of patients would increase the volume of goods and services purchased by the hospital but would not be factored into the price change measured by a fixed-weight hospital market basket. Only when the index is rebased would changes in the quantity and intensity be captured, with those changes

being reflected in the cost weights. Therefore, we rebase the market basket periodically so that the cost weights reflect recent changes in the mix of goods and services that hospitals purchase to furnish inpatient care between base periods.

3. Development of the 2022-Based LTCH Market Basket Cost Categories and Weights

We invited public comments on our proposed methodology, discussed in this section of this rule, for deriving the proposed 2022-based LTCH market basket.

a. Use of Medicare Cost Report Data

The major types of costs underlying the proposed 2022-based LTCH market basket are derived from the Medicare cost reports (CMS Form 2552–10, OMB Control Number 0938-0050) for LTCHs. Specifically, we use the Medicare cost reports for seven specific costs: Wages and Salaries, Employee Benefits, Contract Labor, Pharmaceuticals, Professional Liability Insurance (PLI), Home Office/Related Organization Contract Labor, and Capital. A residual category is then estimated and reflects all remaining costs not captured in the seven types of costs identified previously. The 2017-based LTCH market basket similarly used the Medicare cost reports.

Medicare cost report data include costs for all patients (including but not limited to those covered by Medicare, Medicaid, and private insurance). Because our goal is to measure cost shares for facilities that serve Medicare beneficiaries and are reflective of case mix and practice patterns associated with providing services to Medicare beneficiaries in LTCHs, we proposed to limit our selection of Medicare cost reports to those from LTCHs that have a Medicare average length of stay (LOS) that is within a comparable range of their total facility average LOS. We define the Medicare average LOS based on data reported on the Medicare cost report (CMS Form 2552–10, OMB Control Number 0938-0050) Worksheet S–3, Part I, line 14. We believe that applying the LOS edit results in a more accurate reflection of the structure of costs associated with Medicare covered days as our proposed edit excludes those LTCHs that had an average total facility LOS that were notably different than the average Medicare LOS. For the 2017-based LTCH market basket, we used the cost reports submitted by LTCHs with Medicare

average LOS within 25 percent (that is, 25 percent higher or lower) of the total facility average LOS for the hospital. Based on our analysis of the 2022 Medicare cost reports, for the proposed 2022-based LTCH market basket, we proposed to again use the cost reports submitted by LTCHs with Medicare average LOS within 25 percent (that is, 25 percent higher or lower) of the total facility average LOS for the hospital. The universe of LTCHs had an average Medicare LOS of 26 days, an average total facility LOS of 35 days, and aggregate Medicare utilization (as measured by Medicare inpatient LTCH days as a percentage of total facility inpatient LTCH days) of 34 percent in 2022. Applying the proposed trim excludes 11 percent of LTCH providers and results in a subset of LTCH Medicare cost reports with an average Medicare LOS of 26 days, average facility LOS of 30 days, and aggregate Medicare utilization (based on days) of 40 percent. The 11 percent of providers that are excluded had an average Medicare LOS of 29 days, average facility LOS of 71 days, and aggregate Medicare utilization of 14 percent.

We proposed to use the cost reports for LTCHs that meet this requirement to calculate the costs for the seven major cost categories (Wages and Salaries, Employee Benefits, Contract Labor, Professional Liability Insurance, Pharmaceuticals, Home Office/Related Organization Contract Labor, and Capital) for the market basket. Also, as described in section VIII.D.3.d. of the preamble of this final rule, and as done for the 2017-based LTCH market basket, we also proposed to use the Medicare cost report data to calculate the detailed capital cost weights for the Depreciation, Interest, Lease, and Other Capital-Related cost categories.

(1) Wages and Salaries Costs

We proposed to derive Wages and Salaries costs as the sum of routine inpatient salaries, ancillary salaries, and a proportion of overhead (or general service cost center) salaries as reported on Worksheet A, column 1. Because overhead salary costs are attributable to the entire LTCH, we proposed to only include the proportion attributable to the Medicare allowable cost centers. For the 2022-based LTCH market basket, we proposed that routine and ancillary Wages and Salaries costs would be equal to salary costs as reported on Worksheet A, column 1, lines 30

through 35, 50 through 76 (excluding 52 and 75), 90 through 91, and 93. Then, we proposed to estimate the proportion of overhead salaries that are attributed to Medicare allowable costs centers. We proposed to first calculate overhead salaries as the sum of Worksheet A, column 1, lines 4 through 18. We then calculate the “Medicare allowable ratio” equal to routine and ancillary Wages and Salaries divided by total non-overhead salaries (Worksheet A, column 1, line 200 less overhead salaries). We proposed to multiply this Medicare allowable ratio by overhead salaries to determine the overhead salaries attributed to Medicare allowable cost centers. The sum of routine salaries, ancillary salaries, and the estimated Medicare allowable portion of overhead salaries represent Wages and Salaries costs. A similar methodology was used to derive Wages and Salaries costs in the 2017-based LTCH market basket.

(2) Employee Benefits Costs

Similar to the 2017-based LTCH market basket, we proposed to calculate Employee Benefits costs using data from Worksheet S-3, part II, column 4, lines 17, 18, 20, and 22. The completion of Worksheet S-3, part II is only required for IPPS hospitals. For 2022, we found that approximately 42 percent of LTCHs voluntarily reported the Employee Benefits data, which has increased from the approximately 20 percent of LTCHs that reported these data that were used for the 2017-based LTCH market basket. Our analysis of the Worksheet S-3, part II data submitted by these LTCHs indicates that we continue to have a large enough sample to enable us to produce a reasonable Employee Benefits cost weight. Specifically, we found that when we recalculated the cost weight after weighting to reflect the characteristics of the universe of LTCHs (such as by type of ownership—nonprofit, for-profit, and government—and by region), the recalculation did not have a material effect on the resulting cost weight. Therefore, we proposed to use Worksheet S-3, part II data (as was done for the 2017-based LTCH market basket) to calculate the Employee Benefits cost weight in the proposed 2022-based LTCH market basket.

We note that, effective with the implementation of CMS Form 2552–10, OMB Control Number 0938-0050, we began collecting Employee Benefits and Contract Labor data on Worksheet S–3, part V, which is applicable to LTCHs. However, approximately 12 percent of LTCHs reported data on Worksheet S–3, part V for 2022, which has fallen since 2017 when roughly 17 percent of LTCHs reported these data. Because a greater percentage of LTCHs continue to report data on Worksheet S-3, part II than Worksheet S-3, part V, we did not propose to use the Employee Benefits and Contract Labor data reported on Worksheet S-3, part V to calculate the Employee Benefits and Contract Labor cost weights in the proposed 2022-based LTCH market basket. We continue to encourage all providers to report Employee Benefits and Contract Labor data on Worksheet S-3, part V.

(3) Contract Labor Costs

Contract Labor costs reported on the Medicare cost reports are primarily associated with direct patient care services. Contract Labor costs for services such as accounting, billing, and legal are estimated using other government data sources as described in this section of this final rule. Approximately 40 percent of LTCHs voluntarily reported Contract Labor costs on Worksheet S-3, part II, which was similar to the percentage obtained from 2017 Medicare cost reports.

As was done for the 2017-based LTCH market basket, we proposed to derive the Contract Labor costs for the proposed 2022-based LTCH market basket using voluntarily reported data from Worksheet S–3, part II. Our analysis of these data indicates that we have a large enough sample to enable us to produce a representative Contract Labor cost weight. Specifically, we found that when we recalculated the cost weight after weighting to reflect the characteristics of the universe of LTCHs by region, the recalculation did not have a material effect on the resulting cost weight. Therefore, we proposed to use data from Worksheet S-3, part II, column 4, lines 11 and 13 to calculate the Contract Labor cost weight in the proposed 2022-based LTCH market basket.

(4) Pharmaceuticals Costs

We proposed to calculate Pharmaceuticals costs using non-salary costs reported for the pharmacy cost center (line 15) and drugs charged to patients cost center (line 73). We proposed to calculate these costs as Worksheet A, column 7, less Worksheet A, column 1 for each of these lines. A similar methodology was used for the 2017-based LTCH market basket.

(5) Professional Liability Insurance Costs

We proposed that Professional Liability Insurance (PLI) costs (often referred to as malpractice costs) be equal to premiums, paid losses and self-insurance costs reported on Worksheet S-2, part I, columns 1 through 3, line 118. A similar methodology was used for the 2017-based LTCH market basket.

(6) Home Office/Related Organization Contract Labor Costs

We proposed to calculate the Home Office/Related Organization Contract Labor costs using data reported on Worksheet S-3, part II, column 4, lines 1401, 1402, 2550, and 2551 for those LTCH providers reporting total salaries on Worksheet S-3, part II, line 1. A similar methodology was used for the 2017-based LTCH market basket.

(7) Capital Costs

We proposed that Capital costs be equal to Medicare allowable capital costs as reported on Worksheet B, part II, column 26, lines 30 through 35, 50 through 76 (excluding 52 and 75), 90 through 91 and 93. A similar methodology was used for the 2017-based LTCH market basket.

b. Final Major Cost Category Computation

After we derive costs for the major cost categories for each provider using the Medicare cost report data as previously described, we proposed to trim the data for outliers. For each of the seven major cost categories, we first proposed to divide the calculated costs for the category by total Medicare allowable costs calculated for the provider to obtain cost weights for the universe of LTCH providers. For the 2022-based LTCH market basket (similar to the approach

used for the 2017-based LTCH market basket), we proposed that total Medicare allowable costs would be equal to the total costs as reported on Worksheet B, part I, column 26, lines 30 through 35, 50 through 76 (excluding 52 and 75), 90 through 91, and 93.

For the Wages and Salaries, Employee Benefits, Contract Labor, Pharmaceuticals, Professional Liability Insurance, and Capital cost weights, after excluding cost weights that are less than or equal to zero, we proposed to then remove those providers whose derived cost weights fall in the top and bottom 5 percent of provider specific derived cost weights to ensure the exclusion of outliers. We note that missing values are assumed to be zero consistent with the methodology for how missing values were treated in the 2017-based LTCH market basket. After the outliers have been excluded, we sum the costs for each category across all remaining providers. We proposed to divide this by the sum of total Medicare allowable costs across all remaining providers to obtain a cost weight for the 2022-based LTCH market basket for the given category. This trimming process is done for each cost weight separately.

For the Home Office/Related Organization Contract Labor cost weight, we proposed to apply a 1-percent top only trimming methodology. We believe, as the Medicare cost report data (Worksheet S-2, part I, line 140) indicate, that not all LTCHs have a home office. LTCHs without a home office can incur these expenses directly by having their own staff, for which the costs would be included in the Wages and Salaries and Employee Benefits cost weights. Alternatively, LTCHs without a home office could also purchase related services from external contractors for which these expenses would be captured in the residual “All Other” cost weight. We believe this 1-percent top-only trimming methodology is appropriate as it addresses outliers while allowing providers with zero Home Office/Related Organization Contract Labor costs to be included in the Home Office/Related Organization Contract Labor cost weight calculation. If we applied both the top and bottom 5 percent trimming methodology, we would exclude providers who have zero Home Office/Related Organization Contract Labor costs.

Finally, we proposed to calculate the residual “All Other” cost weight that reflects all remaining costs that are not captured in the seven cost categories listed.

We did not receive any specific comments on the proposed methodology to derive the major cost weights using the Medicare cost reports and therefore are finalizing this methodology without modification. We note that comments we received on the overall market basket method, transparency of the method, and resulting market basket updates and labor-related share are discussed later in section VIII.D.5 and VIII.D.6 of the preamble of this final rule. We refer readers to Table EEEE 1 for the resulting proposed and final cost weights for these major cost categories.

TABLE EEEE 1—MAJOR COST CATEGORIES AS DERIVED FROM MEDICARE COST REPORTS

Major Cost Categories	2022-Based LTCH Market Basket (Percent)	2017-Based LTCH Market Basket (Percent)
Wages and Salaries	42.7	42.6
Employee Benefits	6.5	6.2
Contract Labor	12.6	4.4
Professional Liability Insurance (Malpractice)	0.7	0.5
Pharmaceuticals	4.5	6.2
Home Office/Related Organization Contract Labor	3.7	1.9
Capital	8.5	9.9
All Other	20.8	28.3

The Wages and Salaries and Employee Benefits cost weights calculated from the Medicare cost reports for the 2022-based LTCH market basket are similar to the Wages and Salaries and Employee Benefits cost weights for the 2017-based LTCH market basket. The Contract Labor cost weight, however, is approximately 8 percentage points higher than the Contract Labor cost weight in the 2017-based LTCH market basket. The 2022-based Pharmaceuticals and Capital cost weights are lower than the 2017-based LTCH market basket by 1.7 percentage points and 1.4 percentage points, respectively. The 2022-based Home Office/Related Organization Contract Labor cost weight has increased by 1.8 percentage points compared to the 2017-based LTCH market basket.

As we did for the 2017-based LTCH market basket, we proposed to allocate the Contract Labor cost weight to the Wages and Salaries and Employee Benefits cost weights based on their relative proportions under the assumption that Contract Labor costs are comprised of both Wages and Salaries and Employee Benefits. The Contract Labor allocation proportion for Wages and Salaries is equal to the Wages and Salaries cost weight as a percent of the sum of the Wages and Salaries cost weight and the Employee Benefits cost weight. This rounded percentage is 87 percent. Therefore, we proposed to allocate 87 percent of the Contract Labor cost weight to the Wages and Salaries cost weight and 13 percent to the Employee Benefits cost weight. We received no comments on the proposed methodology to allocate the Contract Labor cost weight to the Wages and Salaries cost weight and Employee Benefits cost weight and therefore, are finalizing this methodology without modification. We refer readers to Table EEEE 2 that shows the proposed and final Wages and Salaries and Employee Benefits cost weights after Contract Labor cost weight allocation for both the 2022-based LTCH market basket and the 2017-based LTCH market basket.

TABLE EEEE 2- WAGES AND SALARIES AND EMPLOYEE BENEFITS COST WEIGHTS AFTER CONTRACT LABOR ALLOCATION

Major Cost Categories	2022-Based LTCH Market Basket	2017-Based LTCH Market Basket
Compensation	61.8	53.2
Wages and Salaries	53.6	46.4
Employee Benefits	8.2	6.8

After the allocation of the Contract Labor cost weight, the 2022-based Wages and Salaries cost weight is 7.2 percentage points higher and the Employee Benefits cost weight is 1.4 percentage points higher, relative to the respective cost weights for the 2017-based LTCH market basket. As a result, in the 2022-based LTCH market basket, the compensation cost weight is 8.6 percentage points higher than the Compensation cost weight for the 2017-based LTCH market basket.

c. Derivation of the Detailed Operating Cost Weights

To further divide the residual “All Other” cost weight estimated from the 2022 Medicare cost report data into more detailed cost categories, we proposed to use the 2017 Benchmark I–O “The Use Table (Supply-Use Framework)” data for NAICS 622000, Hospitals, published by the Bureau of Economic Analysis (BEA). These data are publicly available at the following Web site: <https://www.bea.gov/industry/input-output-accounts-data>. For the 2017-based LTCH market basket, we used the 2012 Benchmark I–O data, the most recent data available at the time (85 FR 58913).

The BEA Benchmark I–O data are scheduled for publication every 5 years with the most recent data available for 2017. The 2017 Benchmark I–O data are derived from the 2017 Economic Census and are the building blocks for BEA’s economic accounts. Therefore, they represent the most comprehensive and complete set of data on the economic processes or mechanisms by which output is produced and distributed.²⁵⁶ BEA also produces Annual I–O estimates. However, while based on a similar methodology, these estimates reflect less comprehensive and less detailed data sources and are subject to revision when benchmark data becomes available. Instead of using the less detailed Annual I–O data, we proposed to inflate the 2017 Benchmark I–O data forward to 2022 by applying the annual price changes from the respective price proxies to the appropriate market basket cost categories that are obtained from the 2017 Benchmark I–O data, and calculated the cost shares that each cost category represents using the inflated data. These resulting 2022 cost shares were applied to the residual “All Other” cost weight to obtain the detailed cost weights for the proposed 2022-based LTCH market basket. For example, the cost for Food: Direct Purchases represents 4.3 percent of the sum of the residual “All Other” 2017 Benchmark I–O Hospital Expenditures inflated to 2022. Therefore, the Food: Direct Purchases cost weight represents 4.3 percent of the proposed 2022-based LTCH market basket’s residual “All Other” cost category (20.8 percent), yielding a “final” Food: Direct

²⁵⁶ http://www.bea.gov/papers/pdf/IOmanual_092906.pdf

Purchases proposed cost weight of 0.9 percent in the proposed 2022-based LTCH market basket ($0.043 \times 20.8 \text{ percent} = 0.9 \text{ percent}$).

Using this methodology, we proposed to derive seventeen detailed LTCH market basket cost category weights within the proposed 2022-based LTCH market basket residual “All Other” cost weight (20.8 percent). These categories are: (1) Electricity and Other Non-Fuel Utilities; (2) Fuel: Oil and Gas; (3) Food: Direct Purchases; (4) Food: Contract Services; (5) Chemicals; (6) Medical Instruments; (7) Rubber and Plastics; (8) Paper and Printing Products; (9) Miscellaneous Products; (10) Professional Fees: Labor-Related; (11) Administrative and Facilities Support Services; (12) Installation, Maintenance, and Repair Services; (13) All Other Labor-Related Services; (14) Professional Fees: Nonlabor-Related; (15) Financial Services; (16) Telephone Services; and (17) All Other Nonlabor-Related Services. We note that these are the same categories as were used in the 2017-based LTCH market basket (with several cost categories being renamed for clarification purposes).

We did not receive any specific comments on the proposed methodology to derive the detailed operating cost weights and therefore are finalizing this methodology without modification. We note that general comments we received on the resulting market basket cost weights are discussed later in section VIII.D.5 and VIII.D.6 of the preamble of this final rule.

d. Derivation of the Detailed Capital Cost Weights

As described in section VIII.D.3.b. of the preamble of this final rule, we proposed a Capital-Related cost weight of 8.5 percent in the proposed 2022-based LTCH market basket as calculated from the 2022 Medicare cost reports for LTCHs after applying the proposed trims as previously described. We proposed to then separate this total Capital-Related cost weight into more detailed cost categories. Using Worksheet A-7 in the 2022 Medicare cost reports, we are able to group capital-related costs into the following categories: Depreciation, Interest, Lease, and Other Capital-Related costs, as shown in Table EEEE 3, which is the same methodology used for the 2017-based LTCH market basket.

We also proposed to allocate lease costs, which are 65 percent of total capital costs in the proposed 2022-based LTCH market basket, across each of the remaining detailed capital-related cost categories as was done in the 2017-based LTCH market basket. This would result in three primary capital-related cost categories in the proposed 2022 based LTCH market basket: Depreciation, Interest, and Other Capital-Related costs. Lease costs are unique in that they are not broken out as a separate cost category in the proposed 2022-based LTCH market basket. Rather, we proposed to proportionally distribute these costs among the cost categories of Depreciation, Interest, and Other Capital-Related, reflecting the assumption that the underlying cost structure of leases is similar to that of capital-related costs in general. As was done for the 2017-based LTCH market basket, we proposed to assume that 10 percent of the lease costs represents overhead and to assign those costs to the Other Capital-Related cost category accordingly. Therefore, we are assuming that approximately 6.5 percent ($65.0 \text{ percent} \times 0.1$) of total capital-related costs represent lease costs attributable to overhead, and we proposed to add this 6.5 percentage points to the 7.3 percent Other Capital-Related cost category weight. We also proposed to distribute the remaining lease costs (58.5 percent, or 65.0 percent less 6.5 percentage points) proportionally across the three cost categories (Depreciation, Interest, and Other Capital-Related) based on the proportion that these categories comprise of the sum of the Depreciation, Interest, and Other Capital-Related cost categories (excluding lease expenses). For example, the Other Capital-Related cost category represented 21.0 percent of all three cost categories (Depreciation, Interest, and Other Capital-Related) prior to any lease expenses being allocated. This 21.0 percent is applied to the 58.5 percent of remaining lease expenses so that another 12.3 percentage points of lease expenses as a percent of total capital-related costs is allocated to the Other Capital-Related cost category. Therefore, the resulting proposed Other Capital-Related cost weight is 26.1 percent (7.3 percent + 6.5 percent + 12.3 percent). This is the same methodology used for the 2017-based LTCH market basket. The proposed allocation of these lease expenses are shown in Table EEEE 3.

Finally, we proposed to further divide the Depreciation and Interest cost categories. We proposed to separate Depreciation cost category into the following two categories: (1) Building and Fixed Equipment and (2) Movable Equipment. We also proposed to separate the Interest cost category into the following two categories: (1) Government/Nonprofit; and (2) For profit.

To disaggregate the Depreciation cost weight, we needed to determine the percent of total depreciation costs for LTCHs (after the allocation of lease costs) that are attributable to Building and Fixed equipment, which we hereafter refer to as the “fixed percentage.” We proposed to use depreciation and lease data from Worksheet A-7 of the 2022 Medicare cost reports, which is the same methodology used for the 2017-based LTCH market basket. Based on the 2022 LTCH Medicare cost report data, we have determined that depreciation costs for building and fixed equipment account for 39 percent of total depreciation costs, while depreciation costs for movable equipment account for 61 percent of total depreciation costs. As previously mentioned, we proposed to allocate lease expenses among the Depreciation, Interest, and Other Capital-Related cost categories. We determined that leasing building and fixed equipment expenses account for 94 percent of total leasing expenses, while leasing movable equipment expenses account for 6 percent of total leasing expenses. We proposed to sum the depreciation and leasing expenses for building and fixed equipment, as well as sum the depreciation and leasing expenses for movable equipment. This results in the proposed Building and Fixed Equipment Depreciation cost weight (after leasing costs are included) representing 78 percent of total depreciation costs and the Movable Equipment Depreciation cost weight (after leasing costs are included) representing 22 percent of total depreciation costs.

To disaggregate the Interest cost weight, we determine the percent of total interest costs for LTCHs that are attributable to government and nonprofit facilities, which we hereafter refer to as the “nonprofit percentage,” because price pressures associated with these types of interest costs tend to differ from those for for-profit facilities. We proposed to use interest costs data from Worksheet A-7 of the 2022 Medicare cost reports for LTCHs, which is the same

methodology used for the 2017-based LTCH market basket. The nonprofit percentage determined using this method is 48 percent.

We received no specific comments on the proposed methodology to derive the detailed capital cost weights and therefore are finalizing this methodology without modification. Table EEEE 3 provides the proposed and final detailed capital cost shares obtained from the Medicare cost reports. Ultimately, these detailed capital cost shares are applied to the total Capital-Related cost weight determined in section VIII.D.3.b. of the preamble of this final rule to separate the total Capital-Related cost weight of 8.5 percent into more detailed cost categories and weights.

TABLE EEEE 3--CAPITAL COST SHARE COMPOSITION FOR THE 2022-BASED LTCH MARKET BASKET

	Capital Cost Share Composition Before Lease Expense Allocation (Percent)	Capital Cost Share Composition After Lease Expense Allocation (Percent)
Depreciation	23	63
Building and Fixed Equipment	18	49
Movable Equipment	5	14
Interest	4	11
Government/Nonprofit	2	5
For Profit	2	6
<i>Lease</i>	<i>65</i>	<i>N/A</i>
Other	7	26

Note: Detail may not add to total due to rounding.

e. 2022-Based LTCH Market Basket Cost Categories and Weights

Table EEEE 4 shows the cost categories and weights for the proposed and final 2022-based LTCH market basket compared to the 2017-based LTCH market basket.

TABLE EEEE 4--2022-BASED LTCH MARKET BASKET COST WEIGHTS COMPARED TO 2017-BASED LTCH MARKET BASKET COST WEIGHTS

Cost Category	2022-based LTCH Market Basket Cost Weight	2017-based LTCH Market Basket Cost Weight
Total	100.0	100.0
Compensation	61.8	53.2
Wages and Salaries	53.6	46.4
Employee Benefits	8.2	6.8
Utilities	1.2	1.9
Electricity and Other Non-Fuel Utilities	0.9	1.3
Fuel: Oil and Gas	0.3	0.6
Professional Liability Insurance	0.7	0.5
Malpractice	0.7	0.5
All Other Products and Services	27.7	34.4
All Other Products	12.6	15.6
Pharmaceuticals	4.5	6.2

Cost Category	2022-based LTCH Market Basket Cost Weight	2017-based LTCH Market Basket Cost Weight
Food: Direct Purchases	0.9	1.4
Food: Contract Services	1.4	1.6
Chemicals	0.4	0.5
Medical Instruments	3.4	3.6
Rubber and Plastics	0.5	0.5
Paper and Printing Products	0.6	0.8
Miscellaneous Products	1.0	1.1
All Other Services	15.1	18.9
Labor-Related Services	6.2	9.7
Professional Fees: Labor-Related	3.0	4.5
Administrative and Facilities Support Services	0.5	0.9
Installation, Maintenance, and Repair Services	1.0	2.1
All Other: Labor-Related Services	1.7	2.3
Nonlabor-Related Services	8.9	9.1
Professional Fees: Nonlabor-Related	6.1	5.9
Financial Services	1.2	1.2
Telephone Services	0.2	0.4
All Other: Nonlabor-Related Services	1.4	1.6
Capital-Related Costs	8.5	9.9
Depreciation	5.3	5.5
Building and Fixed Equipment	4.2	4.2
Movable Equipment	1.2	1.3
Interest Costs	1.0	2.1
Government/Nonprofit	0.5	0.4
For Profit	0.5	1.6
Other Capital-Related Costs	2.2	2.3

Note: Totals may not sum due to rounding.

4. Selection of Price Proxies

After developing the proposed cost weights for the 2022-based LTCH market basket, we selected the most appropriate wage and price proxies currently available to represent the rate of price change for each cost category. For the majority of the cost weights, we base the price proxies on U.S. Bureau of Labor Statistics (BLS) data and group them into one of the following BLS categories:

- *Employment Cost Indexes.* Employment Cost Indexes (ECIs) measure the rate of change in employment wage rates and employer costs for employee benefits per hour worked. These indexes are fixed-weight indexes and strictly measure the change in wage rates and employee benefits per hour. ECIs are superior to Average Hourly Earnings (AHE) as price proxies for input price indexes because they are not affected by shifts in occupation or industry mix, and because they measure pure price change and are available by both occupational group and by industry. The industry ECIs are based on the NAICS and the occupational ECIs are based on the Standard Occupational Classification System (SOC).

- *Producer Price Indexes.* Producer Price Indexes (PPIs) measure the average change over time in the selling prices received by domestic producers for their output. The prices included in the PPI are from the first commercial transaction for many products and some services (<https://www.bls.gov/ppi/>).

- *Consumer Price Indexes.* Consumer Price Indexes (CPIs) measure the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services (<https://www.bls.gov/cpi/>). CPIs are only used when the purchases are similar to those of retail consumers rather than purchases at the producer level, or if no appropriate PPIs are available.

We evaluate the price proxies using the criteria of reliability, timeliness, availability, and relevance:

- *Reliability.* Reliability indicates that the index is based on valid statistical methods and has low sampling variability. Widely accepted statistical methods ensure that the data were collected and aggregated in a way that can be replicated. Low sampling variability is desirable because it indicates that the sample reflects the typical members of the population. (Sampling variability is variation that occurs by chance because only a sample was surveyed rather than the entire population.)

- *Timeliness.* Timeliness implies that the proxy is published regularly, preferably at least once a quarter. The market baskets are updated quarterly, and therefore, it is important for the underlying price proxies to be up-to-date, reflecting the most recent data available. We believe that using proxies that are published regularly (at least quarterly, whenever possible) helps to ensure that we are using the most recent data available to update the market basket. We strive to use publications that are disseminated frequently, because we believe that this is an optimal way to stay abreast of the most current data available.

- *Availability.* Availability means that the proxy is publicly available. We prefer that our proxies are publicly available because this will help ensure that our market basket updates

are as transparent to the public as possible. In addition, this enables the public to be able to obtain the price proxy data on a regular basis.

- *Relevance.* Relevance means that the proxy is applicable and representative of the cost category weight to which it is applied.

We believe that the CPIs, PPIs, and ECIs that we have selected meet these criteria. Therefore, we believe that they continue to be the best measure of price changes for the cost categories to which they would be applied.

Table EEEE 7 lists all price proxies that we proposed to use for the 2022-based LTCH market basket. The next section of the rule contains a detailed explanation of the price proxies we proposed for each cost category weight.

a. Price Proxies for the Operating Portion of the 2022-Based LTCH Market Basket

(1) Wages and Salaries

We proposed to continue to use the ECI for Wages and Salaries for All Civilian workers in Hospitals (BLS series code CIU1026220000000I) to measure the wage rate growth of this cost category. This is the same price proxy used in the 2017-based LTCH market basket (85 FR 58917).

(2) Employee Benefits

We proposed to continue to use the ECI for Total Benefits for All Civilian workers in Hospitals to measure price growth of this category. This ECI is calculated using the ECI for Total Compensation for All Civilian workers in Hospitals (BLS series code CIU1016220000000I) and the relative importance of wages and salaries within total compensation. This is the same price proxy used in the 2017-based LTCH market basket (85 FR 58917).

(3) Electricity and Other Non-Fuel Utilities

We proposed to continue to use the PPI Commodity Index for Commercial Electric Power (BLS series code WPU0542) to measure the price growth of this cost category. This is the same price proxy used in the 2017-based LTCH market basket (85 FR 58917).

(4) Fuel: Oil and Gas

For the 2022-based LTCH market basket, we proposed to use a blend of the PPI Industry for Petroleum Refineries (NAICS 3241), PPI for Other Petroleum and Coal Products (NAICS 32419) and the PPI Commodity for Natural Gas. Our analysis of the Bureau of Economic Analysis' 2017 Benchmark I-O data for NAICS 622000 Hospitals shows that Petroleum Refineries expenses account for approximately 86 percent, Other Petroleum and Coal Products expenses account for about 7 percent and Natural Gas expenses account for approximately 7 percent of Hospitals' (NAICS 622000) total Fuel: Oil and Gas expenses. Therefore, we proposed to use a blend of 86 percent of the PPI Industry for Petroleum Refineries (BLS series code PCU324110324110), 7 percent of the PPI for Other Petroleum and Coal Products (BLS series code PCU32419) and 7 percent of the PPI Commodity Index for Natural Gas (BLS series code WPU0531) as the price proxy for this cost category. The 2017-based LTCH market basket used a 90/10 blend of the PPI Industry for Petroleum Refineries and PPI Commodity for Natural Gas, reflecting the 2012 I-O data (85 FR 58917). We believe that the three proposed price proxies are the most technically appropriate indices available to measure the price growth of the Fuel: Oil and Gas cost category in the 2022-based LTCH market basket.

(5) Professional Liability Insurance

We proposed to continue to use the CMS Hospital Professional Liability Index as the price proxy for PLI costs in the 2022-based LTCH market basket. To generate this index, we collect commercial insurance medical liability premiums for a fixed level of coverage while holding non-price factors constant (such as a change in the level of coverage). This is the same proxy used in the 2017-based LTCH market basket (85 FR 58917).

(6) Pharmaceuticals

We proposed to continue to use the PPI Commodity for Pharmaceuticals for Human Use, Prescription (BLS series code WPUSI07003) to measure the price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58917).

(7) Food: Direct Purchases

We proposed to continue to use the PPI Commodity for Processed Foods and Feeds (BLS series code WPU02) to measure the price growth of this cost category. This is the same price proxy used in the 2017-based LTCH market basket (85 FR 58917).

(8) Food: Contract Purchases

We proposed to continue to use the CPI for Food Away From Home (BLS series code CUUR0000SEFV) to measure the price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58917).

(9) Chemicals

Similar to the 2017-based LTCH market basket, we proposed to use a four-part blended PPI as the proxy for the chemical cost category in the 2022-based LTCH market basket. The proposed blend is composed of the PPI Industry for Industrial Gas Manufacturing, Primary Products (BLS series code PCU325120325120P), the PPI Industry for Other Basic Inorganic Chemical Manufacturing (BLS series code PCU32518–32518), the PPI Industry for Other Basic Organic Chemical Manufacturing (BLS series code PCU32519–32519), and the PPI Industry for Other Miscellaneous Chemical Product Manufacturing (BLS series code PCU325998325998). For the 2022-based LTCH market basket, we proposed to derive the weights for the PPIs using the 2017 Benchmark I–O data. The 2017-based LTCH market basket used the 2012 Benchmark I–O data to derive the weights for the four PPIs (85 FR 58917 through 58918). We did not receive comments on the proposed methodology to derive the blended Chemicals price proxy using the 2017 Benchmark I–O and therefore are finalizing this methodology without modification. Table EEEE 5 shows the weights for each of the four PPIs used to create the

proposed and final blended Chemicals proxy for the 2022-based LTCH market basket compared to the 2017-based blended Chemicals proxy.

TABLE EEEE 5: BLENDED CHEMICAL PPI WEIGHTS

Name	2022-based LTCH Chemical Weights (Percent)	2017-based LTCH Chemical Weights (Percent)	NAICS
PPI Industry for Industrial Gas Manufacturing	26	19	325120
PPI Industry for Other Basic Inorganic Chemical Manufacturing	10	13	325180
PPI Industry for Other Basic Organic Chemical Manufacturing	49	60	325190
PPI Industry for Other Miscellaneous Chemical Product Manufacturing	15	8	325998

(10) Medical Instruments

We proposed to use a blended price proxy for the Medical Instruments category. The 2017 Benchmark I–O data shows the majority of medical instruments and supply costs are for NAICS 339112—Surgical and medical instrument manufacturing costs (approximately 64 percent) and NAICS 339113—Surgical appliance and supplies manufacturing costs (approximately 36 percent). To proxy the price changes associated with NAICS 339112, we proposed to use the PPI for Surgical and medical instruments (BLS series code WPU1562). This is the same price proxy we used in the 2017-based LTCH market basket. To proxy the price changes associated with NAICS 339113, we proposed to use a 50/50 blend of the PPI for Medical and surgical appliances and supplies (BLS series code WPU1563) and the PPI for Miscellaneous products, Personal safety equipment and clothing (BLS series code WPU1571). We proposed to include the latter price proxy as it would reflect personal protective equipment including but not limited to face shields and protective clothing. The 2017 Benchmark I–O data does not provide specific expenses for these products; however, we recognize that this category reflects costs faced by LTCHs. For the 2017-based LTCH market basket, we used a blend composed of 57 percent of the commodity-based PPI Commodity for Surgical and Medical Instruments (BLS series code WPU1562) and 43 percent of the PPI Commodity for Medical and

Surgical Appliances and Supplies (BLS series code WPU1563) reflecting the 2012 Benchmark I-O data (85 FR 58918).

(11) Rubber and Plastics

We proposed to continue to use the PPI Commodity for Rubber and Plastic Products (BLS series code WPU07) to measure price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58918).

(12) Paper and Printing Products

We proposed to use a 61/39 blend of the PPI Commodity for Publications Printed Matter and Printing Material (BLS Series Code WPU094) and the PPI Commodity for Converted Paper and Paperboard Products (BLS series code WPU0915) to measure the price growth of this cost category. The 2017 Benchmark I-O data shows that 61 percent of paper and printing expenses are for Printing (NAICS 323110) and the remaining expenses are for Paper manufacturing (NAICS 322). The 2017-based LTCH market basket (85 FR 58918) used the PPI Commodity for Converted Paper and Paperboard Products (BLS series code WPU0915) as this comprised the majority of expenses as reported in the 2012 Benchmark I-O data.

(13) Miscellaneous Products

We proposed to continue to use the PPI Commodity for Finished Goods Less Food and Energy (BLS series code WPUFD4131) to measure the price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58918).

(14) Professional Fees: Labor-Related

We proposed to continue to use the ECI for Total Compensation for Private Industry workers in Professional and Related (BLS series code CIU2010000120000I) to measure the price growth of this category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58918).

(15) Administrative and Facilities Support Services

We proposed to continue to use the ECI for Total Compensation for Private Industry workers in Office and Administrative Support (BLS series code CIU2010000220000I) to measure the price growth of this category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58918).

(16) Installation, Maintenance, and Repair Services

We proposed to continue to use the ECI for Total Compensation for All Civilian workers in Installation, Maintenance, and Repair (BLS series code CIU1010000430000I) to measure the price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58918).

(17) All Other: Labor-Related Services

We proposed to continue to use the ECI for Total Compensation for Private Industry workers in Service Occupations (BLS series code CIU2010000300000I) to measure the price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58918).

(18) Professional Fees: Nonlabor-Related

We proposed to continue to use the ECI for Total Compensation for Private Industry workers in Professional and Related (BLS series code CIU2010000120000I) to measure the price growth of this category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58919).

(19) Financial Services

We proposed to continue to use the ECI for Total Compensation for Private Industry workers in Financial Activities (BLS series code CIU201520A000000I) to measure the price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58919).

(20) Telephone Services

We proposed to continue to use the CPI for Telephone Services (BLS series code CUUR0000SEED) to measure the price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58919).

(21) All Other: Nonlabor-Related Services

We proposed to continue to use the CPI for All Items Less Food and Energy (BLS series code CUUR0000SA0L1E) to measure the price growth of this cost category. This is the same proxy used in the 2017-based LTCH market basket (85 FR 58919).

We received the following comments on our proposed price proxies for the 2022-based LTCH market basket.

Comment: A few commenters stated that the Bureau of Labor Statistics' Employment Cost Index (ECI) used by CMS to calculate the labor portion of hospital costs only considers the salary costs of hospitals' employed staff; it does not reflect the portion of labor costs associated with contract labor that have risen in recent years. The commenters stated that this has proven to be a significant problem – and a major shortcoming of the current approach to calculating rate increases.

The commenters further stated that while the public health emergency has ended, LTCHs' reliance on contract staffing, and in particular contract nurses, has not ended, nor will it anytime soon. The commenters stated that while the need for such supplemental staffing has declined to a degree, it is not going away. The commenters stated their belief that CMS's calculation of Medicare LTCH rates should reflect this. For this reason, the commenters asked CMS to find new or additional data sources that capture this aspect of hospitals' labor costs when calculating future LTCH rate increases, including the final rate increase for FY 2025.

Response: We believe that the ECI for wages and salaries for hospital workers is accurately reflecting the price change associated with the labor used to provide hospital care. We believe that the price of employed staff and contract labor are influenced by the same factors and

should generally grow at similar rates. The ECI appropriately does not reflect other factors that might affect the rate of price changes associated with labor costs such as a shift in the occupations that may occur due to increases in case-mix or shifts in hospital purchasing decisions (for instance, to hire or to use contract labor). In most periods when there are not significant occupational shifts or significant shifts between employed and contract labor, the data has shown that the growth in the ECI for wages and salaries for hospital workers has generally been consistent with overall hospital wage trends. For example, our analysis of the Medicare cost report data shows from 2011 to 2019 the compound annual growth rate of both IPPS Medicare allowable salaries per hour and contract labor costs per hour was 2.5 percent, near the 2.0-percent growth rate of the ECI for wages and salaries for hospital workers over the same period (note the ECI would not reflect skill mix change whereas the salaries data would reflect these changes).

From 2019 to 2022, however, as noted by the commenters, contract labor utilization increased and employed labor utilization decreased, the combination of which is reflected in the LTCH compensation cost weight for the proposed LTCH market basket. Over this same period, the ECI for hospital workers grew 3.6 percent, which is about 1.6 percentage points faster than the 2011 to 2019 historical average growth rate, reflecting the recent wage price inflation cited by the commenters.

For this final rule, based on the more recent IGI second quarter 2024 forecast with historical data through the first quarter of 2024, the projected 2022-based LTCH market basket increase factor for FY 2025 reflects an increase in compensation prices of 4.0 percent.

After consideration of public comments, we are finalizing the price proxies for the operating portion of the 2022-based LTCH market basket as proposed without modification.

b. Price Proxies for the Capital Portion of the 2022-Based LTCH Market Basket

(1) Capital Price Proxies Prior to Vintage Weighting

We proposed to continue to use the same price proxies for the capital-related cost

categories as were applied in the 2017-based LTCH market basket, which are provided in Table EEEE 7 and described in this section of this rule. Specifically, we proposed to proxy:

- Depreciation: Building and Fixed Equipment cost category by BEA's Chained Price Index for Nonresidential Construction for Hospitals and Special Care Facilities (BEA Table 5.4.4. Price Indexes for Private Fixed Investment in Structures by Type).
- Depreciation: Movable Equipment cost category by the PPI Commodity for Machinery and Equipment (BLS series code WPU11).
- Nonprofit Interest cost category by the average yield on domestic municipal bonds (Bond Buyer 20-bond index).
- For-profit Interest cost category by the average yield of the iBoxx AAA Corporate Bond Yield index.
- Other Capital-Related cost category by the CPI-U for Rent of Primary Residence (BLS series code CUUS0000SEHA).

We believe these are the most appropriate proxies for LTCH capital-related costs that meet our selection criteria of relevance, timeliness, availability, and reliability. We also proposed to continue to vintage weight the capital price proxies for Depreciation and Interest in order to capture the long-term consumption of capital. This vintage weighting method is similar to the method used for the 2017-based LTCH market basket and is described in section VIII.D.4.b.(2). of the preamble of this final rule.

We received no comments on the proposed price proxies for the capital portion of the 2022-based LTCH market basket and therefore are finalizing the use of these price proxies without modification.

(2) Vintage Weights for Price Proxies

Because capital is acquired and paid for over time, capital-related expenses in any given year are determined by both past and present purchases of physical and financial capital. The vintage-weighted capital-related portion of the proposed 2022-based LTCH market basket is

intended to capture the long-term consumption of capital, using vintage weights for depreciation (physical capital) and interest (financial capital). These vintage weights reflect the proportion of capital-related purchases attributable to each year of the expected life of building and fixed equipment, movable equipment, and interest. We proposed to use vintage weights to compute vintage-weighted price changes associated with depreciation and interest expenses.

Capital-related costs are inherently complicated and are determined by complex capital-related purchasing decisions, over time, based on such factors as interest rates and debt financing. In addition, capital is depreciated over time instead of being consumed in the same period it is purchased. By accounting for the vintage nature of capital, we are able to provide an accurate and stable annual measure of price changes. Annual nonvintage price changes for capital are unstable due to the volatility of interest rate changes and, therefore, do not reflect the actual annual price changes for LTCH capital-related costs. The capital-related component of the proposed 2022-based LTCH market basket reflects the underlying stability of the capital-related acquisition process.

The methodology used to calculate the vintage weights for the proposed 2022-based LTCH market basket is the same as that used for the 2017-based LTCH market basket with the only difference being the inclusion of more recent data. To calculate the vintage weights for depreciation and interest expenses, we first need a time series of capital-related purchases for building and fixed equipment and movable equipment. We found no single source that provides an appropriate time series of capital-related purchases by hospitals for all of the previously mentioned components of capital purchases. The early Medicare cost reports did not have sufficient capital-related data to meet this need. Data we obtained from the American Hospital Association (AHA) do not include annual capital-related purchases. However, the AHA does provide a consistent database of total expenses from 1963 to 2020 – the latest available data. Consequently, we proposed to use data from the AHA Panel Survey and the AHA Annual Survey to obtain a time series of total expenses for hospitals. We also proposed to use data from

the AHA Panel Survey supplemented with the ratio of depreciation to total hospital expenses obtained from the Medicare cost reports to derive a trend of annual depreciation expenses for 1963 through 2020. We proposed to separate these depreciation expenses into annual amounts of building and fixed equipment depreciation and movable equipment depreciation as previously determined. From these annual depreciation amounts we derive annual end-of-year book values for building and fixed equipment and movable equipment using the expected life for each type of asset category. While data are not available that are specific to LTCHs, we believe this information for all hospitals serves as a reasonable proxy for the pattern of depreciation for LTCHs.

To continue to calculate the vintage weights for depreciation and interest expenses, we also needed to account for the expected lives for building and fixed equipment, movable equipment, and interest for the proposed 2022-based LTCH market basket. We proposed to calculate the expected lives using Medicare cost report data for LTCHs. The expected life of any asset can be determined by dividing the value of the asset (excluding fully depreciated assets) by its current year depreciation amount. This calculation yields the estimated expected life of an asset if the rates of depreciation were to continue at current year levels, assuming straight-line depreciation. Using this proposed method, we determined the average expected life of building and fixed equipment to be equal to 16 years, and the average expected life of movable equipment to be equal to 9 years. For the expected life of interest, we believe that vintage weights for interest should represent the average expected life of building and fixed equipment because, based on previous research described in the FY 1997 IPPS final rule (61 FR 46198), the expected life of hospital debt instruments and the expected life of buildings and fixed equipment are similar. We note that for the 2017-based LTCH market basket, we derived an expected average life of building and fixed equipment of 18 years and an expected average life of movable equipment of 9 years (85 FR 58920).

Multiplying these expected lives by the annual depreciation amounts results in annual year-end asset costs for building and fixed equipment and movable equipment. Then we calculated a time series, beginning in 1964, of annual capital purchases by subtracting the previous year's asset costs from the current year's asset costs.

For the building and fixed equipment and movable equipment vintage weights, we proposed to use the real annual capital-related purchase amounts for each asset type to capture the actual amount of the physical acquisition, net of the effect of price inflation. These real annual capital-related purchase amounts are produced by deflating the nominal annual purchase amount by the associated price proxy as previously provided. For the interest vintage weights, we proposed to use the total nominal annual capital-related purchase amounts to capture the value of the debt instrument (including, but not limited to, mortgages and bonds). Using these capital-related purchase time series specific to each asset type, we proposed to calculate the vintage weights for building and fixed equipment, for movable equipment, and for interest.

The vintage weights for each asset type are deemed to represent the average purchase pattern of the asset over its expected life (in the case of building and fixed equipment and interest, 16 years, and in the case of movable equipment, 9 years). For each asset type, we used the time series of annual capital-related purchase amounts available from 2020 back to 1964. These data allow us to derive forty-two 16-year periods of capital-related purchases for building and fixed equipment and interest, and forty-nine 9-year periods of capital-related purchases for movable equipment. For each 16-year period for building and fixed equipment and interest, or 9-year period for movable equipment, we proposed to calculate annual vintage weights by dividing the capital-related purchase amount in any given year by the total amount of purchases over the entire 16-year or 9-year period. This calculation is done for each year in the 16-year or 9-year period and for each of the periods for which we have data. Then we proposed to calculate the average vintage weight for a given year of the expected life by taking the average of these vintage weights across the multiple periods of data.

We received no comments on the proposed methodology to derive the vintage weights for the 2022-based LTCH market basket and therefore are finalizing these vintage weights without modification.

The vintage weights for the capital-related portion of the proposed and final 2022-based LTCH market basket and the 2017-based LTCH market basket are presented in Table EEEE 6.

TABLE EEEE 6-- 2022-BASED LTCH MARKET BASKET AND 2017-BASED LTCH MARKET BASKET VINTAGE WEIGHTS FOR CAPITAL-RELATED PRICE PROXIES

Year	Building and Fixed Equipment		Movable Equipment		Interest	
	2022-based 16 years	2017-based 18 years	2022-based 9 years	2017-based 9 years	2022-based 16 years	2017-based 18 years
1	0.051	0.046	0.094	0.093	0.037	0.031
2	0.053	0.047	0.099	0.096	0.039	0.032
3	0.055	0.046	0.103	0.101	0.042	0.033
4	0.057	0.048	0.107	0.109	0.046	0.036
5	0.059	0.048	0.112	0.113	0.049	0.038
6	0.059	0.051	0.116	0.117	0.052	0.042
7	0.060	0.052	0.119	0.119	0.055	0.045
8	0.062	0.053	0.123	0.124	0.059	0.048
9	0.064	0.055	0.128	0.129	0.063	0.052
10	0.065	0.057	--	--	0.067	0.056

17		0.064	--	--		0.083
18		0.065	--	--		0.088
Total	1.000	1.000	1.000	1.000	1.000	1.000

Note: Numbers may not add to total due to rounding.

The process of creating vintage-weighted price proxies requires applying the vintage weights to the price proxy index where the last applied vintage weight in Table EEEE6 is applied to the most recent data point. We have provided on the CMS Web site an example of how the vintage weighting price proxies are calculated, using example vintage weights and example price indices. The example can be found at the following link: <http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/MedicareProgramRatesStats/MarketBasketResearch.html> in the zip file titled “Weight Calculations as described in the IPPS FY 2010 Proposed Rule.”

c. Summary of Price Proxies of the 2022-Based LTCH Market Basket

Table EEEE 7 shows both the operating and capital price proxies for the proposed and final 2022-based LTCH market basket.

TABLE EEEE 7—PRICE PROXIES FOR THE 2022-BASED LTCH MARKET BASKET

Cost Description	Price Proxies
Total	
Compensation	
Wages and Salaries	ECI for Wages and Salaries for All Civilian workers in Hospitals
Employee Benefits	ECI for Total Benefits for All Civilian workers in Hospitals
Utilities	
Electricity and Other Non-Fuel Utilities	PPI for Commercial Electric Power
Fuel: Oil and Gas	Blend of PPIs
Professional Liability Insurance	
Malpractice	CMS Hospital Professional Liability Insurance Premium Index
All Other Products and Services	
All Other Products	
Pharmaceuticals	PPI Commodity for Pharmaceuticals for human use, prescription
Food: Direct Purchases	PPI for Processed Foods and Feeds
Food: Contract Services	CPI-U for Food Away From Home
Chemicals	Blend of PPIs
Medical Instruments	Blend of PPIs
Rubber and Plastics	PPI Commodity for Rubber and Plastic Products
Paper and Printing Products	Blend of PPIs
Miscellaneous Products	PPI Commodity for Finished Goods Less Food and Energy
All Other Services	
Labor-Related Services	
Professional Fees: Labor-Related	ECI for Total compensation for Private industry workers in Professional and related
Administrative and Facilities Support Services	ECI for Total compensation for Private industry workers in Office and administrative support
Installation, Maintenance, and Repair Services	ECI for Total compensation for Civilian workers in Installation, maintenance, and repair
All Other: Labor-Related Services	ECI for Total compensation for Private industry workers in Service occupations
Nonlabor-Related Services	
Professional Fees: Nonlabor-Related	ECI for Total compensation for Private industry workers in Professional and related
Financial Services	ECI for Total compensation for Private industry workers in Financial activities
Telephone Services	CPI-U for Telephone Services
All Other: Nonlabor-Related Services	CPI-U for All Items Less Food and Energy
Capital-Related Costs	
Depreciation	
Building and Fixed Equipment	BEA chained price index for nonresidential construction for hospitals and special care facilities - vintage weighted (16 years)
Movable Equipment	PPI Commodity for machinery and equipment - vintage weighted (9 years)
Interest Costs	
Government/Nonprofit	Average yield on domestic municipal bonds (Bond Buyer 20 bonds) - vintage weighted (16 years)
For Profit	Average yield on iBoxx AAA bonds - vintage weighted (16 years)
Other Capital-Related Costs	CPI-U for Rent of primary residence

5. FY 2025 Market Basket Update for LTCHs

For FY 2025 (that is, October 1, 2024 through September 30, 2025), we proposed to use an estimate of the proposed 2022-based LTCH market basket to update payments to LTCHs based on the best available data. Consistent with historical practice, we estimate the LTCH

market basket update for the LTCH PPS based on IHS Global, Inc.'s (IGI) forecast using the most recent available data. IGI is a nationally recognized economic and financial forecasting firm with which CMS contracts to forecast the components of the market baskets and total factor productivity (TFP).

Based on IGI's fourth quarter 2023 forecast with history through the third quarter of 2023, the projected market basket update for FY 2025 was 3.2 percent. This projected 2022-based LTCH market basket update reflected an increase in compensation prices (proxied by the ECIs for All Civilian workers in Hospitals) of 3.7 percent. IGI's forecast of the ECIs considers overall labor market conditions (including rise in contract labor employment due to tight labor market conditions) as well as trends in contract labor wages, which both have an impact on wage pressures for workers employed directly by the hospital.

Consistent with our historical practice of estimating market basket increases based on the best available data, we proposed a market basket update of 3.2 percent for FY 2025.

Furthermore, because the proposed FY 2025 annual update is based on the most recent market basket estimate for the 12-month period (currently 3.2 percent), we also proposed that if more recent data became subsequently available (for example, a more recent estimate of the market basket), we would use such data, if appropriate, to determine the FY 2025 annual update in the final rule. (The proposed annual update to the LTCH PPS standard payment rate for FY 2025 is discussed in greater detail in section V.A.2. of the Addendum to the proposed rule.)

Based on the more recent data available for this FY 2025 IPPS/LTCH final rule (that is, IGI's second quarter 2024 forecast of the 2022-based LTCH market basket with historical data through the first quarter of 2024), we estimate that the FY 2025 market basket update is 3.5 percent.

Using the current 2017-based LTCH market basket and IGI's second quarter 2024 forecast for the market basket components, the FY 2025 market basket update would be 3.4 percent (before taking into account any statutory adjustment). Therefore, the update based on the

2022-based LTCH market basket is currently projected to be 0.1 percentage point higher for FY 2025 compared to the current 2017-based LTCH market basket. This higher update is primarily due to the higher Compensation cost weight in the 2022-based market basket (61.8 percent) compared to the 2017-based LTCH market basket (53.2 percent). This is partially offset by the lower cost weight associated with All Other Services (such as Professional Fees and Installation, Maintenance, and Repair Services) for the 2022-based LTCH market basket relative to the 2017-based LTCH market basket. Table EEEE 8 compares the 2022-based LTCH market basket and the 2017-based LTCH market basket percent changes.

TABLE EEEE 8—2022-BASED LTCH MARKET BASKET AND 2017-BASED LTCH MARKET BASKET PERCENT CHANGES, FYs 2020 THROUGH 2027

	Fiscal Year (FY)	2022-Based LTCH Market Basket Percent Change	2017-Based LTCH Market Basket Percent Change
Historical Data	FY 2020	2.2	2.0
	FY 2021	2.6	2.8
	FY 2022	5.1	5.5
	FY 2023	5.1	4.8
	Average 2020-2023	3.8	3.8
Forecast	FY 2024	4.0	3.7
	FY 2025	3.5	3.4
	FY 2026	3.1	3.1
	FY 2027	2.9	2.9
	Average 2024-2027	3.4	3.3

Note that these market basket percent changes do not include any further adjustments as may be statutorily required.

Source: IHS Global Inc. 2nd quarter 2024 forecast

Over the historical time period covering FY 2020 through FY 2023, the average growth rate of the 2022-based LTCH market basket is the same as the average growth rate of the 2017-based LTCH market basket. Over the forecasted time period covering FY 2024 through FY 2027, the average growth rate of the 2022-based LTCH market basket is 0.1 percentage point higher than the average growth rate of the 2017-based LTCH market basket. This is driven by higher projected growth for FY 2024 and FY 2025 for the 2022-based LTCH market basket, which is primarily a result of the higher Compensation cost weight combined with faster projected growth in Compensation prices for FY 2024 and FY 2025 relative to projected prices for All Other Services. In FY 2026 and FY 2027 prices for these two aggregate cost categories are projected to grow at similar rates.

We summarize the public comments we received on the adequacy of the proposed LTCH market basket increase and our responses in section VIII.C.2.d. of the preamble of this final rule. Below are comments we received regarding the proposed methods for deriving the LTCH market basket.

Comment: Some commenters expressed concern that the proposed 3.2 percent market basket update and the 4.3 percentage point increase in the labor-related share do not sufficiently account for the dramatic increase in labor costs that LTCHs are incurring. Several commenters stated that there were proposed increases in the cost category weights for Contract Labor (12.6 percent versus 4.4 percent currently) and Home Office/Related Organization Contract Labor (3.7 percent versus 1.9 percent currently), but that CMS forecasted that the overall update will only be 0.1 percentage point higher for FY 2025 through FY 2027 using this 2022-based market basket. The commenters stated that according to CMS, this is primarily due to the offset from the lower All Other cost category weight (20.8 percent versus 28.3 percent currently), which includes things such as Professional Fees and Installation, Maintenance, and Repair Services. The commenters claimed that CMS is saying that most of the increases in labor costs reflected in the updated market basket are effectively removed by the All Other cost category. A commenter stated that this would only be true if All Other costs decreased substantially in FY 2022 compared to FY 2017 and the commenter stated that it is not clear from the proposed rule that this is the case. A commenter stated that the assigned cost weights for labor costs and All Other costs only reflect the relative proportion of such costs in the market basket, not how much overall costs in those categories have grown since FY 2017. Commenters stated that a 0.1 percentage point increase to the market basket update, using the rebased and revised LTCH market basket, does not reflect an overall increase in the cost of LTCH goods and services, compared to the 2017-based market basket.

Commenters stated that CMS needs to either modify the methodology it used to rebase and revise the market basket or apply a separate adjustment to the market basket rate to account

for significantly higher labor and supply costs incurred by providers. Another commenter requested CMS adjust the market basket to reflect staffing levels and ratios as well as stated that it should also account for facilities using highly priced temporary staff during surges or staff shortages.

Response: As stated previously, to derive the LTCH market basket for a specific base year, total base period costs are estimated for a set of mutually exclusive and exhaustive spending categories. Of those total costs, we estimate the proportion of total costs that each category represents, with these proportions called cost weights. Therefore, any changes in the cost weight from a prior base period will reflect the growth in the costs for that specific category relative to the growth in the costs for other categories. As a result, while costs for a particular category may have increased from 2017 to 2022, the cost weight (such as contract labor) would only increase if these specific costs increased faster than the increase in total costs from 2017 to 2022. Therefore, we disagree with the commenter that a decrease in the All Other cost category would only occur if All Other costs decreased substantially in 2022 compared to 2017.

As indicated by the commenters, the cost weights of the LTCH market basket are intended to reflect the relative proportion that specific costs represent of total costs, and not how much overall costs in those categories have increased since the prior base year. The LTCH market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to provide LTCH services. We believe that the proposed methodology to derive the cost categories and cost weights of the proposed market basket is detailed and robust and that this proposed method produces valid relative cost weights that are representative of LTCH cost structures. To allow for interested parties to evaluate this methodology, we have provided the detailed calculations including the data sources (such as the specific Medicare cost report fields) and trimming methodology so that commenters are able to replicate the methodology and provide specific comments on the derivation of these cost weights. We will continue to monitor the Medicare cost

reports as new data becomes available, and any changes to the LTCH market basket will be proposed in future rulemaking.

Comment: Some commenters requested that CMS publish additional information and underlying data regarding its market basket methodology, as they have been unable to replicate some of CMS' figures. A commenter was concerned about the lack of transparency from CMS regarding the rebased and revised market basket. The commenter stated that they conducted an independent analysis of the rebased market basket CMS proposed for FY 2025. The commenter stated that it was unclear how CMS arrived at the 3.2 percent market basket update from the revised market basket cost categories. The commenter stated that their analyst discovered that there were many uncertainties in the data that CMS used to rebase and revise the market basket, including whether the data accurately represents LTCH costs, how the data were trimmed, and the exact subcomponents of each cost category. Accordingly, the commenter requested that CMS provide more transparency in the final rule regarding the data used to rebase the market basket and how that data resulted in the proposed 3.2 percent market basket update for the FY 2025 LTCH PPS payment update.

Response: In the FY 2025 IPPS/LTCH proposed rule (89 FR 36268 through 36271), for each of the major cost categories of the market basket, we provided detailed descriptions of the Worksheet, column number, and line number on the Medicare cost report that we proposed to use to derive the costs for each category as well as for total Medicare allowable costs. For categories such as benefits and contract labor where data reporting is more limited, we performed detailed analysis of the data by reweighting the cost weights by ownership type using the distribution of the universe of LTCHs and compared these results to the proposed cost weights to help ensure that the data were representative of LTCHs, which we noted in the FY 2025 IPPS/LTCH proposed rule (89 FR 36270). In addition, in the proposed rule, we provided descriptions of the trimming methods applied for each cost weight, which is again described in section VIII.D.3.b of the preamble of this final rule. We believe this information is sufficient to

allow stakeholders to replicate the market basket cost weights that we proposed and are finalizing for the 2022-based LTCH market basket.

Information on the CMS market baskets can be found at the CMS website:

<https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information>.

This website provides information including but not limited to how a top-line market basket level is derived from the detailed cost categories, how a four-quarter percent change moving average is calculated, and a link to a spreadsheet containing an example of how the detailed market basket cost weights are calculated for the 2006-based IPPS market basket, which is similar to the approach followed for the LTCH market basket as well as most of the other CMS market baskets. In addition, the latest, publicly available CMS market baskets are available at the CMS website: <https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-data>. We note that publicly available market baskets on the CMS website would reflect an updated forecast only after a proposed or final rule is published. Using these spreadsheets, stakeholders are able to replicate the top-line market basket index levels in the historical time period by multiplying the detailed index level for each cost category by the associated cost weight. These products (weight multiplied by index level) can then be summed up to derive the aggregate market basket index level. In response to the commenter's request for more transparency, in this final rule, we are also providing the projected increase for FY 2025 for some of the aggregated cost categories that underlie the most recent forecast of the FY 2025 LTCH market basket increase (3.5 percent). This detail is consistent with the level of information that we publish on the CMS website on a quarterly basis as described above. We note that prices for the compensation cost weight, which accounts for about 62 percent of the market basket are projected to increase 4.0 percent in FY 2025; prices for All Other Products and Services, which accounts for about 28 percent of the market basket are projected to increase 2.8 percent; and prices for Capital-Related costs, which accounts for about 8.5 percent of the LTCH market

basket are projected to increase 3.2 percent. Weighting the projected price increases for these aggregated categories (reflecting 98.5 percent of the LTCH market basket cost weights with the remaining 1.5 percent reflecting Utilities and PLI), we obtain a weighted average projected increase of 3.5 percent. While the projected market basket increase is calculated using the aggregation of the detailed price forecasts multiplied by their respective cost weights for each of the 26 individual cost categories, we want to provide an estimate of how the broader cost categories are contributing to the overall increase. We strive for transparency regarding our methods and regularly respond to questions from stakeholders regarding the market baskets via email at dnhs@cms.hhs.gov.

Comment: A few commenters requested CMS closely evaluate its current forecasting and market basket practices for further refinement. Commenters stated that during this period of high cost growth, Medicare payment updates for LTCHs have now shown a consistent pattern of failing to not only forecast, but also eventually capture this growth. The commenters stated that despite the high rates of medical inflation, LTCH payments have not kept up with general inflation. Commenters claimed that since fee-for-service Medicare patients make up more than half of all LTCH discharges, and other insurers adjust payment rates relative to Medicare reimbursement, these missed forecasts compound the obstacles facing LTCHs.

Commenters also stated that it is confounding how hospitals, and especially labor-intensive LTCHs, could have a market basket that is significantly below general inflation. The commenters stated that there has been very large growth in LTCH costs in the last several years which has exceeded general inflation. However, they stated, even the actual market basket growth (not forecasts) was below general inflation during this time. The commenters stated that the market basket itself may have shortcomings that fail to properly capture growth.

The commenters stated that there may be many overlapping, contributing factors to the market basket failing to capture inflationary factors. One such factor is the increased utilization in contract labor, which the Employment Cost Index does not capture. They encouraged CMS to

thoroughly reexamine the market basket and its recent shortcomings to identify other potential areas for refinement and stated support for working with CMS to assist with such an endeavor.

Response: Since the inception of the LTCH PPS, the LTCH payment rates (with the exception of statutorily-mandated updates) have been updated by a projection of a market basket percentage increase – consistent with other CMS PPS updates (including the IPPS, SNF PPS, and Home Health PPS). The LTCH market basket (as well as other CMS market baskets) is a fixed-weight, Laspeyres-type index that measures price changes over time and would not reflect increases in costs associated with changes in the volume or intensity of input goods and services. As such, the LTCH market basket update would reflect the prospective price pressures described by the commenters as increasing during a high inflation period (such as faster wage growth or higher energy prices), but would not reflect other factors that might increase the level of costs, such as the quantity of labor used. The impact of changes in quantity or use of services on the market basket cost weights would be captured when the market basket is rebased.

We note that the market basket percentage increase is a forecast of the price pressures that hospitals are expected to face in 2025. We also note that when developing its forecast for the ECI for hospital workers, IGI (a nationally recognized economic and financial forecasting firm with which CMS contracts to forecast the price proxies of the market baskets) considers overall labor market conditions (including rise in contract labor employment due to tight labor market conditions) as well as trends in contract labor wages, both of which could potentially impact wages for workers employed directly by the hospital. As projected by IGI and other independent forecasters, compensation growth and upward price pressures are expected to slow in 2025 relative to 2022 and 2023. Therefore, we believe the projected increase in the LTCH market basket for FY 2025 is reflective of expectations for input price growth in FY 2025.

As is our general practice, we proposed that if more recent data became available, we would use such data, if appropriate, to derive the final FY 2025 LTCH market basket update for the final rule. For this final rule, based on the more recent IGI second quarter 2024 forecast with

historical data through the first quarter of 2024, the projected 2022-based LTCH market basket increase factor for FY 2025 is 3.5 percent, which is 0.3 percentage point higher than the projected FY 2025 LTCH market basket increase factor in the proposed rule, and reflects an increase in compensation prices of 4.0 percent. We would note that the 10-year historical average (2014-2023) growth rate of the 2022-based LTCH market basket is 2.8 percent with compensation prices increasing 2.9 percent. The final FY 2025 LTCH market basket increase reflects IGI's projected inflation and overall economic outlook.

6. FY 2025 Labor-Related Share

As discussed in section V.B. of the Addendum to this final rule, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS payments to account for differences in LTCH area wage levels (§ 412.525(c)). The labor-related portion of the LTCH PPS standard Federal payment rate, hereafter referred to as the labor-related share, is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index. The labor-related share is determined by identifying the national average proportion of total costs that are related to, influenced by, or vary with the local labor market. As discussed in more detail in this section of this rule and similar to the 2017-based LTCH market basket, we classify a cost category as labor-related and include it in the labor-related share if the cost category is defined as being labor-intensive and its cost varies with the local labor market. As stated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58988), the labor-related share for FY 2024 was defined as the sum of the FY 2024 relative importance of Wages and Salaries; Employee Benefits; Professional Fees; Labor-Related Services; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-related Services; and a portion of the Capital-Related Costs from the 2017-based LTCH market basket.

We proposed to continue to classify a cost category as labor-related if the costs are labor-intensive and vary with the local labor market. Given this, based on our definition of the labor-

related share and the cost categories in the 2022-based LTCH market basket, we proposed to include in the labor-related share for FY 2025 the sum of the FY 2025 relative importance of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-Related Services; and a portion of the Capital-Related cost weight from the 2022-based LTCH market basket.

Similar to the 2017-based LTCH market basket, the 2022-based LTCH market basket includes two cost categories for nonmedical Professional fees (including but not limited to, expenses for legal, accounting, and engineering services). These are Professional Fees: Labor-Related and Professional Fees: Nonlabor-Related. For the 2022-based LTCH market basket, we proposed to estimate the labor-related percentage of non-medical professional fees (and assign these expenses to the Professional Fees: Labor-Related services cost category) based on the same method that was used to determine the labor-related percentage of professional fees in the 2017-based LTCH market basket.

As was done for the 2017-based LTCH market basket, we proposed to determine the proportion of legal, accounting and auditing, engineering, and management consulting services that meet our definition of labor-related services based on a survey of hospitals conducted by CMS in 2008. We notified the public of our intent to conduct this survey on December 9, 2005 (70 FR 73250) and did not receive any public comments in response to the notice (71 FR 8588). A discussion of the composition of the survey and post-stratification can be found in the FY 2010 IPPS/LTCH PPS final rule (74 FR 43850 through 43856). Based on the weighted results of the survey, we determined that hospitals purchase, on average, the following portions of contracted professional services outside of their local labor market:

- 34 percent of accounting and auditing services.
- 30 percent of engineering services.
- 33 percent of legal services.

- 42 percent of management consulting services.

For the 2022-based LTCH market basket, we proposed to apply each of these percentages to the respective 2017 Benchmark I–O cost category underlying the professional fees cost category to determine the Professional Fees: Nonlabor-Related costs. The Professional Fees: Labor-Related costs were determined to be the difference between the total costs for each Benchmark I–O category and the Professional Fees: Nonlabor-Related costs. This is the same methodology that we used to separate the 2017-based LTCH market basket professional fees category into Professional Fees: Labor-Related and Professional Fees: Nonlabor-Related cost categories.

Effective for transmittal 18 (<https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/Transmittals/r18p240i>), the hospital Medicare Cost Report (CMS Form 2552-10, OMB No. 0938-0050) is collecting information on whether a hospital purchased professional services (for example, legal, accounting, tax preparation, bookkeeping, payroll, advertising, and management or consulting services or both) from an unrelated organization and if the majority of these expenses were purchased from unrelated organizations located outside of the main hospital’s local area labor market. We encourage all providers to provide this information so we can potentially use these more recent data in future rulemaking to determine the labor-related share.

In the 2022-based LTCH market basket, we proposed that nonmedical professional fees that were subject to allocation based on these survey results represent approximately 3.6 percent of total costs (and are limited to those fees related to Accounting and Auditing, Legal, Engineering, and Management Consulting services). Based on our survey results, we proposed to apportion approximately 2.3 percentage points of the 3.6 percentage point figure into the Professional Fees: Labor-Related cost category and designate the remaining approximately 1.3 percentage points into the Professional Fees: Nonlabor-Related cost category.

In addition to the professional services as previously listed, for the 2022-based LTCH market basket, we proposed to allocate a proportion of the Home Office/Related Organization

Contract Labor cost weight, calculated using the Medicare cost reports as previously stated, into the labor-related and nonlabor-related cost categories. We proposed to classify these expenses as labor-related and nonlabor-related as many facilities are not located in the same geographic area as their home office and, therefore, do not meet our definition for the labor-related share that requires the services to be purchased in the local labor market.

Similar to the 2017-based LTCH market basket, we proposed for the 2022-based LTCH market basket to use the Medicare cost reports for LTCHs to determine the home office labor-related percentages. The Medicare cost report requires a hospital to report information regarding their home office provider. Using information on the Medicare cost report, we compare the location of the LTCH with the location of the LTCH's home office. We proposed to classify a LTCH with a home office located in their respective labor market if the LTCH and its home office are located in the same Metropolitan Statistical Area (MSA). Then we determine the proportion of the Home Office/Related Organization Contract Labor cost weight that should be allocated to the labor-related share based on the percent of total Home Office/Related Organization Contract Labor costs for those LTCHs that had home offices located in their respective MSA of total Home Office/Related Organization Contract Labor costs for LTCHs with a home office. We determined a LTCH's and its home office's MSA using their zip code information from the Medicare cost report. Using this methodology with the 2022 Medicare cost reports, we determined that 4 percent of LTCHs' Home Office/Related Organization Contract Labor costs were for home offices located in their respective MSA, or local labor markets. Therefore, we are allocating 4 percent of the Home Office/Related Organization Contract Labor cost weight ($0.1 \text{ percentage point} = 3.7 \text{ percent} \times 4 \text{ percent}$) to the Professional Fees: Labor-Related cost weight and 96 percent of the Home Office/Related Organization Contract Labor cost weight to the Professional Fees: Nonlabor-Related cost weight ($3.6 \text{ percentage points} = 3.7 \text{ percent} \times 96 \text{ percent}$). For comparison, for the 2017-based LTCH market basket we also

allocated 4 percent of the Home Office/Related Organization Contract Labor cost weight to the Professional Fees: Labor-Related cost weight (85 FR 58924).

In summary, based on the two allocations mentioned earlier, we proposed to apportion 2.4 percentage points (2.3 percentage points + 0.1 percentage point) of the Professional Fees and Home Office/Related Organization Contract Labor cost weights into the Professional Fees: Labor-Related cost category. This amount was added to the portion of professional fees that we already identified as labor-related using the I-O data such as contracted advertising and marketing costs (approximately 0.6 percentage point of total costs) resulting in a total Professional Fees: Labor-Related cost weight of 3.0 percent.

We summarize the public comments we received on our proposed methodology for deriving the proposed labor-related share for FY 2025 and our responses here.

Comment: A commenter appreciated the proposal to increase the labor-related share based on data that better reflect increased labor costs as a percentage of LTCH's overall cost structure. However, the commenter disagreed with CMS' assertion that some portion of professional contract labor costs is not subject to geographic variation in labor costs. The commenter requested that CMS allocate all 3.6 percentage points for professional services costs to the Professional Services: Labor-Related Category for the final rule.

The commenter claimed that CMS' assumption that fees for services provided by firms located outside of a hospital's core-based statistical area (CBSA) do not vary based on geography is invalid. The commenter stated that the implied underpinning of this assumption is that national and regional professional services firms do not compete with local professional services firms based in a hospital's CBSA. However, the commenter stated that this is an erroneous assumption as hospitals seeking professional services solicit proposals for these services from local, regional, and national firms and therefore, regional and national firms have the incentive to adjust their pricing in response to local labor market conditions. The commenter stated that if the local labor market has lower wages than the national average — which will

influence the pricing of a local firm's response to a request for proposal from a hospital — regional and national firms must reduce the offered price of their services to be competitive with local firms that offer the same services. Conversely, the commenter stated, if the local labor market has higher wages than the national average, regional and national firms have every incentive to price accordingly to increase their profit margins on a given contract. Therefore, the commenter claimed that pricing for services offered by regional and national firms to hospitals in differing CBSAs will vary significantly based on local rates due to these firms competing with local firms that provide the same service.

Therefore, the commenter asked CMS to provide evidence that pricing for professional services delivered by regional and national firms to hospitals is offered in a market that is not subject to geographic cost variation. The commenter stated that unless the agency can produce strong evidence that prices for professional services provided by firms outside of a hospital's local labor market are homogenous — that an LTCH in San Antonio, Texas, is charged the same hourly rates for audit services by the same national accounting firm as a hospital in Sacramento, Calif. — it asks CMS to restore the 1.3 percentage points it proposes to reclassify to Professional Services: Nonlabor-Related to the Professional Services: Labor-Related category. In the absence of data that show standardized pricing by regional and national professional services firms, the commenter stated that the Professional Services: Labor-Related category cost weight should be 3.6 percentage points.

Response: We disagree with the commenter and believe it is appropriate that a proportion of Accounting & Auditing, Legal, Engineering, and Management Consulting services costs purchased by hospitals should be excluded from the labor-related share. Under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS standard Federal payment rate to account for differences in LTCH area wage levels under § 412.525(c). The labor-related share of the LTCH PPS standard

Federal payment rate is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index.

The purpose of the labor-related share is to reflect the proportion of the national PPS base payment rate that is adjusted by the hospital's wage index (representing the relative costs of their local labor market to the national average). Therefore, we include a cost category in the labor-related share if the costs are labor intensive and vary with the local labor market.

As acknowledged by the commenter and confirmed by the survey of hospitals conducted by CMS in 2008 (as stated previously in this final rule), professional services can be purchased from local firms as well as national and regional professional services firms. It is not necessarily the case, as asserted by the commenter, that these national and regional firms have fees that match those in the local labor market even though providers have the option to utilize those firms. That is, fees for services purchased from firms outside the local labor market may differ from those that would be purchased in the local labor market for any number of reasons (including but not limited to, the skill level of the contracted personnel, higher capital costs, etc.). As noted earlier in this section of this final rule, the definition for the labor-related share requires the services to be purchased in the local labor market; therefore, CMS' allocation of approximately 64 percent (2.3 percentage points of 3.6 percentage points) of the Professional Fees cost weight to Professional Fees: Labor-Related costs based on the 2008 survey results²⁵⁷ is consistent with the commenter's assertion that not all Professional Fees services are purchased in the local labor market. We believe it is reasonable to conclude that the costs of those Professional Fees services purchased directly within the local labor market are directly related to local labor market conditions and, thus, should be included in the labor-related share. The remaining approximately 36 percent of Professional Fees costs, which are purchased outside the local labor market, reflect different and additional factors outside the local labor market and,

²⁵⁷ The 65 percent is based on a survey conducted by CMS in 2008 as detailed in the FY 2010 IPPS/ LTCH PPS final rule (74 FR 43850 through 43856). This was also used to determine the Professional Fees: Labor-related cost weight in the 2017-based LTCH market basket.

thus, should be excluded from the labor-related share. In addition, we note the compensation costs of professional services provided by hospital employees (which would reflect the local labor market) are included in the labor-related share as they are included in the Wages and Salaries and Employee Benefits cost weights.

Therefore, for the reasons discussed, we believe our proposed methodology of continuing to allocate only a portion of Professional Fees to the Professional Fees: Labor-Related cost category is appropriate. As stated previously, effective for transmittal 18 (<https://www.cms.gov/Regulations-andGuidance/Guidance/Transmittals/Transmittals/r18p240i>), the hospital Medicare Cost Report (CMS Form 2552– 10, OMB No. 0938–0050) is collecting information on whether a hospital purchased professional services (for example, legal, accounting, tax preparation, bookkeeping, payroll, advertising, and management or consulting services or both) from an unrelated organization and if the majority of these expenses were purchased from unrelated organizations located outside of the main hospital’s local area labor market. We encourage all providers to provide this information so we can potentially use it in future rulemaking to determine the labor-related share.

As previously stated, we proposed to include in the labor-related share the sum of the relative importance of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-Related Services; and a portion of the Capital-Related cost weight from the 2022-based LTCH market basket. The relative importance reflects the different rates of price change for these cost categories between the base year (2022) and FY 2025. Based on IGI’s fourth quarter 2023 forecast of the proposed 2022-based LTCH market basket, the sum of the FY 2025 relative importance for operating costs (Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Facilities Support Services, Installation Maintenance and Repair Services, and All Other: Labor-Related Services) was 68.9 percent. The portion of Capital costs that is estimated to be influenced by the local labor market is 46 percent,

which is the same percentage applied to the 2017-based LTCH market basket. Since the relative importance for Capital is 8.4 percent of the proposed 2022-based LTCH market basket in FY 2025, we took 46 percent of 8.4 percent to determine the proposed labor-related share of Capital for FY 2025 of 3.9 percent. Therefore, we proposed a total labor-related share for FY 2025 of 72.8 percent (the sum of 68.9 percent for the operating cost and 3.9 percent for the labor-related share of Capital).

Based on IGI's second quarter 2024 forecast of the 2022-based LTCH market basket, the sum of the FY 2025 relative importance for Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Facilities Support Services, Installation Maintenance & Repair Services, and All Other: Labor-Related Services is 68.9 percent. The portion of Capital costs that is influenced by the local labor market is estimated to be 46 percent, which is the same percentage applied to the 2017-based LTCH market basket. Since the relative importance for Capital is 8.4 percent of the 2022-based LTCH market basket in FY 2025, we take 46 percent of 8.4 percent to determine the labor-related share of Capital for FY 2025 of 3.9 percent. Therefore, using more recent data, the total labor-related share for FY 2025 is 72.8 percent (the sum of 68.9 percent for the operating cost and 3.9 percent for the labor-related share of Capital).

We summarize the comments we received on the proposed FY 2025 labor-related share and our responses here.

Comment: A commenter does not support the proposed increase in the labor-related share, as any increase to the labor-related share percentage penalizes any facility that has a wage index less than 1.0. The commenter stated that across the country, there is a growing disparity between high-wage and low-wage states that harms hospitals in many rural and underserved communities. The commenter claimed that limiting the increase in the labor-related share would help mitigate that growing disparity. The commenter stated that they do not support any increases in the labor-related share percentages.

Response: The total difference between the FY 2025 labor-related share using the proposed 2022-based LTCH market basket (72.8 percent) and the FY 2024 labor-related share using the 2017-based LTCH market basket (68.5 percent) is 4.3 percentage points and this difference is primarily attributable to the revision to the base year cost weights for those categories included in the labor-related share. We periodically rebase the LTCH market basket in order to reflect more recent data on LTCH cost structures. From 2017 to 2022, the Medicare cost report data showed a notable increase in the Compensation cost weight for LTCHs, which is consistent with comments that we received in prior rulemaking, specifically the FY 2024 IPPS/LTCH proposed rule comments (88 FR 59134) that stated the 2017-based LTCH market basket did not sufficiently account for the dramatic increases in labor costs that LTCHs were incurring. We believe incorporating these more recent data in the LTCH market basket is appropriate, and is in response to public comments, resulting in a corresponding increase in the labor-related share. In addition, we proposed to use the FY 2025 relative importance values for the labor-related cost categories from the 2022-based LTCH market basket because it accounts for more recent data regarding price pressures and cost structure of LTCHs. This methodology is consistent with the determination of the labor-related share since the implementation of the LTCH PPS. As stated in the FY 2025 IPPS/LTCH proposed rule, we also proposed that if more recent data became available, we would use such data, if appropriate, to determine the FY 2025 labor-related share for the final rule. Based on IHS Global Inc.'s second quarter 2024 forecast with historical data through the first quarter of 2024, the FY 2025 labor-related share for the final rule is 72.8 percent.

After consideration of public comments, we are finalizing a FY 2025 labor-related share of 72.8 percent.

Table EEEE 9 shows the FY 2025 labor-related share using the 2022-based LTCH market basket relative importance and the FY 2024 labor-related share using the 2017-based LTCH market basket.

**TABLE EEEE 9-- FY 2025 LTCH LABOR-RELATED SHARE AND FY 2024
LTCH LABOR-RELATED SHARE**

	FY 2025 Final Labor-Related Share based on 2022-based LTCH Market Basket¹	FY 2024 Final Labor-Related Share based on 2017-based LTCH Market Basket²
Wages and Salaries	54.6	47.6
Employee Benefits	8.1	6.7
Professional Fees: Labor-Related ³	3.0	4.4
Administrative and Facilities Support Services	0.5	1.0
Installation, Maintenance, and Repair Services	1.0	2.1
All Other: Labor-Related Services	1.7	2.5
Subtotal	68.9	64.3
Labor-Related portion of capital (46%)	3.9	4.2
Total Labor-Related Share	72.8	68.5

¹ IHS Global Inc. 2nd quarter 2024 forecast.

²Based on IHS Global Inc. 2nd quarter 2023 forecast as published in the August 28, 2023 **Federal Register** (84 FR 59367).

³Includes all contract advertising and marketing costs and a portion of accounting, architectural, engineering, legal, management consulting, and home office/related organization contract labor costs.

The total difference between the FY 2025 labor-related share using the 2022-based LTCH market basket (72.8 percent) and the FY 2024 labor-related share using the 2017-based LTCH market basket (68.5 percent) is 4.3 percentage points and this difference is primarily attributable to the revision to the base year cost weights for those categories included in the labor-related share. The 4.3 percentage points revision to the base year cost weights is a result of: (1) an 8.6 percentage points upward revision to the base year Compensation cost weight, which is derived using the LTCH Medicare cost report data; (2) a 3.6 percentage points downward revision in the base year labor-related categories associated with incorporating the 2017 Benchmark I-O data; and (3) a 0.7 percentage point downward revision in the base year labor-related portion of capital costs, which is derived using the LTCH Medicare cost report data.

IX. Quality Data Reporting Requirements for Specific Providers

A. Overview

In section IX. of the proposed rule, we sought comment on and proposed changes to a number of Medicare quality reporting programs. Specifically,

- In section IX.B. of the proposed rule (89 FR 36284 through 36306), we made the following crosscutting quality program proposals or request for comment:

- ++ Adoption of the Patient Safety Structural Measure in the Hospital IQR Program and PCHQR Program.

- ++ Modification to the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey Measure in the Hospital IQR Program, Hospital VBP Program, and PCHQR Program.

- ++ Advancing Patient Safety and Outcomes Across the Hospital Quality Programs – Request for Comment.

- In section IX.C. of the proposed rule (89 FR 36306 through 36341), the Hospital IQR Program.

- In section IX.D. of the proposed rule (89 FR 36341 through 36343), the PCHQR Program.

- In section IX.E. of the proposed rule (89 FR 36343 through 36352), the LTCH QRP.

- In section IX.F. of the proposed rule (89 FR 36352 through 36381), the Medicare Promoting Interoperability Program for eligible hospitals and critical access hospitals (CAHs) (previously known as the Medicare EHR Incentive Program).

We respond to public comments on each of these sections below.

B. Crosscutting Quality Program Policies and Request for Comment

1. Adoption of the Patient Safety Structural Measure Beginning with the CY 2025 Reporting Period/FY 2027 Payment Determination for the Hospital Inpatient Quality Reporting (IQR) Program and the CY 2025 Reporting Period/FY 2027 Program Year for the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

a. Background

A foundational commitment of providing healthcare services is to ensure safety, as embedded in the centuries-old Hippocratic Oath, “First, do no harm.” Yet, the landmark reports *To Err is Human*²⁵⁸ and *Crossing the Quality Chasm*²⁵⁹ surfaced major deficits in healthcare quality and safety. These reports resulted in widespread awareness of the alarming prevalence of patient harm and, over the past two decades, healthcare facilities implemented various interventions and strategies to improve patient safety, with some documented successes.²⁶⁰ However, progress has been slow, and preventable harm to patients in the clinical setting resulting in significant morbidity and mortality remains common. A recent systematic analysis of literature concluded that preventable mortality among inpatients results in approximately 22,165 preventable deaths annually.²⁶¹ In another recent study, researchers identified adverse events in almost one-quarter of admissions and showed that more than one-fifth were deemed preventable and almost one-third were considered serious (that is, caused harm that required intervention or prolonged recovery).²⁶²

Despite established patient safety protocols and quality measures, the COVID-19 public health emergency (PHE) strained the healthcare system substantially, introducing new safety risks and negatively impacting patient safety in the normal delivery of care. Since the onset of the COVID-19 PHE, the U.S. has seen marked declines in patient safety metrics, as evidenced by considerable increases in healthcare-associated infections (HAIs).^{263,264} Studies found that central line-associated blood stream infections (CLABSIs) in hospitals were 60 percent higher than predicted in the absence of COVID-19, catheter-associated urinary tract infections (CAUTIs) were 43 percent higher, and methicillin-resistant *Staphylococcus aureus* (MRSA) bacteremia infections were 44 percent higher. Studies have shown that these results were likely due at least in part to disrupted routine infection control practices during the COVID-19 PHE.^{265,266} Notably, recent reports demonstrate that some HAI rates have begun to decrease towards pre-PHE levels as the U.S. saw a 9 percent overall decrease in CLABSI, a 12 percent overall decrease in CAUTI and a 16 percent overall decrease in hospital onset MRSA bacteremia between 2021 and 2022 in acute care hospital settings.²⁶⁷

As healthcare facilities struggled to address the challenges posed by the COVID-19 PHE, safety gaps and risks in healthcare delivery were illuminated,²⁶⁸ revealing a lack of resiliency in

the healthcare system.^{269,270} Beyond HAIs, other preventable types of patient harm that were brought to the forefront by the COVID-19 PHE include occurrences of pressure injuries²⁷¹ and patient falls²⁷² among hospitalized patients.

In addition to safety issues illuminated during the COVID-19 PHE, two other key patient safety indicators that are worth noting for their prevalence are postoperative respiratory failure^{273,274,275} and acute kidney injuries (AKI).^{276,277}

While the COVID-19 PHE may have disrupted routine infection control practices, these key patient safety indicators nevertheless show the importance of addressing gaps in safety to save lives, provide equitable medical care, and ensure that the U.S. healthcare system is resilient enough to withstand future challenges. Now is the time to recommit to better safety practices for both patients and healthcare workers, establish new protocols, and implement early interventions that would save many lives from preventable harms.

To accomplish these goals, the federal government is taking a multi-pronged approach to improve safety and reduce preventable harm to patients. The Agency for Healthcare Research and Quality (AHRQ), on behalf of HHS, has established the National Action Alliance for Patient

and Workforce Safety (the National Action Alliance) as a public-private collaboration to improve both patient and workforce safety.²⁷⁸ As described by AHRQ, the National Action Alliance is a partnership between HHS and its federal agencies and private stakeholders, including healthcare systems, clinicians, allied health professionals, patients, families, caregivers, professional societies, patient and workforce safety advocates, the digital healthcare sector, health services researchers, employers, and payors interested in recommitting the U.S. to advancing patient and workforce safety to move toward zero harm in healthcare.²⁷⁹

In September 2023, the President’s Council of Advisors on Science and Technology (PCAST) published the “Report to the President: A Transformational Effort on Patient Safety,” with a call to action to renew “our nation’s commitment to improving patient safety.”²⁸⁰ The PCAST report put forth the following recommendations as a part of the call to action: 1) Establish and maintain federal leadership for the improvement of patient safety as a national priority; 2) Ensure that patients receive evidence-based practices for preventing harm and addressing risks; 3) Partner with patients and reduce disparities in medical errors and adverse outcomes; and 4) Accelerate research and deployment of practices, technologies, and exemplar systems of safe care.²⁸¹

As part of this national recommitment to safety in healthcare, we are promoting the use of safety measures throughout our quality programs to identify and measure quality gaps and processes, and to make that information transparent and available to the public. Effective measurement is paramount to monitoring harm events, identifying key gaps, and tracking progress toward safer, more reliable care. Within CMS’ hospital quality measurement programs,

there are several outcome and process measures in use that capture specific conditions or procedures such as the Severe Sepsis and Septic Shock: Management Bundle measure, Patient Safety and Adverse Events Composite measure, Severe Obstetric Complications electronic clinical quality measure (eCQM), and the Safe Use of Opioids – Concurrent Prescribing eCQM. While these metrics are important, they are not sufficient by themselves to measure and incentivize investment in a resilient safety culture or the infrastructure necessary for sustainable high performance within the broad and complex domain of patient safety. The systems-level approach to patient safety maintains that errors and accidents in medical care are a reflection of system-level failures, rather than failings on the part of individuals.²⁸² There is a strong alignment among patient safety experts to shift to a more holistic, proactive, systems-based approach to patient safety.^{283,284,285,286,287,288} While each of our existing measures address processes and outcomes that encourage providers to improve patient safety for specific conditions or related to specific treatments, these measures do not address the overall culture in which the care is provided. Including a systems-level measure would contribute to a culture that improves performance on these individual metrics as well as improves safety for all care provided within the hospital.

To drive action and improvements in safety and address this gap in systems-level measurement for safety within the Hospital IQR and PCHQR Programs, we proposed in the FY

2025 IPPS/LTCH PPS proposed rule (89 FR 36284 through 36293) the adoption of the Patient Safety Structural measure, a new attestation-based measure that assesses whether hospitals demonstrate a structure, culture, and leadership commitment that prioritize safety. The Patient Safety Structural measure includes five complementary domains, each containing a related set of statements that aim to capture the most salient, evidenced-based, structural, and cultural elements of safety. This measure is intended to be a foundational measure and designed to assess hospital implementation of a systems-based approach to safety best practices, as demonstrated by: leaders who prioritize and champion safety; organizational policies, protocols, goals, and metrics reflecting safety as a core value; a diverse group of patients and families meaningfully engaged with healthcare providers as partners in safety; practices indicative of a culture of safety; accountability and transparency in addressing adverse events; and continuous learning and improvement. This Patient Safety Structural measure is informed by *Safer Together: The National Action Plan to Advance Patient Safety*²⁸⁹, developed by the National Steering Committee for Patient Safety convened by the Institute for Healthcare Improvement (IHI), as well as scientific evidence from existing patient safety literature, and detailed input from patient safety experts, advocates, and patients. Combining this systems-level structural measure with other high priority safety outcome measures would result in a robust and complementary patient safety measure set.

We note that other safety measures discussed in this FY 2025 IPPS/LTCH PPS final rule complement the goals we have outlined for the Patient Safety Structural measure. Interested parties are encouraged to review our discussion of measures for Hospital Harm - Falls with Injury (section IX.C.5.c), Hospital Harm - Postoperative Respiratory Failure (section IX.C.5.d), and the adoption of two healthcare-associated infection measures (section IX.C.5.b).

b. Measure Alignment to Strategy

²⁸⁹ National Steering Committee for Patient Safety. *Safer Together: A National Action Plan to Advance Patient Safety*. Boston, Massachusetts: Institute for Healthcare Improvement; 2020.

In addition to the other federal safety initiatives noted previously, this measure also aligns with the CMS National Quality Strategy. Specifically, the CMS National Quality Strategy identifies four priority areas and eight goals, each with an identified objective, success target, and initial action steps for advancing a “high-quality, safe, equitable, and resilient health care system for all individuals.”²⁹⁰ The Patient Safety Structural measure addresses the priority area Safety and Resiliency, and aligns with the goals to enable a responsive and resilient healthcare system to improve quality and to achieve zero preventable harm. For example, attestation statements within the measure require hospitals to confirm if their strategic plan includes publicly sharing their commitment to patient safety as a core value and outlines specific safety goals and associated metrics, including the goal of “zero preventable harm.”

This measure aligns with our efforts under the CMS National Quality Strategy’s goal of advancing equity and whole-person care.²⁹¹ As stated in the measure attestation under Domain 2: Strategic Planning & Organizational Policy (see Table IX.B.1-01 of this final rule), “Patient safety and equity in care are inextricable, and therefore equity, with the goal of safety for all individuals, must be embedded in safety planning, goal-setting, policy and processes.” This measure furthers a patient-centered approach by promoting conversations on equity among hospital staff, leadership, and patients and caregivers that consider the diverse communities served by participants in CMS programs and the particular needs of each hospital’s own community.

The measure also aligns with our Meaningful Measures Framework, which identifies high-priority areas for quality measurement and improvement to assess core issues most critical to high-quality healthcare and improving patient outcomes.²⁹² In 2021, we launched Meaningful Measures 2.0 to promote innovation and modernization of all aspects of quality, and to address a

²⁹¹ Centers for Medicare & Medicaid Services. (2023). CMS National Quality Strategy Handout. Available at: <https://www.cms.gov/files/document/cms-national-quality-strategy-handout.pdf>.

²⁹² Centers for Medicare & Medicaid Services. Meaningful Measures Framework. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/meaningful-measures-20>.

wide variety of settings, interested parties, and measure requirements.²⁹³ The Patient Safety Structural measure supports these efforts and is aligned with the Meaningful Measures Area of “Safety” and the Meaningful Measures 2.0 goal to “Ensure Safe and Resilient Health Care Systems.” This measure also supports the Meaningful Measures 2.0 priority to “promote a safety culture within a health care organization.” This attestation measure focused on patient safety policies, processes, and activities aims to help hospitals better understand priorities for improving safety and serve as a prompt for action to invest in the infrastructure and safety culture necessary to reduce preventable harm to patients. When measure results are made public, patients and families would be able to make informed decisions on what facilities are best for them.

c. Pre-rulemaking Process and Measure Endorsement

As required under section 1890A of the Act, the Consensus-Based Entity (CBE), currently Battelle, established the Partnership for Quality Measurement (PQM) to convene members comprised of clinicians, patients, measure experts, and health information technology specialists, to participate in the pre-rulemaking process and the measure endorsement process. The pre-rulemaking process, which we refer to as the Pre-Rulemaking Measure Review (PRMR), includes a review of measures published on the publicly available list of Measures Under Consideration (MUC List),^{294,295} by one of several committees convened by the PQM, for the purpose of providing multi-stakeholder input to the Secretary on the selection of quality and efficiency measures under consideration for use in certain Medicare quality programs, including the PCHQR and Hospital IQR Programs. The PRMR process includes opportunities for public comment through a 21-day public comment period, as well as public listening sessions. The

²⁹³ Centers for Medicare & Medicaid Services. (2021). Meaningful Measures 2.0: Moving from Measure Reduction to Modernization. Available at: <https://www.cms.gov/meaningful-measures-20-moving-measure-reduction-modernization>. We note that Meaningful Measures 2.0 is still under development.

²⁹⁴ Centers for Medicare & Medicaid Services. (December 1, 2023). 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

²⁹⁵ Centers for Medicare & Medicaid Services. (December 2023). Overview of the List of Measures Under Consideration. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List-Overview.pdf>.

PQM posts the compiled comments and listening session inputs received during the public comment period and the listening sessions within 5 days of the close of the public comment period. More details regarding the PRMR process may be found in the PQM *Guidebook of Policies and Procedures for Pre-Rulemaking Measure Review and Measure Set Review*, available at: <https://p4qm.org/PRMR>, including details of the measure review processes in Chapter 3.

The CBE-established PQM also conducts the measure endorsement and maintenance (E&M) process to ensure a measure submitted for endorsement is evidence-based, reliable, valid, verifiable, relevant to enhanced health outcomes, actionable at the caregiver level, feasible to collect and report, and responsive to variations in patient characteristics – such as health status, language capabilities, race or ethnicity, and income level – and is consistent across types of health care providers, including hospitals and physicians (see section 1890(b)(2) of the Act). The PQM convenes several E&M project groups twice yearly, formally called the E&M Committees, each comprised of an E&M Advisory Group and an E&M Recommendations Group, to vote on whether a measure meets certain quality measure criteria. More details regarding the E&M process may be found in the PQM *Endorsement and Maintenance (E&M) Guidebook* available at: <https://p4qm.org/EM>, including details of the measure endorsement process in the section titled, “Endorsement and Review Process.”

For the voting procedures of the PRMR and E&M processes, the PQM utilizes the Novel Hybrid Delphi and Nominal Group (NHDNG) multi-step process, which is an iterative consensus-building approach aimed at a minimum of 75 percent agreement among voting members, rather than a simple majority vote, and supports maximizing the time spent to build consensus by focusing discussion on measures where there is disagreement. For example, the PRMR Hospital Recommendation Group can reach consensus and have the following voting results: (A) Recommend, (B) Recommend with conditions (with 75 percent of the votes casted as recommend with conditions or 75 percent between recommend and recommend with conditions),

and (C) Do not recommend. If no voting category reaches 75 percent or greater (including the combined [A] recommend and [B] recommend with conditions), the PRMR Hospital Recommendation Group did not come to consensus and the voting result is ‘Consensus not reached.’ Consensus not reached signals continued disagreement amongst the committee despite being presented with perspectives from public comment, committee member feedback and discussion, and highlights the multi-faceted assessments of quality measures. More details regarding the PRMR voting procedures may be found in Chapter 4 of the PQM *Guidebook of Policies and Procedures for Pre-Rulemaking Measure Review and Measure Set Review*. More details regarding the E&M voting procedures may be found in the PQM *Endorsement and Maintenance (E&M) Guidebook*.

(1) Recommendation from the Pre-Rulemaking and Measure Review Process

As part of the PRMR process, the PRMR Hospital Recommendation Group reviewed the Patient Safety Structural measure (MUC2023-188) during a meeting on January 18 and 19, 2024. The Patient Safety Structural measure was included for consideration in the Hospital IQR and PCHQR Programs on the publicly available “2023 Measures Under Consideration List” (MUC List).²⁹⁶

The voting results of the PRMR Hospital Recommendation Group for the Patient Safety Structural measure for the Hospital IQR Program were: eight members of the group recommended adopting the measure into the Hospital IQR Program without conditions; five members recommended adoption with conditions; three committee members voted not to recommend the measure for adoption. Additionally, nine members of the group recommended adopting the measure into the PCHQR Program without conditions; four members recommended adoption with conditions; three committee members voted not to recommend the measure for adoption. Taken together, 81.3 percent of the votes were recommended with conditions for each

²⁹⁶ Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

program. Thus, the committee reached consensus and recommended the Patient Safety Structural measure for the Hospital IQR Program and the PCHQR Program with conditions.

The conditions recommended by the voting committee were: the publication of an implementation guide that clearly documents how safety is to be measured; and using data to narrow the scope before approving the measure for programs. An Attestation Guide was made available at the time of the publication of the proposed rule on the respective Hospital IQR Program and PCHQR Program pages on QualityNet.²⁹⁷ Data obtained from the measure's national use would allow us to evaluate the effectiveness of, and the potential to narrow the future scope of, the proposed attestations. Therefore, we have adequately addressed the conditions raised by the PRMR Hospital Recommendations Group and proposed this measure for adoption.

In addition to the formal voting results on the adoption of the Patient Safety Structural measure, we note that the majority of public comments received on this measure during the PRMR process were supportive, with 91 out of 97 public comments (94%) either supporting (81) adoption or supporting adoption with conditions (10). Comments in support of the proposal included the need for a zero preventable harm goal, robust hospital leadership, developing trust through transparency, and the involvement of patients and their families in safety work. We thank the large number of patients, family members, and other interested parties who publicly participated in the PRMR process.

(2) Endorsement and Measure Review

We proposed to adopt this measure into the Hospital IQR Program and the PCHQR Program despite the measure not being endorsed by the CBE. Section 1886(b)(3)(B)(viii)(IX)(aa) of the Act requires that each measure specified by the Secretary for

²⁹⁷ Centers for Medicare & Medicaid Services, Patient Safety Structural Measure Attestation Guide, available at: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>. The draft Attestation Guide, version 1.0, was available at both: <https://qualitynet.gov/inpatient/iqr/proposedmeasures> and <https://qualitynet.cms.gov/pch/pchqr/proposedmeasures> at the time of the proposed rule. We note that examples provided in this guide are for illustrative purposes.

use in the Hospital IQR Program be endorsed by the entity with a contract under section 1890(a) of the Act, and section 1866(k)(3)(A) of the Act imposes the same requirement for measures specified for use in the PCHQR Program. Sections 1886(b)(3)(B)(viii)(IX)(bb) and 1866(k)(3)(B) of the Act state, however, that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to a measure that has been endorsed or adopted by a consensus organization identified by the Secretary.

We reviewed measures endorsed by both the CBE which currently holds the contract under section 1890(a) of the Act and measures endorsed by the entity which formerly held that contract and were unable to identify any other CBE-endorsed measures on strategies and practices to strengthen hospitals' systems and culture for safety. Considering the lack of endorsed measures on this specified area or medical topic, we have determined that it would be appropriate to use a measure that is not endorsed by the CBE. This measure is relevant to enhanced health outcomes. As described in the background section for this measure (section IX.B.1.a. of the preamble of this final rule), medical errors and adverse events occur frequently and lead to adverse patient outcomes. This measure is designed to identify hospitals that practice a system-based approach to safety and embrace the importance of a safety culture.

Demonstrating a structure, culture, and leadership commitment that prioritizes safety can improve care and outcomes for all patients.²⁹⁸ The validity, feasibility and relevance of the measure have been thoroughly vetted by a Technical Expert Panel (TEP) convened by a CMS contractor and comprised of thought leaders in the field.²⁹⁹ In response to the question of whether the domains capture the most important elements for advancing patient safety, most TEP

²⁹⁸ DiCuccio MH. The Relationship Between Patient Safety Culture and Patient Outcomes: A Systematic Review. *J Patient Saf.* 2015;11(3):135-42. doi:10.1097/PTS.0000000000000058.

²⁹⁹ Yale New Haven Health Services Corporation – Center for Outcomes Research and Evaluation. Summary of Technical Expert Panel (TEP) Meetings Patient Safety Structural Measure (PSSM). Available at: <https://mmshub.cms.gov/sites/default/files/PSSM-TEP-Summary-Report-202306.pdf>

members agreed that they do.³⁰⁰ Furthermore, the measure developers engaged the members of the TEP for their operational and clinical expertise to assure that each domain was actionable and measurable.³⁰¹ As noted, the PRMR Hospital Committee received a total of 91 public comments expressing support for the Patient Safety Structural measure.³⁰² Most commenters were patients and family members who described their individual experiences with the medical system and preventable harms to which they were exposed. These commenters then emphasized the importance of the Patient Safety Structural measure's intent and domains for improving patient safety related to these experiences.³⁰³ Due to the rigorous alignment with patient safety guidelines and literature as noted within section IX.B.1.a. of the preamble of this final rule, as well as strong support from expert stakeholders, patients, and caregivers as noted previously, we are confident that the foundational principles are sound, and the specifications are attainable, measurable, and actionable. We intend to submit the measure for future CBE endorsement.

d. Measure Overview

The Patient Safety Structural measure is a structural measure developed to assess how well hospitals have implemented strategies and practices to strengthen their systems and culture for safety. The Patient Safety Structural measure comprises a set of complementary statements (or, attestations) that aim to capture the most salient, systems-oriented actions to advance safety. These statements should exemplify a culture of safety and leadership commitment to transparency, accountability, patient and family engagement, and continuous learning and improvement. Table IX.B.1-01 includes the five attestation domains and the corresponding attestation statements.

³⁰⁰ *ibid.*

³⁰¹ *ibid.*

³⁰² Battelle - Partnership for Quality Measurement. Compiled MUC List Public Comment Posting. Available at: <https://p4qm.org/sites/default/files/2024-01/Compiled-MUC-List-Public-Comment-Posting.xlsx>

³⁰³ Battelle - Partnership for Quality Measurement. 2023 Measures Under Consideration Public Comment Summary Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2024-01/PRMR-Hospital-Public-Comments-Final-Summary.pdf>

TABLE IX.B.1-01: THE PATIENT SAFETY STRUCTURAL MEASURE’S FIVE DOMAIN ATTESTATIONS

Attestation Domains	Attestation Statements: Attest yes or no to each statement. (Note: Affirmative attestation of all statements within a domain would be required for the hospital to receive a point for the domain)
Domain 1: Leadership Commitment to Eliminating Preventable Harm	
<p>The senior leadership and governing board at hospitals set the tone for commitment to patient safety. They must be accountable for patient safety outcomes and ensure that patient safety is the highest priority for the hospital. While the hospital leadership and the governing board may convene a board committee dedicated to patient safety, the most senior governing board must oversee all safety activities and hold the organizational leadership accountable for outcomes. Patient safety should be central to all strategic, financial, and operational decisions.</p>	<p>(A) Our hospital senior governing board prioritizes safety as a core value, holds hospital leadership accountable for patient safety, and includes patient safety metrics to inform annual leadership performance reviews and compensation.</p> <p>(B) Our hospital leaders, including C-suite executives, place patient safety as a core institutional value. One or more C-suite leaders oversee a system-wide assessment on safety (examples provided in the Attestation Guide),³⁰⁴ and the execution of patient safety initiatives and operations, with specific improvement plans and metrics. These plans and metrics are widely shared across the hospital and governing board.</p> <p>(C) Our hospital governing board, in collaboration with leadership, ensures adequate resources to support patient safety (such as equipment, training, systems, personnel, and technology).</p> <p>(D) Reporting on patient and workforce safety events and initiatives (such as safety outcomes, improvement work, risk assessments, event cause analysis, infection outbreak, culture of safety, or other patient safety topics) accounts for at least 20% of the regular board agenda and discussion time for senior governing board meetings.</p> <p>(E) C-suite executives and individuals on the governing board are notified within 3 business days of any confirmed serious safety events resulting in significant morbidity, mortality, or other harm.</p>
Domain 2: Strategic Planning & Organizational Policy	
<p>Hospitals must leverage strategic planning and organizational policies to demonstrate a commitment to safety as a core value. The use of written policies and protocols that demonstrate patient safety is a priority and identify goals, metrics and practices to advance progress, is foundational to creating an accountable and transparent organization. Hospitals should acknowledge the ultimate goal of zero preventable harm, even while recognizing that this goal may not be currently attainable and requires a continual process of improvement and commitment. Patient safety and equity in care are inextricable, and therefore equity, with the goal of safety for all</p>	<p>(A) Our hospital has a strategic plan that publicly shares its commitment to patient safety as a core value and outlines specific safety goals and associated metrics, including the goal of “zero preventable harm.”</p> <p>(B) Our hospital safety goals include the use of metrics to identify and address disparities in safety outcomes based on the patient characteristics determined by the hospital to be most important to health care outcomes for the specific populations served.</p> <p>(C) Our hospital has implemented written policies and protocols to cultivate a “just culture” that balances no-blame and appropriate accountability and reflects the distinction between human error, at-risk behavior, and reckless behavior.³⁰⁵</p> <p>(D) Our hospital requires implementation of a patient safety curriculum and competencies for all clinical and non-clinical hospital staff, including C-suite executives and individuals on the governing board, regular assessments of these competencies for all roles, and action plans for advancing safety skills and behaviors.</p>

The draft Attestation Guide, version 1.0, was available at both: <https://qualitynet.gov/inpatient/iqr/proposedmeasures> and <https://qualitynet.cms.gov/pch/pchqr/proposedmeasures> at the time of the proposed rule. We note that examples provided in this guide are for illustrative purposes.

³⁰⁵ A “just culture” is defined by the Agency for Healthcare Research and Quality as a system that holds itself accountable, holds staff members accountable, and has staff members that hold themselves accountable. (The CUSP Method. <https://www.ahrq.gov/hai/cusp/index.html>.)

<p>individuals, must be embedded in safety planning, goal-setting, policy, and processes.</p>	<p>(E) Our hospital has an action plan for workforce safety with improvement activities, metrics and trends that address issues such as slips/trips/falls prevention, safe patient handling, exposures, sharps injuries, violence prevention, fire/electrical safety, and psychological safety.</p>
<p>Domain 3: Culture of Safety & Learning Health Systems</p>	
<p>Hospitals must integrate a suite of evidence-based practices and protocols that are fundamental to cultivating a hospital culture that prioritizes safety and establishes a learning system both within and across hospitals. These practices focus on actively seeking and harnessing information to develop a proactive, hospital-wide approach to optimizing safety and eliminating preventable harm. Hospitals must establish an integrated infrastructure (that is, people and systems working collaboratively) and foster psychological safety among staff to effectively and reliably implement these practices.</p>	<p>(A) Our hospital conducts a hospital-wide culture of safety survey using a validated instrument annually, or every 2 years with pulse surveys on target units during non-survey years. Results are shared with the governing board and hospital staff and used to inform unit-based interventions to reduce harm.</p> <p>(B) Our hospital has a dedicated team that conducts event analysis of serious safety events using an evidence-based approach, such as the National Patient Safety Foundation’s Root Cause Analysis and Action (RCA2)³⁰⁶.</p> <p>(C) Our hospital has a patient safety metrics dashboard and uses external benchmarks (such as CMS Star Ratings or other national databases) to monitor performance and inform improvement activities on safety events (such as: medication errors, surgical/procedural harm, falls, pressure injuries, diagnostic errors, and healthcare-associated infections).</p> <p>(D) Our hospital implements a minimum of 4 of the following high reliability practices:</p> <ul style="list-style-type: none"> • Tiered and escalating (for example, unit, department, facility, system) safety huddles at least 5 days a week, with 1 day being a weekend, that include key clinical and non-clinical (for example, lab, housekeeping, security) units and leaders, with a method in place for follow-up on issues identified. • Hospital leaders participate in monthly rounding for safety on all units, with C-suite executives rounding at least quarterly, with a method in place for follow-up on issues identified. • A data infrastructure to measure safety, based on patient safety evidence (for example, systematic reviews, national guidelines) and data from the electronic medical record that enables identification and tracking of serious safety events and precursor events. These data are shared with C-suite executives at least monthly, and the governing board at every regularly scheduled meeting. • Technologies, including a computerized physician order entry system and a barcode medication administration system, that promote safety and standardization of care using evidence-based practices. • The use of a defined improvement method (or hybrid of proven methods), such as Lean, Six Sigma, Plan-Do-Study-Act, and/or high reliability frameworks. • Team communication and collaboration training of all staff. • The use of human factors engineering principles in selection and design of devices, equipment, and processes. <p>(E) Our hospital participates in large-scale learning network(s) for patient safety improvement (such as national or state safety</p>

³⁰⁶ Agency for Healthcare Research and Quality. (2019, September 7). Root Cause Analysis. <https://psnet.ahrq.gov/primer/root-cause-analysis>.

	improvement collaboratives), shares data on safety events and outcomes with these network(s), and has implemented at least one best practice from the network or collaborative.
Domain 4: Accountability & Transparency	
Accountability for outcomes, as well as transparency around safety events and performance, represent the cornerstones of a culture of safety. For hospital leaders, clinical and non-clinical staff, patients, and families to learn from safety events and prevent harm, there must exist a culture that promotes event reporting without fear or hesitation, and safety data collection and analysis with the free flow of information.	<p>(A) Our hospital has a confidential safety reporting system that allows staff to report patient safety events, near misses, precursor events, unsafe conditions, and other concerns, and prompts a feedback loop to those who report.</p> <p>(B) Our hospital reports serious safety events, near misses and precursor events to a Patient Safety Organization (PSO) listed by the Agency for Healthcare Research and Quality (AHRQ)³⁰⁷ that participates in voluntary reporting to AHRQ’s Network of Patient Safety Databases.</p> <p>(C) Patient safety metrics are tracked and reported to all clinical and non-clinical staff and made public in hospital units (for example, displayed on units so that staff, patients, families, and visitors can see).</p> <p>(D) Our hospital has a defined, evidence-based communication and resolution program reliably implemented after harm events, such as AHRQ’s Communication and Optimal Resolution (CANDOR) toolkit³⁰⁸, that contains the following elements:</p> <ul style="list-style-type: none"> • Harm event identification • Open and ongoing communication with patients and families about the harm event • Event investigation, prevention, and learning • Care-for-the-caregiver • Financial and non-financial reconciliation • Patient-family engagement and on-going support <p>(E) Our hospital uses standard measures to track the performance of our communication and resolution program and reports these measures to the governing board at least quarterly.</p>
Domain 5: Patient & Family Engagement	
The effective and equitable engagement of patients, families, and caregivers is essential to safer, better care. Hospitals must embed patients, families, and caregivers as co-producers of safety and health through meaningful involvement in safety activities, quality improvement, and oversight.	<p>(A) Our hospital has a Patient and Family Advisory Council that ensures patient, family, caregiver, and community input to safety-related activities, including representation at board meetings, consultation on safety goal-setting and metrics, and participation in safety improvement initiatives.</p> <p>(B) Our hospital’s Patient and Family Advisory Council includes patients and caregivers of patients who are diverse and representative of the patient population.</p> <p>(C) Patients have comprehensive access to and are encouraged to view their own medical records and clinician notes via patient portals and other options, and the hospital provides support to help patients interpret information that is culturally and linguistically appropriate as well as submit comments for potential correction to their record.</p> <p>(D) Our hospital incorporates patient and caregiver input about patient safety events or issues (such as patient submission of safety events, safety signals from patient complaints or other patient safety experience data, patient reports of discrimination).</p> <p>(E) Our hospital supports the presence of family and other designated persons (as defined by the patient) as essential members</p>

	of a safe care team and encourages engagement in activities such as bedside rounding and shift reporting, discharge planning, and visitation 24 hours a day, as feasible.
--	---

e. Measure Calculation

The Patient Safety Structural measure consists of five domains, each representing a complementary but separate safety commitment. Each of the five domains include five related attestation statements. Hospitals would need to evaluate and determine whether they can affirmatively attest to each domain. For a hospital to affirmatively attest to a domain, and receive a point for that domain, a hospital would evaluate and determine whether it engaged in each of the statements that comprise the domain (see Table IX.B.1-01), for a total of five possible points (one point per domain). A hospital would not be able to receive partial points for a domain.

For example, for Domain 2 (“Strategic Planning & Organizational Policy”), a hospital would evaluate and determine whether it meets the statements related to its strategic plan (Statement A), its safety goals (Statement B), policies and protocols for a “just culture” (Statement C), a patient safety curriculum and competencies for all hospital staff (Statement D), and an action plan for workforce safety (Statement E) (see Table IX.B.1-01). If its plan meets all five of these statements, the hospital would attest “yes” to each of the five attestation statements and would receive one point for Domain 2. If, for example, its plan only meets Statement A and Statement B, but does not meet Statement C, Statement D, and Statement E, the hospital would attest “yes” to Statement A and Statement B, attest “no” to Statement C, Statement D, and Statement E, and receive zero points for Domain 2. The hospital’s overall score for the Patient Safety Structural measure can range from a total of zero to five points. If a hospital is comprised of more than one acute care hospital facility under one CCN, all such facilities reporting under the same CCN would need to satisfy these criteria for the hospital to affirmatively attest and receive points.

For more details on the measure specifications and the Attestation Guide for the Hospital IQR Program, we refer readers to the Web-Based Data Collection tab under the IQR Measures page and PCHQR measures page on QualityNet at both:

<https://qualitynet.cms.gov/inpatient/iqr/measures#tab2> and

<https://qualitynet.cms.gov/pch/measures, respectively>. For more details on the measure specifications for the PCHQR Program, we refer readers to the Measures tab under the PCHQR page on QualityNet at: <https://qualitynet.cms.gov/pch/measures>.

f. Data Submission and Reporting

Hospitals would be required to submit information for the Patient Safety Structural measure once annually using the data submission and reporting standard procedures set forth by the CDC for the National Healthcare Safety Network (NHSN). Presently, hospitals report measure data to the CDC NHSN on a monthly or quarterly basis, depending on the measure. Under the data submission and reporting process for the Patient Safety Structural measure, hospitals would be required to submit data once annually. We refer readers to the CDC's NHSN website (<https://www.cdc.gov/nhsn/index.html>) for data submission and reporting procedures; information more specific to the Patient Safety Structural measure would be available through NHSN before the first data submission period opens. We refer readers to sections IX.C.9. and IX.D.4 of the preamble of this final rule for more details on our previously finalized data submission and deadline requirements for structural measures in the Hospital IQR Program and PCHQR Program, respectively. We further refer readers to sections IX.C.9. and IX.D.4 of the preamble of this final rule for more details on our previously finalized data submission requirements for measures submitted via the CDC NHSN in the Hospital IQR Program and PCHQR Program, respectively. We proposed to adopt the Patient Safety Structural measure in the Hospital IQR Program beginning with the CY 2025 reporting period/FY 2027 payment determination and the PCHQR Program beginning with the CY 2025 reporting period/FY 2027 program year. Hospitals participating in the Hospital IQR Program and the PCHQR Program

would satisfy their reporting requirement for the measure if they attest “yes” or “no” to each attestation statement in all five domains.

We proposed to publicly report the hospital’s measure performance score, which would range from 0 to 5 points, on an annual basis on Care Compare beginning in Fall 2026 and on the Provider Data Catalog available at data.cms.gov for the PCHQR Program beginning in Fall 2026.

We invited public comment on this proposal.

Comment: Many commenters expressed support for the adoption of the Patient Safety Structural measure. Many commenters stated that this measure includes activities known to reduce harm, improve patient-centered care, encourage patient involvement, and encourage transparency. Some commenters stated that the measure emphasizes the importance of a systems-level and non-punitive approach to patient safety. A commenter stated that the Patient Safety Structural measure is data-driven, actionable, and workable. A commenter stated that the measure received a positive response during the MUC review process and that the participants shared personal experiences related to the benefits of this measure in improving patient safety, indicating its importance.

Response: We thank the commenters for their support for the adoption of the Patient Safety Structural measure and for their engagement in the PRMR process. We agree that the measure will provide greater transparency and encourage hospitals to implement activities to improve patient-centered care and reduce preventable harm to patients. We also agree that the measure will drive system-level changes that are actionable for hospitals. We also recognize and restate our appreciation for the public involvement in the PRMR meeting, including the personal experiences shared by patients and patient advocates that emphasized the importance of this measure.

Comment: Several commenters stated that patient safety is an urgent topic and supported adoption of the Patient Safety Structural measure to address it. Some of these commenters stated

that while many of the items in the Patient Safety Structural measure are known best practices, there has been a delay in implementing them. Some commenters stated that the Patient Safety Structural measure would address this by ensuring prioritization of these activities through sending a signal to hospital governance bodies and executive leadership. Other commenters stated that patient safety has been declining and that the COVID-19 PHE accelerated this decline. These commenters expressed the belief that the Patient Safety Structural measure would provide guidance towards delivering safer care and would create a way to recognize hospitals that are exemplars in patient safety. Some commenters stated that the domains identified in the measure are critical areas for hospitals to focus on for patient safety.

Response: We thank the commenters for their support. We agree that it is important for hospitals to not delay adopting patient safety best practices and acknowledge that the COVID-19 PHE was disruptive for hospitals and illuminated gaps in patient safety. We agree that the domains of the Patient Safety Structural measure are critical areas of focus, and that the measure will offer guidance to hospitals on prioritizing patient safety in their organizational structure, culture, strategy, and overall care delivery.

Comment: Several commenters expressed support for the Patient Safety Structural measure because it is an attestation-based structural measure. Several of these commenters stated that being an attestation measure, this measure would have relatively low reporting burden, and that the benefits of adopting this measure, including providing strategies for improved patient safety, would outweigh the additional burden of reporting the measure. A commenter stated that an attestation-based, structural measure is preferential to outcomes-based measures for driving patient safety improvements because outcomes-based measures are lagging indicators. Another commenter stated that the Patient Safety Structural measure complements patient safety indicators (PSIs) but emphasizes building a culture that would drive improvements in safety. Some commenters stated that structural measures can set new expectations for the development of evidence-based programs and processes that would support improvements in

high impact areas. A few commenters stated that by adopting an attestation measure CMS would provide motivation for implementing these activities without impacting hospital payments. A commenter stated that the process of understanding and attesting to these statements would increase the focus on patient safety (regardless of whether hospitals can attest positively). A commenter expressed support for the Attestation Guide.

Response: We thank the commenters for their support of the Patient Safety Structural measure as an attestation-based structural measure and for their support of the Attestation Guide. We agree with the importance of using attestation measures and encouraging hospitals to facilitate a culture to improve safety. We also agree that the attestation measure encourages hospitals to focus on safety regardless of how they score. We also agree that, while attestation measures do entail some burden, they are less demanding than requiring reporting of the data or details underlying each of the attestation statements. By adopting an attestation measure in combination with measures that specifically assess processes and outcomes, we seek to achieve a holistic, systematic approach to advancing patient safety which balances measure types and reporting burden. We further agree that adoption of this attestation measure will complement outcome and process measures currently in CMS' hospital quality measurement programs. We note that within CMS' hospital quality measurement programs, there are several outcome and process measures in use that capture specific conditions or procedures such as the Severe Sepsis and Septic Shock: Management Bundle measure, Patient Safety and Adverse Events Composite measure, Severe Obstetric Complications electronic clinical quality measure (eCQM), and the Safe Use of Opioids – Concurrent Prescribing eCQM. Furthermore, we discuss Hospital Harm - Falls with Injury (section IX.C.5.c), Hospital Harm - Postoperative Respiratory Failure (section IX.C.5.d), and the adoption of two healthcare-associated infection measures (section IX.C.5.b) in this final rule.

Comment: A few commenters supported adoption of the Patient Safety Structural measure because of its alignment with other guidance. A commenter specifically expressed

support for the Patient Safety Structural measure's alignment with the IHI's National Action Plan for Advancing Patient Safety. This commenter emphasized that both the National Action Plan for Advancing Patient Safety and the Patient Safety Structural measure include interdependence among the categories.

Response: We thank the commenters for their support and acknowledge that in developing the Patient Safety Structural measure, we strove to align it with other national efforts to advance patient safety.

Comment: A commenter specifically supported public reporting of this measure to ensure transparency to patients, families, and community members.

Response: We thank the commenter for their support of publicly reporting the Patient Safety Structural measure. We agree that providing publicly reported measure results on the Care Compare website for the Hospital IQR Program promotes transparency to patients, families, communities, and other interested parties, and will allow patients to make more informed decisions on their care. We note that the PCHQR Program publicly reports measure data on data.cms.gov.

Comment: A few commenters expressed support for measures that address patient safety and specifically recommended measures to improve the accuracy of blood and blood culture tests. Some commenters specifically stated that quickly identifying and appropriately treating blood stream infections can reduce inappropriate treatment.

Response: We thank the commenters for their support of safety measures. While the Patient Safety Structural measure does not directly assess the speed and accuracy with which hospitals identify and treat blood stream infections, establishing a structural, cultural, and leadership commitment to prioritizing safety can improve all elements of patient safety, including appropriate treatment of blood stream infections. We continually seek to develop and adopt quality measures that address important quality and patient safety aspects of care and may consider measures directly related to the speed and accuracy with which hospitals identify and

treat blood stream infections as we review the Hospital IQR Program and the PCHQR Program in the future.

Comment: A commenter stated that the Patient Safety Structural measure provides an opportunity to update the physician credentialing process to include a focus on safety behaviors as well as clinical competence.

Response: We thank this commenter for their support of the Patient Safety Structural measure; however, we note that the physician credentialing process is outside the scope of the Hospital IQR Program and the PCHQR Program.

Comment: A few commenters recommended adding domains to the Patient Safety Structural measure. Some of these commenters specifically recommended adding a domain related to workforce well-being and engagement which includes attestations related to soliciting ideas for improved care processes from the workforce and using closed-loop, transparent communications regarding improvement efforts. Other commenters recommended including diagnostic excellence as a domain.

Response: We agree that workforce well-being and engagement is linked with a learning culture that prioritizes safety. We also agree that diagnostic excellence underlies safe and appropriate healthcare. However, the Patient Safety Structural measure was developed by identifying and focusing on the highest priority domains. This allows us to balance the total number of attestations and associated burden on hospitals. Most TEP members agreed that the domains capture the most important elements for advancing patient safety.³⁰⁹ As this measure was developed to capture the most important elements, it is appropriate to adopt the measure without additional domains or attestations. We will continue to evaluate the measure's performance and consider updating it if appropriate in the future.

Comment: A few commenters stated that some attestations are already covered by

³⁰⁹ Yale New Haven Health Services Corporation—Center for Outcomes Research and Evaluation. Summary of Technical Expert Panel (TEP) Meetings Patient Safety Structural Measure (PSSM). Available at: <https://mmshub.cms.gov/sites/default/files/PSSM-TEP-Summary-Report-202306.pdf>.

actions required of hospitals under the Conditions of Participation (CoPs) and recommended that CMS streamline the measure to eliminate duplication. Specifically, commenters stated that Domains 1 and 2 are covered by the hospital CoPs related to quality assessment and performance improvement at 42 CFR 482.2

1(a) through (e). A few commenters recommended aligning with existing requirements, such as those of The Joint Commission or counties or states.

Response: We acknowledge that the hospital CoPs related to quality assessment and performance improvement (QAPI) programs at 42 CFR 482.21(a) through (e) and requirements set forth by entities such as The Joint Commission and other regulatory entities (such as counties and states) address similar topics to the attestations required to report the Patient Safety Structural measure and helped inform its development. However, we disagree that the Patient Safety Structural measure is redundant to these CoPs and other requirements and maintain that it is complementary to them. While existing requirements may outline the minimum activities related to developing, implementing, and maintaining an effective, ongoing, hospital-wide, data-driven quality assessment and performance improvement program, the Patient Safety Structural measure requires hospitals to attest to whether they have built upon these minimum activities to exemplify a culture of safety and leadership with transparency, accountability, patient and family engagement, and continuous learning and improvement. In addition, the public display requirements of the Hospital IQR and PCHQR Programs provide for information on this measure to be available to patients, consumers, family and caregivers, and other interested parties. This transparency can further incentivize quality improvement.

Comment: A few commenters recommended that CMS update the CoPs with the items from this measure instead of adopting a structural measure. Some of these commenters stated that this would allow hospitals to be assessed and receive feedback on their performance during the survey and certification process.

Response: We agree that hospitals benefit from receiving feedback on their patient safety

structures and other CoP requirements during the survey and certification process. However, measures are intended to evaluate, and this measure evaluates the current state of patient safety structures within hospitals. Through standardized measurement and transparency, the Patient Safety Structural measure can also encourage hospitals to build upon the activities already required under the CoPs to establish a culture of safety and leadership commitment to transparency, accountability, patient and family engagement, and continuous learning and improvement. We also note that hospitals are surveyed for CoPs, on average, every three to five years and this quality measure provides more frequent updates to the public.

Comment: Many commenters recommended updating the Attestation Guide. A few of these commenters suggested including examples provided through public comments to improve the Attestation Guide's ability to support reporting. A few commenters recommended providing detailed guidance on data collection, including how hospitals should document that they are satisfying each domain. Some of these commenters stated that additional guidance would improve the Patient Safety Structural measure's ability to support cross-hospital comparisons.

Response: While we agree with commenters that examples can be meaningful and provide hospitals with information to help adopt these evidence-based practices, we also intend the Patient Safety Structural measure to maintain flexibility and allow each hospital to adopt practices that are most effective for its individual circumstances. Because these practices will not be identical across hospitals, the documentation supporting the practice may also vary. We will provide education and outreach materials to support hospitals in identifying additional evidence-based practices they could adopt and in documenting that they have adopted those practices. While we are not updating the Attestation Guide to add detailed documentation guidance, we have updated the Attestation Guide to provide some additional clarification on other topics based on the public comments we received. Version 2.0 of the Attestation Guide is available at both: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>.

Comment: A commenter stated that these domains align with those in the Office of the National Coordinator for Health Information Technology’s (ONC’s) Safety Assurance Factors for EHR Resilience (SAFER) Guides and recommended adopting a staged approach, like the approach used for the SAFER Guides. Specifically, the commenter recommended a staged Yes/No attestation without any financial impacts the first year with expanded requirements in future years.

Response: We agree with the commenter that the SAFER Guides complement the Patient Safety Structural measure. We note that the SAFER Guides are focused on optimizing the safety and safe use of EHRs³¹⁰ while the Patient Safety Structural measure solicits information about whether hospitals have built upon these minimum activities to exemplify a culture of safety and leadership commitment to transparency, accountability, patient and family engagement, and continuous learning and improvement. In the FY 2024 IPPS/LTCH PPS final rule, we modified requirements for the SAFER Guides measure in the Medicare Promoting Interoperability Program to require eligible hospitals and critical access hospitals (CAHs) to attest “yes” to having conducted an annual self-assessment of all nine SAFER Guides at any point during the calendar year in which the EHR reporting period occurs, beginning with the EHR reporting period in CY 2024 (88 FR 59262 through 59265). We note that, unlike the Medicare Promoting Interoperability Program, the Hospital IQR Program is a pay-for-reporting program, which means that hospitals that report the required measure data in accordance with the form, manner, and timing policies specified by the Secretary are not subject to a financial penalty under this program and the PCHQR Program is a quality reporting program that does not have a financial penalty associated with it. Therefore, there will be no financial penalties for hospitals that attest either “yes” or “no” to each of the domains of the Patient Safety Structural measure.

Comment: A commenter stated that because this is a patient safety measure it would be

³¹⁰ Office of the National Coordinator for Health Information Technology (ONC). SAFER Guides. Available at <https://www.healthit.gov/topic/safety/safer-guides>.

appropriate to remove references to workforce safety and create a new measure to address those safety challenges, which the commenter stated are different than those faced by patients.

Response: We agree that there are different safety challenges faced by healthcare workers than those faced by patients. However, not only is workforce safety an important component to identifying hospitals that exemplify a culture of safety and leadership commitment to transparency, accountability, patient and family engagement, and continuous learning and improvement, but it is also a precondition to advancing patient safety with a unified, total systems-based approach to eliminate harm to both patients and the workforce.³¹¹ Because workplace safety is a precondition to advancing patient safety, this measure necessarily includes attestations related to workforce safety. We thank the commenter for their suggestion for a new measure in CMS programs, as we recognize this as an important and ongoing concern for the healthcare workforce.

Comment: A few commenters recommended renaming the measure “Patient and Workforce Safety Structural measure” because items such as “just culture” apply to the workforce as well as patients.

Response: We agree that many of the domains and attestations in the Patient Safety Structural measure apply to the workforce. While workforce safety is an important element of this measure, these elements are included because workforce safety is a precondition to advancing patient safety. Because the measure is focused on establishing structure, culture, and leadership commitment to prioritizing patient safety, it is appropriate for the measure title to focus on advancing patient safety.

Comment: A commenter recommended refining the attestations to include efforts made by health systems instead of at the individual hospital level.

Response: We agree that for hospitals that are part of health systems, there are many best

³¹¹ AHRQ. *Safer Together: A National Action Plan to Advance Patient Safety*. Available at: <https://www.ahrq.gov/patient-safety/reports/safer-together.html>.

practices and resources that can be shared among hospitals across the system. However, patient safety is ultimately the responsibility of the institution providing the care, in this case the individual hospital. Therefore, we encourage hospitals to use resources available through their health systems to meet these attestations, but our intention is that the attestation should represent the structure, culture, and leadership commitment to prioritizing safety at the individual hospital.

Comment: A commenter recommended incentivizing voluntary safety initiatives as opposed to implementing an attestation measure.

Response: The Hospital IQR Program is a pay-for-reporting program, which means that hospitals that report the required measure data in accordance with the form, manner, and timing policies specified by the Secretary are not subject to a financial penalty under this program. The PCHQR Program is a quality reporting program that does not have a financial penalty associated with it. A hospital's performance on the measure, which for the Patient Safety Structural measure is a score from 0 to 5 points, has no impact on a hospital's Medicare reimbursement. Therefore, the activities in the Patient Safety Structural measure are voluntary safety initiatives. While we recognize that a hospital's performance on the measure may impact the hospital's reputation through public reporting, this reputational impact is a means of encouraging the voluntary adoption of safety related best practices.

Comment: A commenter recommended CMS engage with leaders to identify barriers to improving safety.

Response: We agree that hospital leaders are a critical source of information regarding barriers to improving safety. The Patient Safety Structural measure is informed by scientific evidence from existing patient safety research and literature, guidance from established healthcare quality and safety organizations, and detailed input from patient safety experts, advocates and patients. The TEP that provided detailed input on the Patient Safety Structural measure included clinicians and representatives of hospitals and healthcare systems. Because

achieving zero preventable harm is part of our National Quality Strategy,³¹² we welcome additional ideas or input in how we can build on our current activities to increase our progress towards this goal.

Comment: A few commenters stated that hospitals are already engaged in efforts using meaningful, measurable data and that this measure would take away from that.

Response: We disagree that the Patient Safety Structural measure will take away from efforts to use meaningful, measurable data to improve patient safety. Several of the attestations in this measure are related to the use of measurable data to inform patient safety improvement. For example, Domain 1 Statement B requires a hospital to attest to whether C-suite leaders oversee the development of specific improvement plans with metrics, Domain 3 Statement C requires a hospital to attest to whether it has a patient safety metrics dashboard; and Domain 3 Statement D includes the high reliability practice of a data infrastructure to measure safety. Therefore, efforts using meaningful, measurable data will likely be applicable to one or more of the attestation statements, such that hospitals already engaged in these efforts will be able to attest positively to one or more statements based on these efforts.

Comment: Some commenters specifically expressed concern regarding what they characterize as a lack of standard definitions for terms within the attestation statements. Specifically, commenters recommended standard definitions for the following terms: (1) senior governing board, (2) regular board agenda, (3) annual leadership performance reviews and compensation, (4) serious safety event, (5) core institutional value, (6) action plan, and (7) free flow of information.

Response: We thank commenters for these recommendations. We have intentionally left these terms undefined within this measure to maintain flexibility to allow each hospital to adopt practices that are most effective for its individual circumstances. However, common definitions

³¹² CMS. The CMS National Quality Strategy. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy>.

currently used by safety experts in the field, which may guide hospitals attesting to this measure, are described in the Attestation Guide, available on the Web-Based Data Collection tab under the IQR Measures page and PCHQR Measures page on QualityNet at both:

<https://qualitynet.cms.gov/inpatient/iqr/measures#tab2> and

<https://qualitynet.cms.gov/pch/measures>, respectively.

The Attestation Guide provides a description of “serious safety event” (that is, an event judged by the clinical team OR the patient to be “temporary major” or greater). The Attestation Guide also provides more detail and examples of what will be characterized as an event that is greater than “temporary major.” Additionally, the Attestation Guide provides a description of the senior governing board (that is, “the senior governing board is intended to be the body with fiduciary responsibility for the hospital, in charge of resource management, with ultimate authority. The senior governing board may or may not oversee other, subordinate hospital boards and committees”). We monitor measure performance for all of the measures in our quality reporting programs, and if we identify that there is a need for additional guidance, we provide it through our regular education and outreach efforts.

Comment: Some commenters stated that there is a lack of empirical evidence due to insufficient hospital-specific field-testing. Some commenters specifically stated that entity level reliability testing was not performed, performance scores were not reported, and workflow analysis was not conducted.

Response: We acknowledge the commenters’ concern about hospital-specific field-testing. Although entity level testing of this measure has not been conducted, we are confident that the foundational principles are sound, and the included specifications are attainable, measurable, and actionable. We refer readers to **section IX B(1)(a)** and the Background section of this finalized proposal for more discussion of the basis on which we determined this; specifically, we discuss the details of the patient safety guidelines and literature that informed this measure, the TEP input provided, and significant public comment support expressed from

expert stakeholders, patients and caregivers. As data are obtained on this measure, we will continue to monitor and evaluate the measure.

Comment: A few commenters recommended deferring public reporting for at least the first year. A commenter stated that the Hospital IQR Program does not usually publicly report scores of new measures and recommended aligning with that approach by delaying public reporting of the Patient Safety Structural measure.

Response: While we do not expect all hospitals to achieve a score of five on the measure, the information collected under the Patient Safety Structural measure will provide valuable information for patients, families, and caregivers, as well as for healthcare researchers, providers and other members of the public. We note that we may delay public reporting for measures with an initial voluntary reporting period, or measures that may require more complicated implementation of data collection processes as is often the case with EHRs (for an example of a measure for which we have delayed public reporting, we refer readers to our adoption of the Hybrid Hospital-Wide Readmission measure (84 FR 42465 through 42479)), but an attestation-based measure does not entail this level of complexity and hospitals have sufficient time to review and prepare an annual attestation that does not entail a large amount of detailed data.

Comment: A few commenters stated that attestation to a structural measure does not provide actionable data because the improvement has already been achieved to be able to positively attest to the measure.

Response: We agree that one value of an attestation measure is to encourage hospitals to update and improve structures so that they can positively attest to the measure. This measure may also serve to differentiate those hospitals that have already fully implemented the best practices identified. We note that an additional benefit of attestation measures is to provide valuable information for patients, families, and caregivers, as well as for healthcare researchers, providers, and other members of the public on the distribution of these institutional practices.

Comment: Many commenters expressed concern regarding reporting the measure

through NHSN instead of the Hospital Quality Reporting (HQR) system. Some commenters stated that NHSN has operational challenges which could impact hospital reporting. Other commenters stated that this measure would be reported by different personnel than the data currently reported to NHSN and requiring these staff to get access to NHSN would increase the administrative burden.

Response: We recognize that most current quality measures are reported through the HQR System and that because data currently reported through the NHSN are generally related to healthcare-associated infections or vaccinations for healthcare personnel, these data may be collected and reported by different personnel within the hospital (for example, infection control personnel) than those personnel likely to be responsible for reporting the Patient Safety Structural measure. However, because the Patient Safety Structural measure is related to healthcare safety, and the NHSN collects information related to patient safety, reporting of the Patient Safety Structural measure through the NHSN will be most appropriate. We understand some hospitals may want additional staff to obtain access to the NHSN to report the Patient Safety Structural measure. We note that the CDC has streamlined the registration process for new NHSN users in recent years, and the process can often be completed in less than a week. Interested parties may wish to review the NHSN website for details of the latest registration process at: <https://www.cdc.gov/nhsn/index.html>. The CDC is consistently working to further modernize the NHSN application in a constant effort to improve speed and functionality, as well as the user experience.

In recognition that new users have faced challenges in the past, the CDC plans to open this measure for test access in NHSN several weeks before the submission period opens on April 1, 2026, to ensure new users have ample time to obtain and test their access to the system before the first reporting deadline of May 15, 2026. More details about test access outside of the submission period will be provided by NHSN through guidance at a later date.

Comment: Several commenters recommended developing a monitoring, evaluation, and

improvement plan to identify necessary clarifications or modifications for the Patient Safety Structural measure after implementation. A few commenters recommended monitoring for topped-out performance. These commenters also recommended removing the measure if it does not correlate with improved patient outcomes or if patients and families have difficulty interpreting the measure. A few commenters recommended ensuring there are no unintended consequences, such as limiting access or increasing health care costs.

Response: We have a monitoring and evaluation process for both the Hospital IQR Program and the PCHQR Program. Therefore, we intend to monitor and evaluate the performance of the Patient Safety Structural measure in achieving our programmatic goals including encouraging hospital improvement on the measure and providing meaningful information to patients and their families. As part of our monitoring and evaluation efforts we continually evaluate measures for topped-out status, correlation with other measures, and unintended consequences. As we indicated in the proposed rule summary of the PRMR process (89 FR 36287), as data is obtained, we intend to evaluate the effectiveness of, and the potential to narrow, the future scope of the attestations.

Comment: Some commenters expressed concern that this measure adopts overly prescriptive policies. These commenters stated that it would be preferable to encourage “safety via guided adaptability” instead of “safety via control” activities and stated that encouraging “safety via guided adaptability” would improve innovation in safety. These commenters further stated that public reporting, organizational accountability, and transparency have not worked and therefore adopting a measure based on public reporting would likely be ineffective.

Response: The attestation statements within the five domains of the Patient Safety Structural measure were developed in collaboration with a TEP convened by a CMS contractor and comprised of thought leaders in the field.³¹³ Most TEP members agreed that the domains

³¹³ Yale New Haven Health Services Corporation—Center for Outcomes Research and Evaluation. Summary of Technical Expert Panel (TEP) Meetings Patient Safety Structural Measure (PSSM). Available at: <https://mmshub.cms.gov/sites/default/files/PSSM-TEP-Summary-Report-202306.pdf>.

capture the most important elements for advancing patient safety. Furthermore, the measure developers engaged the members of the TEP for their operational and clinical expertise to assure that each domain was actionable and measurable.³¹⁴ Therefore, these domains and attestations are appropriate for encouraging establishment of a structure, culture, and leadership commitment to prioritizing safety. We note that the domains within Patient Safety Structural measure have been designed to be non-prescriptive in how hospitals implement these policies and procedures and therefore provide flexibility for hospitals to establish “safety via guided adaptability” protocols within these domains.

Comment: A commenter recommended that instead of attestation measures, CMS advance the use of Artificial Intelligence (AI) in its electronic measure reporting strategy to increase the availability of data and reduce provider burden and burnout.

Response: While we recognize the future potential of advancing health quality, increasing data availability, and reducing provider burden using AI, this technology has not been sufficiently tested and validated to use for measures in our quality reporting programs.

Comment: A commenter recommended combining multiple structural measures into one multi-dimensional, streamlined measure.

Response: We appreciate the commenter’s recommendation to combine multiple structural measures into one multi-dimensional, streamlined measure; however, we are concerned that such a measure may be administratively complex to report and challenging for interested parties to interpret. As we continue to evolve the Hospital IQR Program and the PCHQR Program we will seek to identify ways to streamline our measures, including potentially combining measures.

Comment: Many commenters did not support adoption of the Patient Safety Structural measure because of the belief that the number of attestations is excessive. Some of these

³¹⁴ Yale New Haven Health Services Corporation—Center for Outcomes Research and Evaluation. Summary of Technical Expert Panel (TEP) Meetings Patient Safety Structural Measure (PSSM). Available at: <https://mmshub.cms.gov/sites/default/files/PSSM-TEP-Summary-Report-202306.pdf>.

commenters stated that this appears to be a survey, not a quality measure because of the number of statements and stated that because it is a survey it is not meaningful in hospital measurement programs.

Response: We disagree with commenters that the number of statements to which hospitals will need to attest is indicative that this measure is a survey because a survey is not defined by the number of questions contained within.³¹⁵ Survey research seeks to collect information from a sample of the population through responses to questions to understand the characteristics of a group.³¹⁶ The Patient Safety Structural measure evaluates and publicly reports information about the quality of care in each hospital that participates in the Hospital IQR Program and the PCHQR Program. The Patient Safety Structural measure is not focused on the characteristics of hospitals as a group, but on the patient safety structures of each individual hospital and how that information can lead to patient safety improvement efforts and inform patient choice. We have adopted other structural measures which require hospitals to attest to specific statements to collect information about specific structures (for example, the Hospital Commitment to Health Equity measure finalized in the FY 2024 IPPS/LTCH PPS final rule (87 FR 49191 through 49201)) to provide meaningful information to consumers regarding individual hospital characteristics.

Comment: Many commenters did not support adoption of the Patient Safety Structural measure because it is an attestation measure which does not measure patient outcomes or patient care. Some of these commenters recommended that CMS identify measure gaps related to patient safety in the current quality reporting programs and develop measures to assess these gaps that would provide actionable data. Some commenters stated that CMS has not shown a link between the attestations and improved patient outcomes.

³¹⁵ Ponto J. Understanding and Evaluating Survey Research. J Adv Pract Oncol. 2015 Mar-Apr;6(2):168-71. Epub 2015 Mar 1. PMID: 26649250; PMCID: PMC4601897.

³¹⁶ Ponto J. Understanding and Evaluating Survey Research. J Adv Pract Oncol. 2015 Mar-Apr;6(2):168-71. Epub 2015 Mar 1. PMID: 26649250; PMCID: PMC4601897.

Response: While this measure does not measure patient outcomes or specific activities of patient care, it does assess hospital implementation of a systems-based approach to safety best practices, which is applicable to all patient care activities and patient outcomes. Safety is a foundational aspect of high-quality care for all patients, regardless of their health condition or if they are at risk of experiencing a specific type of potential harm. Our measure inventory currently lacks measures that emphasize the importance of structure, culture, and leadership commitment to prioritizing safety. Therefore, we have identified that there is a patient safety measure gap in our current quality reporting programs. The Patient Safety Structural measure is informed by scientific evidence from existing patient safety research and literature, guidance from established healthcare quality and safety organizations, and detailed input from patient safety experts, advocates and patients. Statement-level review and input of each measure attestation was provided by a national TEP. We reiterate that research shows a link between these hospital characteristics and improved care and outcomes for patients.^{317, 318}

Comment: Many commenters did not support adoption of the Patient Safety Structural measure because of the concern that attestation measures are subjective. These commenters stated that because of this subjectivity the Patient Safety Structural measure would not meaningfully distinguish between hospitals.

Response: The Patient Safety Structural measure provides hospitals flexibility in meeting each of the attestations. We recognize that there is significant variation between hospitals and the local communities they serve, which means that policies and procedures that are effective in some hospitals may not be effective in other hospitals. Therefore, the attestations in the Patient Safety Structural measure have been developed to encourage hospitals to adopt policies and procedures consistent with a structure, culture, and leadership commitment to prioritizing safety;

³¹⁷ DiCuccio MH. The Relationship Between Patient Safety Culture and Patient Outcomes: A Systematic Review. *J Patient Saf.* 2015;11(3):135– 42. doi:10.1097/PTS.0000000000000058.

³¹⁸ Forbes J, Arrieta A Comparing hospital leadership and front-line workers' perceptions of patient safety culture: an unbalanced panel study *BMJ Leader* Published Online First: 03 April 2024. doi: 10.1136/leader-2023-000922

without being prescriptive in how hospitals implement these policies and procedures. We acknowledge commenters' concerns regarding the potential for there to be subjectivity in how hospitals interpret each attestation statement within the Patient Safety Structural measure. We have developed and provided the Attestation Guide to limit this subjectivity and to help hospitals accurately attest to this measure while still providing flexibility to hospitals. We further note the Patient Safety Structural measure is one measure within a larger portfolio of measures which balances more narrowly specified measures with broader measures. Some of these more narrowly specified measures specifically address patient safety (such as the measures for Hospital Harm - Falls with Injury (section IX.C.5.c) and Hospital Harm - Postoperative Respiratory Failure (section IX.C.5.d)).

Comment: Many commenters did not support the Patient Safety Structural measure because of concerns that the attestations are difficult to implement and therefore hospitals would not be able to prepare for this measure prior to its adoption. Some commenters recommended delaying implementation of the measure to allow hospitals more time to prepare for reporting. A few commenters recommended revising the measure to focus on two to three items per domain. Some of these commenters recommended gradually increasing the number of attestations in future years.

Response: We understand commenters' concerns that many hospitals will not be able to positively attest to all the statements for each domain prior to the Patient Safety Structural measure's implementation for the CY 2025 reporting period. We do not expect all hospitals to achieve a score of five on the measure, especially not in the first reporting year. This measure is intended to further the current state of patient safety structures within hospitals.³¹⁹ By adopting the measure for the CY 2025 reporting period, we can establish a baseline of the current state of patient safety structures within hospitals, which we can use to understand change as hospitals

³¹⁹ Were hospitals already scoring highly on the measure there would be no benefit to adopting it. See 42 CFR 412.140(g)(3)(i) (providing for the removal of measures on which hospitals are performing "so high and unvarying that meaningful distinction and improvements in performance can no longer be made.").

seek to incorporate more of these practices because of the adoption of the Patient Safety Structural measure. Requiring attestation to just two or three items per domain would not be as effective at encouraging hospitals which have already adopted those patient safety structures to advance the state of patient safety as quickly or effectively as adopting all attestations in the first year.

Comment: Some commenters did not support the Patient Safety Structural measure due to concerns that hospitals already engage in the listed activities and that CMS has not shown that there are gaps in these practices. These commenters specifically stated that Patient and Family Advisory Councils (PFACs), PSO participation, participation in large-scale learning networks, and tracking progress against benchmarks are already common practice.

Response: We acknowledge the commenters' concerns; however, the purpose of this measure is in part to uniformly assess whether hospitals perform these activities. Based on the information available to us, there are demonstrated gaps in hospital participation in meaningful data collection, reporting, and learning system activities that would make the uniform evaluation of hospital performance on patient safety improvement activities helpful. For example, hospital adoption of PFACs has waned in recent years, with the 2021 American Hospital Association (AHA) annual survey of over 6,200 U.S. hospitals finding that the number of hospitals with PFACs is 51 percent.³²⁰ A 2019 OIG report found that only 59 percent of general acute care hospitals participating in Medicare work with a PSO.³²¹

Comment: Several commenters did not support the Patient Safety Structural measure because of concerns regarding the reporting burden. These commenters stated that the benefits of the measure are not sufficient to offset the cost associated with determining and documenting whether a hospital's practices meet each attestation. Some of these commenters expressed

³²⁰ Lewis B. Success of Patient and Family Advisory Councils: The Importance of Metrics. *J Patient Exp.* 2023 Apr 10;10:23743735231167972. doi: 10.1177/23743735231167972. PMID: 37064819; PMCID: PMC10103250.

³²¹ US Department of Health and Human Services; Office of the Inspector General, September 2019. OIG Report No. OEI-01-17-00420. <https://oig.hhs.gov/oei/reports/oei-01-17-00420.asp>

concern that the time spent attesting to this measure would take away from patient care and could lead to patient harm.

Response: We understand that there will be administrative burden with understanding each of the attestation statements and determining whether a hospital's patient safety structures are in alignment with the attestation statements. We further recognize that this administrative burden may be greater during the first reporting year as hospitals familiarize themselves with the attestation statements. However, we have concluded that the benefits of this measure justify its costs. Safety is a foundational aspect of high-quality care for all patients, regardless of their health condition or if they are at risk of experiencing a specific type of potential harm. By adopting the Patient Safety Structural measure, we not only assess hospital implementation of a systems-based approach to safety best practices but also promote such implementation. Therefore, the Patient Safety Structural measure has considerable benefit for all patients. While we understand that hospital staff will have to spend time reviewing the attestations and assessing their hospital's safety practices in light of the attestation statements, this activity will further encourage hospitals to understand and implement a systems-based approach to safety best practices, which will in turn improve patient care. We refer the readers to section XII.B.6. of this rule for our estimate of the expected cost for a hospital to report this measure.

Comment: A commenter expressed concern that under-resourced hospitals (such as community and rural hospitals) would face greater challenges documenting and reporting than large hospital systems.

Response: We understand that hospitals with fewer resources for identifying and implementing patient safety best practices may face additional challenges in documenting and reporting their practices. However, safety is a foundational aspect of high-quality care for all patients, regardless of the hospital in which they seek care. The reporting of this measure by all hospitals will provide valuable information and a considerable benefit to patients and encourages hospitals to establish a structural, cultural, and leadership commitment to prioritizing safety.

Furthermore, we note that HHS provides resources to assist hospitals in their focus on patient safety including, for example, CMS's Quality Improvement Organization Program³²² and AHRQ's patient safety resources.³²³

Comment: Many commenters did not support this measure because of the scoring approach in which hospitals would not receive a point for a domain unless they could positively attest to all statements within the domain. A few commenters recommended allowing a hospital to receive credit for the domain by affirmatively attesting to a smaller number of practices within the domain (three or four, instead of all five). Some commenters recommended providing partial credit and stated that this would improve tracking over time.

Response: We understand commenters' concerns that many hospitals will not be able to positively attest to all the statements for each of the domains, which will affect the hospital's score for the entire domain. Nonetheless, we intentionally chose to score the measure at the domain level, for a score of 0-5, instead of allowing partial credit. The Patient Safety Structural measure assesses hospitals in terms of their systemic approach to safety in five domains. Each action within a domain is an important best practice necessary to achieving a high level of performance through the domain on preventable harm reduction for patients. For this reason, a hospital must attest to all the actions within a domain to receive credit for the domain. We reiterate that we do not expect all hospitals to achieve a score of five on the measure, especially not in the first reporting year. The measure is intended to further the current state of patient safety structures within hospitals. Furthermore, requiring attestation to fewer items per domain would be less effective at furthering the current state of patient safety structures within hospitals that currently implement many important elements for advancing patient safety. The decision to use full point scoring is also intended to keep the level of complexity to a minimum and

³²² For more information about the QIO Program we refer readers to: <https://www.cms.gov/medicare/quality/quality-improvement-organizations#:~:text=QIO%20Program%20priorities%3A&text=Improve%20care%20coordination%20and%20the,Increase%20patient%20safety>

³²³ For AHRQ's patient safety resources, we refer readers to: <https://www.ahrq.gov/patient-safety/resources/index.html>

therefore ease the general public's ability to understand the measure.

Comment: Several commenters stated that the measure results would be difficult for patients, the public, and staff to understand and recommended partnering with patients and families on what data regarding safety culture would be meaningful to them. A commenter recommended education and outreach for the public and healthcare community on the nature and purpose of structural measures. A few commenters recommended publicly reporting the results of this measure with additional granularity to identify quality improvement opportunities.

Response: We note that the measure developer convened a TEP to inform development of the Patient Safety Structural measure. In addition to members of healthcare systems and patient safety experts, more than 50 percent of the TEP consisted of individuals that identified as patients or caregivers, some of whom were also representatives of patient and caregiver advocacy organizations. These TEP members provided input on what would be meaningful to patients and their families. The measure scoring structure was developed with their input. Furthermore, as part of the pre-rulemaking process the Patient Safety Structural measure received a total of 91 comments expressing support.³²⁴ Most commenters were patients and family members who described their individual experiences with the medical system and preventable harms to which they were exposed. These commenters then emphasized the importance of the Patient Safety Structural measure's intent and domains for improving patient safety related to these experiences.³²⁵ We may consider potential reporting of more granular data that would allow identification of improvement opportunities. We note that each hospital will know how it attested to each statement and therefore would be able to determine which areas would be most appropriate for improvement opportunities.

Comment: A few commenters recommended developing a strategy to publicly report the

³²⁴ Battelle—Partnership for Quality Measurement. Compiled MUC List Public Comment Posting. Available at: <https://p4qm.org/sites/default/files/2024-01/Compiled-MUC-List-Public-Comment-Posting.xlsx>.

³²⁵ Battelle—Partnership for Quality Measurement. 2023 Measures Under Consideration Public Comment Summary Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2024-01/PRMR-Hospital-Public-Comments-Final-Summary.pdf>.

results of this measure with results from safety outcome measures for comparison.

Response: Section 1886(b)(3)(B)(viii)(VII) of the Act and section 1866(k)(4) of the Act require the Secretary to report quality measures used in the Hospital IQR Program and the PCHQR Program, respectively, on a CMS website. Section 1886(b)(3)(B)(viii)(VII) of the Act and section 1866(k)(4) of the Act for the Hospital IQR Program and the PCHQR Program, respectively, also require that the Secretary establish procedures for making information regarding measures available to the public after ensuring that a hospital has the opportunity to review its data before they are made public. Our current policy is to report data from the Hospital IQR Program and PCHQR Program as soon as it is feasible on CMS websites such as the Compare tool hosted by HHS, currently available at: <https://www.medicare.gov/care-compare>, or its successor website, after a 30-day preview period (78 FR 50776 through 50778). We refer readers to section IX.C.12 for more details on our public display requirement policies for the Hospital IQR Program. Consistent with this requirement, we will publicly report the results of the Patient Safety Structural measure on a CMS website on which we also publicly report the results of other measures in the relevant quality reporting programs (either the Hospital IQR Program or the PCHQR Program) including safety outcome measure. We thank commenters for their suggestion and encourage interested parties to access these data for comparison and analysis when they become publicly available.

Comment: Some commenters stated that the existing patient safety measures, supplemented by other patient safety measures proposed in the FY 2025 IPPS/LTCH PPS proposed rule, are sufficient for measuring patient safety. A commenter stated that the CMS Hospital Star Ratings and condition-specific quality measures are already available to help patients make informed care decisions.

Response: We agree that the existing patient safety measures, the Overall Hospital Quality Star Rating, and the condition-specific quality measures are valuable resources to help patients make informed care decisions. This measure is an important complement to these

resources. Each of the existing patient safety measures serves an important purpose in assessing a specific element of patient safety, for example, a specific condition, procedure, or harm event (such as falls), but none of the existing patient safety measures provides a holistic view of a hospital's structural, cultural, and leadership commitment to prioritizing safety. These elements are critical aspects of ensuring safety for all patients regardless of their health condition or if they are at risk of experiencing a specific type of potential harm. We refer readers to the CY 2025 OPPS/ASC proposed rule where we are soliciting input on potential future methodological modifications regarding the Safety of Care measure group within the Overall Hospital Quality Star Rating (89 FR 59509 through 59515).

Comment: Several commenters did not support the Patient Safety Structural measure because it has not been endorsed by a CBE.

Response: While we recognize the value of measures undergoing CBE endorsement review, we need not adopt solely measures endorsed by a CBE (see section IX.B.1.c). Given the urgency of improving patient safety and the current lack of CBE-endorsed measures that address hospital structures for creating a culture of safety, we determined that it is appropriate to adopt this measure. This measure is designed to identify hospitals that practice a system-based approach to safety and embrace the importance of a safety culture. Demonstrating a structural, cultural, and leadership commitment that prioritizes safety can improve care and outcomes for all patients.³²⁶ Because of the measure's potential to improve care for all patients, we have determined that this is an appropriate topic for a measure for the Hospital IQR Program and the PCHQR Program. We reviewed measures endorsed by both the CBE which currently holds the contract under section 1890(a) of the Act and measures endorsed by the entity which formerly held that contract and did not identify any other CBE-endorsed measures on strategies and practices to strengthen hospitals' systems and culture for safety. In light of the lack of endorsed

³²⁶ DiCuccio MH. The Relationship Between Patient Safety Culture and Patient Outcomes: A Systematic Review. *J Patient Saf.* 2015;11(3):135–42. doi:10.1097/PTS.000000000000058.

measures on this specified area or medical topic, we have determined that it is appropriate to use a measure that is not endorsed by the CBE. We intend to submit the measure for future CBE endorsement after endorsement criteria for structural measures have been made available.

Comment: A commenter stated that they do not support the Patient Safety Structural measure and expressed the belief that it is a punitive measure tied to reimbursement.

Response: The Hospital IQR Program is a pay-for-reporting program, which means that hospitals that report the required measure data in accordance with the form, manner, and timing policies specified by the Secretary are not subject to a financial penalty under this program. A hospital's performance on the measure, which for the Patient Safety Structural measure is a score from 0 to 5 points, has no impact on a hospital's Medicare reimbursement. We note that the PCHQR Program is a quality reporting program that does not have a financial penalty associated with it. The measure determines the level at which hospitals are performing these identified best practices and identifies opportunities for improvement in structural safety practices. We do not expect all hospitals to achieve a maximum score of five points on the measure, especially during the initial years of using the measure in these programs.

Comment: Several commenters supported Domain 1 because of the goal of eliminating preventable harm. A commenter expressed support for Domain 1 Statement B, and specifically supported requiring hospitals to attest that their "specific plans and metrics are widely shared". A few commenters expressed support for Domain 1 Statement C. These commenters stated that leadership engagement would empower leadership to respond expeditiously. A few commenters expressed support for Domain 1 Statement D, stating that it is important to encourage hospitals to use board meetings to discuss patient safety topics because of the commenters' belief that this is not currently a widespread practice. A few commenters expressed support for Domain 1 Statement E; some of these commenters expressed the belief that it is important for senior leaders to learn of patient safety events through internal channels as close to real-time as possible, even though the event review may not be complete until after the notification.

Response: We thank the commenters for their support of Domain 1 and specifically Domain 1 Statements B, C, D, and E. We appreciate commenters' support for leveraging board meetings, developing targeted patient safety plans and metrics, and notifying senior leaders early during serious safety events. Domain 1 includes core activities that place patient safety at the forefront of governing boards and executive leadership's priorities for greater leadership accountability and prioritization in operational, financial, and strategic plans.

Comment: A few commenters recommended linking the language describing Domain 1 Statements A and B with the statement in the Attestation Guide that "no preventable harm" is a long-term goal (which is currently associated with Domain 2 Statement A).

Response: We thank commenters for this suggestion. While Domain 1 is titled, "Leadership Commitment to Eliminating Preventable Harm," Domain 1 Statements A and B do not include the phrases "no preventable harm" or "zero preventable harm." Domain 2 Statement A does include this phrase, and thus Domain 2 Statement A remains an appropriate place for this language. We intend to monitor performance on the Patient Safety Structural measure and, if we identify that there is a need for additional guidance, provide it through our regular education and outreach efforts.

Comment: A few commenters recommended ensuring accurate attestation to this measure by developing an audit plan.

Response: We understand commenters' concerns regarding the accuracy of provider self-reported data and are continuously evaluating new ways to ensure accurate information is submitted to CMS and shared with the public. We do require all hospitals participating in the Hospital IQR Program and PCHs participating in the PCHQR Program to complete the Data Accuracy and Completeness Acknowledgement (DACA) each year, which requires an annual attestation that all the information reported to CMS for these respective programs is accurate and complete to the best of the submitters' knowledge because CMS expects all hospitals to submit complete and accurate data with respect to quality measures. For more information on the

Hospital IQR Program’s DACA requirements, we refer readers to section IX.C.11. of this final rule. For more information on the PCHQR Program’s DACA requirements, we refer readers to 42 CFR 412.24(c).

Comment: A few commenters recommended updates to Domain 1. A few commenters recommended ensuring that hospitals include physicians and medical staff as part of operational and strategic planning. A commenter recommended changing the name to “Leadership Commitment to Eliminating Preventable Harm and Creating an Environment of Ongoing Safety” because the absence of measurable preventable harm does not always indicate a safe environment. A commenter recommended revising the language of Domain 1 to remove references to “eliminate” and replacing these references with “engineer out” to focus on the multi-disciplinary approach to improving safety.

Response: We thank commenters for their recommended updates to Domain 1. We note that statement-level review and input of each measure attestation was provided by a national TEP. Most TEP members agreed that the domains capture the most important elements for advancing patient safety.³²⁷ Furthermore, the Patient Safety Structural measure is intended to provide hospitals flexibility in meeting each of the attestations. We recognize that there is significant variation between hospitals, which means that policies and procedures that are effective in some hospitals may not be effective in other hospitals. Therefore, the attestations in the Patient Safety Structural measure have been developed to encourage hospitals to adopt policies and procedures consistent with a structure, culture, and leadership commitment to prioritizing safety, without being prescriptive in how hospitals implement these policies and procedures including specifying the staff responsible for engaging in operational and strategic planning.

With respect to the specific recommendations raised by commenters, we agree that the

³²⁷ Yale New Haven Health Services Corporation—Center for Outcomes Research and Evaluation. Summary of Technical Expert Panel (TEP) Meetings Patient Safety Structural Measure (PSSM). Available at: <https://mmshub.cms.gov/sites/default/files/PSSM-TEP-Summary-Report-202306.pdf>.

absence of measurable preventable harm does not always indicate a safe environment but note that the domain refers to the elimination of preventable harm, regardless of whether and how that harm is measured. We disagree with the commenter that the term “engineer out” more effectively conveys a multidisciplinary approach to safety than the term “eliminate.” We note that the term “engineer out” could be interpreted to compartmentalize responsibility for reducing preventable harm in a way that implies that the staff responsible for developing and implementing processes have responsibility for safety to the exclusion of staff responsible for other functions (such as staff responsible for operations).

Comment: A few commenters recommended updates to specific attestation statements within Domain 1. These recommendations were:

- Statement A: Remove language related to annual performance reviews and compensation because of concerns that annual performance reviews are too infrequent to motivate change and that there may be unintended consequences (such as funding going to executive bonuses instead of safety initiatives).
- Statement B: Require each unit or department to set and publicly share a goal which supports the plans and metrics.
- Statement C: Require hospitals to attest that they embed patient safety into everyday clinical operations instead of that they ensure adequate resources to support patient safety.
- Statement D: Increase flexibility with respect to the percentage of regular board meetings focused on safety to allow quality and patient safety subcommittees to meet the requirement, to reduce the 20 percent threshold dedicated to these topics during board meetings, and to not disadvantage hospitals that are required to have open board meetings (that is, public hospitals).
- Statement E: Shorten the timeframe for reporting serious safety events to the board. Require reporting of employee injuries to C-suite executives within 24 hours.

Response: We thank commenters for these recommended updates. We reiterate that the

Patient Safety Structural measure was developed with input from national experts to allow hospitals flexibility in how they meet each individual statement. With respect to Domain 1 Statement A, we understand commenters' concern that annual activities may be too infrequent for active learning, review, reprioritization, and problem solving. Often annual performance reviews include regular status checks throughout the year to ensure progress and address barriers to achieving goals to allow for improved active learning, review, reprioritization, and problem solving. While we recognize it is possible that some hospitals or health systems may allocate funding that had previously been used for patient safety to increase executive pay due to the attestation in Domain 1 Statement A, we note that this will be reflected in other attestations in the Patient Safety Structural measure, such as Domain 1 Statement C, which requires attestation to whether the hospital governing board, in collaboration with leadership, ensures adequate resources to support patient safety (such as equipment, training, systems, personnel, and technology).

We agree with the commenter that setting and publicly sharing a goal which supports the plans and metrics would be a way of ensuring that these plans and metrics are widely shared across the hospital and note that hospitals will have flexibility to implement this policy under Domain 1 Statement B.

We note that Domain 1 refers to the Leadership Commitment to Eliminating Preventable Harm and that Statement C requires hospitals to attest to whether their hospital governing board, in partnership with leadership, ensures adequate resources to support patient safety. While ensuring adequate resources is a function of the governing board, in partnership with leadership, embedding patient safety into everyday clinical operations is a shared responsibility across the entire hospital workforce. Therefore, the recommended statement exceeds the scope of Domain 1.

With respect to Domain 1 Statement D, we note that there is support for a 20 percent threshold for hospital leadership and board meetings in the Self-Assessment Tool created to

complement the recommendations in *Safer Together: A National Action Plan to Advance Patient Safety*. In support of the report’s recommendation to ensure safety is a “demonstrated core value,” the National Steering Committee for Patient Safety provided the suggestion that hospitals could “[a]llocate and evaluate the effectiveness of time spent in leadership meetings and all board meetings to address quality and safety and share patient and family experiences with staff, leaders, and board members” as a means of achieving this recommendation. In the Self-Assessment Tool, this committee of patient safety stakeholders and experts targeted 20 percent as the allocation of time that should be dedicated to these topics during leadership and board meetings, under the heading of “Culture, Leadership, and Governance,” awarding a score of 3 or 4 (of 4) for hospitals at which “At least 20 percent of all leadership and board meeting agendas are dedicated to review and discussion of safety.”³²⁸ We understand commenters’ concerns that public or government owned hospitals may be required to hold open board meetings. We note that there are benefits to open meetings including transparency, maintaining a close relationship with interested parties, generating trust, and fostering openness and accountability.³²⁹ We understand that some specific patient safety discussions such as those that include identifiable or protected information may be more appropriate for closed sessions. However, the patient safety benefits of allocating at least 20 percent of leadership and board meetings to patient safety topics extend to both public and private hospitals and warrant the inclusion of Domain 1 Statement D. Furthermore, while we understand that many hospitals have quality and patient safety subcommittees, because of the importance of safety, the awareness, discussion, and responsibility for understanding safety issues in the organization ultimately rests with the organization’s leaders with fiduciary responsibility for the hospital. We encourage hospitals to address this attestation by integrating patient safety into other topics during board

³²⁸ National Steering Committee for Patient Safety. *Self-Assessment Tool: A National Action Plan to Advance Patient Safety*. Boston, Massachusetts: Institute for Healthcare Improvement; 2020.

³²⁹ AHA. *Sample Policy for Open Board Meetings*. Available at: <https://trustees.aha.org/sites/default/files/trustees/sample-policy-for-open-board-meetings-for-public-or-government-hospitals.pdf>

meetings where appropriate. We reiterate that there are no financial penalties for hospitals that attest either “yes” or “no” to each of the attestation statements to calculate the 0–5-point score for the Patient Safety Structural measure.

With respect to Domain 1 Statement E, we agree with the commenter that it may be appropriate in some situations to notify C-suite executives and individuals on the governing board within 24 hours of employee injuries. However, we wanted to provide hospitals with some flexibility and did not identify a 24 hour deadline as a top priority for safety during our extensive literature review and interaction with patient safety experts, advocates, and patients. We support earlier reporting to the board for serious safety events and recognize that some state and local laws may require more immediate reporting. We reiterate that the Patient Safety Structural measure is intended to provide hospitals flexibility in meeting each of the attestations.

Comment: A commenter requested clarification on Domain 1 Statement A, specifically regarding whether the performance review needs to cite specific metrics or only requires implementation of initiatives to improve quality and safety.

Response: With respect to the elements of annual leadership performance reviews we have intentionally maintained flexibility to allow each hospital to adopt practices that are most effective for its individual circumstances; that is, we have not included a requirement that the performance review cite specific metrics. We monitor performance on all of the measures in our quality reporting programs and, if we identify that there is a need for additional guidance we provide it through our regular education and outreach efforts.

Comment: A commenter recommended that leaders should be coached to improve performance on patient safety and patient safety structures, not penalized for poor performance.

Response: We agree with the commenter that coaching is an effective means to improve performance. The Hospital IQR Program is a pay-for-reporting program, which means that hospitals that report the required measure data in accordance with the form, manner, and timing policies specified by the Secretary are not subject to a financial penalty under this program, and

the PCHQR Program is a quality reporting program that does not have a financial penalty associated with it. Therefore, there are no financial penalties for hospitals that attest either “yes” or “no” to each of the attestation statements to calculate the 0–5-point score for the Patient Safety Structural measure. Therefore, there are no financial penalties associated with hospital performance on the Patient Safety Structural measure. However, the commenter may be referring to the Domain 1 Statement A attestation, which requires hospitals to attest whether “Our hospital senior governing board prioritizes safety as a core value, holds hospital leadership accountable for patient safety, and includes patient safety metrics to inform annual leadership performance reviews and compensation.” This attestation is not prescriptive in how the governing board should hold hospital leadership accountable for patient safety. Hospitals retain the flexibility to use positive reinforcement strategies such as coaching and incentives.

Comment: Many commenters did not support Domain 1 Statement E and expressed concern that the three-day timeline for notifying senior leaders of patient safety events would not provide adequate time for such notice. Many commenters stated that the three-day timeline was insufficient for serious events because of the complexity of analyzing the event and providing recommendations. Some of these commenters stated that reporting within three days would lead to superficial reviews which could lead to missed opportunities for meaningful impact and long-term improvement. A few commenters stated that the C-suite’s role does not include operational oversight or root cause analysis and stated that presenting information to the board without an actionable plan may not be meaningful. A few commenters stated that this attestation contradicts the CoPs, specifically, 42 CFR 482.21(e)(3), which provides executives with the authority to set clear expectations for safety. These commenters stated that these clear expectations include the authority to set appropriate timelines and processes for reporting and therefore setting a specific timeline is contradictory. A commenter stated that the three-day deadline is not supported by safety science. Another commenter stated that their state requires reporting to the state within 15 days and recommended deferring to state timeframes when available.

Response: We acknowledge the commenters’ concern about a three-day timeline for notifying senior leaders of patient safety events; however, there is support for timely notification of hospital senior leadership in the Self-Assessment Tool created to complement the recommendations in *Safer Together: A National Action Plan to Advance Patient Safety*. In the Self-Assessment Tool, the National Steering Committee for Patient Safety, under the heading of “Culture, Leadership, and Governance,” determined it was appropriate to award a score of 3 or 4 (of 4) for hospitals at which “The CEO and Board Chair are notified within 24 hours of a serious adverse event.”³³⁰ To allow flexibility, consistent with the CoPs, and provide hospitals the ability to set the practices that make the most sense for their individual circumstances, the timeframe identified in Domain 1 Statement E extends the timeframe from 24 hours to three business days. This will provide hospitals more time to report confirmed serious safety events while retaining a timely approach for informing hospital and board leadership. Because hospitals still retain flexibility within the three-day period and for setting other expectations with respect to safety, this is not contradictory to the CoP. Furthermore, we reiterate that the Patient Safety Structural measure builds upon the activities already required under the CoPs³³¹, therefore hospitals that do not choose to require executives be notified within 3 days of safety events can attest no to Domain 1 Statement E.

Comment: A few commenters expressed support for Domain 2 Statement A because the commenters stated that setting a goal of zero harm is important to establish a culture that prioritizes safety. A few commenters expressed support for Domain 2 Statement C. These commenters stated that a “just culture” is foundational to patient safety and that, although training and collaboratives to produce a “just culture” exist, hospitals have been slow to implement these activities. A commenter expressed support for Domain 2 Statement D because

³³⁰ National Steering Committee for Patient Safety. *Self-Assessment Tool: A National Action Plan to Advance Patient Safety*. Boston, Massachusetts: Institute for Healthcare Improvement; 2020.

³³¹ Center for Clinical Standards and Quality, Quality, Safety & Oversight Group. *Revision to State Operations Manual (SOM), Hospital Appendix A - Interpretive Guidelines for 42 CFR 482.21, Quality Assessment & Performance Improvement (QAPI) Program*.

of the importance of safety skills and competency assessments. A commenter expressed support for Domain 2 Statement E because of the commenter’s concern about the risk of workplace violence.

Response: We appreciate the commenters’ support for Domain 2 Statements A, C, D, and E. We agree that setting a goal of zero preventable harm, establishing a “just culture”, requiring safety competence assessments, and mitigating workplace violence are all critical activities to hospitals establishing a culture of safety. These activities ensure that patient safety is a core value throughout an organization’s strategy and policies.

Comment: A few commenters recommended removing the phrase “zero preventable harm” from the description of Domain 2. These commenters stated that eliminating preventable harm should be a continuous aspirational aim instead of a part of a strategic plan that is regularly updated. Some commenters stated that use of the phrase “zero preventable harm” can lead to under reporting due to concern about “breaking the streak” or overly complex efforts to determine whether an event was preventable. A few commenters recommended setting the goal of year-over-year improvement in rates of preventable harm to avoid gaming of the strict definition of zero preventable harm (that is, defining events as non-preventable or not reporting them).

Response: We thank the commenters for their recommendation to remove the phrase “zero preventable harm.” The inclusion in the Patient Safety Structural measure of a goal of zero preventable harm was informed by extensive input from a TEP, and directly reflects the CMS National Quality Strategy Goal for Safety to “Achieve zero preventable harm.”³³² While we agree that a year-over-year measurement approach may be attractive, it would not be appropriate to track improvement rates under the structure of this measure. We note that existing measures in the Hospital IQR Program and the PCHQR Program require reporting outcome data in the

³³² Centers for Medicare and Medicaid Services. CMS National Quality Strategy. 2024. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy>

care environment.

Comment: A few commenters recommended updates to specific attestation statements within Domain 2. These recommendations were:

- Statement A: Remove the term “core value” because core values are often differentiating factors, especially for faith-based organizations, and safety should be a universal aspiration integrated into all operations instead of creating value statements.

- Statement B: Add the phrase “either alone or in partnership with community organizations” after the phrase “identify and address” to reflect that many hospitals cannot address disparities in their communities due to resource limitations.

- Statement C: Expand to include a focus on psychological safety as part of a “just culture.” Discuss the proactive use of “just culture” frameworks as part of intentional system design. Rephrase to read, “Our hospital has written policies and protocols to cultivate a just culture that emphasizes learning, where frontline staff feel safe to speak up about the challenges they face in delivering care. In turn, hospital leadership demonstrates a commitment to those staff who take the time to report concerns by supporting those that experience errors, coaches well-intentioned but misaligned actions, and seeks corrective action for conscious, reckless choices that do not align with our organizational value” to align with a systems view of safety.

- Statement D: Include a patient safety curriculum and competency assessment for all employees and all medical staff regardless of their role or where they work in the system to show that all employees are valued as part of achieving patient safety. Include examples of curricula and competencies to improve workforce safety and provide guidance on measuring these competencies. Rephrase to focus on advancing human factors and systems design improvements instead of specifically advancing skills and behaviors. Exclude C-suite executives and governing board members from the patient safety curriculum and competencies due to concerns that by including executive leaders in the training the training would be too high level to focus on operational issues affecting care providers.

- Statement E: Include “safety for all” instead of more narrowly focusing on workforce safety. Also address fatigue, mental health, and emotional wellbeing.

Response: We thank commenters for these recommended updates. We reiterate that the Patient Safety Structural measure was developed with input from national experts to allow hospitals flexibility in how they meet each individual statement. We recognize that some hospitals, including faith-based organizations, may have other contexts for using the term “core value.” Therefore, we have intentionally not provided guidance or definitions for how a hospital would incorporate patient safety as a “core institutional value.”

We agree with the commenter that hospitals cannot address disparities in their communities without partnership with outside organizations. We note that Domain 2 Statement B specifically asks hospitals to attest whether their “hospital safety goals include the use of metrics to identify and address disparities in safety outcomes based on the patient characteristics determined by the hospital to be most important to health care outcomes for the populations served.” We note that in the Attestation Guide for Domain 2 Statement B we recommend potential harm indicators that hospitals can use to identify safety outcomes.³³³ These harm indicators include the AHRQ Patient Safety Indicators (PSI), which include items such as “Death Rate in Low-Mortality Diagnosis Related Groups,” “Pressure Ulcer Rate,” and “Death Rate Among Surgical Inpatients with Serious Treatable Conditions,” among others³³⁴, which are more significantly affected by hospital policies, procedures, and operations than patient risk factors or disparities within the community. Nevertheless, we recognize that there may be community factors which can increase some patients’ risks for certain adverse safety outcomes and that it is appropriate for hospitals to work with community organizations to address those factors. We note that hospitals will be able to attest “yes” to this statement regardless of whether they partner

³³³ Centers for Medicare & Medicaid Services, Patient Safety Structural Measure Attestation Guide, available at: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>.

³³⁴ AHRQ. Quality Indicators. Available at: https://qualityindicators.ahrq.gov/Downloads/Modules/V2023/AHRQ_QI_Indicators_List.pdf.

with community organizations to identify and address disparities.

We agree with commenters that the elements of a “just culture” would increase the likelihood of establishing an environment conducive to psychological safety. Specifically, because a “just culture” recognizes that individual practitioners should not be held accountable for system failings over which they have no control and recognizes that many individual or “active” errors represent predictable interactions between human operators and the systems in which they work,³³⁵ a “just culture” can create an atmosphere in which there is a shared belief that it is permissible to express ideas, ask questions, and admit mistakes without a fear of negative consequences.³³⁶ Domain 2 Statement C’s reference to a “just culture” therefore necessarily incorporates considerations of psychological safety.

We agree with the commenter that the use of “just culture” frameworks is part of intentional system design. We address the role of “just culture” frameworks as part of intentional system design in the Attestation Guide by stating that, “a just culture recognizes that individual practitioners should not be held accountable for system failings over which they have no control. A just culture also recognizes many individual or ‘active’ errors represent predictable interactions between human operators and the systems in which they work.”

The current language for Domain 2 Statement C is, “Our hospital has implemented written policies and protocols to cultivate a “just culture” that balances no blame and appropriate accountability and reflects the distinction between human error, at-risk behavior, and reckless behavior.” AHRQ defines a “just culture” as a system that holds itself accountable, holds staff members accountable, and has staff members that hold themselves accountable.³³⁷ Furthermore, the Attestation Guide states that a “just culture” “recognizes that individual practitioners should not be held accountable for system failings over which they have no control. A just culture also

³³⁵ Centers for Medicare & Medicaid Services, Patient Safety Structural Measure Attestation Guide, available at: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>.

³³⁶ Gallo, A. What Is Psychological Safety. Harvard Business Review. Available at: <https://hbr.org/2023/02/what-is-psychological-safety>.

³³⁷ AHRQ. The CUSP Method. Available at: <https://www.ahrq.gov/hai/cusp/index.html>.

recognizes many individual or ‘active’ errors represent predictable interactions between human operators and the systems in which they work. However, in contrast to a culture that touts ‘no blame’ as its governing principle, a ‘just culture’ does not tolerate conscious disregard of clear risks to patients or gross misconduct (for example, falsifying a record, performing professional duties while intoxicated).” This guidance on “just culture” provides an explanation of the practical application of a “just culture” in balancing accountability with encouraging staff to feel safe in addressing challenges they face.

With respect to Domain 2 Statement D, we agree with commenters that including all employees, even those who do not work in the hospital, in training with respect to a patient safety curriculum or competency assessment has the potential to show that they are valued members of the patient safety team. We note that this statement does include all clinical and non-clinical staff at the hospital to cover all hospital-based employees. Hospitals and health systems that choose to include additional employees in the patient safety training and competency assessments will be able to do so.

We agree that human factors and system design improvements are a vital part of advancing patient safety. As stated in the Attestation Guide, the development of the Patient Safety Structural measure is anchored in best practices and evidence for improving patient safety and reducing harm using a total systems framework that views patient safety events as a result of system failure rather than individual error and encourages a systems approach which takes the view that most errors reflect predictable human failings in the context of poorly designed systems.³³⁸ However, even within a well-designed system, individuals responsible for processes need to have sufficient competencies to fulfill their responsibilities. Therefore, we designed Domain 2 Statement D to complement the other systems-based attestations within the Patient Safety Structural measure.

³³⁸ Centers for Medicare & Medicaid Services, Patient Safety Structural Measure Attestation Guide, available at: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>.

We agree with commenters that patient safety curriculum and competencies for clinical and non-clinical staff would vary based on role. To avoid hospitals using trainings that are so high level that they do not address operational issues affecting care providers we refer readers to the following examples of validated, industry-standard trainings and competencies, which are also included in the Attestation Guide:

- Comprehensive-Unit-based Safety Program (CUSP);³³⁹
- AHRQ's Communication and Optimal Resolution (CANDOR) toolkit;³⁴⁰
- The CDC's Infection Control Assessment and Response program and tool;³⁴¹
- TeamSTEPPS communication framework;³⁴²
- Institute for Healthcare Improvement's Root Cause Analyses and Action (RCA²)

resources;³⁴³

- Shared Decision Making;³⁴⁴
- Tools to reduce central line infections;³⁴⁵
- Utilization of data analytics;
- Performance improvement methodologies such as Plan-Do-Study-Act;³⁴⁶ and
- Ethical standards.

To allow hospitals flexibility with respect to the curricula they have selected and the competencies that they have determined are most critical to develop within their hospital we

have intentionally maintained flexibility to allow each hospital to develop their own competency assessments. We intend to monitor measure performance on the Patient Safety Structural measure and, if we identify that there is a need for additional guidance, provide it through our regular education and outreach efforts.

The statement to which hospitals will attest for Domain 2 Statement E is: “Our hospital has an action plan for workforce safety with improvement activities, metrics and trends that address issues such as slips/trips/falls prevention, safe patient handling, exposures, sharps injuries, violence prevention, fire/electrical safety, and psychological safety.” We note that the list of potential workforce safety elements is intended to be a set of examples, and not a comprehensive list of items affecting workforce safety.

The intent of the Patient Safety Structural measure is to identify hospitals that exemplify a culture of safety and leadership commitment to transparency, accountability, patient and family engagement, and continuous learning and improvement to advance our goal of achieving zero preventable harm. We have focused Domain 2 Statement E on workforce safety, instead of the broader “safety for all” recommended by the commenter because workforce safety is a precondition to advancing patient safety with a unified, total systems-based approach to eliminate harm to both patients and the workforce.³⁴⁷ We note that hospitals maintain the flexibility to address “safety for all” under this attestation, as long as they include a focus on workforce safety within their broader strategy for “safety for all.”

Comment: Some commenters stated that introducing competency assessments for Domain 2 Statement D would be costly and administratively burdensome.

Response: We understand that hospitals that do not currently have a structure in place for assessing staff competency with respect to patient safety would need to develop and implement a plan for these assessments to attest “yes” to this statement. While we acknowledge that adopting

³⁴⁷ AHRQ. *Safer Together: A National Action Plan to Advance Patient Safety*. Available at: <https://www.ahrq.gov/patient-safety/reports/safer-together.html>.

this practice may entail costs for such hospitals, the value of implementing these assessments justifies the investment required. We reiterate that we do not expect all hospitals to achieve a score of five on the measure, especially in the first year. Hospitals that are not able to adopt these assessments can attest to the other domains as appropriate and receive a score of 0-4 without any financial penalties.

Comment: A commenter expressed support for Domain 3 because of the importance of creating a culture of patient safety in improving patient safety. A few commenters supported Domain 3 Statement A and stated that safety culture surveys are another established tool to provide feedback to leaders. A commenter expressed support for Domain 3 Statement C because of the use of external benchmarks. A few commenters supported Domain 3 Statement E because learning collaboratives are a proven way to spread innovation and improve outcomes.

Response: We thank the commenters for their support of Domain 3, specifically Domain 3 Statements A, C, and E. We appreciate the commenters' support for activities that would foster a culture of safety and continuous learning systems, including external benchmarking, using tools to provide feedback to leaders, and participation in learning collaboratives. We note that culture of safety surveys have been shown to provide feedback to leaders and, with a structured debrief, to have a positive effect on working patterns and safety culture.³⁴⁸ These activities support evidence-based practices that encourage hospital-wide approaches to addressing safety.

Comment: A few commenters recommended updates to specific attestation statements within Domain 3. These recommendations were:

- Statement A: Emphasize that the culture of safety survey should include psychological safety.
- Statement B: Clarify whether an analysis needs to be completed for every event or

³⁴⁸ Bethune RM, Ball S, Doran N, Harris M, Medina-Lara A, Fornasiero M, Hill M, Lang I, McGregor-Harper J, Sheaff R. How Safety Culture Surveys Influence the Quality and Safety of Healthcare Organisations. *Cureus*. 2023 Sep 3;15(9):e44603. doi: 10.7759/cureus.44603. PMID: 37795070; PMCID: PMC10546949.

cluster, and encourage hospitals to perform analyses for events that do not reach the threshold of serious safety events. A commenter also recommended taking an approach of prospective evaluation when things go correctly.

- Statement C: Transition from benchmarking on external metrics to benchmarking on zero harm to encourage high performing hospitals to continue to improve. Reframe safety as the capacity to make things go right instead of a count of the number of things that go wrong.

- Statement D: Require all the practices listed because they are interconnected and rely on one another. Rephrase as “characteristics of a learning and improving organization” because high reliability is a framework but some of the elements included in the list are improvement methods. Refine the high reliability practices as follows:

- ++ Require safety and process improvement huddles to start at the unit level, cover all shifts, and roll up on Monday – Friday with additional safety huddles on weekends;

- ++ Require hospital leaders to participate in weekly safety related rounding to provide sufficient visibility;

- ++ Encourage coaching leaders between the care delivery personnel and executives on leading for safety and process improvement;

- ++ Expand from training on team communication and collaboration to include other training elements (specifically, personal habits and skills to reduce lapse, cognitive bias training, and tools to reduce bias);

- ++ Reframe training on team communication and collaboration to incorporate patient safety principles into leadership training to avoid over reliance on online modules;

- ++ Add a statement regarding a standard daily process improvement method for every work;

- ++ Add a statement regarding leadership skills training in leading a team to 100 percent performance on safety practices; and

++ Refine the description of defined improvement methods to ensure that the method is appropriate to the problem(s) being solved.

- Statement E: Remove this statement because many large-scale learning networks are not PSOs and the commenters state that sharing data with these networks would be a violation of the Patient Safety and Quality Improvement Act of 2005 (PSQIA) (Pub. L. 109-41) for hospitals that report to PSOs.

Response: We note that Statement A in Domain 3 requires hospitals to attest to whether they “conduct a hospital-wide culture of safety survey using a validated instrument annually.” In the Attestation Guide for this measure, we provide two examples of validated instruments which hospitals can use to conduct this survey.³⁴⁹ The AHRQ Survey on Patient Safety Culture includes 10 composite measures, including “Response to Error,” “Communication About Error,” and “Communication Openness.”³⁵⁰ The Safety Attitude Questionnaire includes statements such as, “It is easy for personnel here to ask questions when there is something that they do not understand,” “In this clinical area, it is difficult to discuss errors,” and “Morale in this clinical area is high.”³⁵¹ Therefore, while neither of these survey instruments specifically have a domain related to psychological safety, key elements of psychological safety are embedded in the existing domains and questions. While hospitals may choose to use other surveys, we intend the Patient Safety Structural measure to maintain flexibility to allow each hospital to adopt practices that are most effective for its individual circumstances.

Domain 3 Statement B requires hospitals to attest whether they have a “dedicated team that conducts event analysis of serious safety events using an evidence-based approach, such as the National Patient Safety Foundation’s Root Cause Analysis and Action.” This statement does not introduce limitations or requirements on the activities of the dedicated team; instead, it

³⁴⁹ Centers for Medicare & Medicaid Services, Patient Safety Structural Measure Attestation Guide, available at: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>.

³⁵⁰ AHRQ. Hospital Survey on Patient Safety Culture. Topics Covered by the SOPS Hospital Survey 2.0. Available at: <https://www.ahrq.gov/sops/surveys/hospital/index.html>.

³⁵¹ Safety Attitudes: Frontline Perspectives from this Patient Care Area. Available at: <https://www.uth.edu/chqs/assets/docs/faq-short-form.pdf>.

requires hospitals to attest “yes” or “no” as to whether the hospital has such a team. We agree with commenters that it would be worthwhile for these teams to also evaluate events that do not reach the threshold of serious safety events and to seek best practices from situations in which everything went correctly. However, we did not identify this as a top priority for safety during our extensive literature review and interaction with patient safety experts, advocates, and patients and therefore we are not currently requiring hospitals to attest to whether their dedicated teams evaluate these situations. We will monitor performance on the Patient Safety Structural measure, and if we identify opportunities for additional improvements in patient safety structures, we will consider these in future refinements.

As more hospitals begin to benchmark based on external metrics and use those metrics to identify best practices, we anticipate that national performance on patient safety will improve. This improved national performance would, in turn, lead to a higher standard of patient safety in the external metrics that hospitals are using for benchmarking. High performing hospitals could benchmark on zero harm in addition to analyzing their performance on external metrics to further drive quality improvement.

Consistent with AHRQ guidance, we consider patient safety to refer to freedom from accidental or preventable injuries produced by medical care.³⁵² This includes both proactively following practices that ensure positive outcomes as well as implementing practices or interventions that reduce the occurrence of preventable adverse events.³⁵³

The high reliability practices listed under Domain 3 Statement D reflect practices of high reliability organizations. These are organizations or systems that operate in hazardous conditions but have fewer adverse events than comparable organizations. With respect to patient safety, high reliability organizations are considered to operate with nearly failure-free performance

³⁵² AHRQ. PSNet. Glossary: Patient Safety. Available at: https://psnet.ahrq.gov/glossary-0?f%5B0%5D=glossary_az_content_title%3AP.

³⁵³ AHRQ. PSNet. Glossary: Patient Safety. Available at: https://psnet.ahrq.gov/glossary-0?f%5B0%5D=glossary_az_content_title%3AP.

records, not simply better than average ones.³⁵⁴ Therefore, these practices are not inherently interrelated; they are practices that are associated with consistently high performance. While we agree that implementing all of the listed practices would advance a hospital's commitment to patient safety, for the purposes of the Patient Safety Structural measure, a hospital may attest "yes" to Domain 3 Statement D as long as it has implemented at least four of the listed practices. Because the items listed under Domain 3 Statement D are practices associated with high reliability organizations it is appropriate and accurate to refer to them as high reliability. High reliability hospitals achieve safety, quality, and efficiency goals by applying five key principles: (1) sensitivity to operations (that is, heightened awareness of the state of relevant systems and processes); (2) reluctance to simplify (that is, acceptance that work is complex, with the potential to fail in new and unexpected ways); (3) preoccupation with failure (that is, to view near misses as opportunities to improve, rather than proof of success); (4) deference to expertise (that is, to value insights from staff with the most pertinent safety knowledge over those with greater seniority); and (5) practicing resilience (that is, to prioritize emergency training for many unlikely, but possible, system failures).³⁵⁵ The listed items are consistent with the practices of these organizations and thus reflect appropriate and effective high reliability practices. We agree with commenters that a leadership process improvement method for every work unit and leadership skills training in leading a team to 100 percent performance are both practices with the potential to further improve a hospital's culture of safety; however, we did not identify them as consistent practices across organizations identified as high reliability organizations.

With respect to the concern that by submitting data to a PSO, hospitals would no longer be able to work with another large-scale learning network, we disagree. Some information becomes patient safety work product (PSWP) protected under the PSQIA when that information

³⁵⁴ AHRQ. PSNet. Glossary: High Reliability Organization. Available at: https://psnet.ahrq.gov/glossary-0?F%5B0%5D=glossary_az_content_title%3AP.

³⁵⁵ Centers for Medicare & Medicaid Services, Patient Safety Structural Measure Attestation Guide, available at: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>.
<https://qualitynet.cms.gov/pch/measures>.]

is submitted to a PSO. We refer readers to 42 CFR 3.20 for information regarding what constitutes PSWP. Depending on the individual circumstances of a hospital that chooses to work with both a PSO and a large-scale learning network that is not a PSO, the hospital could disclose other, non-PSWP information to the learning network or disclose non-identifiable PSWP consistent with its obligations under the PSQIA. Therefore, we are not modifying Domain 3 Statement E because there is sufficient flexibility for hospitals to work with large-scale learning networks of their choosing.

Due to commenters' concerns regarding Domain 4 Statement B, discussed in detail below, we are modifying the attestation in Domain 4 Statement B, to the following, "Our hospital voluntarily works with a Patient Safety Organization listed by the Agency for Healthcare Research and Quality (AHRQ)³⁵⁶ to carry out patient safety activities as described in 42 CFR 3.20, such as, but not limited to, the collection and analysis of patient safety work product, dissemination of information such as best practices, encouraging a culture of safety, or activities related to the operation of a patient safety evaluation system." A hospital could positively attest to this revised statement even if it chooses to work with a large-scale learning network that is not a PSO to analyze and understand patient safety events and with a PSO for other patient safety activities. We note that if a hospital chooses to work with a large-scale learning network other than a PSO, information disclosed to that network does not become PSWP and is not subject to the confidentiality and privilege protections established by the PSQIA.

Comment: A commenter recommended creating a sense of urgency to improve workforce wellbeing because many staff do not feel heard and an annual survey, as described in Domain 3 Statement A, would not improve that.

Response: While we agree that an annual survey, on its own, may not be sufficient to

³⁵⁶ Agency for Healthcare Research and Quality. Federally-Listed Patient Safety Organizations (PSOs). Retrieved January 5, 2024, from https://pso.ahrq.gov/pso/listed?f%5B0%5D=resources_provided%3A2

lead to a culture that encourages staff to express their concerns, this is not the only attestation in the Patient Safety Structural measure that addresses workforce safety and workforce wellbeing. Specifically, Domain 2 Attestation E focuses on the development of an action plan for workforce safety, and includes psychological safety as a potential area for improvement. Additionally, a positive attestation on Domain 2 Attestation C would require policies and protocols to cultivate a “just culture,” the cultivation of which can create an atmosphere in which there is a shared belief that it is permissible to express ideas, ask questions, and admit mistakes without a fear of negative consequences.³⁵⁷ An atmosphere in which it is permissible to express ideas and ask questions would also be an atmosphere which would improve staff feelings of being heard.

Comment: A few commenters recommended establishing a method to ensure that use of dashboards and benchmarking in Domain 3 Statement C does not allow staff to overlook harm, including potential harm, because the specific harm was not included on the dashboard.

Response: We agree with commenters that it is important that staff does not overlook harm or potential harm that does not meet the threshold or criteria for specific dashboards. We note that the Patient Safety Structural measure is comprised of interrelated domains and attestations. Therefore, while harm or potential harm may not be identified because of its presence on a specific dashboard, activities to support the other attestations (including having a dedicated team that conducts event analysis, adopting high reliability practices, participating in large-scale learning networks, and engaging patients and their families as co-producers of safety and health) could minimize the likelihood that harm or potential harm is overlooked.

Comment: A few commenters recommended providing information on the purpose and activities of a huddle, including clarifying that it is not just to encourage situational awareness but also to identify ongoing risk to patients and to engage leadership support, as needed, to improve consistent attestation for Domain 3 Statement D.

³⁵⁷ Gallo, A. What Is Psychological Safety. Harvard Business Review. Available at: <https://hbr.org/2023/02/what-is-psychological-safety>.

Response: The first high reliability practice identified in Domain 3 Statement D describes “[t]iered and escalating (e.g., unit, department, facility, system) safety huddles at least 5 days a week, with 1 day being a weekend, that include key clinical and non-clinical (e.g., lab, housekeeping, security) units and leaders, with a method in place for follow-up on issues identified.” In the Attestation Guide, we provide further information on the purpose and structure of a “tiered and escalating huddle” system including clarifying that the purpose is to identify potential risk and engage leadership support. We specifically state that “‘tiered and escalating huddle’ system involves a series of brief, focused conversations, typically daily, that rapidly identify and escalate safety, quality, and operational issues from a broad array of frontline staff to a focused group of senior leaders.”³⁵⁸

Comment: A few commenters recommended providing additional guidance on how to use electronic medical records (EMRs) to identify and track safety events for the data infrastructure-related high reliability practice within Domain 3 Statement D.

Response: While we agree with commenters that examples can be meaningful and provide hospitals with information to help adopt these evidence-based practices, we also intend the Patient Safety Structural measure to maintain flexibility to allow each hospital to adopt practices that are most effective for its individual circumstances. Specifically, with respect to the use of EMRs to identify and track safety events, flexibility is appropriate so each hospital can work with its EMR vendor to establish the best methods for using the hospital’s system to identify and track safety events. We note as an example that EMR-based tracking of healthcare-associated infections and other harms that hospitals are already collecting for reporting to the CDC’s National Healthcare Safety Network or electronic clinical quality measures (eCQMs) used in the Hospital IQR and Promoting Interoperability Programs, respectively, could be part of an electronic data infrastructure to measure safety. Hospitals could similarly identify and track

³⁵⁸ Centers for Medicare & Medicaid Services, Patient Safety Structural Measure Attestation Guide, available at: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>.

additional safety events that reflect the hospital's prioritized areas of focus and improvement.

Comment: A commenter recommended clarifying that hospital staff are not responsible for device and equipment selection and therefore the high reliability practice of incorporating human factors engineering in device, equipment, and process design listed within Domain 3 Statement D would be more appropriate at the board level.

Response: We note that the referenced high reliability practice in Domain 3 Statement D describes “[t]he use of human factors engineering principles in selection and design of devices, equipment, and processes.” We agree with commenters that hospital staff are usually not responsible for selecting or designing devices and equipment at the hospital. We did not specify who would be responsible for each of these activities because it may vary from hospital to hospital and the same employees may not be responsible for all these activities. For example, a senior leader may influence device and equipment purchases, while a frontline supervisor may be responsible for designing operational processes.

Comment: A commenter stated that for Domain 3 Statement D it is not feasible for safety council leaders to round monthly on all units. This commenter also expressed the concern that while conducting rounds, if leaders specifically focus on safety, these leaders may overlook other potential concerns.

Response: With regard to the high reliability practice in Domain 3 Statement D on whether “[h]ospital leaders participate in monthly rounding for safety on all units, with C-suite executives rounding at least quarterly, with a method in place for follow-up on issues identified,” we understand that having each hospital leader round in every unit monthly would not be feasible for most hospitals. We have retained flexibility for hospitals to identify which leaders round in each unit, as long as leaders round in every unit and C-suite executives round at least quarterly. We also note that attesting to this high reliability practice would not require that these rounds be exclusive to safety and would recommend including other practices or concerns as appropriate.

Comment: A commenter recommended removing practices that are already established as common practices from Domain 3 Statement D to further advance safety, so that hospitals are not rewarded for standard practices.

Response: We reiterate that the Patient Safety Structural measure was developed with input from national experts and through this input we determined that these practices are highly indicative of a culture of safety and are therefore important to include, regardless of their current prevalence. We further note that to positively attest to Domain 3 Statement D hospitals must implement a minimum of four of these practices, which will further encourage hospitals to adopt practices which are less well established.

Comment: Several commenters expressed support for Domain 4 Statement B. These commenters stated that this would incentivize hospitals and PSOs to engage in an activity that supports analysis of harm events. A commenter stated that this attestation would support the legislative purpose of the PSO program to become a national learning system. A commenter stated that use of the Network of Patient Safety Databases (NPSD) is crucial and that the potential increase in data submissions would improve inter-hospital collaboration on patient safety.

Response: We thank the commenters for their support of Domain 4 Statement B. We agree that hospitals voluntarily working with PSOs to track and report patient harm and safety events can be an important and effective activity to help analyze and learn from prior events. We also agree that increased use of the NPSD may further facilitate collaboration across hospitals and support the full potential of the important role that PSOs can play. While we continue to believe that working with a PSO that shares information with the NPSD is an important goal for hospitals to strive towards, we recognize that there are feasibility limitations that would make it difficult for most hospitals to positively attest yes to this domain at this time. Therefore, as discussed below, we are modifying Domain 4 Statement B to read, “Our hospital voluntarily works with a Patient Safety Organization listed by the Agency for Healthcare Research and

Quality (AHRQ)³⁵⁹ to carry out patient safety activities as described in 42 CFR 3.20, such as, but not limited to, the collection and analysis of patient safety work product, dissemination of information such as best practices, encouraging a culture of safety, or activities related to the operation of a patient safety evaluation system.”

Comment: A few commenters expressed support for Domain 4 Statement D. Some of these commenters stated that it would be particularly important for patients experiencing harm to know there is a defined communication and resolution program in place. Another commenter noted that communication and resolution programs interrelate to the elements of the other domains, underscoring the importance of establishing a defined communication and resolution program. Other commenters stated a communication and resolution program would benefit healthcare personnel who are currently discouraged from discussing patient harm with patients. A commenter stated that there is a growing body of evidence to support Domain 4 Statement D and, as such, there are support materials available for hospitals seeking to implement communication and resolution programs.

Response: We thank the commenters for their support of Domain 4 Statement D. We agree that well-defined communications and resolution programs are critical for continued engagement and support of patients who experienced harm and would encourage healthcare staff to have transparent conversations with patients. Evidence-based resources, like AHRQ’s Communication and Optimal Resolution (CANDOR) toolkit, are helpful tools for hospitals seeking to improve and implement communication and resolution programs.

Comment: A few commenters recommended updates to specific attestation statements within Domain 4. These recommendations were as follows:

- Statement B: Remove the requirement that the PSO reports to NPSD and instead work with AHRQ to increase the number of PSOs that participate in the NPSD prior to including this

³⁵⁹ Agency for Healthcare Research and Quality. Federally-Listed Patient Safety Organizations (PSOs). Retrieved January 5, 2024, from https://psa.ahrq.gov/psa/listed?f%5B0%5D=resources_provided%3A2

attestation. A commenter stated that their state requires reporting to a state-designated PSO, but not all state-designated PSOs report to the NPSD so some hospitals in their state would be unable to attest positively to this statement. Replace the phrase “voluntary reporting” with “voluntary aggregate reporting” to demonstrate that data reported to the NPSD would be non-identifiable.

- Statement C: Require hospitals to have patient safety metrics available upon request instead of publishing them to reduce operational complexity.

Response: We understand that currently there are only a few PSOs that participate in voluntary reporting to the NPSD and agree with commenters that it would be appropriate for HHS to seek to increase that number. Because of concerns that very few hospitals would be able to positively attest to this statement, and that hospitals may be unable to improve performance by engaging with PSOs that voluntarily report to the NPSD because of insufficient numbers of such PSOs, we are modifying the attestation in Domain 4 Statement B to remove the portion of the attestation related to voluntary reporting to the NPSD. The attestation will thus focus instead on the beneficial activities possible through engagement with a PSO. Through this revision, a hospital that works with a PSO, including a state-designated PSO, from AHRQ’s published list of PSOs³⁶⁰ to carry out patient safety activities as described in 42 CFR 3.20 will be able to positively attest to this statement.

Commenters’ concerns that data submitted by PSOs to the NPSD would be identifiable are misplaced. Before any PSWP is shared with the NPSD, a PSO submits the data to the PSO Privacy Protection Center³⁶¹ to ensure all identifying information has been removed and the data are aggregated before transferring it to the NPSD. There is no cost to PSOs for these privacy protection services. Nonetheless, the revisions to Domain 4 Statement B mean that a hospital need not attest that its PSO voluntarily submits data to the NPSD. Although we are modifying Domain 4 Statement B, we continue to encourage PSOs to voluntarily report serious safety

³⁶⁰ AHRQ’s published list of PSOs is available at: <https://pso.ahrq.gov/pso/listed>.

³⁶¹ For additional information on the PSO Privacy Protection Center, we refer readers to https://www.psoppc.org/psoppc_web/

events, near misses, and precursor events to the NPSD to increase the amount of nationally representative safety data for research and analyses (analogous to the National Transportation Safety Board's safety research of US civil aviation accident and injury data³⁶²).

With respect to the commenters' recommendation that we update Statement C to allow hospitals to make patient safety metrics available upon request instead of publishing them, we understand that hospitals seek to balance transparency and operational complexity. By establishing workflows to report and present safety data, hospitals establish an additional pathway to ensure continuing focus on patient safety. Furthermore, by reporting metrics to all clinical and non-clinical staff and making these data public in hospital units, hospitals provide the opportunity for patients to have access to these important data without the potential for fear of reprisal that may be associated with having to request these data from hospital personnel.

Comment: A commenter stated that under current regulations there are three options for patient safety improvement: (1) join a PSO; (2) create a PSO; or (3) use other non-PSO channels for similar functions. The commenter expressed concern that Domain 4 Statement B allows less flexibility without demonstrating that working with a PSO is preferable to other non-PSO channels.

Response: We believe that the commenter is referring to the Medicare CoP for hospitals at 42 CFR 482.21 that requires the development, implementation, and maintenance of an effective, ongoing, hospital-wide, data-driven quality assessment and performance improvement program. The Patient Safety Structural measure does not make any changes to the requirements at 42 CFR 482.21 nor does it affect the voluntary nature of a hospital working with a PSO, creating a PSO, or choosing to not work with a PSO. While Domain 4 Statement B is intended to encourage hospitals to work with a PSO because evidence shows that most hospitals working with PSOs say that this work has helped them understand the causes of patient safety events and

³⁶² <https://www.nts.gov/safety/Pages/default.aspx>

prevent future patient safety events³⁶³, it does not mandate that all hospitals must work with a PSO, only to attest “yes” or “no” as to whether or not they work with a PSO. We note there is no financial penalty for attesting “no”.

Comment: Some commenters stated that the attestation statement in Domain 4 Statement B on whether a hospital reports serious safety events, near misses, and precursor events to a PSO that participates in voluntary reporting to the NPSD mandates hospitals to report to PSOs in violation of the PSQIA.

Response: To avoid the risk of hospitals unintentionally disclosing PSWP, as discussed previously, we are modifying the Domain 4 Statement B attestation to more broadly describe working with a PSO. The modified statement, “Our hospital voluntarily works with a Patient Safety Organization listed by the Agency for Healthcare Research and Quality (AHRQ)³⁶⁴ to carry out patient safety activities as described in 42 CFR 3.20, such as, but not limited to, the collection and analysis of patient safety work product, dissemination of information such as best practices, encouraging a culture of safety, or activities related to the operation of a patient safety evaluation system,” continues to encourage hospitals to work with PSOs without specifying any reporting of serious safety events, near misses, or precursor events to a PSO. Working with a PSO is a practice consistent with a culture of safety because evidence shows that most hospitals working with PSOs say that this work has helped them understand the causes of patient safety events and prevent future patient safety events.³⁶⁵ However, the modified statement does not require hospitals to attest whether they report patient safety event information to PSOs.

Comment: Some of the commenters who were concerned about the attestation in Domain 4 Statement B expressed concern that adopting a measure with this attestation into CMS quality

³⁶³ Strategies to Improve Patient Safety: Final Report to Congress Required by the Patient Safety and Quality Improvement Act of 2005. Rockville, MD: Agency for Healthcare Research and Quality; December 2021. ³⁶⁴ Agency for Healthcare Research and Quality. Federally-Listed Patient Safety Organizations (PSOs). Retrieved January 5, 2024, from https://pso.ahrq.gov/pso/listed?f%5B0%5D=resources_provided%3A2

³⁶⁵ Office of the Inspector General. Patient Safety Organizations: Hospital Participation, Value, and Challenges. September 2019. Available at: <https://oig.hhs.gov/oei/reports/oei-01-17-00420.pdf>

reporting programs would make reporting to a PSO mandatory by penalizing them and impacting hospital payment. Some of these commenters also expressed concern that hospitals would be penalized for not achieving a perfect score.

Response: Domain 4 Statement B encourages hospitals to report to a PSO as this is an indicator of a hospital's efforts to improve the quality of its care, as described elsewhere in this rule. Nonetheless, the revisions we have made to the statement provide hospitals with additional flexibility regarding how they work with PSOs and does not require that a hospital report PSWP to a PSO to be completed. No hospital is required by the Hospital IQR and PCHQR Programs to report to a PSO, nor is a hospital's Medicare payment affected by whether a hospital responds to Domain 4 Statement B in the affirmative or the negative. The Hospital IQR Program is a pay-for-reporting program, which means that hospitals that report the required measure data in accordance with the form, manner, and timing policies specified by the Secretary are not subject to a financial penalty under this program. A hospital's performance on the measure, which for the Patient Safety Structural measure is a score from 0 to 5 points, has no impact on a hospital's Medicare reimbursement. Therefore, hospitals that choose not to work with a PSO can attest "no" to Domain 4 and can earn up to 4 points on the measure; there is no financial penalty for attesting "no". We note that the PCHQR Program is a quality reporting program that does not have a financial penalty associated with it.

As we noted, this measure is intended to determine the level at which hospitals are performing these identified best practices and to identify opportunities for improvement in structural safety practices. Like other quality measures, we would not expect all hospitals to achieve a perfect or maximum score on the measure, especially during the initial years of using the measure in these programs. We proposed this measure for the Hospital IQR and PCHQR Programs because of the identified gaps and variation in the adoption of these safety practices across hospitals (89 FR 36285). We do want to encourage hospitals to improve their scores on measures over time as a fundamental goal to improve the quality of care. For the Patient Safety

Structural measure, improvement on the measure could include hospitals working with PSOs if not already doing so. Furthermore, we note that the TEP included hospital representatives and clinicians who did not express concern that this statement created an implicit mandate for hospitals to report patient safety event information to PSOs.³⁶⁶

Comment: Some commenters expressed concern that the attestation in Domain 4 Statement B would make reporting to a PSO mandatory through impacting hospital reputations and that this would violate the PSQIA.

Response: As modified, a hospital could respond to Domain 4 Statement B in the affirmative without reporting serious safety events, near misses, or precursor events to a PSO so long as it performs other patient safety activities with a PSO. While we understand commenters' concerns about the potential negative impact on a hospital's reputation associated with public display of measure performance information of a score less than five out of five points, or a score that is less than other hospitals, we note the fundamental goal of both the Hospital IQR Program and the PCHQR Program is to drive quality improvement through measurement and transparency in the public display of quality information. Section 1886(b)(3)(B)(viii)(VII) of the Act and section 1866(k)(4) of the Act require the Secretary to report quality measures used in the Hospital IQR Program and the PCHQR Program, respectively, on a CMS website (currently, the Compare tool on Medicare.gov). This public reporting of quality measures gives patients, consumers, and other interested parties access to important information to make informed healthcare decisions.

For the Patient Safety Structural measure, we would publicly report each hospital's score for this measure, which would range from 0 to 5 points, on the Compare tool. We would also publicly report the national average score and the average score in the hospital's state.

Therefore, while public reporting of this score could encourage hospitals to work with a PSO if

³⁶⁶ Yale New Haven Health Services Corporation – Center for Outcomes Research and Evaluation. Summary of Technical Expert Panel (TEP) Meetings Patient Safety Structural Measure (PSSM). Available at: <https://mmshub.cms.gov/sites/default/files/PSSM-TEP-Summary-Report-202306.pdf>

they are not already working with one (as well as encourage improvement upon the other safety practices asked about in the measure), the Patient Safety Structural measure does not require hospitals to achieve any of the listed attestations.

Comment: A commenter stated their belief that including this attestation in the domain titled “Accountability and Transparency” indicates reporting to the PSO is being used for regulatory accountability in violation of the PSQIA which blocks federal oversight agencies from using PSOs as a federal reporting program.

Response: We disagree with the commenters’ characterization that the title of Domain 4 or the attestation in Statement B adds a regulatory accountability component beyond the statutory authorities of the Hospital IQR Program and the PCHQR Program or the PSQIA, or that a measure asking hospitals about reporting patient safety data to a PSO creates a federal PSO reporting program. The title of this domain was intended to emphasize the importance of accountability and transparency related to a broad range of a hospital’s internal and external safety practices. We have no intention to establish a federal PSO reporting program through this or any other quality measure. Furthermore, as modified, a hospital could respond to Domain 4 Statement B in the affirmative without reporting serious safety events, near misses, or precursor events to a PSO so long as it performs other patient safety activities with a PSO.

Comment: Some commenters stated their concern that Domain 4 Statement B would compel PSOs that do not currently report to the NPSD to begin doing so, and that this amounts to governmental interference with private sector business operations. These commenters further stated that the government does not have the right to mandate government collection of the proprietary data collected by PSOs.

Response: This measure does not affect the voluntary nature of a hospital working with a PSO, nor does it require a hospital to work with a specific PSO. The Patient Safety Structural measure seeks to evaluate and report information about practices that hospitals have in place which demonstrate a structure, culture, and leadership commitment that prioritizes safety and to

encourage adoption of these practices. Nonetheless, we have modified Domain 4 Statement B to remove references to whether the hospital reports PSWP to a PSO and whether the PSO voluntarily reports information to the NPSD.

Comment: Some commenters stated that CMS did not provide scientific evidence that this measure would improve the quality of hospital care. Some commenters specifically stated that CMS did not provide evidence that reporting to a PSO which reports to the NPSD is correlated with improved quality of hospital care. Some commenters expressed concern that CMS did not explain why participation in a PSO which reports to NPSD is preferential to participation in any other PSO.

Response: The systems-level approach to patient safety maintains that errors and accidents in medical care are a reflection of system-level failures, rather than failings on the part of individuals.³⁶⁷ There is a strong alignment among patient safety experts to shift to a more holistic, proactive, systems-based approach to patient safety.^{368 369 370 371 372 373} This Patient Safety Structural measure supports and encourages this shift to a holistic, proactive, systems-based approach to patient safety by highlighting evidence-based practices that hospitals can implement to establish such an approach. We refer readers to the Background section of this discussion for the details of the patient safety guidelines and literature that informed this measure. Furthermore, evidence shows that most hospitals working with PSOs say that this

work has helped them understand the causes of patient safety events and prevent future patient safety events.³⁷⁴ There are many ways in which PSOs engage their member hospitals to support improvement in patient safety. As an example, PSOs can offer root-cause analyses of specific events, or analysis of data aggregated across hospitals and other non-hospital providers.

Through these analyses PSOs can show members how their safety compares to that of their peers. Among hospitals that receive that service, 96 percent of hospitals find the service helpful for improving quality and safety.³⁷⁵ By encouraging hospitals to work with PSOs if they do not already, we can expand the use of this valuable patient safety resource and improve quality at hospitals which do not currently use these services. As discussed, we are modifying the Domain 4 Statement B attestation to no longer include specific references to the reporting of PSWP to a PSO or references to PSO reporting to the NPSD. Still, we continue to encourage PSOs to voluntarily submit data to the NPSD. Nonidentifiable PSWP data reported to the NPSD can inform research that further improves the quality of clinical care while ensuring patient and provider confidentiality.³⁷⁶ Nationally representative safety data is vital to identifying and improving patient safety practices and driving innovation in quality improvement. It would also allow for the development of best practices which could then be implemented at hospitals to further improve patient safety and quality.

Comment: Some commenters expressed their concern that the measure would penalize hospitals for using PSOs that choose not to report to the NPSD. Some commenters also stated that this measure would limit membership to only certain PSOs which is not consistent with Congressional intent in establishing PSOs through the PSQIA.

Response: As discussed previously, we are modifying the Domain 4 Statement B

³⁷⁴ Office of the Inspector General. Patient Safety Organizations: Hospital Participation, Value, and Challenges. September 2019. Available at: <https://oig.hhs.gov/oei/reports/oei-01-17-00420.pdf>

³⁷⁵ Office of the Inspector General. Patient Safety Organizations: Hospital Participation, Value, and Challenges. September 2019. Available at: <https://oig.hhs.gov/oei/reports/oei-01-17-00420.pdf>

³⁷⁶ Strategies to Improve Patient Safety: Final Report to Congress Required by the Patient Safety and Quality Improvement Act of 2005. Rockville, MD: Agency for Healthcare Research and Quality; December 2021. AHRQ Publication No. 22-0009. <https://pso.ahrq.gov/sites/default/files/wysiwyg/strategies-improve-patient-safety-final.pdf>.

attestation to no longer include references to PSO reporting to the NPSD, which will more broadly encourage hospitals to work with PSOs if they are not already doing so.

Comment: A commenter stated that AHRQ is only authorized to collect nonidentifiable PSWP for the NPSD.

Response: We agree that AHRQ is only authorized to share nonidentifiable PSWP through the NPSD. Specifically, before any PSWP is shared with the NPSD, a PSO submits the data to the PSO Privacy Protection Center³⁷⁷ to ensure all identifying information has been removed and the data are aggregated before transferring it to the NPSD. There is no cost to PSOs for these privacy protection services. We note that while we continue to encourage PSOs to voluntarily report PSWP to the NPSD, we have removed the reference to the NPSD from Domain 4 Statement B.

Comment: A commenter stated that this measure would make hospital reimbursement dependent on the actions of organizations outside the control of the hospital, specifically PSOs.

Response: We disagree that this measure would make hospital reimbursement dependent on the actions of PSOs. The only effect this measure would have on hospital reimbursement from CMS would be if a hospital participating in the Hospital IQR Program chose not to report on the measure at all or did not submit the measure consistent with the form, manner, and timing specified.

Comment: A few commenters expressed concern that mandatory reporting to PSOs for accountability may stifle voluntary exchange of patient safety information which could have a detrimental effect on innovation and learning systems. These commenters also expressed concern that if the measure requires reporting of patient safety data to the federal government, it may discourage hospitals from working with PSOs because of concerns that sensitive hospital information could be used in quality or accountability programs. These commenters stated that

³⁷⁷ For additional information on the PSO Privacy Protection Center, we refer readers to https://www.psoppc.org/psoppc_web/

discouraging hospitals from working with PSOs would, in turn, limit the ability of PSOs and hospitals to improve healthcare quality and safety.

Response: As discussed previously, we have modified the measure in a way that increases flexibility regarding hospital relationships with PSOs. We do agree with the commenter that an important element of the PSQIA is the voluntary exchange of patient safety information to support innovation and contribute to a learning health system aimed at reducing preventable harms. In light of PSQIA data protections, including the treatment of PSWP as privileged and confidential, we disagree that healthcare providers would stop working with PSOs if more PSOs voluntarily submit patient safety events to the NPSD. Furthermore, increased aggregation and analysis of more comprehensive, nationally representative patient safety data in the NPSD, which is non-identifiable, could potentially help accelerate innovation and the identification of potential solutions to improve safety. The use of quality measures focused on safety, including the Patient Safety Structural measure, complements the important collaboration among hospitals and PSOs and helps set national priorities for safety in hospitals.

Comment: Some commenters expressed concern regarding which entities voluntarily report to the NPSD. Some of these commenters stated that many PSOs do not currently report patient safety events to the NPSD, and that many PSOs do not collect patient safety event data. These commenters were concerned that adding this attestation may compel PSOs to change their business models to avoid going out of business if hospitals select PSOs that do report to NPSD. Some commenters stated that some hospitals work with other entities that are not PSOs, such as insurers or Accountable Care Organizations, for analyzing data and developing best practices to ensure patient safety. Because insurers, among others, are not allowed to form PSOs, hospitals that work with insurers for risk management would not be able to have their data reported to the NPSD by their risk management organization. Other commenters stated that organizations other than PSOs, including healthcare providers, can report to the NPSD and adoption of this measure may limit hospital choices for how to report data to the NPSD if they choose to.

Response: We recognize and applaud hospitals that have developed a multi-pronged approach for improving patient safety, including working with PSOs whether or not such PSOs voluntarily report to the NPSD, as well as working with other organizations and entities that are not PSOs, or also large-scale learning networks as described in Domain 3 Statement E. We also understand that while some PSOs may focus on patient safety activities such as development and dissemination of best practices, all PSOs are required to collect and analyze PSWP.³⁷⁸ Because evidence shows that most hospitals working with PSOs say that this work has helped them understand the causes of patient safety events and prevent future patient safety events³⁷⁹, we proposed to include in the measure an attestation statement specifically regarding the reporting of patient safety events to PSOs. Due to concerns about the availability of PSOs which report to the NPSD and to avoid the risk of hospitals unintentionally disclosing PSWP, we have modified the attestation in Domain 4 Statement B to allow a more flexible approach to PSO engagement.

Comment: Some commenters also expressed concern that there is no standardized definition for the terms used in this measure (specifically, “serious patient safety event”, “precursor event”, and “near miss”), which the commenters stated would affect how hospitals and PSOs interpret these terms and therefore make the measure less effective.

Response: We intentionally left these terms undefined within this measure to maintain flexibility to allow each hospital to adopt practices that are most effective for its individual circumstances. However, Domain 4 Statement B has been modified and no longer includes these terms. Domain 4 Statement B now instead refers to patient safety activities as described in 42 CFR 3.20, such as, but not limited to, the collection and analysis of patient safety work product, dissemination of information such as best practices, encouraging a culture of safety, or activities related to the operation of a patient safety evaluation system. We made this change in

³⁷⁸ 42 USC 299b-21(5)(B), 299b-24(a)(1)(A) and (2)(A).

³⁷⁹ Strategies to Improve Patient Safety: Final Report to Congress Required by the Patient Safety and Quality Improvement Act of 2005. Rockville, MD: Agency for Healthcare Research and Quality; December 2021. AHRQ Publication No. 22-0009. <https://pso.ahrq.gov/sites/default/files/wysiwyg/strategies-improve-patient-safety-final.pdf>.

recognition of the range of activities PSOs may engage in and to improve the clarity of the measure.

Comment: Some commenters expressed concern that the measure would require hospitals and PSOs to use AHRQ's Common Formats to report patient safety data to the NPSD, and that this would disrupt existing data systems, including the risk of no longer being able to conduct long-term trend analyses, as well as add substantial time and expense for PSOs.

Response: The modified Domain 4 Statement B no longer references submission of data to the NPSD, which will provide additional flexibility for hospitals and PSOs to establish reporting formats that are most effective for their relationships. Use of the AHRQ Common Formats is voluntary and available as a potential tool for hospitals (whether they work with a PSO or not). Common Formats for Event Reporting are presently required for submitting data to the PSO Privacy Protection Center for inclusion in the NPSD.³⁸⁰ The use of these formats improves the comparability of data across PSOs and ensures privacy protection.

Comment: A commenter expressed concern that the measure's TEP stated that this measure is part of a long-term strategy to generate data and convey priorities to Medicare providers, which the commenters interpreted to mean that CMS would include more requirements for hospital reporting through PSOs in the future.

Response: The statement the commenters are referring to was made by several participants in the TEP that informed development of the Patient Safety Structural measure during an advocacy event for Patients for Patient Safety.³⁸¹ This event was not an official part of the measure development process, and neither the event nor the statement was endorsed by CMS. The statements made at that event do not reflect CMS policy. For information about our strategy with respect to measure development and improving patient safety, we refer readers to the CMS

National Quality Strategy³⁸² and the specific action steps in the CMS National Quality Strategy: Quality in Motion document.³⁸³

Comment: Some commenters were concerned that Domain 4 Statement B would be difficult to achieve because the technology to efficiently transmit serious safety events, precursor events, and near miss events to a PSO is not available so this would be administratively burdensome.

Response: We have modified Domain 4 Statement B in a way that increases flexibility for hospitals to engage with PSOs. As modified, a hospital could respond to Domain 4 Statement B in the affirmative without reporting serious safety events, near misses, or precursor events to a PSO so long as it performs other patient safety activities with a PSO. Furthermore, we understand that there is considerable variation in how hospitals engage in patient safety related learning networks, including whether and how they work with a PSO. We also recognize that not all hospitals have established processes for transmitting serious safety events, precursor events, and near-miss events to their chosen PSO. While this practice is no longer specified in Domain 4 Statement B, and we acknowledge that adopting this practice may entail costs such as investment in a system to support patient safety event reporting if a hospital does not already have such a system in place, the value of collecting and analyzing adverse events data to improve patient safety justifies any investment required as evidenced by the improvements in safety associated with the use of a PSO.³⁸⁴ We encourage hospitals that are seeking to establish a system for reporting these data to a PSO to use the tools available including the Common Formats³⁸⁵ and AHRQ's guidance on choosing a PSO³⁸⁶ to reduce the time and costs involved in

establishing these systems. .

Comment: A commenter supported Domain 5 Statement A and stated that adopting a PFAC is a good way to achieve diversity and equity goals. A few commenters expressed support for Domain 5 Statement C. These commenters stated that patient access to medical records is an important means of engaging patients in their care that further improves quality and safety. A commenter also stated that because of the 21st Century Cures Act there are readily available tools and resources to support patient access to their medical records. A few commenters expressed support for Domain 5 Statement D. These commenters specifically supported the use of patient complaints to prevent similar issues in the future. A few commenters expressed support for Domain 5 Statement E. These commenters stated that patient engagement at the bedside is a longstanding best practice.

Response: We thank the commenters for their support of Domain 5 and specific comments supporting Domain 5's Statements A, C, D and E. We reiterate that Domain 5 activities are aimed to improve equitable and effective engagement of patients, families, and caregivers to promote safer care. We agree a PFAC provides a pathway for patients, families, and caregivers to provide input on critical safety related activities. We also agree that there should be continuous improvement and learning from patient inputs on patient safety events or challenges and that patients should have comprehensive access to their own medical records to further facilitate their engagement in care. We encourage hospitals to implement evidence-based tools and best practices to provide safe, high-quality care to patients.

Comment: A commenter stated the belief that there are situations in which patient, family, and caregiver involvement is inappropriate and recommended modifying the Domain 5 description to reflect that hospitals "should" involve patients, families, and caregivers instead of "must" involve patients, families, and caregivers.

Response: While we acknowledge the possibility that there may be some specific situations in which involving patients, families, or caregivers is infeasible or inappropriate, we

note that the Domain 5 description represents the hospital’s overall culture. Embedding patients, families, and caregivers through meaningful involvement in safety activities, quality improvement, and oversight is a critical practice to achieve safer, better care. Therefore, the possible existence of some situations in which this is impractical or inappropriate does not preclude establishing a culture that prioritizes such engagement. We note that the specific attestations for Domain 5 do not require patients, families, or caregivers to be involved in every element of the hospital’s operations in order to attest “yes,” and that in situations where limitations may be necessary flexibility is provided. Specifically, we note that Domain 5 Statement E requires the hospital to attest to whether it “supports the presence of family and other designated persons (as defined by the patient) as essential members of a safe care team and encourages engagement in activities such as bedside rounding and shift reporting, discharge planning, and visitation 24 hours a day, *as feasible*.” (emphasis added).

Comment: A few commenters recommended updates to specific attestation statements within Domain 5. These recommendations were:

- Statement A: Allow different structures for PFACs to address safety (such as at the system level or as a subset of another PFAC).
- Statement C: Include “family caregivers or other parties” because hospitalized patients may not be able to use the portal.

Response: Domain 5 Statement A requires hospitals to attest whether “Our hospital has a Patient and Family Advisory Council that ensures patient, family, caregiver and community input to safety-related activities, including representation at board meetings, consultation on safety-goal setting and metrics, and participation in safety improvement initiatives.” This attestation is not prescriptive of the form or structure for this PFAC and provides flexibility for hospitals and health systems to develop and adopt a PFAC structure that works for their individual circumstances.

We agree with commenters that some hospitalized patients may not be able to use patient

portals without assistance. In addition to providing and encouraging access to medical records and clinician notes via patient portals, to affirmatively attest to Domain 5 Statement C hospitals must both provide patients with other options for accessing these data and provide support to help patients interpret the information. Therefore, while expanding access to patient approved family caregivers or other parties is a means of engaging these parties, it is not necessary for a hospital to affirmatively attest to Domain 5 Statement C because patient access to medical information is otherwise addressed by the attestation's reference to additional options and support.

Comment: A commenter expressed concern regarding Domain 5 Statement A that CMS had not provided evidence that a PFAC is associated with improved safety or quality.

Response: Patients, caregivers, and family members offer critical vantage points that can help hospitals identify gaps and priorities for improving patient care. In particular, working with patients and families as advisors at the organizational level can help reduce medical errors and improve safety and quality of health care.^{387,388,389} Many leading healthcare quality and safety organizations advocate for the importance of patient and family engagement, and there is support for a safety focused PFAC in the Self-Assessment Tool created and implemented to complement the recommendations in *Safer Together: A National Action Plan to Advance Patient Safety*. In the Self-Assessment Tool, the National Steering Committee for Patient Safety determined it was appropriate, under the heading of “Patient and Family Engagement,” to award a score of 2 (of 4) for a hospital that has a PFAC and a score of 3 or 4 (of 4) for a hospital at which “The organization has an actively engaged PFAC. Senior leaders ensure the PFAC informs an organization- or system-wide strategy and measurement plan for patient engagement.”³⁹⁰ For

³⁹⁰ National Steering Committee for Patient Safety. *Self-Assessment Tool: A National Action Plan to Advance Patient Safety*. Boston, Massachusetts: Institute for Healthcare Improvement; 2020.

these reasons, the TEP informing development of this measure strongly supported attestation statements addressing PFAC.

Comment: A few commenters expressed concern because of potential complexities related to establishing a PFAC. A commenter expressed concern that maintaining a PFAC could disproportionately burden small hospitals.

Response: We recognize the concern that hospitals with fewer resources may face challenges instituting PFAC. However, engagement of patients, families, and caregivers is essential for improving safety and hospitals such that the long-term benefits would outweigh the costs. The TEP informing development of this measure strongly supported attestation statements addressing PFAC because patients, caregivers, and family members offer critical vantage points that can help hospitals identify gaps and priorities for improving patient care. In particular, working with patients and families as advisors at the organizational level can help reduce medical errors and improve safety and quality of health care.^{391,392,393}

Comment: A few commenters stated that providing access to patient information in Domain 5 Statement C is covered by the requirements of the Promoting Interoperability Program and required by the 21st Century Cures Act.

Response: We believe that the commenters are referring to the Medicare Promoting Interoperability Program reporting requirement for the Provider to Patient Exchange objective, which requires that for at least one unique patient discharged from the eligible hospital or CAH inpatient or emergency department (Place of Service (POS) 21 or 23) the following apply: (1) the patient (or patient-authorized representative) is provided timely access to view online, download, and transmit their health information; and (2) the eligible hospital or CAH ensures the patient's health information is available for the patient (or patient-authorized representative) to

³⁹¹ Guide to Patient and Family Engagement in Hospital Quality and Safety. Content last reviewed March 2023. Agency for Healthcare Research and Quality, Rockville, MD. <https://www.ahrq.gov/patient-safety/patients-families/engagingfamilies/index.html>

access using any application of their choice that is configured to meet the technical specifications of the application programming interface (API) in the eligible hospital’s or CAH’s certified electronic health record technology (CEHRT) (88 FR 59273). While a large majority of hospitals are meeting this Medicare Promoting Interoperability Program requirement as part of the meaningful use of certified EHR technology, the attestation in Domain 5 Statement C describes a broader approach to engaging patients as partners in their care. Under this attestation, hospitals would not only provide the patient access but would encourage them to review their data and support them in interpreting the information in a way that is culturally and linguistically appropriate. Hospitals would also help patients submit comments for potential corrections, which could be a vital element of patient safety if the patient’s record were incomplete or inaccurate.

After consideration of the public comments we received, we are finalizing adoption of the Patient Safety Structural measure in the Hospital IQR and PCHQR Programs with a modification to the attestation statement in Domain 4 Statement B. The attestation statements we are finalizing are set forth in Table IX.B.1-02.

TABLE IX.B.1-02: THE PATIENT SAFETY STRUCTURAL MEASURE’S FIVE DOMAIN ATTESTATIONS

Attestation Domains	Attestation Statements: Attest yes or no to each statement. (Note: Affirmative attestation of all statements within a domain would be required for the hospital to receive a point for the domain)
Domain 1: Leadership Commitment to Eliminating Preventable Harm	
The senior leadership and governing board at hospitals set the tone for commitment to patient safety. They must be accountable for patient safety outcomes and ensure that patient safety is the highest priority for the hospital. While the hospital leadership and the governing board may convene a board committee dedicated to patient safety, the most senior governing board must	(A) Our hospital senior governing board prioritizes safety as a core value, holds hospital leadership accountable for patient safety, and includes patient safety metrics to inform annual leadership performance reviews and compensation. (B) Our hospital leaders, including C-suite executives, place patient safety as a core institutional value. One or more C-suite leaders oversee a system-wide assessment on safety (examples provided in the Attestation Guide), ³⁹⁴ and the execution of patient safety initiatives and operations, with specific improvement plans and

³⁹⁴ Centers for Medicare & Medicaid Services, Patient Safety Structural Measure Attestation Guide, available at: <https://qualitynet.cms.gov/inpatient/iqr/measures> and <https://qualitynet.cms.gov/pch/measures>. The draft Attestation Guide, version 1.0, was available at both: <https://qualitynet.gov/inpatient/iqr/proposedmeasures> and <https://qualitynet.cms.gov/pch/pchqr/proposedmeasures> at the time of the proposed rule. We note that examples provided in this guide are for illustrative purposes.

<p>oversee all safety activities and hold the organizational leadership accountable for outcomes. Patient safety should be central to all strategic, financial, and operational decisions.</p>	<p>metrics. These plans and metrics are widely shared across the hospital and governing board. (C) Our hospital governing board, in collaboration with leadership, ensures adequate resources to support patient safety (such as equipment, training, systems, personnel, and technology). (D) Reporting on patient and workforce safety events and initiatives (such as safety outcomes, improvement work, risk assessments, event cause analysis, infection outbreak, culture of safety, or other patient safety topics) accounts for at least 20% of the regular board agenda and discussion time for senior governing board meetings. (E) C-suite executives and individuals on the governing board are notified within 3 business days of any confirmed serious safety events resulting in significant morbidity, mortality, or other harm.</p>
<p>Domain 2: Strategic Planning & Organizational Policy</p>	
<p>Hospitals must leverage strategic planning and organizational policies to demonstrate a commitment to safety as a core value. The use of written policies and protocols that demonstrate patient safety is a priority and identify goals, metrics and practices to advance progress, is foundational to creating an accountable and transparent organization. Hospitals should acknowledge the ultimate goal of zero preventable harm, even while recognizing that this goal may not be currently attainable and requires a continual process of improvement and commitment. Patient safety and equity in care are inextricable, and therefore equity, with the goal of safety for all individuals, must be embedded in safety planning, goal-setting, policy, and processes.</p>	<p>(A) Our hospital has a strategic plan that publicly shares its commitment to patient safety as a core value and outlines specific safety goals and associated metrics, including the goal of “zero preventable harm.” (B) Our hospital safety goals include the use of metrics to identify and address disparities in safety outcomes based on the patient characteristics determined by the hospital to be most important to health care outcomes for the specific populations served. (C) Our hospital has implemented written policies and protocols to cultivate a “just culture” that balances no-blame and appropriate accountability and reflects the distinction between human error, at-risk behavior, and reckless behavior.³⁹⁵ (D) Our hospital requires implementation of a patient safety curriculum and competencies for all clinical and non-clinical hospital staff, including C-suite executives and individuals on the governing board, regular assessments of these competencies for all roles, and action plans for advancing safety skills and behaviors. (E) Our hospital has an action plan for workforce safety with improvement activities, metrics and trends that address issues such as slips/trips/falls prevention, safe patient handling, exposures, sharps injuries, violence prevention, fire/electrical safety, and psychological safety.</p>
<p>Domain 3: Culture of Safety & Learning Health Systems</p>	
<p>Hospitals must integrate a suite of evidence-based practices and protocols that are fundamental to cultivating a hospital culture that prioritizes safety and establishes a learning system both within and across hospitals. These practices focus on actively seeking and harnessing information to develop a proactive, hospital-wide approach to optimizing safety and eliminating preventable harm. Hospitals must establish an integrated infrastructure (that is, people and systems working collaboratively) and foster psychological safety among staff to</p>	<p>(A) Our hospital conducts a hospital-wide culture of safety survey using a validated instrument annually, or every 2 years with pulse surveys on target units during non-survey years. Results are shared with the governing board and hospital staff and used to inform unit-based interventions to reduce harm. (B) Our hospital has a dedicated team that conducts event analysis of serious safety events using an evidence-based approach, such as the National Patient Safety Foundation’s Root Cause Analysis and Action (RCA2)³⁹⁶. (C) Our hospital has a patient safety metrics dashboard and uses external benchmarks (such as CMS Star Ratings or other national databases) to monitor performance and inform improvement activities on safety events (such as: medication errors,</p>

³⁹⁵ A “just culture” is defined by the Agency for Healthcare Research and Quality as a system that holds itself accountable, holds staff members accountable, and has staff members that hold themselves accountable. (The CUSP Method. <https://www.ahrq.gov/hai/cusp/index.html>.)

³⁹⁶ Agency for Healthcare Research and Quality. (2019, September 7). Root Cause Analysis. <https://psnet.ahrq.gov/primer/root-cause-analysis>.

<p>effectively and reliably implement these practices.</p>	<p>surgical/procedural harm, falls, pressure injuries, diagnostic errors, and healthcare-associated infections).</p> <p>(D) Our hospital implements a minimum of 4 of the following high reliability practices:</p> <ul style="list-style-type: none"> • Tiered and escalating (for example, unit, department, facility, system) safety huddles at least 5 days a week, with 1 day being a weekend, that include key clinical and non-clinical (for example, lab, housekeeping, security) units and leaders, with a method in place for follow-up on issues identified. • Hospital leaders participate in monthly rounding for safety on all units, with C-suite executives rounding at least quarterly, with a method in place for follow-up on issues identified. • A data infrastructure to measure safety, based on patient safety evidence (for example, systematic reviews, national guidelines) and data from the electronic medical record that enables identification and tracking of serious safety events and precursor events. These data are shared with C-suite executives at least monthly, and the governing board at every regularly scheduled meeting. • Technologies, including a computerized physician order entry system and a barcode medication administration system, that promote safety and standardization of care using evidence-based practices. • The use of a defined improvement method (or hybrid of proven methods), such as Lean, Six Sigma, Plan-Do-Study-Act, and/or high reliability frameworks. • Team communication and collaboration training of all staff. • The use of human factors engineering principles in selection and design of devices, equipment, and processes. <p>(E) Our hospital participates in large-scale learning network(s) for patient safety improvement (such as national or state safety improvement collaboratives), shares data on safety events and outcomes with these network(s), and has implemented at least one best practice from the network or collaborative.</p>
--	---

Domain 4: Accountability & Transparency

<p>Accountability for outcomes, as well as transparency around safety events and performance, represent the cornerstones of a culture of safety. For hospital leaders, clinical and non-clinical staff, patients, and families to learn from safety events and prevent harm, there must exist a culture that promotes event reporting without fear or hesitation, and safety data collection and analysis with the free flow of information.</p>	<p>(A) Our hospital has a confidential safety reporting system that allows staff to report patient safety events, near misses, precursor events, unsafe conditions, and other concerns, and prompts a feedback loop to those who report.</p> <p>(B) Our hospital voluntarily works with a Patient Safety Organization listed by the Agency for Healthcare Research and Quality (AHRQ)³⁹⁷ to carry out patient safety activities as described in 42 CFR 3.20, such as, but not limited to, the collection and analysis of patient safety work product, dissemination of information such as best practices, encouraging a culture of safety, or activities related to the operation of a patient safety evaluation system.</p> <p>(C) Patient safety metrics are tracked and reported to all clinical and non-clinical staff and made public in hospital units (for example,</p>
--	--

³⁹⁷ Agency for Healthcare Research and Quality. Federally-Listed Patient Safety Organizations (PSOs). Retrieved January 5, 2024, from https://psa.ahrq.gov/psa/listed?f%5B0%5D=resources_provided%3A2

	<p>displayed on units so that staff, patients, families, and visitors can see).</p> <p>(D) Our hospital has a defined, evidence-based communication and resolution program reliably implemented after harm events, such as AHRQ's Communication and Optimal Resolution (CANDOR) toolkit³⁹⁸, that contains the following elements:</p> <ul style="list-style-type: none"> • Harm event identification • Open and ongoing communication with patients and families about the harm event • Event investigation, prevention, and learning • Care-for-the-caregiver • Financial and non-financial reconciliation • Patient-family engagement and on-going support <p>(E) Our hospital uses standard measures to track the performance of our communication and resolution program and reports these measures to the governing board at least quarterly.</p>
<p>Domain 5: Patient & Family Engagement</p>	
<p>The effective and equitable engagement of patients, families, and caregivers is essential to safer, better care. Hospitals must embed patients, families, and caregivers as co-producers of safety and health through meaningful involvement in safety activities, quality improvement, and oversight.</p>	<p>(A) Our hospital has a Patient and Family Advisory Council that ensures patient, family, caregiver, and community input to safety-related activities, including representation at board meetings, consultation on safety goal-setting and metrics, and participation in safety improvement initiatives.</p> <p>(B) Our hospital's Patient and Family Advisory Council includes patients and caregivers of patients who are diverse and representative of the patient population.</p> <p>(C) Patients have comprehensive access to and are encouraged to view their own medical records and clinician notes via patient portals and other options, and the hospital provides support to help patients interpret information that is culturally and linguistically appropriate as well as submit comments for potential correction to their record.</p> <p>(D) Our hospital incorporates patient and caregiver input about patient safety events or issues (such as patient submission of safety events, safety signals from patient complaints or other patient safety experience data, patient reports of discrimination).</p> <p>(E) Our hospital supports the presence of family and other designated persons (as defined by the patient) as essential members of a safe care team and encourages engagement in activities such as bedside rounding and shift reporting, discharge planning, and visitation 24 hours a day, as feasible.</p>

2. Modification of the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey Measure Beginning with the CY 2025 Reporting Period/FY 2027 Payment Determination for the Hospital IQR Program, the CY 2025 Reporting Period/FY 2027 Program Year for the PCHQR Program, and the FY 2030 Program Year for the Hospital VBP Program

a. Background

We refer readers to the FY 2024 IPPS/LTCH PPS final rule for our most recent updates to HCAHPS survey administration requirements and additional background information for the Hospital VBP Program, the Hospital IQR Program, and the PCHQR Program (88 FR 59083 through 59089, 88 FR 59196 through 59201, and 88 FR 59229 through 59232, respectively). For more details including information about patient eligibility for the HCAHPS Survey, please refer to the current HCAHPS Quality Assurance Guidelines, which can be found on the official HCAHPS website at: <https://hcahpsonline.org/en/quality-assurance/>.

The HCAHPS Survey measure (CBE #0166) asks recently discharged patients questions about aspects of their hospital inpatient experience that they are uniquely suited to respond to. The HCAHPS Survey as a whole is termed as a single “measure” for purposes of the Hospital IQR, PCHQR, and Hospital VBP Programs. We refer to the elements of the HCAHPS Survey that are publicly reported as “sub-measures” and to the questions within each sub-measure as survey “questions,” for the Hospital IQR and PCHQR Programs. Sub-measures are comprised of one, two, or three survey questions. For example, the sub-measure, “Overall Hospital Rating,” consists of one survey question and the sub-measure “Communication with Nurses” consists of three survey questions. In the Hospital VBP Program, the sub-measures of the HCAHPS Survey are referred to as “dimensions.” We refer readers to the HCAHPS On-Line website, www.HCAHPSonline.org, for a map of each question on the HCAHPS Survey and its sub-measures.

The current HCAHPS Survey measure consists of 29 survey questions that are organized into ten sub-measures in the Hospital IQR and PCHQR Programs, including 19 questions that

ask “how often” or whether patients experienced a critical aspect of hospital care, rather than whether they were “satisfied” with their care. The current survey measure also includes three screener questions that direct patients to relevant questions, five questions to adjust for the mix of patients across hospitals, and two questions (race and ethnicity) that support Congressionally mandated reports outlined in the Healthcare Research and Quality Act of 1999 (Pub. L. No. 106-129).³⁹⁹ These components of the survey measure are used to construct the ten publicly reported HCAHPS Survey sub-measures in the Hospital IQR and PCHQR Programs. The survey questions are organized into eight dimensions in the Person and Community Engagement Domain for the Hospital VBP Program. We note that the Hospital VBP Program uses eight dimensions while the Hospital IQR and PCHQR Programs use 10 sub-measures because “Cleanliness” and “Quietness” have been combined as a single dimension in the Hospital VBP Program for scoring purposes and the “Recommend Hospital” sub-measure is not included in the Hospital VBP Program. The rationale for combining these elements of the survey is described further in section IX.B.2.g(3) of this final rule and can be found in the Hospital Inpatient VBP Program final rule (76 FR 26497 through 26526). The current HCAHPS Survey can be found at <https://hcahpsonline.org/en/survey-instruments/>.

b. Overview of the Modifications to the HCAHPS Survey Measure

We proposed to adopt the updated HCAHPS Survey measure for the Hospital IQR, PCHQR, and Hospital VBP Programs in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36298 through 36304). We proposed the updated HCAHPS Survey measure would result in a survey with 32 questions that make up a total of 11 sub-measures, with seven of those sub-measures being multi-question sub-measures and the other four sub-measures being single-question sub-measures. Four of the multi-question sub-measures and three of the single-question sub-measures in the updated version of the HCAHPS Survey measure would remain unchanged

³⁹⁹Agency for Healthcare Research and Quality. (2023) 2023 National Healthcare Quality and Disparities Report. Available at: <https://www.ahrq.gov/research/findings/nhqdr/nhqdr23/index.html>

from those that are in the current version of the HCAHPS Survey measure. For the Hospital VBP Program, the 32-question survey in the updated HCAHPS Survey measure would be organized into nine dimensions. We outline the specific updates later in this section.

We identified the need for the updates to the HCAHPS Survey measure through focus groups and cognitive interviews with patients and caregivers, discussions with technical experts, and literature reviews that were conducted by a CMS contractor who made recommendations to CMS. A literature scan was used to compile and review items from existing surveys, focusing on topics not covered in the current HCAHPS Survey measure. CMS, patients, and providers reviewed the questions identified through the scan. Four patient focus groups were conducted to assign importance to and inform the further development of potential new questions, while also refining existing questions. This replicates the approach taken during the original development of the HCAHPS Survey measure. The focus groups included people with both planned and unplanned hospital stays, a variety of racial and ethnic groups, and both older and younger adults. The focus groups used both an exploratory and confirmatory approach to explore new topics and confirm the topics we had identified through the survey literature. The group discussion explored what it means to have a quality patient experience and what participants thought of their hospital stay – what went well and what went poorly. Group discussions were conducted in English and Spanish.

The findings from the focus group informed the development of the updates to the HCAHPS Survey questions, including the newly developed questions that were tested in cognitive interviews. Cognitive interviews were also conducted in English and in Spanish. Lastly, a CMS contractor convened a technical expert panel that provided feedback on the current survey content and the new content areas.

We have determined that adopting the updated version of the HCAHPS Survey measure would amount to a minimal change in burden because the combination of removals and additions of survey questions would result in only an additional 45 seconds to complete the survey. The

time required to complete the 32-question survey is estimated to average eight minutes.

Additionally, prior to the removal of the “Communication About Pain” questions in the CY 2019 OPPS/ASC final rule (83 FR 59140 through 59149), the HCAHPS Survey measure previously included 32 questions. We refer readers to sections XII.B.4., XII.B.6., and XII.B.7. of this final rule for more information on our estimated changes to the information collection burden.

The adoption of the updated version of the HCAHPS Survey measure would not result in any changes to the survey administration, the data submission and reporting requirements, or the data collection protocols. The updated version of the HCAHPS Survey measure includes three new sub-measures: the multi-item “Care Coordination” sub-measure, the multi-item “Restfulness of Hospital Environment” sub-measure, and the “Information About Symptoms” single-item sub-measure. The updated HCAHPS Survey measure also removes the existing “Care Transition” sub-measure and modifies the existing “Responsiveness of Hospital Staff” sub-measure. The seven new questions are as follows:

- During this hospital stay, how often were doctors, nurses and other hospital staff informed and up-to-date about your care?
- During this hospital stay, how often did doctors, nurses and other hospital staff work well together to care for you?
- Did doctors, nurses or other hospital staff work with you and your family or caregiver in making plans for your care after you left the hospital?
- During this hospital stay, how often were you able to get the rest you needed?
- During this hospital stay, did doctors, nurses and other hospital staff help you to rest and recover?
- During this hospital stay, when you asked for help right away, how often did you get help as soon as you needed?
- Did doctors, nurses or other hospital staff give your family or caregiver enough information about what symptoms or health problems to watch for after you left the hospital?

As discussed more fully later in this section, these new questions address aspects of hospital care identified by patients and then tested in the 2021 HCAHPS Survey large-scale mode experiment described in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59196 through 59197) as important to measuring the quality of hospital care.

The updated HCAHPS Survey measure would no longer include the following four questions:

- During this hospital stay, after you pressed the call button, how often did you get help as soon as you wanted it?
- During this hospital stay, staff took my preferences and those of my family or caregiver into account in deciding what my health care needs would be when I left.
- When I left the hospital, I had a good understanding of the things I was responsible for in managing my health.
- When I left the hospital, I clearly understood the purpose for taking each of my medications.

In the updated HCAHPS Survey measure, the question on the use of the call button is removed in response to hospital input indicating that call buttons have been replaced by other mechanisms (such as a direct phone line). The other questions are removed because they do not follow standard Consumer Assessment of Healthcare Providers & Systems (CAHPS) question wording and were perceived as duplicative of existing and new survey questions by the patients who participated in our content testing.

TABLE IX.B.2-01 CROSSWALK OF UPDATED HCAHPS SURVEY QUESTIONS TO UPDATED HCAHPS SURVEY SUB-MEASURES

Updated HCAHPS Survey Questions	Updated HCAHPS Survey Sub-Measure
During this hospital stay, how often did nurses treat you with <u>courtesy and respect</u> ?	Communication with Nurses
During this hospital stay, how often did nurses <u>listen carefully to you</u> ?	Communication with Nurses
During this hospital stay, how often did nurses <u>explain things</u> in a way you could understand?	Communication with Nurses

During this hospital stay, how often did doctors treat you with <u>courtesy and respect</u> ?	Communication with Doctors
During this hospital stay, how often did doctors <u>listen carefully to you</u> ?	Communication with Doctors
During this hospital stay, how often did doctors <u>explain things</u> in a way you could understand?	Communication with Doctors
During this hospital stay, how often were your room and bathroom kept clean?	Single Item Sub-Measure: Cleanliness
During this hospital stay, how often were you able to get the rest you needed?	Restfulness of Hospital Environment**◆
During this hospital stay, how often was the area around your room quiet at night?	Restfulness of Hospital Environment**◆
During this hospital stay, did doctors, nurses and other hospital staff help you to rest and recover?	Restfulness of Hospital Environment**◆
During this hospital stay, how often were doctors, nurses and other hospital staff informed and up-to-date about your care?	Care Coordination**
During this hospital stay, how often did doctors, nurses and other hospital staff work well together to care for you?	Care Coordination**
Did doctors, nurses or other hospital staff work with you and your family or caregiver in making plans for your care after you left the hospital?	Care Coordination**
How often did you get help in getting to the bathroom or in using a bedpan as soon as you wanted?	Responsiveness of Hospital Staff*
During this hospital stay, when you asked for help right away, how often did you get help as soon as you needed?	Responsiveness of Hospital Staff*
Before giving you any new medicine, how often did hospital staff tell you what the medicine was for?	Communication About Medicines
Before giving you any new medicine, how often did hospital staff describe possible side effects in a way you could understand?	Communication About Medicines
Did doctors, nurses or other hospital staff give your family or caregiver enough information about what symptoms or health problems to watch for after you left the hospital?	Single Item Sub-Measure: Information about Symptoms**
During this hospital stay, did doctors, nurses or other hospital staff talk with you about whether you would have the help you needed after you left the hospital?	Discharge Information

During this hospital stay, did you get information in writing about what symptoms or health problems to look out for after you left the hospital?

Discharge Information

Using any number from 0 to 10, where 0 is the worst hospital possible and 10 is the best hospital possible, what number would you use to rate this hospital during your stay?

Single Item Sub-Measure: Rating

Would you recommend this hospital to your friends and family?

Single Item Sub-Measure: Recommend

*As described in section IX.B.2.e(4) of this final rule, the updates include removing one question and adding a new question to the Responsiveness of Hospital Staff sub-measure.

** As described in section IX.B.2.b. of this final rule, the updates include adding three new sub-measures: “Care Coordination,” “Restfulness of the Hospital Environment,” and “Information about Symptoms.”

◆As described in section IX.B.2.e(2) of this final rule, the “Restfulness of Hospital Environment” sub-measure includes two new questions and one existing question (Quietness). We note that the “Quietness” question itself would remain unchanged in the updated HCAHPS Survey measure but would no longer be its own single-question sub-measure, and would instead be a question within the new “Restfulness of Hospital Environment” multi-question sub-measure.

We refer hospitals and HCAHPS Survey vendors to the official HCAHPS website at <https://www.hcahpsonline.org> for information regarding the HCAHPS Survey measure, its administration, oversight, and data adjustments. Detailed information on current HCAHPS Survey data collection protocols can be found in the HCAHPS Quality Assurance Guidelines, located at: <https://www.hcahpsonline.org/en/quality-assurance/>. The Draft Quality Assurance Guidelines for the proposed updated HCAHPS Survey measure were made available in May 2024 at the official HCAHPS website at: <https://www.hcahpsonline.org/en/quality-assurance/>.

c. Measure Alignment to Strategy

The HCAHPS Survey measure produces systematic, standardized, and comparable information about patients’ experience of hospital care and promotes person-centered care. We have identified that patient experience measures, including the HCAHPS Survey measure, are foundational metrics, known as the Universal Foundation of quality measures. The Universal Foundation is intended to focus provider attention, reduce burden, identify disparities in care, prioritize development of interoperable, digital quality measures, allow for cross-comparisons across programs, and help identify measurement gaps.⁴⁰⁰ One of the goals of the National

⁴⁰⁰ Centers for Medicare & Medicaid Services (2023) Aligning Quality Measures Across CMS – the Universal Foundation. Available at: <https://www.cms.gov/aligning-quality-measures-across-cms-universal-foundation>

Quality Strategy ⁴⁰¹ is to foster engagement and to bring the voices of patients to the forefront. As part of fostering engagement, it is critical to hear the voices of individuals by obtaining feedback directly from patients on hospital performance and to incorporate their feedback as part of our comprehensive approach to quality.

d. Pre-rulemaking Process and Measure Endorsement

(1) Recommendation from Pre-Rulemaking and Measure Review Process

We refer readers to section IX.B.1.c. of this final rule for details on the Pre-Rulemaking Measure Review (PRMR) process including the voting procedures the PRMR process uses to reach consensus on measure recommendations. The PRMR Hospital Committee, comprised of the PRMR Hospital Advisory Group and PRMR Hospital Recommendation Group, reviewed the proposed updated version of the HCAHPS Survey measure. The PRMR Hospital Recommendation Group reviewed the proposed updated HCAHPS Survey measure (MUC2023-146, 147, 148, 149) during a meeting on January 18-19, 2024, to vote on a recommendation with regard to use of this measure for the PCHQR, Hospital IQR, and Hospital VBP Programs.

The PRMR Hospital Recommendation Group reached consensus for each of the three programs. For each program, they recommended the updates to the HCAHPS Survey measure with conditions.⁴⁰²

The voting results of the PRMR Hospital Recommendation Group for the proposed updates to the HCAHPS Survey measure within the Hospital IQR Program were: nine members of the group recommended adopting the updates without conditions; eight members recommended adoption with conditions; and two committee members voted not to recommend the updates for adoption. Taken together, 89.5 percent of the votes were between “recommend”

⁴⁰¹ Centers for Medicare and Medicaid Services. (2024) CMS National Quality Strategy. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy>

⁴⁰² Battelle - Partnership for Quality Measurement. (2024). Pre-Rulemaking Measure Review Measures Under Consideration 2023 Recommendations Report. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-2023-MUC-Recommendations-Report-Final.pdf>

and “recommend with conditions.” Thus, the committee reached consensus and recommended the updates to the HCAHPS Survey measure within the Hospital IQR Program with conditions.

The voting results of the PRMR Hospital Recommendation Group for the proposed updates to the HCAHPS Survey measure within the Hospital VBP Program were: ten members of the group recommended adopting the updates without conditions; seven members recommended adoption with conditions; and two committee members voted not to recommend the updates for adoption. Taken together, 89.5 percent of the votes were between “recommend” and “recommend with conditions.” Thus, the committee reached consensus and recommended the updates to the HCAHPS Survey measure within the Hospital VBP Program with conditions.

The voting results of the PRMR Hospital Recommendation Group for the proposed updates to the HCAHPS Survey measure within the PCHQR Program were: eleven members of the group recommended adopting the updates without conditions; six members recommended adoption with conditions; and two committee members voted not to recommend the updates for adoption. Taken together, 89.5 percent of the votes were between “recommend” and “recommend with conditions.” Thus, the committee reached consensus and recommended the updates to the HCAHPS Survey measure within the PCHQR Program with conditions.

The conditions that the committee recommended for all three programs were: CBE endorsement; consideration should be given to not extending the survey length and removal of overlapping items; use of adaptive questions in computerized administration to minimize items; and use of a mechanism to monitor trends in performance data over time.

After taking these conditions into account, we proposed to adopt the updated HCAHPS Survey measure in all three programs. As noted in section IX.B.2.b. of this final rule and in response to the committee’s condition that consideration be given to not extending the survey length, the updated HCAHPS Survey measure would result in only an additional 45 seconds to complete the survey. We have estimated that the total time required to complete the 32-question survey is, on average, eight minutes. Additionally, in response to the committee’s condition that

consideration be given to removing overlapping items, we note that similar or overlapping questions were identified and considered for removal during the development and testing of the updated HCAHPS Survey measure, as described further in section IX.B.2.b. of this final rule. By developing items with patients' and caregivers' input and then empirically testing the new questions, we have ensured that the questions in the updated HCAHPS Survey add unique, non-redundant information about key aspects of patient experience of care.⁴⁰³ The committee also raised the condition that the survey use adaptive questions in computerized administration to minimize items. However, adaptive questions in computerized administration would be infeasible in the mail mode of the HCAHPS Survey measure. Since all modes of survey administration that are available for the updated HCAHPS Survey (Mail Only, Phone Only, Mail-Phone, Web-Mail, Web-Phone, and Web-Mail-Phone) must be parallel, adaptive questions in computerized modes would not be appropriate for this measure at this time. We will take this feedback into consideration for any future potential changes to survey administration. In response to the committee's condition that a mechanism to monitor trends in performance data over time be used, we note that as part of administering each of these quality programs, we regularly monitor and evaluate hospitals' performance data trends. We will continually monitor these trends in performance with the updated HCAHPS Survey measure. We address the committee's condition of CBE endorsement in the following section.

(2) Measure Endorsement

We refer readers to section IX.B.1.c. of this final rule for details on the endorsement and maintenance (E&M) process including the measure evaluation procedures the CBE's E&M Committees use to evaluate measures and whether they meet endorsement criteria. The HCAHPS Survey measure was first endorsed in 2005 by the former CBE, the National Quality Forum. The former CBE renewed its endorsement of the current HCAHPS Survey measure in

⁴⁰³ Battelle - Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

2009, 2015, and 2019. The current HCAHPS Survey measure was most recently submitted to the CBE for maintenance endorsement review in the Spring 2019 cycle (CBE #0166) and was endorsed on October 25, 2019.⁴⁰⁴ We note that the HCAHPS Survey measure remains an endorsed measure, and we intend to submit the updated HCAHPS Survey measure to the current CBE for endorsement in Fall 2025. Section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We have determined that the updates to the HCAHPS Survey measure are appropriately specified. The HCAHPS Survey measure remains endorsed, and the updated survey only modifies some of the questions and sub-measures within the survey. The HCAHPS Survey measure is designed to produce standardized information about patients' perspectives of care that allow objective and meaningful comparisons of hospitals on topics that are important to consumers, and these updates would improve the feedback we receive directly from patients on hospital performance. Therefore, we proposed these updates to the measure before the updates received CBE endorsement.

e. Modification of the HCAHPS Survey Measure for the Hospital IQR Program Beginning with the CY 2025 Reporting Period/FY 2027 Payment Determination and the PCHQR Program Beginning with the CY 2025 Reporting Period/FY 2027 Program Year

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36298 through 36300), we proposed to update the current HCAHPS Survey measure in the Hospital IQR and PCHQR Programs by adding three new sub-measures:

- “Care Coordination” sub-measure

⁴⁰⁴ Battelle - Partnership for Quality Measurement. HCAHPS (Hospital Consumer Assessment of Healthcare Providers and Systems) Survey. Available at: <https://p4qm.org/measures/0166>.

- “Restfulness of Hospital Environment” sub-measure
- “Information About Symptoms” sub-measure

The updates also remove the existing “Care Transition” sub-measure and modify the existing “Responsiveness of Hospital Staff” sub-measure. The new “Care Coordination” sub-measure encompasses and broadens the current “Care Transition” sub-measure and the new questions in the “Care Coordination” sub-measure are more congruent with the other survey questions. The updated measure replaces one of the two survey questions in the current “Responsiveness of Hospital Staff” sub-measure with a new survey question that strengthens this sub-measure. The updates to the HCAHPS Survey measure are detailed in section IX.B.2.b. of this final rule and we refer readers to the HCAHPS website at <https://www.hcahpsonline.org> for further details.

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed that the updated HCAHPS Survey measure would be implemented in the Hospital IQR and PCHQR Programs beginning with patients discharged on January 1, 2025 (89 FR 36298). Reporting of responses from the updated HCAHPS Survey measure for patients discharged between January 1, 2025, and December 31, 2025, would be used for the CY 2025 reporting period/FY 2027 payment determination for the Hospital IQR Program and for the CY 2025 reporting period/FY 2027 program year for the PCHQR Program. HCAHPS Survey sub-measures are publicly reported on a CMS website quarterly on a rolling basis, with the oldest quarter of data rolled off, and the most recent quarter rolled on with each refresh. As such, there would be a period during which some quarters of reporting data come from the current version of the HCAHPS Survey measure, and others come from the updated HCAHPS Survey measure. Through this time period, publicly reported HCAHPS Survey data for the Hospital IQR and PCHQR Programs would consist only of data from the eight unchanged sub-measures in the current HCAHPS Survey measure. When four quarters of the updated HCAHPS Survey data have been submitted, public reporting would reflect all of the modifications in the updated HCAHPS Survey measure. The public reporting

timeline of the updates to the HCAHPS Survey measure for the Hospital IQR and PCHQR

Programs can be found in Table IX.B.2-02.

TABLE IX.B.2-02 TIMELINE FOR PUBLIC REPORTING OF THE HCAHPS SURVEY MEASURE IN THE HOSPITAL IQR AND PCHQR PROGRAMS

Table IX.B.2-02 Hospital IQR and PCHQR Programs Public Reporting Timeline for the Current and Updated Version of the HCAHPS Survey Measure		
Public Reporting Date	Quarters of Data Publicly Reported[♦]	Publicly Reported Sub-Measures
January 2025	Q2 2023 – Q1 2024	10 sub-measures in the current HCAHPS Survey
April 2025	Q3 2023 – Q2 2024	10 sub-measures in the current HCAHPS Survey
July 2025	Q4 2023 – Q3 2024	10 sub-measures in the current HCAHPS Survey
October 2025	Q1 2024 – Q4 2024	10 sub-measures in the current HCAHPS Survey
January 2026	Q2 2024 – Q1 2025	8 unchanged sub-measures in the current HCAHPS Survey*
April 2026	Q3 2024 – Q2 2025	8 unchanged sub-measures in the current HCAHPS Survey*
July 2026	Q4 2024 – Q3 2025	8 unchanged sub-measures in the current HCAHPS Survey*
October 2026	Q1 2025 – Q4 2025	11 sub-measures in the updated HCAHPS Survey**
January 2027	Q2 2025 – Q1 2026	11 sub-measures in the updated HCAHPS Survey
April 2027	Q3 2025 – Q2 2026	11 sub-measures in the updated HCAHPS Survey
July 2027	Q4 2025 – Q3 2026	11 sub-measures in the updated HCAHPS Survey
October 2027	Q1 2026 – Q4 2026	11 sub-measures in the updated HCAHPS Survey***

♦ We note that for the PCHQR Program, the HCAHPS Survey data are displayed on the Provider Data Catalog (PDC), while the HCAHPS Survey data for the Hospital IQR Program are displayed on Care Compare and in the PDC.

* Survey questions that comprise eight sub-measures on the current HCAHPS Survey measure would remain unchanged on the updated HCAHPS Survey measure. These sub-measures would continue to be publicly reported for the Hospital IQR and PCHQR Programs: “Communication with Nurses,” “Communication with Doctors,” “Communication about Medicines,” “Discharge Information,” “Overall Rating,” “Recommend Hospital,” “Cleanliness,” and “Quietness.”

** First public reporting date that there would be four quarters of data available for the proposed updated HCAHPS Survey measure for public reporting under the Hospital IQR and PCHQR Programs.

*** The updated HCAHPS Survey data would have been publicly reported for one full year.

(1) Addition of the Care Coordination Sub-Measure in the Updated HCAHPS Survey Measure

The “Care Coordination” sub-measure is a newly developed multi-question sub-measure and is composed of three new survey questions that ask patients how often hospital staff were informed and up-to-date about the patient’s care, how often hospital staff worked well together to care for the patient, and whether hospital staff worked with the patient and family or caregiver in making plans for the patient’s care post-hospitalization. The new questions address aspects of hospital care identified by patients participating in focus groups as important to measuring the quality of hospital care. Cognitive testing demonstrated the new questions were accurately and consistently interpreted. The “Care Coordination” sub-measure was shown to have good

measurement properties (hospital-level reliability is 0.792 and Cronbach's alpha is 0.765) and construct validity in the 2021 mode experiment.⁴⁰⁵ This sub-measure would fill a gap of furthering coordination efforts within the hospital setting and support our goals of including measures related to seamless care coordination and person-centered care. Across multiple focus groups, patients indicated that how well doctors, nurses, and other staff work together or as a team in caring for a patient was the most important information to have to understand what their care would be like in one hospital versus another.

(2) Addition of the Restfulness of Hospital Environment Sub-measure in the Updated HCAHPS Survey Measure

The Restfulness of Hospital Environment – Hospital Patient sub-measure would fill a gap related to providing a restful and healing environment within the hospital setting and support our goal of including measures related to person-centered care. The “Restfulness” sub-measure is a newly developed multi-question sub-measure comprised of three survey questions: two new questions that ask how often patients were able to get the rest they needed, and whether hospital staff helped the patient to rest and recover, and one current survey question that asks how often the area around the patient's room was quiet at night (“Quietness”). Cognitive testing demonstrated the new questions were accurately and consistently interpreted. The 2021 mode experiment established that the “Restfulness” sub-measure has good measurement properties (hospital-level reliability is 0.870 and Cronbach's alpha is 0.735) and construct validity.⁴⁰⁶ The existing “Quietness” sub-measure is currently a stand-alone question in the HCAHPS Survey measure. The updates to the HCAHPS Survey measure would move the stand-alone “Quietness” sub-measure into the new Restfulness of Hospital Environment sub-measure. In the updated

⁴⁰⁵ Battelle - Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

⁴⁰⁶ Battelle - Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

version of the HCAHPS Survey measure, the “Quietness” question itself would not change and would continue to be publicly reported.

(3) Addition of the Information About Symptoms Sub-measure in the Updated HCAHPS Survey Measure

The “Information About Symptoms” sub-measure is a newly developed single-question sub-measure that would fill a gap of providing instructions and information for family and caregivers to take care of patients after discharge and supports our goal of including measures related to person-centered care. The new question captures an aspect of hospital care identified by patients participating in focus groups as important, and cognitive testing demonstrated the question was accurately and consistently interpreted. The sub-measure is a stand-alone question that asks the patient whether doctors, nurses, or other hospital staff gave the patient’s family or caregiver enough information about symptoms or health problems to watch out for after the patient left the hospital. The sub-measure has good hospital level-reliability (0.729) at the expected average number of completed surveys per hospital.⁴⁰⁷

(4) Modification of the Responsiveness of Hospital Staff Sub-measure in the Updated HCAHPS Survey Measure

The revisions to the “Responsiveness of Hospital Staff” sub-measure would entail adding one new survey question to this sub-measure and removing one current survey question from this sub-measure. The current survey question that would be removed from the “Responsiveness of Hospital Staff” sub-measure is the “Call Button” question. Input from hospitals indicated that call buttons have largely been replaced by other mechanisms (such as a direct phone line), and qualitative testing demonstrated that the new question captures all modes of requesting help. The 2021 mode experiment established that the modified “Responsiveness of Hospital Staff” sub-measure has good measurement properties (hospital-level reliability is 0.786 and Cronbach’s

⁴⁰⁷ Battelle - Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

alpha is 0.749) and construct validity.⁴⁰⁸ Having patients report their experience of the responsiveness of hospital staff highlights an important aspect of hospital care from the patient's perspective about getting help for one's needs during a hospital stay, which is a component of person-centered care. These modifications to the "Responsiveness of Hospital Staff" sub-measure would fill a gap related to the care by nursing and other staff within the hospital setting and support our goals of including measures assessing person-centered care and the quality of hospital staff. The revised "Responsiveness of Hospital Staff" sub-measure would be comprised of two survey questions: one current survey question that asks how often patients received help in getting to the bathroom or in using a bedpan as soon as they wanted, and one new survey question that asks how often patients got help as soon as they needed it when they asked for help right away.

(5) Removal of the Care Transition Sub-measure in the Updated HCAHPS Survey Measure

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53513 through 53516), we added the three-question "Care Transition" sub-measure (CTM-3) to the HCAHPS Survey measure in the Hospital IQR Program. We finalized the addition of the HCAHPS Survey measure, including the CTM-3 sub-measure, for the PCHQR Program in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50844 through 50845). The updates to the HCAHPS Survey measure would remove this three-question sub-measure from the HCAHPS Survey measure and replace it with a new "Care Coordination" sub-measure, which would encompass and broaden the current "Care Transition" sub-measure and is more congruent with the other questions in the HCAHPS Survey measure in terms of question form and response options. For these reasons, the updated version of the HCAHPS Survey measure removes the "Care Transition" sub-measure.

(6) Modification to the "About You" Section for the Hospital IQR, PCHQR, and Hospital VBP Programs

⁴⁰⁸ Battelle - Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

The “About You” questions are used either for patient-mix adjustment or for Congressionally-mandated reports.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36300), we proposed that the changes to the “About You” section of the updated HCAHPS Survey measure would be:

- replacing the existing “Emergency Room Admission” question with a new, “Hospital Stay Planned in Advance” question;
- reducing the number of response options for the existing “Language Spoken at Home” question;
- alphabetizing the response options for the existing ethnicity question; and
- alphabetizing the response options for the existing race question.

We note that to achieve the goal of fair comparisons across all hospitals that participate in HCAHPS Survey measure, it is necessary to adjust for factors that are not directly related to hospital performance but do affect how patients answer HCAHPS Survey questions. To ensure that differences in HCAHPS Survey measure results reflect differences in hospital quality only, HCAHPS Survey measure results are adjusted for patient-mix and mode of survey administration. Only the adjusted results are publicly reported and considered the official results. Information about the HCAHPS Survey patient-mix adjustment can be found at: <https://hcahpsonline.org/en/mode--patient-mix-adj>. We do not collect or adjust for patients’ socioeconomic status, however, the HCAHPS Survey patient-mix adjustment does include patients’ highest level of education, which can be related to socioeconomic status. Several questions on the HCAHPS Survey, as well as information drawn from hospital administrative data, are used for the patient-mix adjustment. The questions in the “About You” section of the survey that are used in patient-mix adjustment are:

- In general, how would you rate your overall health?
- In general, how would you rate your overall mental or emotional health?
- What is the highest grade or level of school that you have completed?

- What language do you mainly speak at home?

Administrative data provided by hospitals are also used in patient-mix adjustment, including patient's age, sex, and service line. Lag time, which is the number of days between a patient's discharge from the hospital and the return of the mail survey or the final disposition of the telephone or interactive voice recognition (IVR) survey, is also used in patient-mix adjustment.⁴⁰⁹

Neither patient race nor ethnicity is used to adjust HCAHPS Survey results; these questions are included on the survey to support Congressionally-mandated reports. The adjustment model also addresses the effects of non-response bias. More information about the patient-mix adjustment coefficients for publicly reported HCAHPS Survey measure results can be found under "Mode and Patient-Mix Adjustment" at: <https://www.hcahpsonline.org>.

The current "About You" survey question that asks whether the patient was admitted to the hospital through the emergency room would be replaced with a new question that asks whether this hospital stay was planned in advance. This "Hospital Stay Planned in Advance" question is being adopted for use as a patient-mix adjuster to distinguish between planned and unplanned stays. Cognitive testing indicated that "Hospital Stay Planned in Advance" is better understood as intended than the current admission through the emergency room question. Unplanned stays are not within the hospital's control but can result in worse patient experiences than hospital stays that had been planned. Accounting for these differences in this preadmission characteristic allows for fairer comparisons of hospital performance.

To make survey administration more efficient and reduce respondent burden, especially in the telephone mode of survey administration, we proposed that the response options for the "Language Spoken at Home" question would be changed to: "English," "Spanish," "Chinese," or "Another language" (89 FR 36300). English, Spanish, and Chinese account for 98.2 percent of

⁴⁰⁹ Elliott, M.N., Zaslavsky, A.M., Goldstein, E. et al. (2009) Effects of Survey Mode, Patient Mix, and Nonresponse on CAHPS Hospital Survey Scores. *Health Services Research*. 44: 501-518. <https://doi.org/10.1111/j.1475-6773.2008.00914.x>

all HCAHPS Survey measure responses. The response options for the two race/ethnicity questions would be alphabetized to correspond to current best survey practices.

These modifications would not be included in public reporting of the HCAHPS Survey measure and would not affect scoring under the Hospital VBP Program, but the “Hospital Stay Planned in Advance” question would be employed in the patient-mix adjustment of survey responses.

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to implement these changes along with the proposed updated version of the HCAHPS Survey measure for the Hospital IQR, PCHQR, and Hospital VBP Programs described in earlier sections (89 FR 36300).

We received public comment on the overall updates to the HCAHPS Survey measure.

Comment: Many commenters broadly supported adopting the updates to the HCAHPS Survey measure across the Hospital IQR, Hospital VBP, and PCHQR Programs as proposed because they stated that the updates modernize the survey, promote person-centered care, reflect new technology and the best practices for patient care, better align with CMS’s quality strategies, and make the questions more relevant to patients and families while also being useful to hospitals. Several commenters commended CMS for the approach to align the updates across three programs, for considering stakeholder feedback in identifying opportunities for improvement, and for continuing to improve capturing patient experiences and the voice of the patient. Several commenters supported the removal of questions they deemed redundant and efforts to reduce survey length by limiting the number of supplemental items to manage survey burden. A few commenters supported the inclusion of family caregivers in the updated survey questions, and a few commenters specifically supported the staggered implementation of the updates in public reporting and in the Hospital VBP Program. A commenter supported CMS’ efforts to refine measuring patient experience, while another commenter stated that the additional information from patients and caregivers would help hospital administrators ensure they are delivering high quality care.

Response: We thank the commenters for their support. We agree with commenters that the updates align with our national quality strategies. As noted in the FY 2025 IPPS/LTCH PPS proposed rule, one of our key goals is to foster engagement and bring the voices of patients to the forefront (89 FR 36296). The updates to the HCAHPS Survey measure enable us to obtain feedback directly from patients on hospital performance and to incorporate their feedback as part of our comprehensive approach to quality.

Comment: Several commenters requested clarifications on the updates to the HCAHPS Survey measure, with a few commenters requesting clarification on the overall testing of the updates, questioning whether the new components would be representative of a hospital making improvements. A few commenters supported the updates to the HCAHPS Survey measure but requested additional information on how the items were tested to help understand whether they measure hospitals accurately. A commenter recommended shortening the survey, removing redundant questions, and authorizing real-time survey alternatives because they gather broader patient feedback.

Response: We thank the commenters for their support and refer them to the PRMR report that outlines the testing we conducted,⁴¹⁰ which included a literature review, technical expert panels, focus groups and cognitive interviews with patients and caregivers, and a mode experiment in 2021 among 46 hospitals. We refer readers to the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36293 through 36297) which outlines the content testing, hospital input, and patient focus groups that informed our updates to the survey. As described in the proposed rule, the patient focus groups identified the aspects of hospital care addressed in the new questions as important to measuring the quality of hospital care, and the updated sub-measures were tested for hospital-level reliability and validity at the expected average number of completed surveys per hospital. We also refer readers to the FY 2025 IPPS/LTCH PPS proposed

⁴¹⁰ Battelle—Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

rule (89 FR 36299) where we outline the reliability and validity testing of each sub-measure. Along with empirically testing these updates, the updates to this survey were developed with patients' and caregivers' input, and we have ensured that the questions in the updated HCAHPS Survey measure add unique, non-redundant information about key aspects of patient experience of care. We thank the commenter for the recommendation to continue reducing the question set, and we will continue to evaluate and test ways to improve the survey in future program years. We do not anticipate authorizing real-time survey alternatives at this time, but we will re-evaluate alternatives in future program years.

Comment: A few commenters expressed support for the new web-first survey modalities and the extended 49-day window for survey responses because they stated they have been shown to increase survey response rates, especially among historically underrepresented populations.

Response: We thank the commenters for their support. We wish to note that the web-first survey modalities and 49-day window for survey responses were finalized in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59197 through 59199).

Comment: A few commenters generally did not support the updates to the HCAHPS Survey measure because they stated the addition of more questions would create resistance among patients who are already discouraged by the current number of questions.

Response: We thank the commenters for their feedback. As discussed in the FY 2025 IPPS/LTCH PPS proposed rule, four patient focus groups were conducted to inform the development of the updates to the HCAHPS Survey (89 FR 36293). These patients identified the aspects of hospital care that were important to them when measuring the quality of care they received. As a result, we do not agree that the updates to the survey would create resistance among patients. Additionally, we did not receive negative feedback about the length of the survey that was tested in the 2021 HCAHPS mode experiment, which was 43 items compared to

the updated HCAHPS Survey measure, which includes 32 items.⁴¹¹ The survey did not require multiple calls to complete, and respondents in the 2021 mode experiment did not have complaints about the time on the phone or the length of the interview. Moreover, interviewers did not report any challenges keeping respondents engaged through the end of the survey. Additionally, the updates to the HCAHPS Survey measure would create minimal change in burden because they result in only an additional 45 seconds to complete the survey, even without considering the reduction in total survey length that would result from the new limit on supplemental items. The 12-item limit on supplemental items, which was finalized in the FY 2024 IPPS/LTCH PPS final rule, effectively reduces the average length of the HCAHPS Survey measure (88 FR 59199). Currently, the median number of supplemental items added to the HCAHPS Survey is 14, while 25 percent of hospitals add 30 or more extra items. The 12-item limit of supplemental items will help to reduce the length of the updated HCAHPS Survey measure.

Comment: A few commenters requested clarifications regarding the impact of the updates to the HCAHPS Survey measure on the Star Ratings, including how the HCAHPS Summary Star Rating would be calculated both during the transition period and after the new survey is publicly reported, how the abbreviated set of HCAHPS Survey measure scores released during the transition would be used to calculate the Overall Hospital Quality Star Rating, and how CMS would incorporate the new HCAHPS Survey measure scores into the Overall Hospital Quality Star Rating after the new survey is publicly reported. They also requested clarification on how the modified public reporting schedule might impact the inclusion of HCAHPS in Hospital Overall Stars.

Response: In response to the requests for clarifications regarding the Star Ratings, the HCAHPS Summary Star Rating would continue to be the average of the publicly reported

⁴¹¹ HCAHPS Online. (2021) HCAHPS Mode Experiment Survey Instrument. Available at: <https://hcahponline.org/globalassets/hcahps/whats-new/mode-experiment/hcahps-mode-experiment-survey-instrument.pdf>

HCAHPS Survey measure as described in the Technical Notes for HCAHPS Star Ratings.⁴¹²

During the transition period when the number of HCAHPS Survey sub-measures are reduced from 10 to 8 sub-measures, the HCAHPS Summary Star Rating would be constructed by averaging the Star Ratings from “Communication with Nurses,” “Communication with Doctors,” “Communication about Medicines,” “Discharge Information,” the average of the Star Ratings assigned to “Cleanliness of Hospital Environment” and “Quietness of Hospital Environment,” and the average of the Star Ratings assigned to “Hospital Rating” and “Recommend the Hospital.” We will update the HCAHPS Star Rating Technical Notes on the official HCAHPS On-Line website (<https://hcahpsonline.org/en/hcahps-star-ratings/>) prior to the January 2026 public reporting on the Compare tool to describe how the 8 sub-measures are used to calculate the HCAHPS Summary Star Rating.

The HCAHPS Star Rating Technical Notes will be updated again prior to the October 2026 public reporting on the Compare tool to describe the calculation of the HCAHPS Star Ratings when the number of publicly reported HCAHPS Survey sub-measures increases from 8 to 11. For the October 2026 public reporting and forward, the HCAHPS Summary Star Rating will be constructed by averaging the HCAHPS Star Ratings from “Communication with Nurses,” “Communication with Doctors,” “Restfulness of Hospital Environment,” “Care Coordination,” “Responsiveness of Hospital Staff,” “Communication about Medicines,” “Discharge Information,” the average of the Star Ratings assigned to “Cleanliness of Hospital Environment” and “Information About Symptoms,” and the average of the Star Ratings assigned to “Hospital Rating” and “Recommend the Hospital.” The weight of the Patient Experience measure group in the Overall Hospital Quality Star Rating, which includes the HCAHPS Survey measure, would not change without notice-and-comment rulemaking.

Comment: Many commenters expressed concerns over the updates to the HCAHPS Survey measure. Several commenters stated the new length of the survey can have negative

⁴¹² <https://hcahpsonline.org/en/hcahps-star-ratings/#TechNotes>.

effects on patient completion such as increased burden, survey fatigue, and reduced response rates at a time when response rates are already trending downward. A few commenters requested clarification on whether the updated 32 question survey had been tested with patients to determine if the added length had any negative effects on the patient's likelihood of completing the survey. A commenter recommended limiting the Restfulness sub-measure to one question because they stated that including repetitive questions may decrease survey completion. A commenter expressed concern that the additional 45 seconds equates to a 10 percent extension. A commenter stated that the additions to the survey were outpacing the removal of items and recommended working with AHRQ to research longer term solutions to reduce length and improve response rates.

Response: We have developed the new items with patients' and caregivers' input and empirically tested the new questions and sub-measures. We refer readers to the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36293 through 36297) and this final rule which outlines the content testing, hospital input, and patient focus groups that informed our updates to the survey. The new items address those aspects of hospital care that patient focus groups identified as important to measuring the quality of hospital care, and the new sub-measures were tested for hospital-level reliability and validity at the expected average number of completed surveys per hospital.⁴¹³ ⁴¹⁴ We refer readers to the PRMR report for additional information on the testing we conducted.⁴¹⁵ Therefore, we have ensured that the questions proposed in the updated HCAHPS Survey measure add unique, non-redundant information about key aspects of patient experience of care. Additionally, if we limited the Restfulness sub-measure to one question, the reliability of this sub-measure would be reduced. We have determined that the modified version of the

⁴¹³ Crofton C, Darby C, Farquhar M, Clancy CM. (2005) The CAHPS Hospital Survey: development, testing, and use. *Jt Comm J Qual Patient Saf.* 31(11):655-9, 601. doi: 10.1016/s1553-7250(05)31084-1. PMID: 16335067.

⁴¹⁴ Giordano LA, Elliott MN, Goldstein E, Lehrman WG, and Spencer PA. (2010) Development, Implementation, and Public Reporting of the HCAHPS Survey. *Medical Care Research and Review*, 67 (1): 27-37. <https://journals.sagepub.com/doi/10.1177/1077558709341065>

⁴¹⁵ Battelle—Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

HCAHPS Survey measure creates minimal change in burden because the updates result in only an additional 45 seconds to complete the survey. Limiting the supplemental items to no more than 12 will also effectively reduce the length of the survey. We also remind commenters that the HCAHPS Survey measure has previously included 32 questions—the same number of questions in the updated version. The previous 32 question version of the HCAHPS Survey measure did not negatively affect response rates. Prior CAHPS studies suggest that the effect of a three-item change in survey length on the response rate is less than one percentage point.^{416 417}

Comment: A commenter questioned whether the data from the new sub-measures could be used to improve performance because the measures are not based upon clinical practice guidelines.

Response: The HCAHPS Survey measure is not intended to measure clinical outcomes. Rather, it is intended to measure patients' experiences of hospital care, a key metric in assisting healthcare organizations to move toward patient-centered care.

Comment: A few commenters expressed concerns about the validity of the survey, believing that the survey may not measure quality of staff but rather capture wider system-level issues such as staffing shortages, and that there was limited evidence to demonstrate a relationship between patient satisfaction, care quality, and clinical outcomes.

Response: With regard to concerns that the HCAHPS Survey measure results may be a reflection of system-wide issues, we agree that these issues, such as staffing shortages, can adversely affect patient experience; when that happens, HCAHPS accurately captures the impact of the system-wide issue on patient experience.⁴¹⁸ Patient experience of care surveys, including the HCAHPS Survey measure, capture an independently important dimension of quality of care

⁴¹⁶ Burkhart Q, Orr N, Brown JA, et al. (2021) Associations of Mail Survey Length and Layout with Response Rates Medical Care Research and Review 78(4): 441-448. DOI: <https://doi.org/10.1177/1077558719888407>

⁴¹⁷ Beckett MK, Elliott MN, Gaillot S, et al. (2016) Establishing limits for supplemental items on a standardized national survey. Public Opinion Quarterly 80(4): 964-976 DOI: <https://doi.org/10.1093/poq/nfw028>

⁴¹⁸ Elliott MN, Beckett MK, Cohea CW, et al. (2023) Changes in Patient Experiences of Hospital Care During the COVID-19 Pandemic. JAMA Health Forum 2023;4(8):e232766. DOI: <https://doi.org/10.1001/jamahealthforum.2023.2766>

and are associated with better care and outcomes in other areas, such as lower hospital readmissions.^{419 420}

Comment: A commenter expressed concern that the changes to the survey may disrupt years of data and comparisons that have been used to judge improvements in patient satisfaction.

Response: With regard to possible disruptions to survey continuity and hospitals' ability to compare results from the updated HCAHPS Survey measure with the current version, 8 of 10 current HCAHPS sub-measures would be unchanged on the updated HCAHPS Survey measure (see Table IX.B.2-02); there would be no discontinuity in historical comparisons for these sub-measures. The "Quietness" question would be unchanged in the updated HCAHPS Survey measure but would be made part of the new "Restfulness of Hospital Environment" sub-measure. However, the "Quietness" question would be reported as a single question in both the preview reports hospitals receive before each public reporting and in the Provider Data Catalog, thus permitting continuous comparisons with historical data. Only one sub-measure, "Care Transition," and one substantive question, "Call Button," would be removed from the survey.

Comment: A commenter expressed that patient care needs were in direct conflict with the HCAHPS Survey's priorities, such as when a patient may require more intensive monitoring and regular interventions, and therefore interruptions, overnight. The commenter acknowledged that creating a restful environment is an important dimension of helping patients get better, but that restfulness cannot be prioritized to the detriment of patient needs and outcomes and recommended that CMS engage interested parties to determine how to better balance competing priorities.

Response: In response to the request to engage interested parties, we note that we engaged multiple interested parties. Patients were engaged during initial work to identify

⁴¹⁹ Anhang-Price R, Elliott MN, et al. (2014) Examining the Role of Patient Experience Surveys in Measuring Health Care Quality. *Medical Care Research and Review* 71(5):522-54.-DOI: <https://doi.org/10.1177/1077558714541480>

⁴²⁰ Anhang Price R, Elliott MN, Cleary PD, Zaslavsky AM, Hays RD. (2015) Should Health Care Providers be Accountable for Patients' Care Experiences?. *Journal of General Internal Medicine* 30(2): 253–6. DOI: <https://doi.org/10.1007/s11606-014-3111-7>

concepts they deemed important in assessing quality of care during a hospital stay as well as concepts they deemed less important. Multiple audiences were included as technical experts in the technical expert panel convened by a CMS contractor, which included discussions of new content and priorities and trade-offs between new and existing content. In addition, multiple rounds of qualitative testing and discussions were conducted with patients and caregivers. We do not agree that the survey's priorities are in conflict with patient care because patient focus groups identified these aspects of care as important to measuring the quality of hospital care, and survey development and recent refinement took patient care needs, patient information needs, and input from interested parties into account when developing and refining the HCAHPS Survey measure.^{421 422}

Comment: Many commenters provided additional recommendations for the HCAHPS Survey measure including that CMS go further in expanding use of the survey to address challenges with under-reporting patient safety events and speeding up the process for integrating and reporting on the HCAHPS Survey measure changes because they are discouraged that the implementation for these updates is extended over several years.

Response: We appreciate the commenters' recommendations and will consider additional ways to expand use of the HCAHPS Survey measure in future program years. While the HCAHPS Survey measure does not ask patients directly about patient safety events, the survey information could complement other patient safety data collection. In regard to speeding up the process to integrate and report on the HCAHPS Survey measure, we note that changing the HCAHPS Survey entails thorough development and testing, followed by thorough vetting of the proposed changes through a number of internal, external, and rulemaking processes. Then, to publicly report HCAHPS sub-measures, four quarters of survey data must be collected. Lastly,

⁴²¹ Crofton C, Darby C, Farquhar M, Clancy CM. (2005) The CAHPS Hospital Survey: development, testing, and use. *Jt Comm J Qual Patient Saf.* 31(11):655-9, 601. doi: 10.1016/s1553-7250(05)31084-1. PMID: 16335067.

⁴²² Giordano LA, Elliott MN, Goldstein E, Lehrman WG, and Spencer PA. (2010) Development, Implementation, and Public Reporting of the HCAHPS Survey. *Medical Care Research and Review*, 67 (1): 27-37. <https://journals.sagepub.com/doi/10.1177/1077558709341065>

the adoption of new or revised HCAHPS sub-measures into the Hospital VBP Program entails meeting the statutory requirements as outlined in section 1886(o)(2)(C)(i) of the Act which precludes us from adopting a measure into the Hospital VBP Program until we have specified the updates under the Hospital IQR Program and included them on Care Compare for at least one year prior to the beginning of the performance period for such fiscal year. Therefore, we cannot speed the timeline up for implementation.

Comment: Several commenters recommended additional testing and analyses to ensure that the updates reflect a streamlined approach to the survey before they are adopted in the CMS programs. Their recommendations included analyzing the reading levels of all the proposed new questions and modifying the wording as necessary, having a third party fully vet and endorse the updates before implementing them, conducting further validity and reliability testing, ensuring the questions are worded in a way that allows patients to assess an aspect of quality, and providing more information on the survey design process and the criteria used to determine when questions are considered to overlap.

Response: Regarding the recommendation for additional testing and analyses when adopting the updates, we have conducted substantial testing through the 2021 mode experiment, patient focus groups, literature reviews, technical expert panels, and reliability and validity testing, as described in both the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36293 through 36299) and the PRMR report.⁴²³ Changing the HCAHPS Survey entails thorough development and testing, followed by thorough vetting of the proposed changes through a number of internal, external, and rulemaking processes. As such, we do not agree that additional testing is needed before adopting these updates.

Comment: A few commenters offered recommendations for additional survey questions including a medication reconciliation question because medication errors are estimated to be the

⁴²³ Battelle—Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

most common error made in hospitals, a patient consent question that would eliminate the need for organizations to add supplemental questions, and a question similar to one in the Medicare Advantage CAHPS Survey that addresses patients' perceptions of unfair or insensitive treatment during their hospital stay. A few commenters made recommendations around the languages offered for the HCAHPS Survey measure including expanding the approved HCAHPS languages, offering the survey in all approved languages for all survey modes similar to the Outpatient and Ambulatory Surgery CAHPS, reconsidering limiting the HCAHPS Survey measure to only support English and Spanish languages, and requiring hospitals to offer the survey in the language preferred by the patient or family member.

Response: We thank commenters for their suggestions of additional questions to add to the HCAHPS Survey measure and we will consider testing and potentially adding these questions in future program years. We also thank the commenters for their recommendations regarding offering the HCAHPS Survey measure in additional languages, and we will take these recommendations into consideration for future program years.

We note that the HCAHPS Survey measure is available in 8 official non-English translations, and that the official Spanish translation must be administered to all Spanish-prefering patients beginning in January 2025.⁴²⁴ We welcome suggestions for new translations in future program years.

Comment: A few commenters recommended additional changes to the survey including changing the "Likelihood to Recommend" responses to "Net Promoter Score" responses and adding "Caregiver Status" to the list of standardized patient assessment data elements for reporting.

Response: We thank the commenters for their recommendations. In response to changing the "Likelihood to Recommend" ("Recommend Hospital") responses to "Net Promoter Score" responses, the response options for the "Recommend Hospital," which have been

⁴²⁴ HCAHPS Quality Assurance Guidelines, V18.0. Available at: <https://hcahpsonline.org/en/quality-assurance/>

cognitively tested, empirically validated, and used in the HCAHPS Survey measure since its inception as well as in other CAHPS surveys, are appropriate for achieving the goals of the HCAHPS Survey measure. We understand that the Net Promoter Score is a popular surveying method to capture customer loyalty, however we disagree with using the Net Promoter Score because there is a lack of research to support the use of the Net Promoter Score as a primary metric of patient experience at this time, including information about validity and reliability in the hospital setting.⁴²⁵

Comment: A few commenters stated that some questions are redundant or subjective, with a commenter believing that questions 20, “Information about Symptoms,” and 23, “Discharge Information in Writing” both provide information about symptoms post-discharge. A few commenters also recommended combining or clarifying questions 20, “Information about Symptoms,” and 23, “Discharge Information in Writing”, and 19, “Care Coordination Post-Hospital” and 22, “Discharge Information Help” to avoid redundancies, replacing “doctors, nurses, and other hospital staff” to “healthcare team” throughout the survey because they stated that “healthcare team” encompasses all individuals who may care for a patient, and reviewing the “Discharge Information” questions, the “Information About Symptoms” question, and the new “Care Coordination” questions to determine how to incorporate the concept of language preferences. The commenters also requested clarification on whether the information being provided in response to the “Discharge Information” questions, the “Information About Symptoms” question, and the new “Care Coordination” questions is actually understood by the patient and family or caregiver and whether inclusion of both the “Information About Symptoms” and “Discharge Information” questions will provide enough differentiated information to warrant adding to the length of the survey. A few commenters requested clarification on what “other hospital staff” refers to in the “Care Coordination” sub-measure

⁴²⁵ Adams C, Walpola R, Schembri AM, Harrison R. (2022) The ultimate question? Evaluating the use of Net Promoter Score in healthcare: A systematic review. *Health Expect.* (5):2328-2339. doi: 10.1111/hex.13577.

because not every individual in a hospital environment would have reason to be included in a patient's plan of care.

Response: We note that we do not collect standardized patient assessment data or protected health information from patients or from hospitals and the HCAHPS Survey measure does not include patient assessment data, and therefore, we cannot add "Caregiver Status" to the list of standardized patient assessment data elements. We may consider developing and testing items about caregiver status for future use; however we also note that we have added questions about communicating with family and caregivers in both the new "Care Coordination" sub-measure and in the new "Information about Symptoms" single-item sub-measure. We also remind the commenter that a patient's proxy is permitted to respond to the HCAHPS Survey beginning with January 2025 discharges, as finalized in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59198).

Survey questions 20 and 23 differ in significant ways. Question 20, "Information About Symptoms," asks about the engagement of family members or caregivers, specifically whether the patient's family or caregiver received enough information about what symptoms or health problems to help watch for after the patient leaves the hospital. Patients identified information communicated to a patient's family members or caregivers as an aspect of care that is critical to measuring quality. In contrast, Question 23, "Discharge Information in Writing," is specific to the patient's experience. It asks whether the patient received written information about symptoms or health problems to look out for after leaving the hospital, which patients also identified as an aspect of care that is important to measuring quality and is only asked of patients who go directly home after leaving the hospital. These are different topics and are measured via separate items to ensure that the data collected are actionable. Questions 20 and 23 are also not empirically redundant. The empirical testing of the new questions for the updated HCAHPS Survey measure, both from their content and from statistical evidence, demonstrated that these questions address different aspects of patient care and that each question independently predicts

the overall rating of the hospital. We refer the commenter to the PRMR report for additional information on the testing we conducted.⁴²⁶ Given these important differences, it is appropriate to maintain questions 20 and 23 as separate questions. Similarly, we have determined that the “Information About Symptoms” and “Discharge Information” questions use terms that are well understood by the patient and family or caregiver based on focus groups and cognitive interviews and therefore need not be clarified.

Additionally, we do not agree with commenters’ recommendations to combine questions 19 and 22 in the HCAHPS Survey measure because we have determined via qualitative and quantitative testing that these questions address different key aspects of care as identified by patients and caregivers. Question 19, the “Care Coordination Post-Hospital” question, collects information on whether the patient’s family or caregiver was involved in discussion of the patient’s post-discharge care needs, while question 22, the “Discharge Information Help” question, is specific to the patient’s experience and asks patients who were discharged to their own home or someone else’s home whether doctors, nurses or other hospital staff talked with them about whether they would have the needed level of help or support after leaving the hospital. As explained above, questions 20 and 23 similarly address different aspects of patient care, focusing on either the experience of the patient’s family or caregiver (question 20) or the experience of the patient (question 23) in receiving information about symptoms or health problems to watch for after the patient leaves the hospital.

Comment: A few commenters expressed concerns with the verbiage in the new “Care Coordination” sub-measure, with a commenter noting that the repetition of the language, “doctors, nurses, and other hospital staff” may confuse patients and instead recommended collapsing the list into “hospital team” to be more inclusive and aligned with health literacy standards. Another commenter expressed concern about the use of “other hospital staff” because

⁴²⁶ Battelle—Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

they stated that other hospital staff should not be informed about a patient's care. The commenter recommended removing the term or better defining it in the question. A commenter also recommended modifying the question in the "Discharge Information" sub-measure about whether patients have the help they need after they leave the hospital to address needed support for family caregivers. A commenter recommended limiting the addition of new questions to only those that provide meaningful and actionable data because they stated that repetitive questions can limit response rates.

Response: The phrase "doctors, nurses, and other hospital staff" has been used since the inception of HCAHPS and was subject to multiple rounds of testing during HCAHPS development and the current refinement of HCAHPS content. These efforts confirmed that the phrase is clearly understood by patients. Cognitive testing indicated that patients understood that other hospital staff included staff such as individuals providing therapy who should be aware of the patient's condition.

Patients indicated that how well "doctors, nurses, and other staff work together or as a team" in caring for a patient was the most important information to have in determining what their care would be like at a particular hospital. The term "other hospital staff" refers to anyone else involved in the patient's care during their hospital stay, including but not limited to those who take patients for X-rays or medical tests, individuals providing treatment or therapy during the in-patient stay, and those who participate in discharge planning. Cognitive testing indicates that repeated use of this phrase ensures that patients understand who is included; terms such as "Care team" and "Hospital team" are less familiar to patients. Based on these efforts, we determined that the survey language is clear and intelligible to patients.

We agree with the commenter that the addition of new questions should be limited to only those that provide meaningful and actionable data and have identified that the updates to the HCAHPS Survey measure provide such data. A CMS contractor convened a technical expert panel that engaged physicians, nurses, academics, and representatives of hospitals, insurers, and

patient advocacy groups to assess the actionability of all new items proposed for testing to ensure we focused the new content on actionable events, and we note that every proposed question had statistical evidence that it improved measurement of the sub-measure to which it belonged.⁴²⁷ We will consider how to incorporate the concept of language preferences into the sub-measures in future program years.

Comment: A commenter did not support the “Information About Symptoms” sub-measure because they believed it is substantially similar to the “Discharge Information in Writing” question. A commenter questioned the sub-measure’s intent as they stated the question seems to be more about whether the hospital gave the patient information rather than whether the patient was able to understand the information. A few commenters made recommendations about the new “Information About Symptoms” question including modifying the question to focus more on the patient’s understanding than on the task of handing over education, and explicitly mentioning the patient in the question to reinforce a patient-and-family centered care model. A commenter recommended modifying the “Discharge Information in Writing” question to incorporate information about systems and to say, “in your preferred language in writing.”

Response: We appreciate the commenter’s concern; however, through our 2021 mode experiment, focus groups, technical expert panel, and literature review, we have ensured that the questions proposed, including the “Information About Symptoms” question, add unique, non-redundant information about key aspects of patient experience of care. The “Information About Symptoms” sub-measure focuses on information communicated to a patient’s family or caregiver, an aspect of care that patients identified as critical to measuring quality. In contrast, the “Discharge Information in Writing” question asks about written information provided to the patient, which is also important to measuring quality. These are different topics and are measured via separate items to ensure that the data collected are actionable. We refer the

⁴²⁷ Battelle—Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

commenter to the PRMR report for additional information on the testing we conducted.⁴²⁸

We also note that the “Information About Symptoms” question captures an important aspect of hospital care identified by patients and caregivers participating in focus groups. Cognitive testing demonstrated that the “Information About Symptoms” question was accurately and consistently interpreted, as described in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36299). We agree that ensuring patient comprehension is important and will take this feedback into consideration, along with the suggestion to include “in your preferred language in writing,” in the “Discharge Information in Writing” question for future program years.

Comment: A few commenters offered additional recommendations including that CMS report survey results by race and ethnicity to aid in reducing disparities. Another commenter recommended that CMS should talk to employers and other purchasers to utilize HCAHPS for their maternity populations.

Response: We appreciate the commenters’ recommendations. We will consider reporting survey results by race and ethnicity in future program years. Maternity patients have been eligible for the HCAHPS Survey measure since its inception. Our research indicates that maternity patients are particularly affected by mode of survey administration; we recommend that hospitals carefully choose the mode of HCAHPS administration that will fully capture their entire patient population.^{429 430}

Comment: A commenter recommended using Short Message Service (SMS) or other forms of text messages as an additional survey mode because they stated it would help increase response rates.

Response: While the current web administration mode does not include a text message

⁴²⁸ Battelle—Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

⁴²⁹ Elliott MN, Brown JA, Hambarsoomian K, et al. (2024) Survey Protocols, Response Rates, and Representation of Underserved Patients: A Randomized Clinical Trial. JAMA Health Forum. 5(1):e234929. doi: 10.1001/jamahealthforum.2023.4929.

⁴³⁰ HCAHPS Online. (2022) “Improving Representativeness of the HCAHPS Survey” podcast. Available at: <https://hcahponline.org/en/podcasts/#ImprovingRepresentativeness>

option, we will take these recommendations into consideration for future program years while also taking into consideration the Telephone Consumer Protection Act (TCPA) requirements. We evaluated the possibility of using text message as a mode for survey implementation but determined that varying standards across states, possible charges for text messages, as well as the requirements of TCPA, make a text survey infeasible for the national, standardized HCAHPS Survey measure at this time. However, we will continue to explore this as an option for the future.

Comment: A commenter recommended additional financial support for under-resourced hospitals to help them move beyond process improvements.

Response: We cannot provide additional financial support for under-resourced hospitals as part of the HCAHPS Survey measure at this time.

We also received public comments on the specific addition of the “Care Coordination” sub-measure to the HCAHPS Survey measure.

Comment: Many commenters specifically supported the adoption of the “Care Coordination” sub-measure because they stated that it is broader and clearer than the “Care Transition” sub-measure, addresses important dimensions of patient experience not previously addressed, and provides information about how well a patient felt their care team worked together. Several commenters noted that the new “Care Coordination” sub-measure reflects CMS’s commitment to the role of patient reported experiences and another commenter stated it would serve to reduce overlap between care transition and discharge information. A few commenters stated the new sub-measure would enhance the HCAHPS Survey measure, better capture patient experience of hospital care, and improve understanding of the challenges faced in coordinating care across the care continuum. A commenter expressed support for the “Care Coordination” measure because they stated it is broader than the “Care Transition” sub-measure but noted that care coordination is important at care transition.

Response: We thank commenters for their support of the new “Care Coordination” sub-measure. We agree that care coordination is important at care transition, and have determined, through the four patient focus groups that were conducted before proposing these updates, that the updated question set captures the key aspects of patient experience of care including at the point of care transition. We reiterate that the new “Care Coordination” sub-measure focuses on how well hospital staff worked together and whether doctors and staff worked to make care transition plans for the patient post-hospitalization.

Comment: A commenter did not support removing the question, “During this hospital stay, staff took my preferences and those of my family or caregiver into account in deciding what my health care needs would be when I left,” because the commenter stated the new “Care Coordination” questions do not inherently take personal preferences into account.” The commenter recommended maintaining this question and the new “Care Coordination” questions.

Response: We appreciate the commenter’s concern, however, the question asking about preferences was removed because it was perceived by patients in the focus groups as duplicative of existing and new survey questions, as described in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36294).

Comment: A commenter recommended broadening the “Care Coordination” sub-measure to include whether family caregivers received any needed support to capture additional data on caregiver support.

Response: We thank the commenter for the recommendation and will consider further broadening the “Care Coordination” sub-measure in future program years. We note patients and caregivers identified these questions, as written, as very important to addressing key aspects of patient care.

We also received public comments on the specific addition of the “Restfulness of Hospital Environment” sub-measure to the HCAHPS Survey measure.

Comment: Several commenters supported the addition of the new “Restfulness” sub-measure, believing that the questions would enhance the HCAHPS Survey measure and are significant contributions that reflect CMS’s commitment to expanding the role of patient reported experiences. A commenter supported the “Restfulness” sub-measure because they stated that rest and sleep are foundational occupations that affect daily patient function and quality of life, and another supported the addition of the “Restfulness” sub-measure, but expressed concern that combining all hospital staff into a single question complicates hospitals’ work. Another commenter supported the wording of “doctors, nurses, and other hospital staff” because they stated a patient may not always know what type of staff a specific person is, and thus the wording lessens the possibility of inaccurate survey responses. A commenter specifically supported the “Quietness” question because it enhances the HCAHPS Survey measure and better captures patient experience of hospital care.

Response: We thank commenters for their support of the new “Restfulness” sub-measure.

Comment: A few commenters did not support the “Restfulness” sub-measure because they stated the questions are too subjective and may create confusion. A few commenters also stated that hospitals by nature are not restful environments and proper care and safety should take precedence over rest. A few commenters expressed concern that the questions may divert attention from more critical elements of care. A few commenters requested additional testing information and data about how patients interpret the “Restfulness” sub-measure in light of their concerns that the questions are subjective and stated that there may be important reasons to interrupt a patient’s rest. A commenter recommended that the sub-measure be sent to a workgroup to make changes to the questions to ensure there are no unintended consequences. A commenter recommended removing the “Quietness” question altogether.

Response: Cognitive testing demonstrated that the new questions were accurately and consistently interpreted by patients. Additionally, we have identified the need for this sub-

measure through focus groups and cognitive interviews with patients and caregivers, discussions with technical experts, and literature reviews that were conducted by a CMS contractor who made recommendations to CMS. “Restfulness of Hospital Environment” was deemed an important new topic to add to the HCAHPS Survey measure based on stakeholder feedback, including that from hospital staff and patient groups. Clinicians on our technical expert panel, patients, and patient advocates supported these questions. This sub-measure can be satisfied by avoiding needless disruptions and explaining to patients the importance of necessary ones. We have also conducted reliability and validity testing at the expected average number of completed surveys per hospital and therefore do not agree that additional review by a workgroup is necessary at this time. We refer the commenter to the PRMR report for additional information on the testing conducted on these updates, which did not identify any unintended consequences.⁴³¹

In response to the request to remove the “Quietness” question, we note that this question is already included in the current version of the HCAHPS Survey measure as a single-question sub-measure, and the question itself is not changing in the updated version of the survey.

Comment: Several commenters expressed concerns about the “Restfulness” sub-measure including concerns about the validity and reliability.

Response: We appreciate the commenters’ concerns. We reiterate that we identified the need for these updates through focus groups and cognitive interviews with patients and caregivers, discussions with technical experts, and literature reviews. The new questions within the “Restfulness” sub-measure fill a gap related to providing a restful and healing environment within the hospital setting and support our goal of including measures related to person-centered care. We also reiterate that we have conducted reliability and validity testing at the expected average number of completed surveys per hospital. We refer the commenter to the PRMR report

⁴³¹ Battelle—Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

for additional information on the testing conducted on these updates, including testing specifically on the “Restfulness” sub-measure.⁴³²

Comment: A few commenters also requested clarification on the extent of the risk adjustment approach that may account for differences in the score of the “Restfulness” sub-measure.

Response: We thank commenters for their request. The HCAHPS patient-mix adjustment (risk adjustment) approach accounts for factors not under a hospital’s control that affect how patients answer survey items, such as, patients’ service line by sex, age, education, language spoken at home, and self-rated overall and mental health. The same patient-mix model used for all other HCAHPS sub-measures was proposed for the “Restfulness of Hospital Environment” sub-measure. The current HCAHPS patient-mix adjustments can be found at <https://hcahpsonline.org/en/mode--patient-mix-adj/#jan2023publiclyreported>. An example of patient-mix adjustment for the updated HCAHPS Survey measure can be found at https://hcahpsonline.org/globalassets/hcahps/training-materials/2024_training-materials_slides.pdf.

Comment: A few commenters expressed concerns that the sub-measure may result in providers prioritizing a quiet environment over providing necessary medical rounds, and that if certain services need to be provided overnight, the disruption may affect performance on the survey. A few commenters also expressed concern that the sub-measure may unfairly penalize or disadvantage certain hospitals such as quaternary hospitals with high acuity patients, hospitals in densely urban neighborhoods, and hospitals with dual occupancy rooms. A commenter supported the inclusion of the new “Restfulness” questions, but expressed concern that rooms with one or more other patients are hard to control and that prioritizing restfulness could lead hospitals to limit family visitations. Another commenter recommended monitoring implementation to ensure no unintended consequences. A commenter recommended

⁴³² Ibid.

reconsidering implementation of the “Restfulness” sub-measure because they stated that the practice of checking on patients regularly throughout the night could diminish with this sub-measure, which could lead to more falls. Another commenter recommended removing the “Rest and Recover” question, which asks, “During this hospital stay, did doctors, nurses, and other hospital staff help you rest and recover?”, because hospitals provide 24/7 care, and providers often need to interrupt patients throughout the night for treatment or to take vitals.

Response: The HCAHPS Survey measure is designed to produce standardized information about patients’ perspectives of care that allows comparison of hospitals on topics that are important to consumers. While we acknowledge that commenters’ concerns about prioritization of safe patient care practices is valid and that hospitals should be conducting necessary medical rounds, the survey is designed to measure patients’ experience of care and the care should be provided to promote as restful an experience as possible while delivering the necessary clinical care. The goal of the “Restfulness of the Hospital Environment” items is not merely comfort, but to promote recovery. Restfulness can be accomplished with no reduction in rounding. We remind commenters that the HCAHPS Survey measure has always included the “Quietness” question, which would be retained in the updated HCAHPS Survey measure in the new “Restfulness of Hospital Environment” sub-measure. There is evidence that both quiet and rest are important for recovery.^{433 434} We are not aware of any unintended consequences from the “Quietness” question. “Restfulness of the Hospital Environment,” which is based on one current HCAHPS item and two new HCAHPS items, was deemed an important new topic to add to HCAHPS based on stakeholder feedback from hospital staff and patient groups. The concept of “rest and recovery” was important to the technical expert panel convened by a CMS contractor to provide feedback on updating the HCAHPS Survey measure. In particular, the

⁴³³ Stewart NH, Arora VM. (2022) Sleep in Hospitalized Older Adults. *Sleep Med Clin.* 17(2):223-232. doi: 10.1016/j.jsmc.2022.02.002. Epub 2022 Apr 22. PMID: 35659075

⁴³⁴ Hedges C, Hunt C, Ball P. (2019) Quiet Time Improves the Patient Experience. *J Nurs Care Qual.* 34(3):197-202. doi: 10.1097/NCQ.0000000000000363. PMID: 30198951.

panel encouraged CMS to add items that asked about rest and/or recovery, noting the concept is distinct from sleep, which is also important to recovery and is independently important in care. The items were designed and worded to acknowledge that activities such as rounding, tending to other patients, or managing emergencies are necessary. Cognitive testing suggests that if patients are told why they are being woken they do not rate this item negatively. The goal of this measure is to discourage needless disruptions and to encourage communication between providers and patients. Dual occupancy rooms, like hospitals with lower staffing, may result in poorer patient experience; the HCAHPS Survey measure seeks to measure and report actual performance.

Comment: Several commenters offered recommendations to modify the “Restfulness” questions. Their recommendations included removing the “Rest and Recover” question (Question 18) because they stated it is unclear what “rest and recover” means and feedback around “rest” is captured by other questions in the “Restfulness of the Hospital Environment” sub-measure; combining questions 8, “During this hospital stay, how often are you able to get the rest you needed?” and 18, “During this hospital stay, did the doctors, nurses, and other hospital staff help you rest and recover?” into one question asking if the hospital staff helped the patient rest and recover because they stated it speaks more to the care provided by the staff; modifying the language to say “During this hospital stay, did your hospital team help you rest?” because they stated a team approach prevents the possibility of incorrect survey responses; and asking patients to report the ability of the environment to support “rest” versus “rest you need” because they stated rest may come secondary to treatment needs and a patient may have difficulty getting a good night’s sleep anywhere except their own bed. A few commenters expressed concerns with the term “recover” with one believing that rest and recovery are two different dimensions and another noting that not all inpatients are anticipated to recover from their condition. The commenters recommended removing the words, “and recover” to better focus on “restfulness.”

Response: We appreciate the commenters' recommendations. However, we wish to note that the questions as currently written were reviewed by patient focus groups and tested for reliability and validity, and we therefore do not agree with modifying the wording or combining the questions as the commenters have suggested earlier. Cognitive testing suggests that if patients are told why they are being woken they do not rate this item negatively. The goal of this measure is to discourage needless disruptions and to encourage communication between providers and patients. Empirical testing of the "Restfulness of Hospital Environment" sub-measure in the 2021 mode experiment provides strong support for each question in the sub-measure and the sub-measure as a whole. We note that the "Quietness" question has always been included in the HCAHPS Survey measure and will provide continuity in both public reporting and in the Hospital VBP program.

We received public comments on the specific addition of the "Information about Symptoms" sub-measure to the HCAHPS Survey measure.

Comment: Several commenters expressed support for the adoption of the new "Information About Symptoms" single-item sub-measure because they stated the addition of the "Information About Symptoms" question is a significant contribution to committing to the role of patient reported experiences that would enhance the HCAHPS Survey measure. A few commenters supported the sub-measure with a commenter stating that it can provide important information about how well a patient felt that his or her care team assisted with post-discharge planning, and another commenter noting that the sub-measure has been shown to improve patient outcomes. A commenter recommended strengthening the question to also include information on how to address symptoms, such that the question would read, "During this hospital stay, did doctors, nurses, or other hospital staff give your family enough information about what symptoms or health problems to watch for after you left the hospital and how to address them?" because they stated that this revision would provide useful information for hospitals, consumers, and caregivers.

Response: We thank the commenters for their support of the new “Information About Symptoms” sub-measure, and we will continue to consider additional ways to strengthen the survey, including revising the question to include information on how to address a patient’s symptoms in future program years. Any changes to a question’s wording would need to be tested before we can consider incorporating them in future years.

We also received public comments on the specific modification of the “Responsiveness of Hospital Staff” sub-measure to the HCAHPS Survey measure.

Comment: Several commenters supported adopting the modifications to the “Responsiveness of Hospital Staff” sub-measure because they enhance the person-centeredness of care, represent current workflows within hospitals, are more inclusive of different hospital strategies, and accurately measure the patient experience. A few commenters specifically supported the removal of the “Call Button” question because they stated that the technology is evolving, and the new questions better reflect current practices.

Response: We thank the commenters for their support of the modifications to the Responsiveness of Hospital Staff sub-measure. We agree that the modifications are more inclusive and accurately measure the patient experience. We also appreciate the support of the removal of the “Call Button” question.

Comment: A few commenters did not support the verbiage of “right away” and “as soon as you needed” in the new “Responsiveness” sub-measure and recommended rewording or removing the questions because they stated the language is too subjective. Some commenters suggested that CMS should develop alternative phrasing to enhance clarity and accessibility such as replacing “right away” with “quickly,” while another commenter recommended removing the word “right away” entirely from the question because they stated that it makes the question too wordy and indicates that the question pertains only to those who need urgent help.

Response: We thank the commenters for their suggestions regarding the wording of the “Responsiveness of Hospital Staff” sub-measure, however, we do not agree that the wording of

the question should be changed. The terms “right away” and “as soon as you needed” are commonly used in CAHPS surveys to identify care needs that are time-sensitive. We discussed the item wording and terms with patients in multiple focus groups and cognitive interviews and found that the uses of “right away” and “as soon as you needed” promote common, consistent interpretation of the survey item across patients. As part of the cognitive interviews, we discussed their understanding of the terms included in these questions and found no issues.

Comment: A commenter also questioned whether patients tend to respond more positively to questions framed around immediate responsiveness versus those related to the call bell and recommended that CMS grant access to the research demonstrating the impact of the modified questions.

Response: We refer the commenter requesting access to our research to the PRMR report for additional information on the testing we conducted on these updates.⁴³⁵ Because the “Call Button” question and the new “Help Right Away” question, which asks, “During this hospital stay, when you asked for help right away, how often did you get help as soon as you needed?” were not tested in the same study, it is not possible to confidently compare their mean scores. We do, however, have strong evidence of the reliability and validity of the new “Help Right Away” question, which was developed in response to stakeholder concerns about the “Call Button” question.

We also received public comments on the specific removal of the “Care Transition” sub-measure from the HCAHPS Survey measure.

Comment: Several commenters supported the removal of the “Care Transition” sub-measure because they stated that the “Care Coordination” sub-measure encompasses a broader range of questions than “Care Transition” did and removing “Care Transition” would reduce repetitiveness and overlap. A commenter stated the changes would enhance the HCAHPS

⁴³⁵ Battelle—Partnership for Quality Measurement. (2023). 2023 Pre-Rulemaking Measure Review (PRMR) Preliminary Assessment Report: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2023-12/PRMR-Hospital-Committee-PA-Final-Report.pdf>

Survey measure and another commenter supported that the removal of the “Care Transition” sub-measure in conjunction with the adoption of the “Care Coordination” sub-measure would ensure there is not an increase to the survey’s length.

Response: We thank the commenters for their support of the removal of the “Care Transition” sub-measure and agree that the “Care Coordination” sub-measure broadens the current “Care Transition” sub-measure.

Comment: A commenter recommended that the updates to the survey be delayed until the conclusion of the Magnet application period because the Magnet teams look closely at measures within the “Care Transition” dimension so the updates could impact entities undergoing Magnet submission.

Response: We understand that outside credentialing programs, such as Magnet, may employ the HCAHPS Survey measure in their own eligibility, assessment, or credentialing processes. There are numerous credentials that hospitals can choose to pursue, and while we respect the commitment to excellence, we do not control or oversee such secondary uses and cannot base our implementation timelines on outside credentialing. We invite these organizations to familiarize themselves with the updated HCAHPS Survey measure to assess its suitability for their needs.

We also received public comments on the specific modifications to the “About You” section of the HCAHPS Survey measure.

Comment: A few commenters specifically supported the updates to the “About You” section, with a few supporting the alphabetization of the response options for the race and ethnicity questions and one supporting the modified language spoken at home question because they stated it makes survey completion less burdensome. A commenter supported incorporating the “Hospital Stay Planned in Advance” question because they stated it more appropriately captures the reason for admission. Another commenter supported the updates but recommended aligning the HCAHPS Survey measure questions with the updated OMB standards for

maintaining, collecting, and presenting federal data on race and ethnicity to reduce disparities and harmonize data collection across agencies.

Response: We thank the commenters for their support of the updates to the “About You” section, and we agree that the updates make the survey less burdensome to complete. We appreciate the recommendation to align with the OMB standards and harmonize data collection across agencies. We will take this into consideration in future program years.

Comment: A few commenters did not support the new “Hospital Stay Planned in Advance” question, with a commenter believing the new verbiage is ambiguous and may result in a lack of meaningful data, and another commenter expressed concern that the new question could have unintended consequences for how patient mix is adjusted and recommended not finalizing.

Response: As described in the FY 2025 IPPS/LTCH PPS proposed rule, the new “Hospital Stay Planned in Advance” question would account for differences in this preadmission characteristic, as an unplanned hospital stay can result in worse patient experiences than if the hospital stay had been planned (89 FR 36300). The cognitive testing that we conducted indicated that the new question is better understood than the current “Admission through the Emergency Room” question.

Comment: Several commenters expressed concerns about the updates to the “About You” section, including a few commenters who expressed concerns about limiting the number of language response options in the “About You” section because they stated restricting the language options could undermine and underrepresent patient experiences, particularly when the release of the web-first modalities has been found to increase response rates for many of the language options that CMS is proposing to remove. A few commenters recommended maintaining or even expanding the range of languages identified in the survey because they stated it would provide a more accurate picture of enrollee demographics and inform decisions regarding survey translation. A commenter recommended monitoring the percent of responses in

the “Other” category and broadening the options again in the future.

Response: We thank commenters for their feedback about limiting the number of language response options in the “About You” section. We note that reciting a long list of languages in question 29 increases survey burden for patients, especially in the telephone mode. Additionally, the response option, “Another language,” which remains available as a response option for anyone who does not speak English, Spanish, or Chinese, would more efficiently gather important information for use in patient-mix adjustment. Patient-mix adjustment of “Language Spoken at Home” will employ four categories: “English,” “Spanish,” “Chinese,” and “Another language.” Because patient-mix adjustment combines all other languages into one category, the response option “Another language” will improve survey efficiency and reduce burden, especially on telephone surveys.⁴³⁶ Official translations of the HCAHPS Survey in Spanish, Chinese, Russian, Vietnamese, Portuguese, German, Tagalog, and Arabic will continue to be available for use, though only English and Spanish versions will be required. We also appreciate the recommendations to maintain or increase the range of language options, but we remind commenters that we identified these changes as an effort to make survey administration more efficient and reduce respondent burden, especially in the telephone mode of survey administration. Additionally, we will continue to monitor trends in patient language and will consider broadening the options again in the future.

Comment: A few commenters expressed concerns about the new “Hospital Stay Planned in Advance” question because they stated the question may require more clarity and further guidance to ensure that patients understand the question as intended. A commenter expressed concern that the “Hospital Stay Planned in Advance” question has the possibility to be doubly adjusted with a service line adjustment for maternity and another potential adjustment for the admission being unplanned. Another commenter expressed concern that in cases related to

⁴³⁶ HCAHPS Online. (2023) Patient Mix Adjustment. Available at: <https://hcahpsonline.org/en/mode--patient-mix-adj/#jan2023publiclyreported>

hospital stays for childbirths, the hospital admission date for a vaginal delivery could be viewed by a patient as either unplanned or planned in advance. The commenter therefore recommended further guidance to survey respondents about how to answer the question, including covering the most common situations where there may be ambiguity.

Response: We appreciate commenters' feedback about the new "Hospital Stay Planned in Advance" question. Cognitive testing indicated that the question is well understood and is better understood than the current "Admission Through the Emergency Room" question. Our results from the 2021 mode experiment also indicate that adjusting for unplanned stays improves the accuracy of HCAHPS scores. Patient-mix adjustment is implemented via multiple regression in such a way that ensures that double adjustment does not occur. When an adjustor is added, any "overlapping" adjustment with other adjustors is automatically removed. Data collected in the 2021 mode experiment also indicated that maternity care is not often reported by patients as being unplanned. We note that the response options for the new "Hospital Stay Planned in Advance" question offer patients the choice of selecting among "Yes, definitely," "Yes, somewhat," and "No." The response option, "Yes, somewhat," is available for hospital stays that were neither "yes, definitely" planned in advance, nor "no," unplanned.

Comment: A few commenters made recommendations about the "About You" section including a few commenters that made recommendations about race and ethnicity data. Their recommendations included implementing OMB's revised standards for the collection of race and ethnicity data, combining the two race and ethnicity questions into one question on both race and ethnicity, and adding a Middle Eastern or North African category. A commenter recommended that race and ethnicity be separated instead of grouped together.

Response: We appreciate the commenters' recommendations for additional updates to the race and ethnicity questions and will take these into consideration in future program years.

We also invited public comment on the proposed adoption of the updated HCAHPS Survey measure for the Hospital IQR Program beginning with the CY 2025 reporting period/FY

2027 payment determination and the PCHQR Program beginning with the CY 2025 reporting period/FY 2027 program year.

Comment: A commenter specifically supported the adoption of the updates to the HCAHPS Survey measure in the PCHQR Program but recommended examining whether “Restfulness” disproportionately penalizes urban hospitals.

Response: We thank the commenter for their support of the adoption of the updates in the PCHQR Program. The “Restfulness of Hospital Environment” sub-measure was identified to have good hospital-level reliability (0.729) at the expected average number of completed surveys per hospital. Testing found no evidence that the measure is less accurate for urban than rural hospitals.

Comment: A commenter specifically supported the modified public reporting schedule for the Hospital IQR Program.

Response: We thank the commenter for their support of the public reporting schedule.

Comment: A commenter recommended that CMS complete validity testing and receive CBE endorsement to understand the strength of the correlations of the multi-item and single-item measures with the overall measures before implementing the changes into the Hospital IQR Program.

Response: We refer the commenter to the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36299) and this final rule where we outline the reliability and validity testing we conducted on all of the updates we proposed to the HCAHPS Survey measure. We will submit the updated HCAHPS Survey measure to the current CBE for endorsement in Fall 2025. We note that section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the

Secretary. We have determined that the updates to the HCAHPS Survey measure are appropriately specified. The HCAHPS Survey measure remains endorsed, and the updated survey only modifies some of the questions and sub-measures within the survey. The HCAHPS Survey measure is designed to produce standardized information about patients' perspectives of care that allow objective and meaningful comparisons of hospitals on topics that are important to consumers, and these updates would improve the feedback we receive directly from patients on hospital performance. Therefore, we are adopting these updates to the measure before the updates receive CBE endorsement.

Comment: A commenter recommended rolling out the new questions beginning with the CY 2026 discharges because health systems and vendors will only have about three months to transition to the new requirements once the final rule is released in August.

Response: Since these updates to the HCAHPS Survey measure are limited to changes to some of the survey questions, we have identified that there would be sufficient time from public display of this final rule on or about August 1, 2024, and when the updated survey would begin to be administered to patients who are discharged in January 2025. The updated HCAHPS Survey has been available in all survey modes on the official HCAHPS website since May 2024, including the official Spanish translation, and the Quality Assurance Guidelines for the updated HCAHPS Survey measure have been available since May 2024. As noted in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36294), the updated version of the HCAHPS Survey measure would not result in any changes to the survey administration or other reporting requirements. We note that changes to the administration of the survey were finalized in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59196 through 59201) and that approved HCAHPS Survey vendors were trained on the updated HCAHPS Survey measure in May 2024. We, therefore, have determined that hospitals would not need additional time before the updated survey is implemented.

After consideration of the public comments received, we are finalizing adoption of the

updated HCAHPS Survey measure in the Hospital IQR and PCHQR Programs as proposed.

f. Modifications to Scoring of the HCAHPS Survey Measure for the Hospital VBP Program for the FY 2027 through FY 2029 Program Years

(1) Background

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to adopt an updated version of the HCAHPS Survey measure so that IPPS hospitals and PCHs can report patient responses to the updated survey for purposes of the Hospital IQR Program and PCHQR Program, respectively, beginning with January 1, 2025, discharges (89 FR 36298 through 36300). We also proposed to adopt the updated version of the HCAHPS Survey measure for purposes of the Hospital VBP Program in section IX.B.2.g. of this final rule; however, section 1886(o)(2)(C)(i) precludes us from doing so until we have specified the updates under the Hospital IQR Program and included them on Care Compare for at least one year prior to the beginning of the performance period for such fiscal year. For this reason, we proposed to adopt the updated version of the HCAHPS Survey measure beginning with the FY 2030 program year in the Hospital VBP Program. However, to relieve hospitals of the burden of having to use two different versions of the survey between FY 2027 and FY 2029, we proposed that hospitals would be able to administer the updated version of the survey starting with January 1, 2025 discharges, and for the purposes of the Hospital VBP Program, we would only score hospitals on the six dimensions of the HCAHPS Survey measure that would remain unchanged from the current version of the survey.

(2) Scoring Modification of the HCAHPS Survey Measure for the Hospital VBP Program for the FY 2027 through FY 2029 Program Years

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to modify scoring to not include the “Responsiveness of Hospital Staff” and “Care Transition” dimensions from scoring in the Hospital VBP Program’s HCAHPS Survey measure in the Person and Community Engagement domain for the FY 2027 through FY 2029 program years (89 FR 36300 through

36301). As noted earlier, we must collect and publicly report four quarters of data on the updated HCAHPS Survey measure before the updates can be adopted into the Hospital VBP Program. As described in section IX.B.2.g(2) of this final rule, the updates to the “Responsiveness of Hospital Staff” dimension would be adopted in the Hospital VBP Program beginning with the FY 2030 program year along with the rest of the updates to the survey after the statutory requirements of section 1886(o)(2)(C)(i) of the Act have been met. As described in section IX.B.2.g(3) of this final rule, scoring on the updated “Responsiveness of Hospital Staff” dimension would begin with the FY 2030 program year. In addition, the “Care Transition” dimension in the current version of the survey would be removed permanently in the proposed updated HCAHPS Survey measure beginning with the FY 2030 program year. Until these updates can be adopted in the Hospital VBP Program beginning in FY 2030, we are excluding these dimensions from scoring for the FY 2027 through FY 2029 program years.

With the adoption of the proposal to not score the “Care Transition” and “Responsiveness of Hospital Staff” dimensions in the Person and Community Engagement domain for the FY 2027 through FY 2029 program years, only six dimensions would continue to be used in the Hospital VBP Program for FY 2027, FY 2028, and FY 2029. By excluding these two dimensions from scoring within the Hospital VBP Program for the FY 2027 through FY 2029 program years, hospitals can continue to be scored on the remaining unchanged dimensions of the current HCAHPS Survey measure until the proposed updated HCAHPS Survey measure could be adopted for use in the Hospital VBP Program beginning in FY 2030.

We proposed to score hospitals only on these six dimensions because we cannot score hospitals on any of the new or updated dimensions associated with the updated HCAHPS Survey measure until they have been adopted and reported in the Hospital IQR Program for one year prior to the beginning of the first performance period of their use in the Hospital VBP Program (89 FR 36300 through 36301). These six unchanged dimensions of the HCAHPS Survey measure would be:

- “Communication with Nurses,”
- “Communication with Doctors,”
- “Communication about Medicines,”
- “Discharge Information,”
- “Cleanliness and Quietness,” and
- “Overall Rating.”

We proposed to modify the scoring such that for each of these six dimensions, Achievement Points (0–10 points) and Improvement Points (0–9 points) would be calculated, the larger of which would be summed across these six dimensions to create a pre-normalized HCAHPS Base Score of 0–60 points (as compared to 0–80 points with the current eight dimensions). The pre-normalized HCAHPS Base Score would then be multiplied by $\frac{8}{6}$ (1.3333333) and then rounded according to standard rules (values of 0.5 and higher are rounded up, values below 0.5 are rounded down) to create the normalized HCAHPS Base Score. Each of the six unchanged dimensions would be of equal weight, so that, as currently scored, the normalized HCAHPS Base Score would range from 0 to 80 points. HCAHPS Consistency Points would be calculated using our current methodology and would continue to range from 0 to 20 points. Like the Base Score, the Consistency Points Score would only consider scores across the remaining six unchanged dimensions of the Person and Community Engagement domain. The final element of the scoring formula, which would remain unchanged from the current formula, would be the sum of the HCAHPS Base Score and the HCAHPS Consistency Points Score for a total score that ranges from 0 to 100 points. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50065) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49565), we adopted a similar modified scoring methodology when the Care Transition sub-measure was added to the current HCAHPS Survey measure in the Hospital VBP Program.

This scoring modification would ensure that hospitals can continue to receive scores on the dimensions of the HCAHPS Survey measure that would remain unchanged in the current

survey and would provide a period of transition until the Hospital VBP Program can adopt the updates to the survey. The updated version of the HCAHPS Survey measure would be adopted in the Hospital IQR and PCHQR Programs beginning with January 1, 2025 discharges, however, those updated sub-measures would not be scored as dimensions for the Hospital VBP Program until the FY 2030 program year. We reiterate that hospitals would only have to circulate one version of the HCAHPS Survey measure at a time.

We invited public comment on this proposal to modify scoring on the HCAHPS Survey measure in the Hospital VBP Program for the FY 2027 through FY 2029 program years to only score on the six dimensions discussed earlier.

Comment: Many commenters expressed support for the proposal to modify scoring in the Hospital VBP Program for the FY 2027 through FY 2029 program years because they stated it prevents duplicate, simultaneous survey reporting, minimizes burden and inconvenience, and allows hospitals to consistently administer a single survey under both the Hospital IQR and Hospital VBP Programs. A few commenters commended CMS for respecting statutory requirements, considering stakeholder feedback, and allowing hospitals time to implement the new survey. A commenter recognized that the modifications necessitate a commensurate adjustment to the Hospital VBP Program scoring methodology, and a commenter conditionally supported the scoring modifications with the recommendation that CMS ensure that the resulting scores of the modified HCAHPS Survey measure would still be reliable and valid.

Response: We appreciate commenters' support of the scoring modifications for the FY 2027 through FY 2029 program years and agree that these modifications ensure that we meet statutory requirements and allow hospitals to consistently administer a single survey under both the Hospital IQR and Hospital VBP Programs. In response to the recommendation, we have determined that the resulting scores of the modified HCAHPS Survey measure would still be reliable and valid given that we are utilizing the normalization methodology, where, as described in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36300 through 36301), for each of these

six dimensions, Achievement Points (0–10 points) and Improvement Points (0–9 points) would be calculated, the larger of which would be summed across these six dimensions to create a pre-normalized HCAHPS Base Score of 0–60 points (as compared to 0–80 points with the current eight dimensions). Then, that pre-normalized HCAHPS Base Score would be multiplied by $\frac{8}{6}$ (1.3333333) and rounded according to standard rules (values of 0.5 and higher are rounded up, values below 0.5 are rounded down) to create the normalized HCAHPS Base Score. Each of the six unchanged dimensions would thus be of equal weight, so that just as hospitals are currently scored, the normalized HCAHPS Base Score would range from 0 to 80 points. This normalization methodology ensures that the updated survey measure is scored on the same scale as it is on the current HCAHPS Survey measure and therefore reliable and viable.

Comment: A commenter expressed concern that only using six HCAHPS Survey sub-measures places greater pressure on the scores in the existing dimensions which they stated creates performance stress for hospitals and payment implications. The commenter recommended delaying operationalizing the scoring modifications for a minimum of one additional year.

Response: We appreciate the commenter's concern, but we disagree that the scoring modification would create performance stress for hospitals and payment implications. Normalizing the scores accounts for some of the differences in the number of dimensions. During the FY 2027 through FY 2029 program years, the six unchanged dimensions will each equally account for 16.7 percent of the Person and Community Engagement domain, up from 12.5 percent under the current survey. However, we determined this was a smaller impact on hospitals than pausing scoring of the entire survey for the three transitional program years. We refer the commenter to the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36300 through 36301) for additional information on how the scoring is modified and normalized. We adopted a similar normalization methodology in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50065) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49565) when the Care Transition sub-

measure was added to the current HCAHPS Survey measure in the Hospital VBP Program.

Comment: A commenter requested clarification on whether the domain weights for the domains in the Hospital VBP Program would remain the same through the FY 2027 through FY 2029 program years when the scoring of the HCAHPS Survey measure is modified.

Response: We thank the commenter for their question and affirm that the domain weights for the Hospital VBP Program would remain unchanged, with each of the four domains in the program being weighted at 25 percent as before.

After consideration of the public comments received, we are finalizing adoption of the modifications to scoring in the Hospital VBP Program for the FY 2027 through FY 2029 program years as proposed.

g. Adoption of the Updated HCAHPS Survey Measure and Associated Scoring Modifications in the Hospital VBP Program Beginning with the FY 2030 Program Year

(1) Background

As described in the FY 2025 IPPS/LTCH PPS proposed rule and section IX.B.2.e. of this final rule, the modifications to the proposed updated version of the HCAHPS Survey measure include adding three new sub-measures, “Care Coordination,” “Restfulness of Hospital Environment,” and “Information About Symptoms” to the survey (89 FR 36298 through 36300). The updates also include removing the existing “Care Transition” sub-measure and modifying the existing “Responsiveness of Hospital Staff” sub-measure. Additionally, we proposed to adopt the updated HCAHPS Survey measure in the Hospital VBP Program beginning with the FY 2030 program year and additional scoring modifications beginning with FY 2030 (89 FR 36301 through 36304). This timeline would allow for the updated HCAHPS Survey measure to be adopted and publicly reported under the Hospital IQR Program for one year, as statutorily mandated. We describe the adoption of these updates and scoring modifications in the following sections.

(2) Adoption of the Updated HCAHPS Survey Measure in the Hospital VBP Program Beginning with the FY 2030 Program Year

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36301 through 36304), we proposed to adopt the updated HCAHPS Survey measure in the Hospital VBP Program beginning with the FY 2030 program year to align with the adoption of the updated HCAHPS Survey measure that we proposed to adopt in the Hospital IQR Program, as described in section IX.B.2.e. of this final rule. Under this proposal, the updated HCAHPS Survey measure would have been publicly reported for one year in the Hospital IQR Program prior to the beginning of the performance period for the HCAHPS Survey measure in the Hospital VBP Program for the FY 2030 program year, which consists of a performance period of CY 2028 and a baseline period of CY 2026.

We note that the number and content of dimensions from the proposed updated HCAHPS Survey measure in the Person and Community Engagement Domain in the Hospital VBP Program in FY 2030 differs slightly from the number and content of the sub-measures in the Hospital IQR and PCHQR Programs. Namely, the “Cleanliness” and “Information about Symptoms” sub-measures are single-item sub-measures in the updated HCAHPS Survey measure in the Hospital IQR and PCHQR Programs, but they would be combined into one dimension in the updated HCAHPS Survey measure for the Hospital VBP Program beginning with the FY 2030 program year.

The dimensions in the Person and Community Engagement Domain in the Hospital VBP Program beginning with the FY 2030 program year are:

- “Communication with Nurses,”
- “Communication with Doctors,”
- “Responsiveness of Hospital Staff,”
- “Communication about Medicines,”
- “Cleanliness and Information About Symptoms,”

- “Discharge Information,”
- “Overall Rating of Hospital,”
- “Care Coordination,” and
- “Restfulness of Hospital Environment.”

We refer readers to Table IX.B.2-03 for the timelines for the current and newly adopted HCAHPS Survey dimensions for the Hospital VBP Program.

In the updated HCAHPS Survey measure, the “Care Transition” dimension is removed. The new “Care Coordination” dimension and the new “Information about Symptoms” question, which is included in the new “Cleanliness and Information about Symptoms” dimension, encompass a broader depiction of person-centered care than does the “Care Transition” dimension. The updated HCAHPS Survey measure includes the new “Care Coordination” dimension, the new “Restfulness of the Hospital Environment” dimension, and the new “Cleanliness and Information about Symptoms” dimension. In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to begin using these three new dimensions in the Hospital VBP Program beginning with the FY 2030 program year (89 FR 36301 through 36304). As noted in section IX.B.2.e(1) of this final rule, the “Care Coordination” dimension would further coordination efforts within the hospital setting and support our goals of including measures related to seamless care coordination and person-centered care. Additionally, the new “Restfulness of the Hospital Environment” dimension is comprised of three survey questions: two new questions that ask how often patients were able to get the rest they needed, and whether hospital staff helped the patient to rest and recover, and one current survey question that asks how often the area around the patient’s room was quiet at night (“Quietness”).

The updated version of the HCAHPS Survey measure further modifies the current “Cleanliness and Quietness” dimension in two ways. Beginning with the FY 2030 program year, the “Quietness” question would be removed from the “Cleanliness and Quietness” dimension and would instead be included in the new “Restfulness of Hospital Environment” dimension;

however, the “Quietness” question itself would remain unchanged on the updated HCAHPS Survey measure. Additionally, beginning with the FY 2030 program year, we proposed to modify the “Cleanliness and Quietness” dimension to be called the “Cleanliness and Information About Symptoms” dimension, which would include the existing “Cleanliness” question and the new “Information About Symptoms” question from the updated HCAHPS Survey measure (89 FR 36301 through 36304). The newly developed “Information About Symptoms” question asks the patient whether doctors, nurses, or other hospital staff gave the patient’s family or caregiver enough information about symptoms or health problems to watch out for after the patient left the hospital.

We refer readers to section IX.B.2.b. of this final rule where we further describe the updates included in the updated HCAHPS Survey measure and to Table IX.B.2-03 for the timelines for the current and newly adopted HCAHPS Survey dimensions for the Hospital VBP Program.

TABLE IX.B.2-03 TIMELINES FOR CURRENT AND NEWLY ADOPTED HCAHPS SURVEY DIMENSIONS FOR THE HOSPITAL VBP PROGRAM

HCAHPS Survey Dimension	FY 2025 Program Year	FY 2026 Program Year	FY 2027 Program Year	FY 2028 Program Year	FY 2029 Program Year	FY 2030 Program Year
	Current HCAHPS Survey Measure		Newly Adopted Transition Period			Newly Adopted Updated HCAHPS Survey Measure
Communication with Nurses	CY 2019 Baseline Period*	CY 2022 Baseline Period	CY 2023 Baseline Period	CY 2024 Baseline Period	CY 2025 Reporting Period	CY 2026 Reporting Period
	CY 2023 Performance Period	CY 2024 Performance Period	CY 2025 Performance Period	CY 2026 Performance Period	CY 2027 Performance Period	CY 2028 Performance Period
Communication with Doctors	CY 2019 Baseline Period*	CY 2022 Baseline Period	CY 2023 Baseline Period	CY 2024 Baseline Period	CY 2025 Baseline Period	CY 2026 Baseline Period
	CY 2023 Performance Period	CY 2024 Performance Period	CY 2025 Performance Period	CY 2026 Performance Period	CY 2027 Performance Period	CY 2028 Performance Period
Responsiveness of Hospital Staff	CY 2019 Baseline Period*	CY 2022 Baseline Period	**	**	**	CY 2026 Baseline Period
	CY 2023 Performance Period	CY 2024 Performance Period	**	**	**	CY 2028 Performance Period
Communication about Medicines	CY 2019 Baseline Period*	CY 2022 Baseline Period	CY 2023 Baseline Period	CY 2024 Baseline Period	CY 2025 Baseline Period	CY 2026 Baseline Period
	CY 2023 Performance Period	CY 2024 Performance Period	CY 2025 Performance Period	CY 2026 Performance Period	CY 2027 Performance Period	CY 2028 Performance Period
Cleanliness and Quietness of Hospital Environment	CY 2019 Baseline Period*	CY 2022 Baseline Period	CY 2023 Baseline Period	CY 2024 Baseline Period	CY 2025 Baseline Period	***
	CY 2023 Performance Period	CY 2024 Performance Period	CY 2025 Performance Period	CY 2026 Performance Period	CY 2027 Performance Period	***
Discharge Information	CY 2019 Baseline Period*	CY 2022 Baseline Period	CY 2023 Baseline Period	CY 2024 Baseline Period	CY 2025 Baseline Period	CY 2026 Baseline Period

	CY 2023 Performance Period	CY 2024 Performance Period	CY 2025 Performance Period	CY 2026 Performance Period	CY 2027 Performance Period	CY 2028 Performance Period
Overall Rating of Hospital	CY 2019 Baseline Period*	CY 2022 Baseline Period	CY 2023 Baseline Period	CY 2024 Baseline Period	CY 2025 Baseline Period	CY 2026 Baseline Period
	CY 2023 Performance Period	CY 2024 Performance Period	CY 2025 Performance Period	CY 2026 Performance Period	CY 2027 Performance Period	CY 2028 Performance Period
Care Transition	CY 2019 Baseline Period*	CY 2022 Baseline Period	#	#	#	#
	CY 2023 Performance Period	CY 2024 Performance Period	#	#	#	#
Care Coordination	♦	♦	♦	♦	♦	CY 2026 Baseline Period
	♦	♦	♦	♦	♦	CY 2028 Performance Period
Restfulness of Hospital Environment	♦	♦	♦	♦	♦	CY 2026 Baseline Period
	♦	♦	♦	♦	♦	CY 2028 Performance Period
Cleanliness and Information about Symptoms	♦	♦	♦	♦	♦	CY 2026 Baseline Period
	♦	♦	♦	♦	♦	CY 2028 Performance Period

*In the FY 2023 IPPS/LTCH PPS final rule, we finalized that these baseline periods would be January 1, 2019, through December 31, 2019 instead of CY 2021 due to the impacts of the COVID-19 public health emergency (87 FR 49111 through 49113).

** In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to not score the “Responsiveness of Hospital Staff” dimension for the FY 2027 through FY 2029 program years, and to score an updated version of this dimension beginning with the FY 2030 program year (89 FR 36300 through 36301).

***In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to stop scoring on the “Cleanliness and Quietness of Hospital Environment” dimension beginning with the FY 2030 program year to align with the updates to the HCAHPS Survey measure that would move the “Quietness” question into the “Restfulness of Hospital Environment” dimension and would combine the “Cleanliness” question with the “Information about Symptoms” question to create the new, “Cleanliness and Information about Symptoms” dimension in the Hospital VBP Program (89 FR 36301 through 36304).

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to not score the “Care Transition” dimension for the FY 2027 through FY 2029 program years, and to remove this dimension from the Hospital VBP Program beginning with the FY 2030 program year (89 FR 36300 through 36301).

♦ In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to begin scoring on three new dimensions, “Care Coordination,” “Restfulness of Hospital Environment,” and “Cleanliness and Information about Symptoms” in the Hospital VBP Program beginning with the FY 2030 program year (89 FR 35301 through 36304).

We invited public comment on the proposal to adopt the updated HCAHPS Survey measure in the Hospital VBP Program beginning with the FY 2030 program year.

Comment: Several commenters supported the Hospital VBP Program linking patient satisfaction to payment incentives. The commenters also commended CMS for considering stakeholder feedback and respecting statutory requirements.

Response: We appreciate the commenters’ support of the adoption of the updated HCAHPS Survey measure and linking the results to payment incentives through the Hospital VBP Program.

Comment: A commenter did not support combining “Information about Symptoms” and “Cleanliness” as a single domain because they stated that the two sub-measures are not related.

Response: While we understand the concern about combining the “Information About Symptoms” and “Cleanliness” questions into a single dimension in the Hospital VBP Program, we proposed that these two questions be combined into one dimension because separating them into two single-question dimensions would give them each more weight than the rest of the HCAHPS Survey measure questions, which are organized into multi-question dimensions (with the exception of Overall Rating). If these questions were each separate dimensions, “Cleanliness,” for example, as a single-question dimension, would receive as much weight as the “Communication with Nurses” dimension, which includes three questions. Therefore, we have determined that the combined “Cleanliness and Information about Symptoms” dimension as a two-question dimension is more comparable to the other HCAHPS Survey measure dimensions.

Comment: A few commenters recommended, with respect to the Hospital VBP Program’s adoption of the updates to the HCAHPS Survey measure, that CMS complete validity testing and receive CBE endorsement before implementing the changes in the Hospital VBP Program and that CMS send the questions to a workgroup to make appropriate changes and ensure that there are not unintended consequences for the Hospital VBP Program.

Response: We appreciate the commenters’ concerns, however, as described in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36299), we conducted validity testing on all of the updates. In addition, we intend to submit the updated HCAHPS Survey measure to the current CBE for endorsement in Fall 2025, so we anticipate the re-endorsement process would be completed well before the FY 2030 program year when the updates to the HCAHPS Survey measure are fully implemented in the Hospital VBP Program. We note that section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We have

determined that the updates to the HCAHPS Survey measure are appropriately specified. The HCAHPS Survey measure remains endorsed, and the updated survey only modifies some of the questions and sub-measures within the survey. The HCAHPS Survey is designed to produce standardized information about patients' perspectives of care that allow objective and meaningful comparisons of hospitals on topics that are important to consumers, and these updates would improve the feedback we receive directly from patients on hospital performance. Therefore, we have determined it is appropriate to adopt these updates to the measure before the updates receive CBE endorsement.

Comment: A commenter expressed concern with the dimensions of the HCAHPS Survey measure that should and should not be included in the Hospital VBP Program methodology for future program years.

Response: We appreciate the commenter's concern; however, the dimensions of the HCAHPS Survey measure are made up of the same survey questions used in the Hospital IQR Program to ensure that hospitals only have to implement one version of the survey. We do not agree that only certain dimensions should be included in the Hospital VBP Program in future program years. We refer readers to the Hospital Inpatient VBP Program final rule in which we explain the inclusion of dimensions in the Hospital VBP Program (76 FR 26517 through 26520).

Comment: A few commenters recommended, with respect to the Hospital VBP Program's adoption of the HCAHPS Survey measure updates, ensuring that the questions are worded in a way that allows patients to accurately assess an aspect of quality and testing the impact of the "Restfulness" sub-measure before implementing these updates in the Hospital VBP Program.

Response: We thank the commenters for their recommendations, but as we discussed above, we identified the need for these updates through focus groups and cognitive interviews with patients and caregivers, discussions with technical experts, and literature reviews. Therefore, the phrasing of the questions, including that of the "Restfulness" questions, has been

tested with patients and the validity of the questions has been tested at the expected average number of completed surveys per hospital.

After consideration of the public comments received, we are finalizing adoption of the updated HCAHPS Survey measure in the Hospital VBP Program beginning with the FY 2030 program year as proposed.

(3) Modification of the Scoring of the HCAHPS Survey Measure in the Hospital VBP Program Beginning with the FY 2030 Program Year

In the FY 2025 IPPS/LTCH PPS proposed rule, we also proposed to adopt a new scoring methodology beginning with the FY 2030 program year (89 FR 36304). For each of the nine dimensions, Achievement Points (0–10 points) and Improvement Points (0–9 points) would be calculated, the larger of which would be summed across the nine dimensions to create a pre-normalized HCAHPS Base Score of 0–90 points (as compared to 0–80 points with the current eight dimensions). The pre-normalized HCAHPS Base Score would then be multiplied by $\frac{8}{9}$ (0.88888889) and rounded according to standard rules (values of 0.5 and higher are rounded up, values below 0.5 are rounded down) to create the normalized HCAHPS Base Score. Each of the nine dimensions would be of equal weight, so that, as currently scored, the normalized HCAHPS Base Score would range from 0 to 80 points. HCAHPS Consistency Points would then be calculated in the same manner as with the original HCAHPS Survey measure in the Hospital VBP Program and would continue to range from 0 to 20 points. Like the Base Score, the Consistency Points Score would consider scores across all nine of the Person and Community Engagement domain dimensions. The final element of the scoring formula, which would remain unchanged from the current formula in the Hospital VBP Program, would be the sum of the HCAHPS Base Score and the HCAHPS Consistency Points Score for a total score that ranges from 0 to 100 points, as before. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50065) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49565), we adopted a similar scoring

methodology when the Care Transition dimension was added to the Person and Community Engagement domain in the Hospital VBP Program.

Additionally, we note that in the scoring of the current HCAHPS Survey measure in the Hospital VBP Program, the “Cleanliness and Quietness” dimension is the average of the publicly reported stand-alone “Cleanliness” and “Quietness” questions. As previously noted, the adoption of the updated HCAHPS Survey measure would result in “Quietness” being removed from this dimension and included as a question in the new “Restfulness of the Hospital Environment” dimension, and “Cleanliness” would be combined with the new “Information about Symptoms.” Therefore, “Quietness” would be scored as part of the “Restfulness of the Hospital Environment” dimension in conjunction with the other questions under that dimension. For the “Cleanliness and Information about Symptoms” dimension, we would take the average of the stand-alone “Cleanliness” and “Information about Symptoms” questions to obtain a score for the “Cleanliness and Information about Symptoms” dimension. For the purposes of the Hospital VBP Program, we proposed these two questions be combined so as not to put more weight on these questions compared to the rest of the HCAHPS Survey questions, which are included in multi-question dimensions (with the exception of Overall Rating) (89 FR 36304). If “Cleanliness,” and “Information About Symptoms,” were treated as single-question dimensions, “Cleanliness,” for example, would receive as much weight as the “Communication with Nurses” dimension, which includes three questions. Therefore, the combined “Cleanliness and Information about Symptoms” dimension is more comparable to the other HCAHPS Survey dimensions.

We invited public comment on this proposal to modify scoring of the HCAHPS Survey measure in the Hospital VBP Program beginning with the FY 2030 program year to account for the adoption of the updated HCAHPS Survey measure.

Comment: A few commenters supported the scoring changes beginning in the FY 2030 program year because they stated that the updates to the HCAHPS Survey measure would

necessitate a commensurate adjustment to the scoring.

Response: We appreciate the support of the scoring modifications beginning with the FY 2030 program year in the Hospital VBP Program.

Comment: A commenter requested clarification on whether domain weights for the domains in the Hospital VBP Program would remain the same after implementation of the updated HCAHPS Survey measure.

Response: We thank the commenter for their question and affirm that the domain weights for the Hospital VBP Program would remain unchanged, with each of the four domains in the program being weighted at 25 percent as before.

After consideration of the public comments received, we are finalizing adoption of the modification of the scoring of the HCAHPS Survey measure in the Hospital VBP Program beginning with the FY 2030 program year as proposed.

3. Advancing Patient Safety and Outcomes Across the Hospital Quality Programs – Request for Comment

The Hospital Readmissions Reduction Program was implemented to reduce excess readmissions effective for discharges from applicable hospitals beginning on or after October 1, 2012. The program uses six claims-based measures to track unplanned inpatient admissions within 30 days following discharge. Using the data collected from these measures, we have observed that since the inception of the program, inpatient readmission rates for the conditions and procedures included in the program have gone down.⁴³⁷

However, studies have found a concurrent increase in patients who, after being discharged from an inpatient stay, visit the emergency department (ED) or receive observation services as an outpatient.^{438 439 440 441 442} As a result, we are concerned that our hospital quality reporting and value-based purchasing programs may not be adequately incentivizing hospitals to improve quality of care by accounting for more types of post-discharge events, such as a return to the ED or the receipt of observation services.

From a patient perspective, unexpectedly returning to any acute care setting, including the ED, or receiving observation services after being discharged from an inpatient hospital stay,⁴⁴³ is an undesirable outcome of care. Patients who are discharged from an inpatient stay but

⁴⁴³ Observation care is a well-defined set of specific, clinically appropriate services, which include ongoing short-term treatment, assessment, and reassessment before a decision can be made regarding whether patients will require further treatment as hospital inpatients or if they are able to be discharged from the hospital. Observation services are commonly ordered for patients who present to the emergency department and who then require a significant period of treatment or monitoring in order to make a decision concerning their admission or discharge. See

then make an unplanned return to the hospital may incur higher healthcare costs than those who do not return to the hospital setting due to potential out-of-pocket charges for the unplanned follow-up care. Research has found that the median out-of-pocket cost of observation services received by Medicare beneficiaries as outpatients was \$448.94, with low-income beneficiaries being more likely to report being concerned about costs of follow-up care, as compared to higher income beneficiaries, and limiting health care utilization that could otherwise be deemed essential in response to higher out-of-pocket costs.⁴⁴⁴

While these unplanned returns to the hospital impose significant burden on patients, such visits can often be avoided with greater attention to care coordination.⁴⁴⁵ This coordination can include addressing barriers such as poor health literacy or social determinants of health that complicate a patient's ability to follow post-discharge instructions, fill prescriptions, or alert hospital staff to new symptoms.⁴⁴⁶ For example, in one study, nurses implemented evidence-based practices for transition care, including engaging in patient education, providing clear post-discharge instructions, and following up with patients via phone calls. The study found that 9.4 percent of patients who received such interventions were readmitted 30 days after discharge, compared to an 18.8 percent readmission rate among patients not receiving such interventions. Similarly, 19.8 percent of patients receiving evidence-based transitional care were readmitted within 90 days after discharge, compared to 31.5 percent among patients in the usual care group.⁴⁴⁷ These findings indicate that supporting patients' discharges by proactively addressing potential barriers is effective in reducing unplanned readmissions.

Therefore, we are continually seeking ways to build on current measures in several quality reporting programs that account for unplanned patient hospital visits to encourage hospitals to improve discharge processes. Current measures include three Excess Days in Acute Care (EDAC) measures currently in the Hospital Inpatient Quality Reporting (IQR) Program, which estimate days spent in acute care within 30 days post-discharge from an inpatient hospitalization for a principal diagnosis of the measure's specified condition. The acute care outcomes include ED visits, receipt of observation services, and unplanned readmissions.⁴⁴⁸ The measures are:

- Excess Days in Acute Care (EDAC) after Hospitalization for Acute Myocardial Infarction (AMI), adopted in the FY 2016 IPPS/LTCH PPS final rule beginning with the FY 2018 payment determination (80 FR 49680 through 49682);
- Excess Days in Acute Care (EDAC) after Hospitalization for Heart Failure (HF), adopted in the FY 2016 IPPS/LTCH PPS final rule beginning with the FY 2018 payment determination (80 FR 49682 through 49690); and
- Excess Days in Acute Care (EDAC) after Hospitalization for Pneumonia, adopted in the FY 2017 IPPS/LTCH PPS final rule beginning with the FY 2019 payment determination (81 FR 57142 through 57148).

Another existing measure that we use to assess unplanned hospital returns is the Hospital Visits After Hospital Outpatient Surgery measure. We adopted this measure into the Hospital Outpatient Quality Reporting (OQR) Program in the CY 2017 OPSS/ASC final rule beginning with the CY 2020 reporting period (81 FR 79764 through 79771) and the Rural Emergency Hospital Quality Reporting (REHQR) Program in the CY 2024 OPSS/ASC final rule beginning with the CY 2024 reporting period (88 FR 82064 through 82066). This measure's outcome includes any unplanned hospital visits (ED visits, receipt of observation services, or unplanned

inpatient admissions) within seven days of outpatient surgery. The measure calculates facility-level measure scores based on the ratio of predicted to expected number of post-surgical hospital visits. By publicly reporting these scores, the measure encourages providers to engage in quality improvement activities to reduce unplanned follow-up visits (81 FR 79765).

While our hospital quality reporting and value-based purchasing programs currently encourage hospitals to address concerns about unplanned returns through several existing measures, we recognize that these measures, taken together, do not comprehensively capture unplanned patient returns to inpatient or outpatient care after discharge. The EDAC measures currently in the Hospital IQR Program only cover patients with a primary discharge of AMI, HF, or Pneumonia. Meanwhile, the Hospital Visits After Hospital Outpatient Surgery measure only covers patients following outpatient surgeries. Furthermore, since both the Hospital IQR and Hospital OQR Programs are quality reporting programs, a hospital's performance on these measures is not tied to payment incentives.

Therefore, we invited public comment on how these programs could further encourage hospitals to improve discharge processes, such as by introducing measures currently in quality reporting programs into value-based purchasing to link outcomes to payment incentives. We noted we were specifically interested in input on adopting measures which better represent the range of outcomes of interest to patients, including unplanned returns to the ED and receipt of observation services within 30 days of a patient's discharge from an inpatient stay.

We invited public comment on this topic. The following provides a summary of the responses we received.

Comment: Many commenters supported measuring a wider range of post-discharge patient outcomes, including ED visits and observation services. Several commenters believed that these outcomes are more relevant to patients and would encourage hospitals to enhance discharge processes to improve patient outcomes. A few commenters also stated that including data on ED visits and observation services would allow for better analysis of post-discharge care,

such as determining which visits and services were preventable.

A few commenters supported having the Hospital Readmissions Reduction Program track ED visits and observation services in addition to inpatient readmissions, while others recommended only tracking post-discharge observation services but not ED visits. A commenter recommended that CMS seek to modify the statutory language of the Hospital Readmissions Reduction Program if its current statute does not allow for the measurement of ED visits and observation services. A commenter noted that if the program's statute does not allow for reporting of observation services, CMS could minimize penalties under the program and instead focus on other quality measures and programs. A few commenters recommended that CMS adopt measures that focus on post-discharge outcomes in value-based purchasing programs, to provide greater incentive for hospitals to reduce excess healthcare utilization.

Several commenters supported the EDAC measures as a better measure of preventable hospital returns than CMS' readmission measures, but requested refinements to the EDAC measures first. For example, several commenters recommended that CMS introduce more comprehensive readmissions measures that would encourage involving patients and their caregivers in discharge planning. Another commenter suggested that CMS create a broader EDAC measure that can be segmented by condition and setting, or create an inpatient and outpatient version of this EDAC measure.

Response: We appreciate the commenters' support and recommendations, including the recommendations to include measures that represent a wider range of outcomes of interest to patients, such as unplanned returns to the ED and receipt of observation services, and to adopt measures that focus on post-discharge outcomes in the value-based purchasing programs. We will take this input into account for future notice-and-comment rulemaking.

Comment: Many commenters expressed concerns with the potential unintended consequences of readmission measures for both hospitals and patients. Many commenters believed that readmission measures place the burden of patient outcomes on hospitals without

appropriately accounting for factors outside of their control, such as the patient's condition severity, social determinants of health, and admissions for conditions unrelated to the initial admission. A few commenters urged CMS to ensure that measures capturing readmissions would not unfairly penalize hospitals that disproportionately serve populations with health-related social needs. Another concern from a few commenters was that including ED visits and observation services as unplanned readmissions could lead to physicians deferring timely evaluation of post-operative concerns or choosing healthier patients.

Several commenters did not support adding the EDAC measures to the Hospital Readmissions Reduction Program. Several commenters stated that the definition of readmissions in the program's statute does not include observation services or ED visits, while one comment requested that CMS clarify its authority to introduce the EDAC measures into the program. A few other commenters had concerns about adopting the EDAC measures to the Hospital Value-Based Purchasing (VBP) Program, noting that it could lead hospitals to be penalized for some of the same readmissions as in the Hospital Readmissions Reduction Program. A commenter stated that CMS does not have the statutory authority to add EDAC measures to the Hospital VBP Program. A few of the commenters suggested that CMS instead introduce readmission measures into quality reporting programs because they do not have performance-based penalties. As an alternative to quality reporting, a commenter recommended addressing unplanned hospital visits through value-based care models such as the Comprehensive Care for Joint Replacement Model or the Bundled Payments for Care Improvement Advanced Model.

Response: We thank the commenters for their feedback and share their concern for avoiding negative effects on patient care arising from measuring unplanned hospital returns. We currently use claims-based readmission, mortality, complication, and EDAC measures (there are currently three EDAC measures in the Hospital IQR Program) to track important clinical conditions. As claims-based measures, they use claims and enrollment data that are already available and do not require any additional burden for hospitals to report. We continuously

reevaluate the risk models to ensure they are as valid and reliable as possible, including considering additional data to augment existing definitions of frailty in these measures. We acknowledge that hospitals do not have control over all factors influencing patients' health outcomes. However, hospitals are usually one of the most resourced healthcare entities in their communities and, as such, have important influence over the health of their patients and the communities they serve.^{449 450 451} We continue to prioritize addressing health disparities through carefully considered approaches that aim to illuminate these disparities. Additionally, we acknowledge that the Hospital VBP Program cannot adopt readmission measures per section 1886(o)(2)(A) of the Act. We will continue to take public feedback into account and evaluate ways to measure patient outcomes within the statutory limits of quality reporting and value-based purchasing programs.

We are also working to harmonize measurement across settings, as noted in the Universal Foundation approach that we published in 2023.⁴⁵² This will help align priorities and accountability across healthcare settings. We also note that any future proposal to implement a new measure or program modification would be announced through notice-and-comment rulemaking.

Comment: A few commenters suggested that the Hospital Readmissions Reduction Program shorten the 30-day timeframe of its current readmission measures to around seven days after discharge. The commenters stated that 30 days is too long to accurately assess care quality because it leaves too much time for extraneous factors to impact hospital readmissions.

⁴⁵² Douglas et al., *Aligning Quality Measures across CMS — The Universal Foundation*, *N Engl J Med* 2023;388:776-779 DOI: 10.1056/NEJMp2215539, VOL. 388 NO. 9.

Several commenters offered ways for CMS to ensure better discharge care. A few commenters suggested that CMS reduce readmissions by measuring and promoting access to at home care such as the Acute Hospital Care at Home program. They cited that hospital at home results in fewer complications and improved discharge planning. To ensure more equitable outcomes, a few commenters urged CMS to promote more focus on social determinants of health at discharge, such as by updating Z code reporting. Another commenter recommended that CMS allow hospitals to report transitional care management codes for patients being discharged from the ED, so that patients can receive appropriate discharge care. A commenter emphasized the importance of patient, family, and caregiver engagement, as well as ensuring patient, family, and caregiver health literacy. To that end, the commenter requested that CMS issue guidance to hospitals on how to empower and engage these groups in the patient's care. A commenter suggested that CMS identify opportunities to provide additional financial support for hospitals to improve discharge planning, as financial constraints can pose a barrier to improvement efforts.

A few commenters suggested that CMS consider other measures to reduce readmissions. A commenter suggested that CMS keep the 30-day episode-based cost measures in the Hospital IQR Program while adopting them in the Hospital VBP Program. The commenter believed that this would reduce readmissions because a significant portion of the variation in these measures is driven by readmissions and other returns to acute care. In another suggestion, a commenter recommended that CMS adopt the National Healthcare Safety Network (NHSN) Hospital-Onset Bacteremia & Fungemia Outcome measure into CMS quality reporting and value-based purchasing programs to enhance infection prevention efforts and thus reduce readmissions. Another commenter promoted the Medicare Spending Per Beneficiary measure in the Hospital VBP Program as a comprehensive evaluation of care transition efforts.

A few commenters stated that the word "readmissions" should not be used in the rule to refer interchangeably to inpatient stays, ED visits, and observation services. To support this, they cited other CMS regulations and resources which make a distinction between inpatient stays

and outpatient stays, with emergency department visits and observation services being categorized as outpatient stays.

A commenter asked that CMS quality measurement include public reporting on ED boarding, that is, when patients are held in the ED while there are no inpatient beds available. The commenter believed that public reporting would hold facilities accountable for long boarding times and make consumers aware of an important aspect of hospital quality of care. Another commenter stated that if CMS chooses to measure observation services in readmission measures, CMS should also include observation services under Medicare Part A payments, or eliminate observation status to create a single hospitalization status. They also suggested counting observation stays towards the skilled nursing facility 3-day rule.

Response: We thank the commenters for their feedback regarding introducing quality measures that encourage hospitals to improve discharge processes. We also thank commenters for other suggestions on ways to reduce unplanned readmissions and improve patient post-discharge outcomes. We will take this feedback into consideration as part of future notice-and-comment rulemaking. We also refer readers to section II.C.12., where the Center for Medicare (CM) is updating their Z code payment policy regarding homelessness and housing instability.

C. Requirements for and Changes to the Hospital Inpatient Quality Reporting (IQR) Program

1. Background and History of the Hospital IQR Program

Through the Hospital IQR Program, we strive to ensure that patients, along with their clinicians, can use information from meaningful quality measures to make better decisions about their healthcare. We support technology that reduces burden and allows clinicians to focus on providing high-quality healthcare for their patients. We also support innovative approaches to improve quality, accessibility, affordability, and equity of care while paying particular attention to improving clinicians' and beneficiaries' experiences when interacting with CMS programs. In combination with other efforts across the Department of Health and Human Services (HHS), the Hospital IQR Program incentivizes hospitals to improve healthcare quality and value, while giving patients the tools and information needed to make the best decisions for themselves.

We seek to promote higher quality, equitable, and more efficient healthcare for Medicare beneficiaries. The adoption of widely agreed upon quality and cost measures supports this effort. We work with relevant interested parties to define measures in almost every care setting and currently measure some aspects of care for almost all Medicare beneficiaries. These measures assess clinical processes and outcomes, patient safety and adverse events, patient experiences with care, care coordination, and cost of care. We have implemented quality measure reporting programs for multiple settings of care. To measure the quality of hospital inpatient services, we implemented the Hospital IQR Program. We refer readers to the following final rules for detailed discussions of the history of the Hospital IQR Program, including statutory history, and for the measures we have previously adopted for the Hospital IQR Program measure set:

- The FY 2010 IPPS/LTCH PPS final rule (74 FR 43860 through 43861);
- The FY 2011 IPPS/LTCH PPS final rule (75 FR 50180 through 50181);
- The FY 2012 IPPS/LTCH PPS final rule (76 FR 51605 through 61653);
- The FY 2013 IPPS/LTCH PPS final rule (77 FR 53503 through 53555);
- The FY 2014 IPPS/LTCH PPS final rule (78 FR 50775 through 50837);

- The FY 2015 IPPS/LTCH PPS final rule (79 FR 50217 through 50249);
- The FY 2016 IPPS/LTCH PPS final rule (80 FR 49660 through 49692);
- The FY 2017 IPPS/LTCH PPS final rule (81 FR 57148 through 57150);
- The FY 2018 IPPS/LTCH PPS final rule (82 FR 38326 through 38328 and 82 FR 38348);
- The FY 2019 IPPS/LTCH PPS final rule (83 FR 41538 through 41609);
- The FY 2020 IPPS/LTCH PPS final rule (84 FR 42448 through 42509);
- The FY 2021 IPPS/LTCH PPS final rule (85 FR 58926 through 58959);
- The FY 2022 IPPS/LTCH PPS final rule (86 FR 45360 through 45426);
- The FY 2023 IPPS/LTCH PPS final rule (87 FR 49190 through 49310); and
- The FY 2024 IPPS/LTCH PPS final rule (88 FR 59144 through 59203).

We also refer readers to 42 CFR 412.140 for Hospital IQR Program regulations.

2. Retention of Previously Adopted Hospital IQR Program Measures for Subsequent Payment Determinations

We refer readers to 42 CFR 412.140(g)(1) for our finalized measure retention policy. We first adopted these policies in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53512 through 53513) and codified them in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59174 through 59175). Pursuant to this policy, when we adopt measures for the Hospital IQR Program beginning with a particular payment determination, we automatically readopt these measures for all subsequent payment determinations unless a different or more limited period is proposed and finalized. Measures are also retained unless we propose to remove, suspend, or replace the measures.

We did not propose any changes to these policies in the proposed rule.

3. Removal of and Removal Factors for Hospital IQR Program Measures

We refer readers to 42 CFR 412.140(g)(2) and (3) for the Hospital IQR Program's policy regarding the factors CMS considers when removing measures from the program. We first

adopted these factors in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41540 through 41544) and codified them in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59174 through 59175).

We did not propose any changes to these policies in the proposed rule.

4. Considerations in Expanding and Updating Quality Measures

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53510 through 53512) for a discussion of the previous considerations we have used to expand and update quality measures under the Hospital IQR Program. We also refer readers to the CMS National Quality Strategy that we launched in 2022, with the aims of promoting the highest quality outcomes and safest care for all individuals.⁴⁵³

To comply with statutory requirements that the Secretary of HHS make publicly available certain quality and efficiency measures that the Secretary is considering for adoption through rulemaking under Medicare,⁴⁵⁴ the Consensus-Based Entity (CBE), currently Battelle, convenes the Partnership for Quality Measurement (PQM), which is comprised of clinicians, patients, measure experts, and health information technology specialists, to participate in the pre-rulemaking process and the measure endorsement process. We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for more details on the updated pre-rulemaking measure reviews (PRMR) process, including the measure endorsement and maintenance (E&M) process, for the purpose of providing multi-interested party input to the Secretary on the selection of quality and efficiency measures under consideration for use in certain Medicare quality programs, including the Hospital IQR Program.

5. New Measures for the Hospital IQR Program Measure Set

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36284 through 36293), we proposed to adopt seven new measures: (1) Patient Safety Structural measure beginning with the

⁴⁵³ Centers for Medicare & Medicaid Services. (2022). What is the National Quality Strategy? Available at: <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Value-Based-Programs/CMS-Quality-Strategy>.

⁴⁵⁴ See section 1890A(a)(2) of the Social Security Act (42 U.S.C. § 1395aaa-1(a)(2)).

CY 2025 reporting period/FY 2027 payment determination; (2) Age Friendly Hospital measure beginning with the CY 2025 reporting period/FY 2027 payment; (3) Catheter-Associated Urinary Tract Infection (CAUTI) Standardized Infection Ratio Stratified for Oncology Locations measure beginning with the CY 2026 reporting period/FY 2028 payment determination; (4) Central Line-Associated Bloodstream Infection (CLABSI) Standardized Infection Ratio Stratified for Oncology Locations measure beginning with the CY 2026 reporting period/FY 2028 payment determination; (5) Hospital Harm - Falls with Injury electronic clinical quality measure (eCQM) beginning with the CY 2026 reporting period/FY 2028 payment determination; (6) Hospital Harm - Postoperative Respiratory Failure eCQM beginning with the CY 2026 reporting period/FY 2028 payment determination; and (7) Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications (Failure-to-Rescue) measure beginning with the July 1, 2023 – June 30, 2025 reporting period/FY 2027 payment determination. We provide more details on these proposals in the subsequent sections of the preamble, and details on the proposed Patient Safety Structural measure are in section IX.B.1.

a. Adoption of Age Friendly Hospital Measure Beginning with the CY 2025 Reporting Period/FY 2027 Payment Determination

(1) Background

The U.S. population is aging rapidly, with nearly one in seven Americans at age 65 years or older in 2019.⁴⁵⁵ In the next 10 years, one in five Americans is estimated to be over 65 years old, reaching 80.8 million by 2040.⁴⁵⁶ As the population ages, care can become more complex,⁴⁵⁷ with patients often developing multiple chronic conditions such as dementia, heart

disease, arthritis, type 2 diabetes, and cancer.⁴⁵⁸ These chronic conditions are among the nation's leading drivers of illness, disability, and healthcare costs.⁴⁵⁹

Hospitals are increasingly faced with treating older patients who have complex medical, behavioral, and psychosocial needs that are often inadequately addressed by the current healthcare infrastructure.⁴⁶⁰ The Centers for Disease Control and Prevention (CDC), and other interested parties, have estimated that over 60 percent of Medicare beneficiaries have two or more chronic conditions.^{461 462} To address the challenges of delivering care to older adults with multiple chronic conditions from a hospital and health system perspective, multiple organizations, including American College of Surgeons (ACS), the Institute for Healthcare Improvement (IHI), and the American College of Emergency Physicians, collaborated to identify and establish age-friendly initiatives based on evidence-based best practices that provide goal centered, clinically effective care for older patients.^{463 464} These organizations define age-friendly care as: 1) following an essential set of evidence-based practices; 2) causing no harm; and 3) aligning with “What Matters”⁴⁶⁵ to the older adult and their family or other caregivers.⁴⁶⁶

⁴⁶⁵ Tinetti, M. (January 2019). [Blog] How focusing on What Matters simplifies complex care for older adults. Institute for Healthcare Improvement. Available at: <https://www.ihl.org/insights/how-focusing-what-matters-simplifies-complex-care-older-adults>.

⁴⁶⁶ Institute for Healthcare Improvement. (2022). Age-friendly health systems: Guide to using the 4Ms in the care of older adults in hospitals and ambulatory practices. Available at: https://forms.ihl.org/hubfs/IHIAgeFriendlyHealthSystems_GuidetoUsing4MsCare.pdf.

Based on these age-friendly initiatives and definition, these organizations have developed a framework comprised of a set of four evidence-based elements of high-quality care to older adults, called the “4 Ms”: What Matters, Medication, Mentation, and Mobility.⁴⁶⁷ The elements of the “4 Ms” help organize care for older adults wellness regardless of the number of chronic conditions, a person’s culture, or their racial, ethnic, or religious background.⁴⁶⁸

The collective evidence from these age-friendly efforts demonstrates that hospitals should prioritize patient-centered care for aging patient populations with multiple chronic conditions. With CMS being the largest provider of healthcare coverage for the 65 years and older population, proposing a quality measure aimed at optimizing care for older patients, using a holistic approach to better serve the needs of this unique population, is timely. Although existing quality metrics have improved both the rate and reporting of clinical outcomes that are important to older individuals, these measures can be narrow in scope and may have limited long term effectiveness due to ceiling effects. We therefore proposed this attestation-based structural measure, the Age Friendly Hospital measure, for the Hospital IQR Program, beginning with the CY 2025 reporting period/FY 2027 payment determination in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36307 through 36314). This structural measure seeks to ensure that hospitals are reliably implementing the “4 M’s”, and thus providing evidence-based elements of high-quality care for all older adults.⁴⁶⁹ The elements in the Age Friendly Hospital measure align with IHI’s and Hartford Foundation national initiative for Age Friendly Systems in which many hospitals already participate.⁴⁷⁰

In the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 27103 through 27109), we solicited public comments about the potential inclusion of two geriatric care measures in the

⁴⁶⁷ Ibid.

⁴⁶⁸ Ibid.

⁴⁶⁹ Institute for Healthcare Improvement. (2022). Age-friendly health systems: Guide to using the 4Ms in the care of older adults in hospitals and ambulatory practices. Available at: https://forms.ihl.org/hubfs/IHIAgeFriendlyHealthSystems_GuidetoUsing4MsCare.pdf.

⁴⁷⁰ Institute for Healthcare Improvement. (2022). Age-friendly health systems: Guide to using the 4Ms in the care of older adults in hospitals and ambulatory practices. Available at: https://forms.ihl.org/hubfs/IHIAgeFriendlyHealthSystems_GuidetoUsing4MsCare.pdf.

Hospital IQR Program measure set. These two potential geriatric care measures focused on ensuring hospitals were committed to implementing surgical, and general hospital best practices, for geriatric populations. Public commenters were largely in support of both geriatric care measures (88 FR 59185 through 59193) and stated that measures focused on geriatric care would help a rapidly aging population with unique characteristics find the care they need. The two potential measures, Geriatric Hospital (MUC2022-112) and Geriatric Surgical (MUC2022-032), were included in the “2022 Measures Under Consideration List” (MUC List)⁴⁷¹ and received significant support from the CBE, and it was recommended that the two measures be combined into one.⁴⁷² In response to CBE and public feedback, we proposed this streamlined and combined version of the former two measures (88 FR 59185 through 59193). This structural measure applies a broad scope of evidence-based best practices, focused on goal centered, clinically effective care for older patients in the hospital inpatient setting.

We note that past comments have reflected concerns regarding structural measures because they do not explicitly link to improved outcomes. This is because there is no existing validation process confirming the accuracy of hospitals’ responses to these types of measures. Despite this, structural measures, over time and in select circumstances, have certain advantages over other types of measures. Structural measures provide a way to address a new topic for which no outcome measure exists, such as the Age Friendly Hospital measure, the Hospital Commitment to Health Equity measure (87 FR 49191 through 49201), and the Maternal Morbidity structural measure (86 FR 45361 through 45365). In these examples, structural measures set a new expectation for the development of evidence-based programs and processes that would support improvements in these high impact areas. In the future, these structural

⁴⁷¹ Centers for Medicare & Medicaid Services. 2022 MUC List. Available at: <https://mmshub.cms.gov/measure-lifecycle/measure-implementation/pre-rulemaking/lists-and-reports>.

⁴⁷² Centers for Medicare & Medicaid Services. MAP 2022-2023 Final Recommendations. Available at: <https://mmshub.cms.gov/measure-lifecycle/measure-implementation/pre-rulemaking/lists-and-reports>.

measures can also be linked to new outcome measures or included in the Hospital Star Ratings Program.

(2) Overview of Measure

The Age Friendly Hospital measure assesses hospital commitment to improving care for patients 65 years or older receiving services in the hospital, operating room, or emergency department. This measure consists of five domains that address essential aspects of clinical care for older patients. Table IX.C.1 includes the five attestation domains and corresponding attestation statements.

TABLE IX.C-1. THE AGE FRIENDLY HOSPITAL MEASURE’S FIVE DOMAIN ATTESTATIONS

Attestation Domains	Attestation Statements: Attest “yes” or “no” to each element. (Note: Affirmative attestation of all elements within a domain would be required for the hospital or health system to receive a point for that domain)
<p>Domain 1: Eliciting Patient Healthcare Goals This domain focuses on obtaining patient’s health related goals and treatment preferences which will inform shared decision making and goal concordant care.</p>	<p>(A) Established protocols are in place to ensure patient goals related to healthcare (health goals, treatment goals, living wills, identification of healthcare proxies, advance care planning) are obtained/reviewed and documented in the medical record. These goals are updated before major procedures and upon significant changes in clinical status.</p>
<p>Domain 2: Responsible Medication Management This domain aims to optimize medication management through monitoring of the pharmacological record for drugs that may be considered inappropriate in older adults due to increased risk of harm.</p>	<p>(A) Medications are reviewed for the purpose of identifying potentially inappropriate medications (PIMs) for older adults as defined by standard evidence-based guidelines, criteria, or protocols. Review should be undertaken upon admission, before major procedures, and/or upon significant changes in clinical status. Once identified, PIMS should be considered for discontinuation, and/or dose adjustment as indicated.</p>
<p>Domain 3: Frailty Screening and Intervention This domain aims to screen patients for geriatric issues related to frailty including cognitive impairment/delirium, physical function/mobility, and malnutrition for the purpose of early detection and intervention where appropriate.</p>	<p>(A) Patients are screened for risks regarding mentation, mobility, and malnutrition using validated instruments ideally upon admission, before major procedures, and/or upon significant changes in clinical status. (B) Positive screens result in management plans including but not limited to minimizing delirium risks, encouraging early mobility, and implementing nutrition plans where appropriate. These plans should be included in discharge instructions and communicated to post-discharge facilities. (C) Data are collected on the rate of falls, decubitus ulcers, and 30-day readmission for patients > 65. These data are stratified by demographic and/or social factors. (D) Protocols exist to reduce the risk of emergency department delirium by reducing length of emergency department stay with a goal of transferring a targeted percentage of older patients out of the emergency department within 8 hours of arrival and/or within 3 hours of the decision to admit.</p>
<p>Domain 4: Social Vulnerability This domain seeks to ensure that hospitals recognize the importance of social vulnerability screening of older adults and have systems in place to ensure that social issues are identified and addressed as part of the care plan.</p>	<p>(A) Older adults are screened for geriatric specific social vulnerability including social isolation, economic insecurity, limited access to healthcare, caregiver stress, and elder abuse to identify those who may benefit from care plan modification. The assessments are performed on admission and again prior to discharge. (B) Positive screens for social vulnerability (including those that identify patients at risk of mistreatment) are addressed through intervention strategies. These strategies should include appropriate referrals and resources for patients upon discharge.</p>
<p>Domain 5: Age-Friendly Care Leadership This domain seeks to ensure consistent quality of care for older adults through the identification of an age friendly champion and/or interprofessional committee tasked with ensuring compliance with all components of this measure.</p>	<p>(A) Our hospital designates a point person and/or interprofessional committee to specifically ensure age friendly care issues are prioritized, including those within this measure. This individual or committee oversees such things as quality related to older patients, identifies opportunities to provide education to staff, and updates hospital leadership on needs related to providing age friendly care. (B) Our hospital compiles quality data related to the Age Friendly Hospital measure. These data are stratified by demographic and/or social factors and should be used to drive improvement cycles.</p>

(3) Measure Alignment to Strategy

This measure aligns with our efforts under the CMS National Quality Strategy priority area of “Equity and Engagement” that seeks to advance equity and whole-person care as well as to engage individuals and communities to become partners in their care.⁴⁷³ This measure additionally aligns with the CMS National Quality Strategy priority area of “Outcomes and Alignment” that aims to improve quality and health outcomes across the care journey including the objective to improve quality in high-priority clinical areas and supportive services.⁴⁷⁴

The domains and attestation statements in this measure span the breadth of the clinical care pathway and, together, provide a framework for optimal care of the older adult patient. More specifically, the domains focus on patient goals, medication management, frailty, social vulnerability, and leadership/governance commitment. This structural measure identifies the best evidence-based practices for hospital leadership, operations, and high reliability across each domain, particularly with the unavailability of more direct metrics related to each of the domains. In addition, this measure complements current patient safety reporting, supports hospitals in improving the quality of care for a complex patient population, and furthers our commitment to advancing health equity among the diverse older communities served by participants in CMS programs.

(4) Pre-rulemaking Process and Measure Endorsement

(a) Recommendation from the PRMR Process

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of the preamble of this final rule for details on the PRMR process including the voting procedures used to reach consensus on measure recommendations. The PRMR Hospital Committee met on January 18-19, 2024, to review measures included by the Secretary on a publicly available “2023

⁴⁷³ Centers for Medicare & Medicaid Services. (2023). CMS National Quality Strategy. Available at: <https://www.cms.gov/files/document/cms-national-quality-strategy-handout.pdf>.

⁴⁷⁴ Ibid.

Measures Under Consideration List” (MUC List),^{475 476} including the Age Friendly Hospital measure (MUC2023-219), and to vote on a recommendation regarding use of this measure.

The PRMR Hospital Recommendation Group for the Age Friendly Hospital measure did not reach consensus and did not recommend including this measure in the Hospital IQR Program either with or without conditions. Eleven of the sixteen members of the group recommended adopting the measure into the Hospital IQR Program without conditions; zero members recommended adoption with conditions; five committee members voted not to recommend the measure for adoption. No voting category reached 75 percent or greater, including the combination of the recommend and the recommend with conditions categories. Thus, the committee did not reach consensus and did not recommend including this measure in the Hospital IQR Program either with or without conditions.

Several PRMR Hospital Committee members applauded the intent of this measure and the push toward transparency and consistency in reporting, noting these types of measures signal to hospital leadership and governance the importance of prioritizing initiatives and implementing frameworks outlined in the measure, highlighting how important this specific measure is for prioritizing improving care for older patients.⁴⁷⁷ PRMR Hospital Committee members also commented on the measure’s flexibility regarding screening tools noting it was not overly prescriptive.⁴⁷⁸ Several PRMR Hospital Committee members noted concerns about structural measures in general and whether they drive action.⁴⁷⁹ Specifically, PRMR Hospital Committee members expressed concerns that the measure domains were not tightly scoped enough to drive discrete action. We acknowledge the concerns identified by the PRMR

⁴⁷⁷ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Final MUC Recommendation Report. Available at: <https://p4qm.org/PRMR>.

⁴⁷⁸ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Final MUC Recommendation Report. Available at: <https://p4qm.org/PRMR>.

⁴⁷⁹ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Final MUC Recommendation Report. Available at: <https://p4qm.org/PRMR>.

Hospital Committee members. Nevertheless, we have concluded that this measure does support reliable practices that drive change, transparent reporting, and prioritization of resources to implement these best practices. The measure was developed from a large collaborative that has evaluated the elements incorporated into these domains across many different geographic locations, hospital sizes, and patient demographics. We also refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 59186) where we discussed previous CBE review of the Geriatric Hospital and Geriatric Surgical measures, which were combined by the measure developer based on previous CBE recommendations to create the Age Friendly Hospital measure. As previously discussed, this structural measure plays a role in establishing the foundation for health outcome quality measures, and this measure would support improvements in quality of care in hospitals participating in the Hospital IQR Program by filling gaps in care management for older adults.

(b) Measure Endorsement

The measure has not been submitted for CBE endorsement at this time. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36307 through 36314), we proposed adoption of this measure into the Hospital IQR Program despite the measure not yet being endorsed by the CBE. Although section 1886(b)(3)(B)(viii)(IX)(aa) of the Act requires that measures specified by the Secretary for use in the Hospital IQR Program be endorsed by the entity with a contract under section 1890(a) of the Act, section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. During measure endorsement, the CBE considers whether a measure “is evidence-based, reliable, valid, verifiable, relevant to enhanced health outcomes, actionable at the caregiver level, feasible to collect and report, and responsive to

variations in patient characteristics, such as health status, language capabilities, race or ethnicity, and income level; and is consistent across types of health care providers, including hospitals and physicians (section 1890(b)(2)(A) and (B) of the Act).”

We reviewed CBE-endorsed measures and were unable to identify any other CBE-endorsed measures on this topic. We are adopting this measure pursuant to section 1886(b)(3)(B)(viii)(IX)(bb) of the Act. As previously discussed, we have determined this an appropriate topic for a measure to be adopted absent endorsement because this measure is important for establishing a foundation for future health outcome measures and that this measure provides a framework of best practices for delivering care to older adults with multiple chronic conditions from a hospital and health system perspective.

(5) Measure Calculation

The Age Friendly Hospital measure consists of five domains, each representing a separate domain commitment. Hospitals or health systems would need to evaluate and determine whether they can affirmatively attest to each domain, some of which have multiple attestation statements, for each hospital reported under their CMS certification number (CCN). For a hospital or a health system to affirmatively attest to a domain, and receive a point for that domain, a hospital or health systems would evaluate and determine whether it engaged in each of the elements that comprise the domain (see Table IX.C.1), for a total of five possible points (one point per domain).

A hospital or health system would not be able to receive partial points for a domain. For example, for Domain 3 (“Frailty Screening and Intervention”), a hospital or health system would evaluate and determine whether their hospital or health system’s processes meet each of the corresponding attestation statements described in (A), (B), (C), and (D) (see Table IX.C.1). If the hospital or health system’s processes meet all four attestation statements in Domain 3, the hospital or health system would receive a point for that domain. However, if the hospital could only affirmatively attest to (B) and (C), for example, then no points could be earned for Domain

3. We note that because the Hospital IQR Program is a pay-for-reporting program, hospitals would receive credit for the reporting of their measure results regardless of their responses to the attestation questions.

For more details on the measure specifications for the Hospital IQR Program, we refer readers to the Web-Based Data Collection tab under the Hospital IQR Program measures page on QualityNet at: <https://qualitynet.cms.gov/inpatient/iqr/measures#tab1> (or other successor CMS designated websites).

(6) Data Submission and Reporting

Hospitals and/or health systems are required to submit information for structural measures once annually using a CMS-approved web-based data collection tool available within the Hospital Quality Reporting (HQR) System. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36307 through 36314) we proposed the mandatory reporting of this measure beginning with the CY 2025 reporting period/FY 2027 payment determination. We refer readers to section IX.C.9. of the preamble of this final rule for more details on our data submission and deadline requirements for structural measures. Specifications for the measure would also be posted on the QualityNet web page at: <https://qualitynet.cms.gov/inpatient/iqr/measures#tab1> (or other successor CMS designated websites)

We refer readers to section IX.C.9. of this final rule for our previously finalized structural measure reporting and submission requirements.

We invited public comment on our proposal to adopt the Age Friendly Hospital measure beginning with CY 2025 reporting period/FY 2027 payment determination.

Comment: Many commenters supported our proposal to adopt the Age Friendly Hospital measure in the Hospital IQR Program. Many commenters noted this measure would address the care needed to improve outcomes for older and vulnerable patients. Many commenters expressed support on the basis that the measure is evidence-based and builds on guidelines established by several medical specialty societies focused on health care provisions for older

adults. Many commenters specifically referred to the “4 M’s” because the measure organizes care around what matters most to the patient, encourages review and reconciliation of medications, requires the assessment of mobility and mentation, and that these matters would benefit older adults and would result in improved outcomes and quality of care for older adults. Several commenters supported this measure and noted that it is a first step towards focusing on and measuring many aspects of geriatric care. A few commenters cited the improvements from this measure that would create a safer environment for older adults in the hospital.

Response: We thank the commenters for their support. We agree that the measure’s focus on patient goals, medication management, frailty, social vulnerability, and leadership/governance commitment would encourage improvements in care provided to older adults in the inpatient hospital setting. We also agree that this measure builds on evidence-based guidelines established from multiple organizations specializing in care delivery for older adults. Lastly, we agree with commenters that this measure would be an initial effort toward quality measures related to geriatric care in the hospital inpatient setting.

Comment: A commenter supported this measure and the expected benefits of having emergency departments that focus on the care and needs of the geriatric population and recommend continuing to advance geriatric emergency care.

Response: We thank the commenter for their support. We note that any future proposal to implement measures focused on geriatric care in the emergency department would be announced through notice-and-comment rulemaking.

Comment: A commenter supported this measure and emphasized that Veterans are at a higher risk for developing dementia and suggested that this measure would encourage hospitals to treat the Veteran as a whole person.

Response: We thank the commenter for their support. We agree that this measure would encourage hospitals to treat those at risk for cognitive changes as a whole person, including Veterans.

Comment: A commenter supported the Age Friendly Hospital measure and stated that public reporting of this measure would help consumers select high-quality care.

Response: We thank the commenter for their support of this measure. We agree that this measure would support consumers' identification of high-quality care.

Comment: A few commenters recommended removing malnutrition screening under Domain 3 because it is not a standard requirement, and hospitals would need to reconsider and integrate this new element into the workflow.

Response: We disagree with the recommendation to remove malnutrition screening discussed in Domain 3. Measure developers included nutrition screening as a part of delirium prevention because studies show that the implementation of cognitive screening and delirium prevention strategies such as education, sleep hygiene, reorientation, and attention to nutrition significantly decreases the number and duration of episodes of delirium in hospitalized patients.^{480 481 482} Thus, nutrition screening has significant value to providing high quality inpatient care for older populations and we will not be removing this language from the measure.

We also refer readers to sections IX.C.5.a.(1)., IX.C.5.a.(2)., and IX.C.5.a.(4). of the preamble of this final rule for more details on the guidelines and literature which informed this measure, the CBE input provided, and the significant public comment support expressed from experts, patients, and caregivers.

Comment: A few commenters did not support the Age Friendly Hospital measure because they stated that some of the practices captured by the measure are duplicative of other reporting requirements, including aspects of accreditation by The Joint Commission or parts of Medicare's Conditions of Participation (CoPs).

⁴⁸⁰ Siddiqi N, Harrison JK, Clegg A, et al. Interventions for preventing delirium in hospitalised non-ICU patients. *Cochrane Database Syst Rev*. Mar 11 2016;3:CD005563. doi:10.1002/14651858.CD005563.pub3

⁴⁸¹ Inouye SK, Bogardus ST, Jr., Charpentier PA, et al. A multicomponent intervention to prevent delirium in hospitalized older patients. *N Engl J Med*. Mar 4 1999;340(9):669-76. doi:10.1056/NEJM199903043400901

⁴⁸² Park, C., et al. (2022). Association Between Implementation of a Geriatric Trauma Clinical Pathway and Changes in Rates of Delirium in Older Adults With Traumatic Injury. *JAMA Surg* 157(8): 676-683.

Response: We believe the commenters are referring to the Medicare CoP for hospitals related to quality assessment and improvement programs at 42 CFR 482.21(a) through (e). We disagree that the Age Friendly Hospital measure is redundant to the CoPs and maintain that it is complementary to them. While the CoPs set forth minimum activities related to developing, implementing, and maintaining an effective, ongoing, hospital-wide, data-driven quality assessment and performance improvement program, the elements of the Age Friendly Hospital measure requires hospitals to attest to whether hospitals have built upon these minimum activities to exemplify optimizing care for older patients with a multifaceted vulnerability profile through implementation of geriatric vulnerability screens, evaluation of patient social determinants of health, preventing the prescription of inappropriate medications, providing goal concordant care, and implementation of a quality framework for oversight of the care pathway for older patients.

Additionally, we continually look for methods to minimize provider reporting burden and do not find that this measure is duplicative of other efforts or currently available measures in the Hospital IQR Program.

Comment: A commenter had concerns about Domain 5, Age-Friendly Care Leadership, specifically the statement requiring a designated point person or interprofessional committee. The commenter suggested that this requirement is unnecessary and redundant as all phases of hospital care have the appropriate hierarchy and structures in place to ensure high quality standards without requiring them to be specifically stated for this measure.

Response: We acknowledge the commenter's concerns regarding potentially duplicative processes and procedures that already exist in hospitals. We do not agree that the Age Friendly Hospital measure, Domain 5, is redundant and that all phases of hospital care in all hospitals have the appropriate structures in place to ensure high quality standards for older patients. Existing geriatric models of care have been shown to have multiple benefits for older hospitalized patients such as decreased rates of delirium, shorter lengths of stay, and improved

function.^{483 484 485 486 487} This measure has been developed to ensure that implementation of quality improvement frameworks is championed by geriatric leadership and that this wide-ranging initiative is lead in a unified manner and continually re-evaluated for opportunities for clinical improvement for older patients. Clinical programs generally cannot succeed without dedicated leadership and ongoing quality monitoring and improvement. The pillars of quality improvement have been well established in the literature, including consistent data collection with continuous feedback allowing for the identification of areas for improvement in process, structure, and outcomes.⁴⁸⁸

Comment: A few commenters recommended including patients 45 years or older instead of patients 65 years and older.

Response: We thank the commenters for their recommendation and will share this feedback with the measure developers. While the measure does not include patients 45 years and older at this time, we note that hospitals are not prevented from implementing the activities described in the domains of this measure and the ensuing care improvements for patients younger than 65 years.

Comment: A few commenters had concerns about the perceived lack of oversight for structural measures, including the Age Friendly Hospital measure. A commenter recommended a stronger audit function to strengthen the measure and ensure accurate reflection of what is

⁴⁸³ Inouye SK, Bogardus ST, Jr., Charpentier PA, et al. A multicomponent intervention to prevent delirium in hospitalized older patients. *N Engl J Med.* Mar 4 1999;340(9):669-76. doi:10.1056/NEJM199903043400901

⁴⁸⁸ Ingraham AM, Richards KE, Hall BL, Ko CY. Quality improvement in surgery: the American College of Surgeons National Surgical Quality Improvement Program approach. *Adv Surg.* 2010;44:251-67. doi:10.1016/j.yasu.2010.05.003

occurring in the hospital. A commenter suggested that the measure may lack direct oversight and may not be easily audited, meaning that hospitals may attest to current practices and refuse to address domains that require significant time, effort, and resources.

Response: We understand commenters' concerns regarding the accuracy of provider self-reported data and are continuously evaluating new ways, including but not limited to an audit plan, to ensure accurate information is submitted to CMS and shared with the public. We acknowledge that past comments have reflected concerns regarding structural measures because they do not explicitly link to improved outcomes. This is because there is no existing validation process confirming the accuracy of hospitals' responses to these types of measures. Despite this, structural measures, over time and in select circumstances, have certain advantages over other types of measures. Structural measures provide a way to address a new topic for which no outcome measure exists, such as the Age Friendly Hospital measure, the Hospital Commitment to Health Equity measure (87 FR 49191 through 49201), and the Maternal Morbidity structural measure (86 FR 45361 through 45365). In these examples, structural measures set a new expectation for the development of evidence-based programs and processes that would support improvements in these high impact areas. We note that we require all hospitals participating in the Hospital IQR Program to complete the Data Accuracy and Completeness Acknowledgement (DACA) each year, which requires an annual attestation that all the information reported to CMS for this program is accurate and complete to the best of the submitters' knowledge. CMS expects all hospitals to submit complete and accurate data with respect to quality measures. We refer readers to section IX.C.11. of this final rule for more details on the DACA policies for the Hospital IQR Program.

Comment: Several commenters questioned the evidence that implementation of the measure would lead to better outcomes. A few commenters did not support this measure and recommended instead developing a geriatric-care surgical outcome-based measure that helps hospitals identify gaps in care for older adults. A commenter recommended evaluating gaps in

quality and working with relevant parties to develop meaningful outcome measures for older populations. A few commenters called for an immediate adoption of this measure and encouraged CMS to move with urgency to further develop this into an outcome measure, given the vulnerability of older populations.

Response: While this measure does not measure patient outcomes or specific activities of patient care, it assesses hospitals' implementation of a systems-based approach to age friendly care best practices, which is applicable to all older patient care activities and outcomes. Age friendly care is a top priority for the rapidly aging populations across the U.S. and although existing quality metrics have improved both the rate and reporting of clinical outcomes that are important to older adults, these measures may be narrow in scope. Optimizing care for older patients with multifaceted vulnerability profiles requires a holistic approach with the goal of improving the entire care pathway to better serve the needs of this unique population. Therefore, we have identified that there is a measure gap in our current quality reporting programs. That is, we have identified a gap in measures that emphasize the importance of complex medical, physiological, and psychosocial needs that are often inadequately addressed in the hospital inpatient infrastructure. Regarding commenter recommendations to develop geriatric-care surgical outcome-based measures, the Age Friendly Hospital measure plays a role in establishing the foundation for health outcome quality measures on this topic and this measure will support improvements in quality of care in hospitals participating in the Hospital IQR Program by filling gaps in care management for older adults. We also refer readers to sections IX.C.5.a.(1), IX.C.5.a.(2), and IX.C.5.a.(4). of the preamble of this final rule for more details on the guidelines and literature which informed this measure, the CBE input provided, and significant public comment support expressed from experts, patients and caregivers.

We thank commenters for their support regarding the inclusion of the Age Friendly Hospital measure and who recommended implementing it sooner than proposed. While we are not finalizing adoption of this measure before the CY 2025 reporting period/FY 2027 payment

determination, this does not preclude hospitals from implementing the practices described in the measure sooner if not doing so already.

Comment: A few commenters had concerns that attestations without quantitative metrics would not lead to quantifiable improvements in quality of care and patient outcomes and recommended continuing to work with interested parties on development of quantifiable metrics to inform data driven quality measures. Commenters noted that attestation measures do not have the same level of significance as outcome measures and do not provide meaningful, actionable data to be used for performance improvement, and are not specific enough to provide comparable information.

Response: We acknowledge commenter concerns regarding whether structural measures explicitly link to quantifiable improvement in quality of care and patient outcomes, however, we disagree that structural measures do not hold the same level of significance as outcome measures. We note that structural measures, in selected circumstances, over time and with experience, offer certain advantages over other types of measures. Structural measures provide a way to address a new topic for which no outcome measure exists, such as the Age Friendly Hospital measure, the Hospital Commitment to Health Equity measure (87 FR 49191 through 49201), and the Maternal Morbidity Structural measure (86 FR 45361 through 45365). In these examples, structural measures set a new expectation for the development of evidence-based programs and processes that would support improvements in these high impact areas. Specifically, regarding the Age Friendly Hospital measure, this measure assesses whether the appropriate structures are in place to ensure high quality care for older patients. In the future, these can also be linked to new outcome measures or included in the Hospital Star Ratings Program. We will continue to engage interested parties as we continue to build on our efforts to address quality of care and patient outcomes for older patients.

Comment: A few commenters had concerns or recommendations regarding the burden of implementing this measure in the timeline proposed. A few commenters had concerns about the

financial and resource burden of implementing two new structural measures for CY 2025 reporting period. Another commenter recommended a transitional approach to implementing this measure by increasing the number of questions year over year. A commenter argued that the Age Friendly Hospital measure would adversely affect care delivery teams and cause additional stress through the expanded requirements for patient screenings in complex patient encounters. The commenter recommended postponing the measure's adoption until at least CY 2026. A commenter recommended a voluntary reporting period.

Response: We understand commenters' concerns. However, we do not expect all hospitals to achieve a score of five out of five on the measure in the first reporting year. This measure is intended to advance the current state of age friendly care structures within hospitals. By adopting the measure for the CY 2025 reporting period, we establish a baseline measure performance, which we can use to understand changes in care practices as hospitals seek to incorporate more of the practices outlined in the measure's requirements. Requiring attestation to two or three items per domain would not allow establishment of a baseline, nor would it as effectively encourage increased adoption of age friendly initiatives within inpatient hospitals. Regarding commenters' concerns about additional burden and the stress this may place on their hospitals, we acknowledge that reporting this measure may increase administrative burden, and we refer readers to section XII.B.6.b. for our discussion of information collection burden. We also acknowledge that hospitals may have to invest in changes to their systems in order to be able to attest "yes" to some domains. We reiterate that we do not expect all hospitals to achieve a score of five on the measure in the first year. Hospitals that are not able to attest positively to all the domains can still meet the measure reporting requirements; therefore, we are not including a voluntary reporting period for this measure. They may receive a score lower than five but would not be subject to a payment reduction so long as they attest to each domain (positively or negatively).

Comment: A few commenters made recommendations to strengthen the measure's elements regarding cognitive changes. A few commenters suggested a requirement to establish a communication plan when cognitive changes have been identified during screening for dementia or cognitive dysfunction. A commenter recommended better cognitive tests for dementia. A few commenters recommended that this measure include education and training about cognitive changes. A commenter recommended hospitals should establish programs and protocols to identify health conditions that affect older populations, such as dementia and Alzheimer's.

Response: We thank the commenters for their input and appreciate the many meaningful practices that could be utilized in hospitals across our nation and the commitment to care for those who are at risk of cognitive dysfunction, including dementia and Alzheimer's disease. While we will not be making the suggested recommendations at this time, we will share all feedback with the measure steward for the future. For this first version of the Age Friendly Hospital measure, the measure steward developed the measure to allow some flexibility in meeting the domains and not be overly prescriptive. Any future proposals to implement such a measure, or to substantively modify the measure to include these recommendations, would be announced through notice-and-comment rulemaking.

Comment: A commenter recommended that CMS consider adding language to the measure to account for the functions of health systems rather than only individual hospitals.

Response: As described in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36307 through 36311), we developed this measure to address the challenges of delivering care to older adults with multiple chronic conditions from both a hospital and health system perspective. Multiple organizations, including American College of Surgeons (ACS), the Institute for Healthcare Improvement (IHI), and the American College of Emergency Physicians (ACEP), collaborated to identify and establish age-friendly initiatives based on evidence-based best

practices that provide goal centered, clinically effective care for older patients.^{489 490} The elements in the Age Friendly Hospital measure align with IHI’s and Hartford Foundation’s national initiative for Age Friendly Systems which has been implemented in hospitals of various sizes, including health systems.⁴⁹¹ For the Hospital IQR Program, hospitals should report the measure to CMS’ Hospital Quality Reporting (HQR) System based on their CMS Certification Number (CCN).

Comment: A few commenters expressed concern about Domain 4, Social Vulnerability. A commenter had concerns about hospitals that serve disadvantaged, rural, or low socioeconomic status communities may be unfairly penalized in element (b) of this Domain. The commenters noted the importance of ensuring that patients are connected to resources to address social vulnerabilities; however, hospitals treating disproportionate numbers of these patients may not have adequate access to such resources to attest “yes” to this portion of the measure, or there could be a lack of available resources in a particular community that is beyond the control of the hospital. A commenter appreciated that element (a) of Domain 4 considers screening for caregiver stress and recommended including “appropriate referrals and resources for patients’ family caregivers, as applicable” to element (b) of Domain 4, to be inclusive of caregivers for all elements of Domain 4.

Response: We acknowledge commenters’ concerns regarding hospitals that serve historically underserved, rural, or low socioeconomic status communities being unfairly penalized in element (b) of this Domain. We acknowledge that facilitating quality improvement for rural hospitals and small hospitals can present unique challenges and is a high priority under

⁴⁸⁹ American Geriatrics Society Expert Panel on the Care of Older Adults with Multimorbidity. (2012). Guiding principles for the care of older adults with multimorbidity: an approach for clinicians. *Journal of the American Geriatrics Society*, 60(10), E1–E25.

Decision making for older adults with multiple chronic conditions: executive summary for the American Geriatrics Society guiding principles on the care of older adults with multimorbidity. *Journal of the American Geriatrics Society*, 67(4), 665–673.

⁴⁹¹ Institute for Healthcare Improvement. (2022). Age-friendly health systems: Guide to using the 4Ms in the care of older adults in hospitals and ambulatory practices. Available at: https://forms.ihl.org/hubfs/IHIAgeFriendlyHealthSystems_GuidetoUsing4MsCare.pdf.

the CMS National Quality Strategy.⁴⁹² We continue to consider ways to support small and rural hospital efforts toward achieving health equity. We note that during development of this measure, we gave this topic significant consideration, and the intent of Domain 4 is to promote adoption of social vulnerability screening of older adults and to emphasize the importance of having systems in place to ensure that social issues are identified and addressed as a part of the care plan, not to impose undue strain on hospitals treating disproportionate numbers of patients that may not have adequate access to such resources.

We acknowledge commenter concerns about public reporting of their score on this measure through Care Compare if a hospital is unable to attest “yes” to a domain. While we recognize that a hospital’s performance on the measure may impact the hospital’s reputation through public reporting, this reputational impact is a means of encouraging the adoption of frameworks centered around providing high quality care to vulnerable elderly patients with multiple medical, psychological, and social needs at highest risk for adverse events after major health events requiring hospitalization. Further, we believe public reporting of healthcare quality data promotes transparency in the delivery of care by increasing the involvement of leadership in healthcare quality improvement, creating a sense of accountability, helping to focus organizational priorities, and providing a means of delivering important healthcare information to consumers.⁴⁹³ Lastly, this measure is intended to provide information to hospitals on high yield points of intervention for older adults who are admitted to a hospital or an emergency department and provide a framework for the optimal care of the older adult patient (89 FR 36307 through 36311).

We note that the Hospital IQR Program is a pay-for-reporting program, and hospitals’ payments are not based on their performance on quality measures. Hospitals would receive

⁴⁹² Centers for Medicare & Medicaid Services. (2023). CMS National Quality Strategy. Available at: <https://www.cms.gov/files/document/cms-national-quality-strategy-handout.pdf>.

⁴⁹³ Centers for Medicare & Medicaid Services Quality Net. Public Reporting Overview. Available at: <https://qualitynet.cms.gov/inpatient/public-reporting>.

credit for successful reporting of their measure results regardless of whether they positively or negatively attest to each statement within a domain. We refer readers to section IX.C.5.a.(6). of this final rule for information on the submission and reporting requirements for this measure. We thank the commenter for their recommendation to include providing referrals to caregivers in element (b) in Domain 4 and will share all feedback with the measure steward.

Comment: A few commenters expressed concern regarding the “all or nothing” scoring methodology regarding the five domain attestations and recommended considering partial credit, noting this would enable hospitals to better understand barriers and where to prioritize efforts for quality improvement.

Response: We understand commenters’ concerns that many hospitals will not be able to positively attest to all the statements for each of the domains, which will affect the hospital’s score for the entire domain. However, the measure steward intentionally chose to score on a zero to five basis at the domain level instead of allowing partial credit (allowing a hospital to receive credit for each positively attested statement) to emphasize the interdependencies of the statements within each domain. Because the Age Friendly Hospital measure assesses hospitals in terms of their systemic approach to age friendly care, it is important to achieve all the actions within each domain, rather than to only meet several items. We reiterate that we do not expect all hospitals to achieve a score of five on the measure in the first reporting year. Furthermore, requiring attestation to fewer items per domain would be less effective at furthering the current state of age friendly structures within hospitals. In addition, full point scoring is also intended to keep the level of complexity to a minimum and therefore ease the general public’s ability to understand the measure. We reiterate that the Hospital IQR Program is a pay-for-reporting program, and hospitals would receive credit for the reporting of their measure results regardless of their responses to the attestation questions.

Comment: A few commenters did not support this measure and had concerns regarding elements included in Domain 3. Specifically, a few commenters had concerns regarding the

transfer of older patients out of the emergency room within eight hours of arrival or three hours of decision to admit as factors that are influenced beyond the control of the hospital. A few commenters questioned the wait time element used in this domain because of workforce shortages, unforeseen hastened disposition of patients, and lack of acceptable boarding time parameters recommendations.

Response: We acknowledge commenters' concerns regarding elements included in Domain 3 that would require attestation to the transfer of older patients out of the emergency room within eight hours of arrival or three hours of the decision to admit. We understand that there may be many factors, including work shortages, that are outside of the control of the hospital that can delay transfer from the emergency room, and that this may be especially true for rural hospitals. However, we remain concerned about patients being subjected to lengthy waiting periods for hospital care, and this element of Domain 3 would encourage hospitals to review their practices, especially for older patients, to ensure that patients are seen as quickly as is reasonable.

Comment: Several commenters had concerns about the limited performance gap for this measure during its testing and stated that reporting on this measure would waste a hospital's limited resources because of the limited potential for performance improvement. A commenter had concerns that this measure would quickly "top out," leaving no room for improvement across hospitals.

Response: We disagree with the concern that this measure has limited potential for improvement across hospitals. The measure developer's initial pilot study showed significant variation in hospital performance. The majority of institutions reported completing some or all of the domains, but there was a wide range between partially and fully attesting to each element across the five domains of this measure. Rates of full compliance on domains ranged from 12.5 percent to 87.5 percent, while rates of partial compliance were higher than the rates of full compliance, accounting for the relatively low noncompliance rates. As with all Hospital IQR

Program measures, we will monitor performance on the measure carefully and will consider removing the measure in the future if it becomes topped-out.

Comment: Several commenters had concerns that this measure may be prone to inconsistent interpretations and therefore be implemented and reported differently across hospitals. A few commenters were concerned that this measure may be inconsistently reported across hospitals that patients and their families may misinterpret the results of this measure when they are publicly reported. A commenter conveyed that the attestations in this measure are not specific enough to ensure that hospitals are reporting comparable information and that the measure therefore is unlikely to lead to improvement in care for this population.

Response: We acknowledge commenters' concern about public reporting of this measure and interpretation by the public. We refer readers to sections IX.C.5.a.(5) and IX.C.5.a.(6) (Measure Calculation and Data Submission and Reporting, respectively) of this final rule for detailed descriptions of how we calculate and publicly report this measure on the Compare tool hosted by HHS, currently available at: <https://www.medicare.gov/care-compare>. This measure includes five attestation-based questions, each representing a separate domain of commitment. Hospitals receive one point for each domain to which they attest "yes" stating they are meeting the required competencies. For each domain there are between one and four associated yes or no sub-questions for related structures or activities within the hospital. Hospitals will only receive a point for each domain if they attest "yes" to all related elements in a domain. A hospital's score can range from a total of zero to five points. For more details on the measure specifications for this measure, we refer readers to the Web-Based Data Collection tab under the Hospital IQR Program measures page on QualityNet at: <https://qualitynet.cms.gov/inpatient/iqr/measures#tab1> (or other successor CMS designated websites). We intend to provide educational materials as part of our outreach and public reporting of this measure to ensure understanding and interpretation of publicly reported data. For measures that are submitted annually, we strive to have educational materials related to

publicly reported data available to hospitals the following fall. For example, public reporting related educational materials for measures with a CY 2025 performance period will be available in the fall of CY 2026.

Regarding commenters concerns about the specificity of this measure and concerns about meaningful improvements, this measure has been developed to provide insightful information to healthcare providers and the public on the number of hospitals currently participating in age friendly care including social vulnerability screening for older adults, ensuring consistent quality care of older patients by ensuring hospitals have an age friendly champion or interprofessional committee, frailty screening for geriatric issues, eliciting patient health related care goals and treatment preferences, and responsible medication management. We also refer readers to sections IX.C.5.a.(1)., IX.C.5.a.(2)., and IX.C.5.a.(4). of the preamble of this final rule for more details on the guidelines and literature which informed this measure, the CBE input provided, and significant public comment support expressed from experts, patients and caregivers.

Comment: A few commenters recommended providing detailed and clear guidance on data collection and data entry to help facilitate meaningful reporting, including how hospitals should document whether they are satisfying each domain, and how it would be published for the public if finalized. A commenter requested guidance on the scope and depth of interventions required to get a point for Domain 3. A commenter requested data specifications or required elements for frailty screenings, medication management, malnutrition, and cognitive impairment, as well as clarity of scope for those requirements. A commenter expressed concern over the lack of definition of “evidence” in Domain 1.

Response: The Age Friendly Hospital measure is intended to provide hospitals flexibility in meeting each of the attestations and allow each hospital to adopt practices that are most effective for its individual circumstances. We recognize that there is significant variation among hospitals, which means that policies and procedures that are effective in some hospitals may not be effective in other hospitals. Because these practices would not be identical across hospitals

the documentation supporting the practice may also vary. Therefore, the attestations in the Age Friendly Hospital measure have been developed to encourage hospitals to adopt policies and procedures consistent with a structure, culture, and leadership commitment to age friendly structures without being overly prescriptive in how hospitals implement these policies and procedures.

Regarding the request for data specifications and clarification on required elements for frailty screenings, medication management, malnutrition, and cognitive impairment, and clarity of scope for those requirements, we remind readers that the Hospital IQR Program is a pay-for-reporting program, and therefore, there are no set performance targets. We refer readers to the measure specifications at <https://qualitynet.cms.gov/inpatient/iqr/> “resources” tab for more details.

We wish to clarify that we will provide educational and training materials to help with consistent implementation which will be conveyed through routine communication channels to hospitals, vendors, and QIOs, including, but not limited to, issuing memos, emails, and notices on the QualityNet website. Additionally, we will provide education and outreach materials to support hospitals in identifying additional evidence-based practices they could adopt and in documenting that they have adopted those practices. For more details on measure specifications, we also refer readers to the Web-Based Data Collection tab under the IQR Measures page on QualityNet at: <https://qualitynet.cms.gov/inpatient/iqr/measures#tab2>.

Comment: A few commenters did not support this measure, noting that structural measures are burdensome to implement. A commenter stated that the benefits of adopting the measure do not sufficiently outweigh the burden of reporting it and suggested that we consider additions to the Conditions of Participation instead.

Response: We understand that there would be administrative burden with understanding each of the attestation statements and determining whether a hospital’s age friendly structures are in alignment with the attestation statements. We acknowledge that reporting this measure may

increase administrative burden, and we refer readers to section XII.B.6.b. of this final rule for our discussion of information collection burden. We further recognize that this administrative burden may be more significant during the first reporting year as hospitals familiarize themselves with the attestation statements. However, implementing evidence-based practices for high-quality care for older adult patients with multiple complex medical conditions is essential to avoiding unnecessary harm such as mortality and loss of function. By adopting the Age Friendly Hospital measure, we are not only assessing hospital implementation of a systems-based approach that spans the breadth of the care pathway, we are also promoting such implementation. Therefore, we expect the Age Friendly Hospital measure to have significant benefits for a large portion of the U.S. patient population. While we understand that hospital staff and leaders will have to spend time reviewing the attestations and assessing their hospital's practices in relation to the attestation statements, this measure assessment will further encourage hospitals to understand and consider implementing systems-based approaches to older patient best practices if they are not already doing so, which will in turn, improve patient care and outcomes.

Comment: Several commenters did not support this measure and recommended that this measure receive endorsement from the CBE prior to adoption into the Hospital IQR Program. A few commenters had concerns that the PRMR Hospital Committee did not reach consensus on this measure and suggested that the measure should be reviewed in more detail before its adoption.

Response: We thank commenters for their recommendation to submit this measure to the CBE for endorsement. While we recognize the value of measures undergoing CBE endorsement review, given the importance of this health topic and, as there are currently no CBE-endorsed measures that address age friendly hospital care from a hospital and healthcare system level, it is important to implement this measure as soon as possible. Although section 1886(b)(3)(B)(viii)(IX)(aa) of the Act requires that measures specified by the Secretary for use in the Hospital IQR Program be endorsed by the entity with a contract under section 1890(a) of

the Act, section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. During measure endorsement, the CBE considers whether a measure is evidence-based, reliable, valid, verifiable, relevant to enhanced health outcomes, actionable at the caregiver level, feasible to collect and report, and responsive to variations in patient characteristics, such as health status, language capabilities, race or ethnicity, and income level; and is consistent across types of health care providers, including hospitals and physicians (section 1890(b)(2)(A) and (B) of the Act).”

We reviewed CBE-endorsed measures and were unable to identify any other CBE-endorsed measures on this topic. We are adopting this measure pursuant to section 1886(b)(3)(B)(viii)(IX)(bb) of the Act. As previously discussed, we have determined this an appropriate topic for a measure to be adopted absent endorsement because this measure is important for establishing a foundation for future health outcome measures and that this measure provides a framework of best practices for delivering care to older adults with multiple chronic conditions from a hospital and health system perspective.

We acknowledge commenters concerns regarding the PRMR Hospital Committee not reaching consensus. We note that this measure has been developed to provide insightful information to healthcare providers and the public on the number of hospitals currently participating in age friendly care including social vulnerability screening for older adults, ensuring consistent quality care of older patients through ensuring hospitals have an age friendly champion or interprofessional committee, frailty screening for geriatric issues, eliciting patient health related care goals and treatment preferences, and responsible medication management. We agree that the potential for unintended consequences exists and note that we consistently

monitor all the measures in the Hospital IQR Program for unintended consequences.

Furthermore, we note that under our previously finalized measure removal policy, codified at 42 CFR 412.140(g)(2) and (3) (88 FR 59144), if we were to identify unintended consequences related to this measure we would consider it for removal. We also refer readers to sections IX.C.5.a.(1)., IX.C.5.a.(2)., and IX.C.5.a.(4). of the preamble of this final rule for more details on the guidelines and literature which informed this measure, the CBE input provided, and significant public comment support expressed from experts, patients and caregivers.

After consideration of the public comments we received, we are finalizing the Age Friendly Hospital measure as proposed beginning with the CY 2025 reporting period/FY 2027 payment determination.

b. Adoption of Two Healthcare-Associated Infection (HAI) Measures Beginning with the CY 2026 Reporting Period/FY 2028 Payment Determination

Healthcare-associated infections (HAIs) are a major cause of illness and death in hospitals, posing a significant threat to patient safety. One in 31 hospital patients in the U.S. have an HAI at any given time, totaling about 687,000 cases per year.⁴⁹⁴ The CDC estimated that about 72,000 patients die from HAIs per year.⁴⁹⁵ HAIs not only put patients at risk, but also increase the hospitalization days required for patients and add considerably to healthcare costs. The CDC estimates that HAIs cost the U.S. healthcare system \$28.4 billion per year.⁴⁹⁶ Statistics on preventability vary but suggest that 55-70 percent of HAIs could be prevented through evidence-based practices including hand hygiene, cleaning surfaces with an appropriate antiseptic, and wearing gowns and gloves.⁴⁹⁷

Given the high risk to patient safety, we previously adopted the National Healthcare

⁴⁹⁴ CDC. (2024). HAI Data Portal. Available at: <https://www.cdc.gov/healthcare-associated-infections/php/data/index.html>.

⁴⁹⁵ Ibid.

⁴⁹⁶ CDC. (2021). Health Topics – Healthcare-associated Infections (HAI). Available at: <https://www.cdc.gov/policy/polaris/healthtopics/hai/index.html#:~:text=HAIs%20in%20U.S.%20hospitals%20have,least%20%2428.4%20billion%20each%20year.>

⁴⁹⁷ Bearman, G., Doll, M., Cooper, K. et al. Hospital Infection Prevention: How Much Can We Prevent and How Hard Should We Try? *Curr Infect Dis Rep* 21, 2. (2019). <https://doi.org/10.1007/s11908-019-0660-2>.

Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) and NHSN Central Line-Associated Bloodstream Infection (CLABSI) measures in various quality reporting programs that measure the annual risk-adjusted standardized infection ratio (SIR) among adult inpatients. The measures were originally introduced in the Hospital IQR Program in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50200 through 50202) and the FY 2012 IPPS/LTCH PPS final rule (76 FR 51617 through 51618). In the FY 2014 IPPS/LTCH PPS final rule, the CAUTI and CLABSI measures were then adopted in the Hospital-Acquired Condition (HAC) Reduction Program (78 FR 50717) and the Hospital Value-Based Purchasing (VBP) Program (78 FR 50681 through 50687).

Patients with cancer are especially vulnerable to developing HAIs. Chemotherapy, a common treatment for patients with cancer, can weaken patients' immune systems and leave them vulnerable to opportunistic infections.⁴⁹⁸ Cancer treatment may also require major surgeries or invasive devices, which can act as another vector for infections.⁴⁹⁹ It is estimated that 10.5 percent of patients undergoing major cancer surgery contract a HAI, compared to only three percent of patients undergoing elective surgeries.⁵⁰⁰ Researchers from the same study also found that patients undergoing major cancer surgery who contracted a HAI were significantly more likely to die in the hospital than patients who did not contract a HAI.⁵⁰¹ In another study, researchers found that developing a HAI was linked to higher costs of care and longer lengths of stay for patients with cancers of the lip, oral cavity, and pharynx.⁵⁰² Therefore, in the FY 2013 IPPS/LTCH PPS final rule, beginning with the FY 2014 program year, we adopted the CAUTI

⁴⁹⁸ da Silva R, Casella T. (2022). Healthcare-associated infections in patients who are immunosuppressed due to chemotherapy treatment: a narrative review. *J Infect Dev Ctries* 16:1784–1795. doi: 10.3855/jidc.16495.

and CLABSI measures in the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program (77 FR 53557 through 53559).

While many oncology services have transitioned to outpatient settings, acute care hospitals continue to specialize in the treatment of certain types of patients with cancer, for example, patients who have received a hematopoietic stem cell transplant and patients who have febrile neutropenia.⁵⁰³ Based on an internal CMS analysis, in 2019 there were 321,961 Medicare beneficiaries with a primary diagnosis of cancer who received some portion of their care in an inpatient hospital setting. Within these inpatient settings, most Medicare beneficiaries with a primary diagnosis of cancer received their care at National Cancer Institute (NCI)-designated hospitals or other acute care hospitals, while only about four percent of Medicare beneficiaries received care at PPS-exempt cancer hospitals (PCHs). Additionally, based on internal CMS analysis, a portion of these Medicare beneficiaries who received care at a PCH also received at least some of their inpatient care at non-PCHs (NCI-affiliated or other hospitals).

The Biden-Harris administration's Cancer Moonshot Program has put a renewed focus on improving outcomes for patients with cancer.⁵⁰⁴ Under this initiative, we seek to ensure that patients with cancer treated at hospitals reporting to the Hospital IQR Program are able to benefit from public reporting of hospital safety data and choose the best provider for their needs. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36311 through 36317), we proposed to adopt the Catheter-Associated Urinary Tract Infection (CAUTI) Standardized Infection Ratio Stratified for Oncology Locations and the Central Line-Associated Bloodstream Infection (CLABSI) Standardized Infection Ratio Stratified for Oncology Locations (hereinafter referred to as the CAUTI-Onc measure and CLABSI-Onc measure, respectively), beginning with the CY 2026 reporting period/FY 2028 payment determination. These measures would supplement, not duplicate, the existing hospital CAUTI and CLABSI measures, as the original hospital CAUTI

⁵⁰³ CDC. (2024). Basic Infection Control and Prevention Plan for Outpatient Oncology Settings. Available at: <https://www.cdc.gov/healthcare-associated-infections/hcp/prevention-healthcare/outpatient-oncology.html>.

⁵⁰⁴ The White House. Cancer Moonshot. <https://www.whitehouse.gov/cancermoonshot/>.

and CLABSI measures look at hospital inpatients except for those in oncology wards, and the CAUTI-Onc and CLABSI-Onc measures look only at patients in oncology wards. Our proposals to adopt the CAUTI-Onc and CLABSI-Onc measures are part of our renewed effort to improve patient safety. We refer readers to the proposed Patient Safety Structural measure in section IX.B.1. for more information.

(1) Adoption of CAUTI-Onc Measure Beginning with the CY 2026 Reporting Period/FY 2028 Payment Determination

(a) Background

Urinary tract infections (UTIs) are a common type of HAI and come with many risks to patients. About 12-16 percent of adult patients in inpatient hospitals will have a urinary catheter at some point during their hospital stay, and almost all healthcare associated UTIs are introduced through instrumentation in the urinary tract.⁵⁰⁵ Furthermore, each day the indwelling urinary catheter remains, a patient has between a three and seven percent increased risk of acquiring a catheter-associated urinary tract infection.⁵⁰⁶ Based on data from the NHSN, the CDC reported that among the 3,780 general acute care hospitals that reported data in 2022, there were 20,237 CAUTIs in that year.⁵⁰⁷

CAUTIs can lead to many negative consequences for patients including cystitis, pyelonephritis, gram-negative bacteremia, endocarditis, vertebral osteomyelitis, septic arthritis, endophthalmitis, and meningitis.⁵⁰⁸ Other consequences of CAUTIs include prolonged hospital stays, higher healthcare costs, and an increased likelihood of mortality.⁵⁰⁹

However, CAUTIs can often be prevented by following guidelines for urinary catheter

⁵⁰⁵ CDC. (2024). Urinary Tract Infection (Catheter-Associated Urinary Tract Infection [CAUTI] and Non-Catheter-Associated Urinary Tract Infection [UTI]) Events. Available at: <https://www.cdc.gov/nhsn/pdfs/pscmanual/7pscCAUTICurrent.pdf>.

⁵⁰⁶ Ibid.

⁵⁰⁷ CDC. (2022). Antibiotic Resistance & Patient Safety Portal: Catheter-Associated Urinary Tract Infections. Available at: <https://arpsp.cdc.gov/profile/nhsn/cauti>.

⁵⁰⁸ CDC. (2024). Urinary Tract Infection (Catheter-Associated Urinary Tract Infection [CAUTI] and Non-Catheter-Associated Urinary Tract Infection [UTI]) Events. Available at: <https://www.cdc.gov/nhsn/pdfs/pscmanual/7pscCAUTICurrent.pdf>.

⁵⁰⁹ Ibid.

use, insertion, and maintenance. At a large academic hospital system, a study investigated the effects of implementing a CAUTI prevention bundle in the intensive care unit (ICU). Prevention practices in this bundle included reducing unnecessary catheter use, following proper catheter maintenance, and ordering a urine culture only when warranted by a clear indication. The research team also updated the electronic health record (EHR) system to support compliance with these prevention guidelines. Researchers found that the CAUTI rates in the ICU decreased from 6.0 CAUTIs per 1,000 urinary catheter days to 0.0. The rest of the hospital then implemented the CAUTI prevention bundle, leading to a decrease in CAUTI rates from 2.0 cases per 1,000 catheter days to 0.6 cases per 1,000 catheter days.⁵¹⁰

In another study, nurses at a large urban teaching hospital implemented CAUTI prevention protocols, including removing catheters from patients no longer needing them and finding alternatives to indwelling urinary catheters. As a result of this initiative, catheter days decreased by 11.8 percent and CAUTI rates declined by 38 percent.⁵¹¹ More information on the prevention of CAUTIs is available at the CDC's Guideline for Prevention of Catheter-associated Urinary Tract Infections, including recommendations regarding who should receive a catheter, catheter insertion, proper insertion techniques, maintenance, quality improvement, and surveillance.⁵¹²

To encourage the use of best practices for urinary catheters and reduce the incidence of CAUTIs, we previously adopted the CAUTI measure (CBE #0138) in several quality reporting and value-based payment programs, including the Hospital IQR, Hospital VBP, and HAC Reduction Programs (76 FR 51617 through 51618, 78 FR 50681 through 50687, and 78 FR

⁵¹⁰ Sampathkumar, P., Barth, J. W., Johnson, M., Marosek, N., Johnson, M., Worden, W., Lembke, J., Twing, H., Buechler, T., Dhanorker, S., Keigley, D., & Thompson, R. (2016). Mayo Clinic Reduces Catheter-Associated Urinary Tract Infections Through a Bundled 6-C Approach. *Joint Commission journal on quality and patient safety*, 42(6), 254–261. [https://doi.org/10.1016/s1553-7250\(16\)42033-7](https://doi.org/10.1016/s1553-7250(16)42033-7).

Reduction of Catheter-Associated Urinary Tract Infections: A Multidisciplinary Approach to Driving Change. *Critical Care Nursing Quarterly* 45(4):p 290-299, October/December 2022. | DOI: 10.1097/CNQ.0000000000000429.

⁵¹² CDC. (2024). Guideline for Prevention of Catheter-Associated Urinary Tract Infections. Available at: <https://www.cdc.gov/infection-control/hcp/cauti/index.html>.

50717, respectively), as discussed earlier. We adopted the measure as part of the HHS Action Plan to Prevent HAIs, as this measure was included among the prevention metrics established in the plan which is available at: <https://www.hhs.gov/oidp/topics/health-care-associated-infections/hai-action-plan/index.html>. Eventually, in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41547 through 41553), we removed the CAUTI measure from the Hospital IQR Program beginning with the CY 2019 reporting period/FY 2021 payment determination to streamline reporting through the HAC Reduction Program.

As noted earlier, the CAUTI measure used in the HAC Reduction and Hospital VBP Programs does not include inpatients in oncology wards. Because patients with cancer are especially vulnerable to developing HAIs like CAUTIs,⁵¹³ it is important to implement quality reporting for patients with cancer, as we have done in adopting the CAUTI measure in the PCHQR Program. Significant associations have been found between UTIs and post-surgery complications, longer hospitalizations, and higher hospital costs among patients with cancer,⁵¹⁴ and post-surgery CAUTI incidence has been found to be as high as 12.5 percent in specific cancer populations.⁵¹⁵ Therefore, it is important to address the needs of this high-risk population and adopt the CAUTI-Onc measure to the Hospital IQR Program. The adoption of this measure would also provide more data to compare CAUTI rates between PCHs and non-PCHs.

(b) Overview of Measure

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36312 through 36314), we proposed to adopt the CAUTI-Onc measure for the Hospital IQR Program beginning with the CY 2026 reporting period/FY 2028 payment determination. The purpose of this measure is to encourage the use of best practices for urinary catheters as set by the CDC and to reduce the

Risk factors for catheter-associated urinary tract infections following radical hysterectomy for cervical cancer. *American journal of obstetrics and gynecology*, 228(6), 718.e1–718.e7. <https://doi.org/10.1016/j.ajog.2023.02.019>.

incidence of CAUTIs for patients with cancer. To report this measure, hospitals would need to verify that all locations, including those housing oncology patients, are correctly mapped in NHSN.

Reducing CAUTI incidence through the adoption of this measure could lead to improved cancer patient outcomes, including reduced morbidity and mortality, less need for antimicrobials, and reduced patient length of stays and medical costs.⁵¹⁶

(c) Measure Alignment to Strategy

The proposal to adopt the CAUTI-Onc measure supports the CMS National Quality Strategy priority area of “Safety and Resiliency.”⁵¹⁷ Specifically, this supports our safety goal to “achieve zero preventable harm,” and to expand the collection and use of safety indicator data across programs for key areas to improve tracking and show progress toward reducing harm. The adoption of this measure additionally supports the “Outcomes and Alignment” priority area in the CMS National Quality Strategy by collaborating with other federal agencies, namely the CDC, to promote alignment in quality measurement and close the existing reporting gap among vulnerable patients with cancer in inpatient settings.⁵¹⁸ This proposal to adopt the CAUTI-Onc measure not only supports two of the CMS National Quality Strategy priority areas, it also supports the Biden-Harris Administration’s Cancer Moonshot program that aims to improve outcomes for patients with cancer.

(d) Pre-rulemaking Process and Measure Endorsement

(i) Recommendation from the PRMR Process

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of the preamble of this final rule for details on the PRMR process, including the voting procedures used to reach consensus on measure recommendations. The PRMR Hospital Committee met on

⁵¹⁶ Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁵¹⁷ CMS National Quality Strategy. (2023). Available at: <https://www.cms.gov/files/document/cms-national-quality-strategy-handout.pdf>.

⁵¹⁸ Ibid.

January 18-19, 2024, to review measures included by the Secretary on a publicly available “2023 Measures Under Consideration List” (MUC List), including the CAUTI-Onc measure (MUC2023-220),^{519 520} and to vote on a recommendation regarding use of this measure.⁵²¹

The PRMR Hospital Committee reached consensus and recommended including this measure in the Hospital IQR Program with conditions. Fourteen members of the group recommended adopting the measure into the Hospital IQR Program without conditions; four members recommended adoption with conditions; and one committee member voted not to recommend the measure for adoption. Taken together, 94.7 percent of the votes recommended this measure in the Hospital IQR Program with conditions.⁵²²

Four members of the voting committee recommended the adoption of this measure into the Hospital IQR Program with the first condition being that CMS consider expanding the reporting period. This would increase the patient volume included in the denominator and increase precision. We have reviewed this recommendation and concluded that expanding the reporting period would result in a critical loss in the ability to observe changes in the SIR over time. Obscuring any observable changes in the SIR would degrade the measure’s ability to assess prevention efforts and further drive quality improvement. Therefore, we proposed this measure for adoption without the modification suggested by four committee members to preserve the measure’s ability to observe changes in the SIR more quickly.

The second condition the PRMR Hospital Committee recommended for the Hospital IQR Program was that the measure should evaluate data by oncology unit type, such as hematology-

⁵¹⁹ Centers for Medicare & Medicaid Services. (December 1, 2023). 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁵²¹ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Pre-Rulemaking Measure Review (PRMR) Meeting Summary: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-Hospital-Recommendation-Group-Meeting-Summary-Final.pdf>.

⁵²² Battelle - Partnership for Quality Measurement. (February 2024). 2023 Final MUC Recommendation Report. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-2023-MUC-Recommendations-Report-Final-.pdf>.

oncology versus solid organ.⁵²³ We acknowledge this condition and may consider it for future rulemaking. We proposed to adopt the CAUTI-Onc measure in the Hospital IQR Program having taken into consideration the conditions raised by the PRMR Hospital Committee.

The measure received strong support from the committee as it addresses an important patient safety concern. During the PRMR Hospital Committee's discussion, some expressed concern about the burden of manual abstraction. Others asked about the measure's validity, and whether the measure should include risk adjustments when HAIs are an issue across the board.

(ii) Measure Endorsement

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for details on the E&M process including the measure evaluation procedures the E&M Committees use to evaluate measures and whether they meet endorsement criteria. The CAUTI measure was most recently submitted to the CBE for endorsement review in the Spring 2019 cycle (CBE #0138) and was endorsed on October 23, 2019.⁵²⁴ In the submission of the CAUTI-Onc measures to the 2023 MUC list, the CDC provided additional oncology-only reliability testing based on existing data submitted to the CDC's NHSN. Because the CAUTI-Onc measure has the same specifications as the CAUTI measure, with the only difference being that it is stratified for oncology locations, additional endorsement of the oncology specific locations is not necessary. The calculations pertinent to those locations are inherently part of the endorsement performed for the CAUTI measure, and the measure (that is, numerator/denominator) is endorsed across all inpatient hospital settings, including oncology locations. The calculation of the SIR includes and accounts for the location of the patient within the facility. The CDC would incorporate information on the stratification by oncology patients during the regularly scheduled measure maintenance re-endorsement process.

⁵²³ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Pre-Rulemaking Measure Review (PRMR) Meeting Summary: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-Hospital-Recommendation-Group-Meeting-Summary-Final.pdf>.

⁵²⁴ Battelle - Partnership for Quality Measurement. NHSN Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure. Available at: <https://p4qm.org/measures/0138>.

(e) Measure Specifications

For this measure, the NHSN calculates the quarterly risk-adjusted SIR of CAUTIs among inpatients at acute care hospitals who are in oncology wards.⁵²⁵ The CDC then calculates the SIR using all four quarters of data from the reporting period year, which CMS uses for performance calculation and public reporting purposes. The CDC defines an oncology ward as an area for the evaluation and treatment of patients with cancer. For more details, we refer readers to the CDC Locations and Descriptions and Instructions for Mapping Patient Care Locations document.⁵²⁶

The numerator is the number of annually observed CAUTIs among acute care hospital inpatients in oncology wards. The denominator is the number of annually predicted CAUTIs among acute care hospital inpatients in oncology wards. By dividing the number of observed CAUTIs by the number of predicted CAUTIs, the SIR compares the actual number of cases to the expected number of cases. However, this does not preclude SIRs from being ranked. The SIR is calculated when there is at least one predicted CAUTI, to achieve a minimum level of precision.⁵²⁷

The measure requires a facility to have at least one predicted CAUTI before calculating the SIR because the precision of a facility's CAUTI rate can vary, especially in low volume hospitals. For this reason, the NHSN calculates the SIR instead of reporting the CAUTI rate directly. A facility's SIR is not meant to be compared directly to that of another facility. Rather, the primary role of the SIR is to compare a facility's CAUTI rate to the national rate after adjusting for facility- and patient-level risk factors.⁵²⁸

The numerator and denominator exclude the following because they are not considered

⁵²⁵ Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁵²⁷ Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁵²⁸ CDC. (2024). NHSN SIR Guide. Available at: <https://www.cdc.gov/nhsn/pdfs/ps-analysis-resources/nhsn-sir-guide.pdf>.

indwelling catheters by NHSN definitions: suprapubic catheters, condom catheters, "in and out" catheters, and nephrostomy tubes. If a patient has either a nephrostomy tube or a suprapubic catheter and has an indwelling urinary catheter, the indwelling urinary catheter would be included in the CAUTI surveillance.⁵²⁹

The SIR also adjusts for various facility and patient-level factors that contribute to HAI risk within each facility. For more information on the risk adjustment methodology please reference the CDC website at: <https://www.cdc.gov/nhsn/2022rebaseline/index.html>.

(f) Data Submission and Reporting

We proposed to collect data for the CAUTI-Onc measure via the NHSN, consistent with the current approach for HAI reporting for the HAC Reduction and Hospital VBP Programs. The NHSN is a secure, internet-based surveillance system maintained and managed by the CDC and provided free of charge to providers. To report to the NHSN, hospitals must first agree to the NHSN Agreement to Participate and Consent form, which specifies how NHSN data would be used, including fulfilling CMS's quality measurement reporting requirements for NHSN data.⁵³⁰

Beginning in 2012, hospitals participating in the Hospital IQR Program began reporting CAUTIs in all adult, pediatric, and neonatal intensive care locations followed by reporting all adult and pediatric medical, surgical, and medical/surgical wards in 2015 using NHSN. According to a 2022 CDC report, 3,780 hospitals are reporting CAUTI data to NHSN; of these, 478 hospitals reported CAUTI data from at least one oncology location.⁵³¹ We anticipate that because most of the hospitals which would begin to report the CAUTI-Onc measure for the Hospital IQR Program are already reporting via NHSN for CAUTI in other locations as well as other measures, they have already set up an account. Hospitals currently reporting CAUTI must

⁵³⁰ CDC. (2023). FAQs About NHSN Agreement to Participate and Consent. Available at: <https://www.cdc.gov/nhsn/about-nhsn/faq-agreement-to-participate.html>.

⁵³¹ CDC. (2024). National and State Healthcare-associated Infections Progress Report. Available at: <https://www.cdc.gov/healthcare-associated-infections/php/data/progress-report.html>.

verify that locations housing oncology patients are correctly mapped as an oncology location based on NHSN's location mapping guidance for accurate event location attribution.

Hospitals would report their data for the CAUTI-Onc measure on a quarterly basis for the purposes of Hospital IQR Program requirements. Presently, hospitals report CAUTI data to the NHSN monthly and the SIR is calculated on a quarterly basis. Under the data submission and reporting process, hospitals would collect the numerator and denominator for the CAUTI-Onc measure each month and submit the data to the NHSN. The data from all 12 months would be calculated into quarterly reporting periods which would then be used to determine the SIR for CMS performance calculation and public reporting purposes. We refer readers to the NHSN website for further information about NHSN reporting requirements. We refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 59141) for information on data submission and reporting requirements for our most recent updates to data submission and reporting requirements for measures submitted via the CDC NHSN.

We invited public comment on our proposal to adopt the CAUTI-Onc measure beginning with the CY 2026 reporting period/FY 2028 payment determination. We received one comment specifically on the CAUTI-Onc measure.

Comment: A commenter stated that requiring culturing to test for CAUTI in febrile oncology patients would be of questionable value to patients and lead to inappropriate culturing stewardship.

Response: We thank the commenter for sharing their feedback. However, we respectfully disagree that culturing is unnecessary for determining if oncology patients have CAUTIs or that adopting the CAUTI-Onc measure would lead to inappropriate culturing. Identifying an eligible positive urine culture is important as the first step for determining if a UTI event occurred. If a patient is febrile but the urine culture does not meet the criteria, then a UTI event did not occur according to the NHSN definition. Furthermore, facilities determine culture ordering policies, and inappropriate culturing practices should be addressed by individual

facilities.⁵³²

We respond to comments that address both the CAUTI-Onc and CLABSI-Onc measures in the following subsection that discusses adoption of the CLABSI-Onc measure.

(2) Adoption of CLABSI-Onc Measure Beginning with the CY 2026 Reporting Period/FY 2028 Payment Determination

(a) Background

Central venous catheters (CVCs) are a crucial aspect of hospital care for administering medications, fluids, and nutrients to patients, as well as running medical tests.⁵³³ However, they also carry the risk of introducing infections, referred to as central line-associated bloodstream infections (CLABSIs).⁵³⁴ CLABSIs are a leading cause of HAIs and are associated with increased morbidity and mortality, prolonged hospitalization, and increased costs.⁵³⁵

According to one study, the development of bloodstream infections (BSIs) after CVC insertion was associated with longer hospital stays of on average seven additional days and a three times higher risk of death during the patient's hospital stay.⁵³⁶ Additionally, a single CLABSI episode costs hospitals an estimated \$48,108 on average.⁵³⁷ While the CLABSI SIR has declined by 16 percent since 2015, CLABSIs still remain prevalent.⁵³⁸ Based on data from

⁵³² CDC. (2024). Urinary Tract Infection (Catheter-Associated Urinary Tract Infection [CAUTI] and Non-Catheter-Associated Urinary Tract Infection [UTI]) Events. Available at: <https://www.cdc.gov/nhsn/pdfs/pscmanual/7pscCAUTIcurrent.pdf>.

the NHSN, the CDC reported that among the 3,728 general acute care hospitals that reported data in 2022, there were 23,389 CLABSIs in that year.⁵³⁹

In one study conducted on a group of academic medical centers across a three-year period, the overall CLABSI rate was 1.73 cases per 1,000 central-line days.⁵⁴⁰ Another study, retrospectively conducted on patients with a CVC in four U.S. hospitals within the same health system, found that patients with a CVC who developed a CLABSI had a 36.6 percent higher likelihood of mortality, and 37 percent higher chance of being readmitted compared to patients who did not develop a CLABSI. The study also found that the average hospital length of stay in patients who developed a CLABSI increased by two days when compared to patients without a CLABSI.⁵⁴¹

Following evidence-based guidelines when inserting and maintaining central lines can help prevent the occurrence of CLABSIs.⁵⁴² Proper central line insertion practices include applying skin antiseptic, ensuring proper hand hygiene, using sterile barrier precautions, and ensuring the skin preparation agent has dried completely before insertion.⁵⁴³ One study of 30 long-term acute care hospitals found that adoption of a catheter maintenance bundle led to the CLABSI rate decreasing by 29 percent.⁵⁴⁴ In another study, researchers implemented the standard CDC bundle along with additional measures in a large acute care hospital. As a result, the CLABSI rate decreased by 68 percent from 2013 to 2017.⁵⁴⁵ Despite a large body of

⁵⁴⁵ Wei, A. E., Markert, R. J., Connelly, C., & Polenakovic, H. (2021). Reduction of central line-associated bloodstream infections in a large acute care hospital in Midwest United States following implementation of a

evidence indicating that adopting a central line bundle decreases CLABSI rates, adoption of these best practices remains inconsistent. A systematic review of the available literature on hospital adherence to the CDC's central line bundle checklist found that none of the medical facilities in the studies followed all elements of the bundle, and compliance rates remained low in follow-up studies.⁵⁴⁶ For more information on the standard CDC bundle, we refer readers to the Guidelines for the Prevention of Intravascular Catheter-Related Infections.⁵⁴⁷

To encourage adherence to best practices for central line use and to reduce the incidence of CLABSIs, we previously adopted the CLABSI measure (CBE #0139) in several quality reporting and value-based payment programs, including the Hospital IQR, Hospital VBP, and HAC Reduction Programs (75 FR 50200 through 50202, 78 FR 50681 through 50687, and 78 FR 50717, respectively), as discussed earlier. We adopted the measure as part of the HHS Action Plan to Prevent HAIs, as this measure was included among the prevention metrics established in the plan which is available at: <https://www.hhs.gov/oidp/topics/health-care-associated-infections/hai-action-plan/index.html>. In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41547 through 41553), we removed the CLABSI measure from the Hospital IQR Program beginning with the CY 2019 reporting period/FY 2021 payment determination to streamline reporting through the HAC Reduction Program.

Currently, the CLABSI measure used in the HAC Reduction and Hospital VBP Programs does not include inpatients in oncology wards. Because patients with cancer are especially vulnerable to developing HAIs like CLABSIs,⁵⁴⁸ it is important to implement quality reporting for patients with cancer, as we have done in adopting the CLABSI measure in the PCHQR

⁵⁴⁷ CDC. (2024). Guidelines for the Prevention of Intravascular Catheter-Related Infections. Available at: <https://www.cdc.gov/infection-control/hcp/intravascular-catheter-related-infection/index.html>.

⁵⁴⁸ Page, J., Tremblay, M., Nicholas, C., & James, T.A. (2016). Reducing Oncology Unit Central Line-Associated Bloodstream Infections: Initial Results of a Simulation-Based Educational Intervention. *Journal of oncology practice*, 12(1), e83–e87. <https://doi.org/10.1200/JOP.2015.005751>.

Program. While central lines are a crucial component of cancer treatment, they are also associated with at least 400,000 bloodstream infections in oncology patients every year in the U.S.⁵⁴⁹ CLABSIs in patients with cancer may lead to sepsis, require interruptions in chemotherapy, and increase the hospital length of stay.⁵⁵⁰ CLABSIs among patients with cancer also incur a high economic burden, costing the U.S. healthcare system over \$18 billion annually.⁵⁵¹ Therefore, it is important to address the needs of this high-risk population and adopt the CLABSI-Onc measure to the Hospital IQR Program. The adoption of this measure would also provide more data to compare CLABSI rates between PCHs and non-PCHs.

(b) Overview of Measure

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36314 through 36317), we proposed to adopt the CLABSI-Onc measure to the Hospital IQR Program beginning with the CY 2026 reporting period/FY 2028 payment determination. The purpose of this measure is to promote CLABSI prevention activities and reduce the incidence of CLABSIs for patients with cancer. Unlike the version of the measure previously in the Hospital IQR Program and that is currently in the HAC Reduction and Hospital VBP Programs, this version we proposed to adopt is limited to inpatients at acute care hospitals in oncology wards. To report this measure, hospitals would need to verify that all locations, including those housing oncology patients, are correctly in NHSN.

Reducing the CLABSI incidence through the adoption of this measure could lead to improved cancer patient outcomes, including reduced morbidity and mortality, less need for antimicrobials, and reduced patient length of stays and medical costs.⁵⁵²

⁵⁵² Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

(c) Measure Alignment to Strategy

The proposal to adopt the CLABSI-Onc measure supports the CMS National Quality Strategy priority area of “Safety and Resiliency.” Specifically, this supports our safety goal to “achieve zero preventable harm,” and to expand the collection and use of safety indicator data across programs for key areas to improve tracking and show progress toward reducing harm. The adoption of this measure additionally supports the “Outcomes and Alignment” priority area in the CMS National Quality Strategy by collaborating with other federal agencies, namely the CDC, to promote alignment in quality measurement and close the existing reporting gap among vulnerable patients with cancer in inpatient settings.⁵⁵³ This proposal to adopt CLABSI-Onc not only supports two of the CMS National Quality Strategy priority areas, it also supports the Biden-Harris Administration’s Cancer Moonshot program that aims to improve outcomes for patients with cancer.

(d) Pre-rulemaking Process and Measure Endorsement

(i) Recommendation from the PRMR Process

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for details on the PRMR process including the voting procedures the PRMR process uses to reach consensus on measure recommendations. The PRMR Hospital Committee met on January 18-19, 2024, to review measures included by the Secretary on a publicly available “2023 Measures Under Consideration List” (MUC List), including the CLABSI-Onc measure (MUC2023-219),^{554 555} and to vote on a recommendation regarding use of this measure.⁵⁵⁶

⁵⁵³ CMS National Quality Strategy. (2023). Available at: <https://www.cms.gov/files/document/cms-national-quality-strategy-handout.pdf>.

⁵⁵⁴ Centers for Medicare & Medicaid Services. (December 1, 2023). 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁵⁵⁵ Centers for Medicare & Medicaid Services. (December 2023). Overview of the List of Measures Under Consideration. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List-Overview.pdf>.

⁵⁵⁶ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Pre-Rulemaking Measure Review (PRMR) Meeting Summary: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-Hospital-Recommendation-Group-Meeting-Summary-Final.pdf>.

The committee reached consensus and recommended including this measure in the Hospital IQR Program with conditions. Fourteen members of the group recommended adopting the measure into the Hospital IQR Program without conditions; four members recommended adoption with conditions; and one committee member voted not to recommend the measure for adoption. Taken together, 94.7 percent of the votes recommended the measure.⁵⁵⁷

Four members of the voting committee recommended the adoption of this measure into the Hospital IQR Program, with the first condition being that CMS consider expanding the reporting period. This would increase the patient volume included in the denominator and increase precision. We have reviewed this recommendation and concluded that expanding the reporting period would result in a critical loss in the ability to observe changes in the SIR over time. Obscuring any observable changes in the SIR would degrade the measure's ability to assess prevention efforts and further drive quality improvement. Therefore, we proposed this measure for adoption without the modification suggested by four committee members to preserve the measure's ability to observe changes in the SIR more quickly.

The second condition the committee recommended for the Hospital IQR Program was that the measure should evaluate data by oncology unit type, such as hematology-oncology versus solid organ.⁵⁵⁸ We acknowledge this condition and may consider it for future rulemaking. We proposed to adopt the CLABSI-Onc measure in the Hospital IQR Program having taken into consideration the conditions raised by the PRMR Hospital Recommendation Committee.

The measure received strong support from the committee as it addresses an important patient safety concern. During the committee's discussion, some expressed concern about the burden of manual abstraction. Others asked about the measure's validity, and whether the

⁵⁵⁷ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Final MUC Recommendation Report. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-2023-MUC-Recommendations-Report-Final-.pdf>.

⁵⁵⁸ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Pre-Rulemaking Measure Review (PRMR) Meeting Summary: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-Hospital-Recommendation-Group-Meeting-Summary-Final.pdf>.

measure should include risk adjustments when HAIs are an issue across the board.

(ii) Measure Endorsement

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for details on the E&M process including the measure evaluation procedures the E&M Committees use to evaluate measures and whether they meet endorsement criteria. The CLABSI measure was most recently submitted to the CBE for endorsement review in the Spring 2019 cycle (CBE #0139) and was endorsed on October 23, 2019.⁵⁵⁹ In the submission of the CLABSI-Onc measure to the 2023 MUC list, the CDC provided additional oncology-only reliability testing based on existing data submitted to the CDC's NHSN. Because the CLABSI-Onc measure has the same specifications as the CLABSI measure, with the only difference being that it is stratified for oncology locations, additional endorsement of CLABSI-Onc is not necessary. The calculations pertinent to those locations are inherently part of the endorsement performed for the CLABSI measure, and the measure (that is, numerator/denominator) is endorsed across all inpatient hospital settings, including oncology locations. The calculation of the SIR includes and accounts for the location of the patient within the facility. The CDC would incorporate information on the stratification by oncology patients during the regularly scheduled measure maintenance re-endorsement process.

(e) Measure Specifications

For this measure, the NHSN calculates the quarterly risk-adjusted SIR of CLABSIs among inpatients at acute care hospitals who are in oncology wards.⁵⁶⁰ The CDC then calculates the SIR using all four quarters of data from the reporting period year, which CMS uses for performance calculation and public reporting purposes. The CDC defines an oncology ward as an area for the evaluation and treatment of patients with cancer. For more details, we refer

⁵⁵⁹ Battelle - Partnership for Quality Measurement. NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure. Available at: <https://p4qm.org/measures/0139>.

⁵⁶⁰ Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

readers to the CDC Locations and Descriptions and Instructions for Mapping Patient Care Locations document.⁵⁶¹

The numerator is the number of annually observed CLABSIs among acute care hospital inpatients in oncology wards. The denominator is the number of annually predicted CLABSIs among acute care hospital inpatients in oncology wards. By dividing the number of observed CLABSIs by the number of predicted CLABSIs, the SIR compares the actual number of cases to the expected number of cases. However, this does not preclude SIRs from being ranked. The SIR is calculated when there is at least one predicted CLABSI, to achieve a minimum level of precision.⁵⁶²

The measure requires a facility to have at least one predicted CLABSI before calculating the SIR because the precision of a facility's CLABSI rate can vary, especially in low volume hospitals. For this reason, the NHSN calculates the SIR instead of reporting the CLABSI rate directly. A facility's SIR is not meant to be compared directly to that of another facility. Rather, the primary role of the SIR is to compare a facility's CLABSI rate to the national rate after adjusting for facility- and patient-level risk factors.⁵⁶³

The numerator and denominator exclude the following devices because they are not considered central lines: arterial catheters (unless in the pulmonary artery, aorta or umbilical artery), arteriovenous fistula, arteriovenous graft, atrial catheters (also known as transthoracic intra-cardiac catheters, those catheters inserted directly into the right or left atrium via the heart wall), extracorporeal membrane oxygenation (ECMO), hemodialysis reliable outflow (HERO) dialysis catheter, intra-aortic balloon pump (IABP) devices, peripheral IV or midlines, or ventricular assist devices (VAD). Additionally, CLABSI events reported to the NHSN as mucosal barrier injury laboratory-confirmed bloodstream infections (MBI-LCBIs) are excluded

⁵⁶¹ CDC. (2024). CDC Locations and Descriptions and Instructions for Mapping Patient Care Locations. Available at: https://www.cdc.gov/nhsn/pdfs/pscmanual/15locationsdescriptions_current.pdf.

⁵⁶² Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁵⁶³ CDC. (2024). NHSN SIR Guide. Available at: <https://www.cdc.gov/nhsn/pdfs/ps-analysis-resources/nhsn-sir-guide.pdf>.

from the SIR.⁵⁶⁴

The SIR also adjusts for various facility and patient-level factors that contribute to HAI risk within each facility. For more information on the risk adjustment methodology please reference the CDC website at: <https://www.cdc.gov/nhsn/2022rebaseline/index.html>.

(f) Data Submission and Reporting

We proposed to collect data for the CLABSI-Onc measure via the NHSN, consistent with the current approach for HAI reporting for the HAC Reduction and Hospital VBP Programs. The NHSN is a secure, internet-based surveillance system maintained and managed by the CDC and provided free of charge to providers. To report to the NHSN, hospitals must first agree to the NHSN Agreement to Participate and Consent form, which specifies how NHSN data would be used, including fulfilling CMS's quality measurement reporting requirements for NHSN data.⁵⁶⁵

Starting in 2011, facilities operating under the Hospital IQR Program began reporting CLABSIs in all adult, pediatric, and neonatal intensive care locations followed by reporting all adult and pediatric medical, surgical, and medical/surgical wards in 2015 using NHSN. According to a 2022 CDC report, 3,728 hospitals are reporting CLABSI data to NHSN; of these, 488 hospitals reported data from at least one oncology location.⁵⁶⁶ We anticipate that because most of the hospitals which would begin to report the CLABSI-Onc measure for the Hospital IQR Program are already reporting via NHSN for other measures, they have already set up an account. Hospitals currently reporting CLABSI must verify that locations housing oncology patients are correctly mapped as an oncology location based on NHSN's location mapping guidance for accurate event location attribution.

Hospitals would report their data for the CLABSI-Onc measure on a quarterly basis for

⁵⁶⁴ Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁵⁶⁵ CDC. (2023). FAQs About NHSN Agreement to Participate and Consent. Available at: <https://www.cdc.gov/nhsn/about-nhsn/faq-agreement-to-participate.html>.

⁵⁶⁶ CDC. (2024). National and State Healthcare-associated Infections Progress Report. Available at: <https://www.cdc.gov/healthcare-associated-infections/php/data/progress-report.html>.

the purposes of Hospital IQR Program requirements. Presently, hospitals report CLABSI data to the NHSN monthly and the SIR is calculated on a quarterly basis. Under the data submission and reporting process, hospitals would collect the numerator and denominator for the CLABSI-Onc measure each month and submit the data to the NHSN. The data from all 12 months would be calculated into quarterly reporting periods which would then be used to determine the SIR for CMS performance calculation and public reporting purposes. We refer readers to the NHSN website for further information about NHSN reporting requirements. We refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 59141) for information on data submission and reporting requirements for our most recent updates to data submission and reporting requirements for measures submitted via the CDC NHSN.

We invited public comment on our proposal to adopt the CLABSI-Onc measure beginning with the CY 2026 reporting period/FY 2028 payment determination. We received two comments specifically on the CLABSI-Onc measure. Because many commenters discussed the two proposed oncology-specific measures (CAUTI-Onc and CLABSI-Onc) together, we summarize their comments and provide our responses after our discussion of CLABSI-specific public comments.

Comment: A commenter supported CMS's proposal to adopt the CLABSI-Onc measure, noting that many patients suffer from CLABSIs each year, that the mortality rate is high, and that CLABSIs extract a high cost on the healthcare system. The commenter stated that the measure would reduce CLABSI incidence and lead to improved outcomes for patients with cancer. The commenter also recommended that CMS adopt other measures designed to improve quality of care for patients requiring CVCs.

Response: We thank the commenters for their feedback. We agree that the CLABSI-Onc measure can help prevent CLABSIs and improve outcomes for patients with cancer. We will also take the feedback to adopt additional measures into account for future rulemaking.

Comment: A commenter recommended that CMS exclude Mucosal Barrier Injury (MBI)

confirmed bloodstream infections from the measure definition.

Response: We thank the commenter for sharing this recommendation. We wish to clarify that the CLABSI-Onc measure does exclude events that meet the definition of an MBI. This exclusion is applied regardless of patient care location or setting.⁵⁶⁷

In addition to a few commenters who specifically discussed either the CAUTI-Onc or CLABSI-Onc measure, many commenters discussed these two proposed oncology-specific measures together. We summarize their comments below and provide our responses.

Comment: Many commenters supported adoption of the CAUTI-Onc and CLABSI-Onc measures because of their potential to improve care quality by promoting prevention practices and reducing CAUTI and CLABSI incidence. Commenters also stated that these measures would fill a gap in quality reporting for patients with cancer, who are particularly vulnerable to developing HAIs.

Response: We thank the commenters for their feedback. We agree that the CAUTI-Onc and CLABSI-Onc measures can improve care quality for patients with cancer and would allow more of them to be covered under quality reporting.

Comment: Several commenters supported the measure but had feedback or questions regarding the methodology of the measures. A few commenters asked CMS to conduct an analysis prior to public reporting to ensure equitable comparisons across hospitals. A commenter requested more information on how SIRs would be calculated at the unit level.

Response: We thank the commenters for their feedback and provide additional information in response to their concerns. The CDC developed a risk adjustment methodology for these measures to ensure equitable comparisons across hospitals. To calculate risk adjustments, the NHSN relies on facility survey data and designation of patient care locations to serve as high-level surrogate markers for patient acuity. While using patient-level data may

⁵⁶⁷ CDC. (2024). Bloodstream Infection Event (Central Line-Associated Bloodstream Infection and Non-central Line Associated Bloodstream Infection). Available at: https://www.cdc.gov/nhsn/pdfs/pscmanual/4psc_clabscurrent.pdf.

better characterize the patient population, the NHSN uses uniformly reported data on patient care locations to determine an appropriate risk adjustment without significantly increasing hospitals' data collection burden.

Regarding the commenter's question about how SIRs would be calculated, the SIR is a scalable, risk-adjusted metric. In CAUTI and CLABSI SIRs, risk adjustment is applied at the individual location level, resulting in a count of infection events (SIR numerator) and predicted number of infections (SIR denominator). In CAUTI and CLABSI SIRs, risk adjustment is applied at the individual location level, resulting in a count of infection events (SIR numerator) and predicted number of infections (SIR denominator). The NHSN then aggregates location-specific results for all of a facility's locations prior to calculating the SIR.

Comment: A commenter requested clarification on the quarterly submission process and the impact of a "not applicable" response for hospitals.

Response: We thank the commenter for their questions. Since the NHSN does not have an option to submit a "not applicable" response when reporting these measures, hospitals that do not have oncology wards do not have a place to specify that within NHSN. Therefore, these location types are left blank within the system. In this case, the NHSN is not able to calculate a SIR and the hospital's data would not be publicly reported. Hospitals may indicate that they do not have any locations mapped as an oncology ward on the Measure Exception form, as applicable. If a hospital indicates this on the form, the hospital need not report zero cases to NHSN, but completion of the Measure Exception form is required to avoid a penalty through a reduction in a hospital's annual payment update (APU) for failing to report the measure. For more information about the submission process, we refer readers to the CDC's operational guidance for reporting CAUTI and CLABSI data, available at:

<https://www.cdc.gov/nhsn/cms/ach.html>.

Comment: A few commenters expressed concern that the smaller denominators for these measures could lead to low volume bias and asked CMS to ensure statistical reliability and

validity.

Response: We wish to clarify that the calculated SIR for the CAUTI-Onc and CLABSI-Onc measures are adjusted for volume. The SIR compares the actual number of cases to the predicted number of cases. The SIR is calculated when there is at least one predicted infection event, to achieve a minimum level of precision. The measures require a facility to have at least one predicted event before calculating the SIR because the precision of a facility's infection rate can vary, especially in low volume hospitals. For this reason, the NHSN calculates the SIR instead of reporting the rate directly. Using the SIRs, we determine and publicly report each hospital's national percentile ranking. While a direct comparison between hospitals' infection rates would be subject to low volume bias, the SIRs account for this bias by comparing the observed to the expected rate.

Comment: A few commenters did not support the measures because they stated that the risk adjustment does not adequately reflect the immunosuppression of patients with cancer. Another commenter objected to the risk adjustment methodology for these measures, stating that the difficulty in preventing HAIs for certain patients does not justify adjustments that hide these difficult cases.

Response: We thank the commenters for sharing their concerns. However, we disagree that the measures do not provide adequate risk adjustment to account for the immunosuppression of patients with cancer. To calculate risk adjustments, the NHSN relies on facility survey data and designation of patient care locations to serve as high-level surrogate markers for patient acuity. Risk adjustment relies on patient location to account for risk factors such as immunosuppression in patients with cancer. It is important for the measures to stratify by location to account for patient risk factors which are not within a hospital's control and ensure that measure results represent each hospital's performance. We will continue to collaborate with the CDC to review and refine this measure, including the risk adjustment model, as part of our measure maintenance and evaluation.

Comment: Several commenters offered suggestions for ensuring the effectiveness of the measures in promoting patient safety and transparent reporting. A few commenters requested that CMS continue to verify the reliability and validity of the measures. A few commenters urged CMS to monitor for unintended consequences, including using publicly reported SIR information to make inappropriate comparisons between facilities. A commenter suggested that CMS provide more background information about airborne infections and preventive practices when discussing these measures.

Response: We appreciate this input and will take it into account. We also note that the measures have been tested and were recommended for inclusion in the Hospital IQR Program by the PRMR Hospital Committee.⁵⁶⁸ Additionally, we will continue to monitor the CAUTI-Onc and CLABSI-Onc measures in the Hospital IQR Program to ensure that the publicly reported data are helpful to consumers when choosing the best hospital for their needs.

Comment: A few commenters expressed concerns about the burden of measure reporting, stating that these measures would impose workloads on hospital staff that outweigh the reporting benefits. One commenter recommended that CMS provide facilities with sufficient time to prepare for collecting data on the CAUTI-Onc and CLABSI-Onc measures.

A commenter stated that the CAUTI-Onc measure should be combined with the CAUTI measure, and the CLABSI-Onc measure should be combined with the CLABSI measure. According to the commenter, the oncology-specific measures are duplicative and dividing reporting between oncology wards and other locations creates additional burden for hospitals.

Response: We appreciate commenters sharing their concerns about the measure reporting burden. We carefully consider the benefit of adopting new measures with attention to the burden on hospitals. We do not agree that the burden of measure reporting for these measures outweighs the reporting benefits. While the measures would require staff time to report, we are

⁵⁶⁸ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Final MUC Recommendation Report. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-2023-MUC-Recommendations-Report-Final-.pdf>.

adopting the measures because of their ability to encourage the use of best practices and thus reduce the incidence of HAIs for patients with cancer. With measure reporting beginning with the CY 2026 reporting period/FY 2028 payment determination, hospitals should have sufficient time to prepare for reporting. We note that hospitals are already reporting the CAUTI and CLABSI measures, which have the same specifications as the CAUTI-Onc and CLABSI-Onc measures, the only difference being the locations at which the measures stratify. In 2022, 3,780 hospitals reported CAUTI events⁵⁶⁹ and 3,728 reported CLABSI events.⁵⁷⁰ In addition, 488 hospitals have already reported data from at least one oncology location.⁵⁷¹

We further note that since the NHSN system currently collects CAUTI-Onc and CLABSI-Onc data, hospitals that have not been reporting such data could begin to do so now in preparation for when the data would be reported to CMS for the Hospital IQR Program beginning with the CY 2026 reporting period.

With regard to the suggestion to combine the oncology-specific measures with the CAUTI and CLABSI measures, we considered this in the development of the proposed rule; however, in collaboration with the CDC, we proposed the CAUTI-Onc and CLABSI-Onc measures as separate measures from the CAUTI and CLABSI measures in the Hospital VBP Program and HAC Reduction Program because patients with cancer are especially vulnerable to HAIs and this can greatly affect measure results. We therefore proposed oncology-specific measures so that they can provide a stratified risk-adjusted measure and report data in the context of the patient population. This would also allow more direct comparison with the CAUTI-Onc and CLABSI-Onc measures used in the PCHQR Program.

Comment: Several commenters expressed concern about the CAUTI-Onc and CLABSI-Onc measures on the basis that many hospitals do not have defined oncology wards and thus

⁵⁶⁹ CDC. (2022). Antibiotic Resistance & Patient Safety Portal: Catheter-Associated Urinary Tract Infections. Available at: <https://arpsp.cdc.gov/profile/nhsn/cauti>.

⁵⁷⁰ CDC. (2022). Antibiotic Resistance & Patient Safety Portal: Central Line-Associated Bloodstream Infections. Available at: <https://arpsp.cdc.gov/profile/nhsn/clabsi>.

⁵⁷¹ CDC. (2024). National and State Healthcare-associated Infections Progress Report. Available at: <https://www.cdc.gov/healthcare-associated-infections/php/data/progress-report.html>.

would not be able to report the measures. A few commenters requested further clarification on how oncology wards would be defined by NHSN. Another commenter stated that defining oncology locations according to the 80 percent rule as listed by the CDC Locations and Descriptions and Instructions for Mapping Patient Care Locations⁵⁷² would exclude some oncology patients from public reporting. A few commenters asked if the measures would distinguish between oncology ward characteristics, such as whether they serve pediatric or adult patients.

Response: We thank the commenters for their input and questions about identifying oncology wards. The CAUTI-Onc and CLABSI-Onc measures allow for the reporting of HAIs for patients with cancer in hospitals that are not PCHs, and the NHSN has developed a location mapping methodology for these measures that allows the model to consider the hospital locations that have higher incidences of HAIs. As currently established by the CDC for reporting to the NHSN, the CLABSI-Onc and CAUTI-Onc measures are collected under a location-based surveillance method, using the CDC's location definitions. Patients with cancer receiving care in other non-oncology inpatient locations would not be captured by the oncology-specific measures. CDC location codes are determined by the type of patient that makes up 80 percent or more of the location's population. This 80 percent rule is standard across all healthcare settings to define hospital locations and does not single out any specific location type. Per the CDC's location definitions, hospitals can report CLABSI and CAUTI data for pediatric oncology locations separately from adult oncology locations.⁵⁷³

After consideration of the public comments we received, we are finalizing the CAUTI-Onc and CLABSI-Onc measures as proposed beginning with the CY 2026 reporting period/FY 2028 payment determination.

c. Adoption of Hospital Harm - Falls with Injury eCQM Beginning with the CY 2026 Reporting Period/FY 2028 Payment Determination

(1) Background

Patient falls are among the most common hospital harms reported and can increase length of stay and patient costs.^{574 575 576} It has been estimated that there are 700,000–1,000,000 inpatient falls in the U.S. annually, with more than one-third resulting in injury and up to 11,000 resulting in patient death.^{577 578} Protocols and prevention measures to reduce patient falls with injury include using fall risk assessment tools to gauge individual patient risk, implementing fall prevention protocols directed at individual patient risk factors, and implementing environmental rounds to assess and correct environmental fall hazards.⁵⁷⁹ There is wide variation in fall rates between hospitals which suggests that this is an area where quality measurement and further improvement is still needed.^{580 581 582 583}

Currently there are no electronic clinical quality measures (eCQMs) that focus specifically on acute care inpatient falls with major or moderate injury in any of the hospital quality reporting or value-based purchasing programs. The Patient Safety Indicator (PSI) 90

composite measure,⁵⁸⁴ which is currently included in the HAC Reduction Program, does include a fall related component, (PSI 08): In Hospital Fall-Associated Fracture Rate; however, it is a claims-based measure that uses a two-year performance period, it is focused on the Medicare fee-for-service (FFS) population, and the numerator is limited to fractures and does not include other fall-associated major and moderate injuries. In the FY 2022 IPPS/LTCH PPS final rule, we highlighted our commitment to developing new digital quality measures that assess various aspects of patient safety in the inpatient setting (87 FR 49181 through 49190). As discussed later in this section of the preamble, the Hospital Harm - Falls with Injury eCQM provides the opportunity to assess the rate of falls that result in a wider range of injuries, in a much larger patient population, and using more timely information from patients' electronic medical records instead of administrative claims data.

(2) Overview of Measure

The Hospital Harm - Falls with Injury measure is a risk-adjusted outcome eCQM. The denominator is inpatient hospitalizations for patients aged 18 and older with a length of stay less than or equal to 120 days that ends during the measurement period. The numerator is inpatient hospitalizations where the patient has a fall that results in moderate injury (such as lacerations, open wounds, dislocations, sprains, and strains) or major injury (such as fractures, closed head injuries, internal bleeding). The diagnosis of a fall and of a moderate or major injury that was present on admission would be excluded from the measure.

The baseline risk-adjustment model accounts for age and several risk factors present on admission (weight loss or malnutrition, delirium, dementia, and other neurological disorders).⁵⁸⁵ The risk-adjustment model has been developed to ensure that hospitals that care for sicker and more complex patients are evaluated fairly.⁵⁸⁶ We refer readers to the eCQI Resource Center

⁵⁸⁴ PSI 90 Technical Specification can be found here: <https://qualitynet.cms.gov/inpatient/measures/psi/resources>.

⁵⁸⁶ Ibid.

(<https://ecqi.healthit.gov/eh-cah>) for more details on the measure specifications and risk methodology.

(3) Measure Alignment to Strategy

This measure aligns with several goals under the CMS National Quality Strategy in addition to supporting our re-commitment to better patient and healthcare worker safety.⁵⁸⁷ The COVID-19 public health emergency (PHE) put significant strain on hospitals and health systems which negatively impacted patient safety in routine care delivery, highlighting the need to address gaps in safety. Adopting the Hospital Harm - Falls with Injury measure is one of several initial actions we are taking in response to the President’s Council of Advisors on Science and Technology (PCAST) call to action to renew “our nation’s commitment to improving patient safety.”⁵⁸⁸ By establishing additional safety indicators, such as this measure, we are building a stronger, more resilient U.S. healthcare system. We refer readers to section IX.B.1. for more details on other efforts toward better patient and healthcare workers safety practices and the proposed Patient Safety Structural measure into the Hospital IQR Program and the PCHQR Program.

This measure aligns with the “Safety and Resiliency” goal of our CMS National Quality Strategy to achieve zero preventable harm, the “Equity and Engagement” goal to ensure that all individuals have the information needed to make the best choices and complements the HHS National Action Alliance to Advance Patient Safety. By providing hospitals with the opportunity to assess the rate of falls with injury in a much larger patient population (all-payer) compared to current measures such as PSI 08 (limited to Medicare FFS), this measure expands the available safety indicator data within CMS programs and promotes equitable care for all. This measure additionally supports the “Outcomes and Alignment” goals to improve quality and health

⁵⁸⁷ CMS National Quality Strategy. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy>.

⁵⁸⁸ President's Council of Advisors on Science and Technology. (2023). Report to the President: A Transformational Effort on Patient Safety. https://www.whitehouse.gov/wp-content/uploads/2023/09/PCAST_Patient-Safety-Report_Sept2023.pdf.

outcomes by providing hospitals a mechanism to track falls with injury event rates and improve falls intervention efforts over time, a key patient safety metric across the care journey. Third, this measure supports CMS' Interoperability goal to improve quality measure efficiency by transitioning to digital measures in CMS quality reporting programs. As an eCQM, this measure increases the digital measure footprint and can also serve as a potential replacement for the claims-based PSI 08 measure (reported within the PSI 90 composite) in the future.

(4) Pre-rulemaking Process and Measure Endorsement

(a) Recommendation from the PRMR Process

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of the preamble of this final rule for details on the PRMR process including the voting procedures used to reach consensus on measure recommendations. The PRMR Hospital Committee met on January 18-19, 2024, to review measures included by the Secretary on a publicly available "2023 Measures Under Consideration List" (MUC List), including the Hospital Harm - Falls with Injury measure (MUC2023-048), and to vote on a recommendation regarding use of this measure.^{589 590}

The committee reached consensus and recommended including this measure in the Hospital IQR Program with conditions. Twelve members of the group voted to adopt the measure into the Hospital IQR Program without conditions; six members voted to adopt with conditions; one committee member voted not to recommend the measure for adoption. Taken together, 94.7 percent of the votes were recommended or recommended with conditions. The six members who voted to adopt with conditions specified the condition as monitoring unintended consequences, such as use of patient restraints. We agree that the potential for unintended consequences exists and note that we consistently monitor all the measures in the

⁵⁸⁹ Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁵⁹⁰ Centers for Medicare & Medicaid Services. (December 2023). Overview of the List of Measures Under Consideration. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List-Overview.pdf>.

Hospital IQR Program for unintended consequences. Furthermore, we note that under our previously finalized measure removal policy, codified at 42 CFR 412.140(g)(2) and (3) (88 FR 59144), if we were to identify unintended consequences related to this measure we would consider it for removal. Furthermore, we note that various programs have been instituted that reduce hospital falls without decreasing mobility (such as the Hospital Elder Life Program)⁵⁹¹ and that the benefits of promoting mobility outweigh any increase in fall risk.⁵⁹²

(b) Measure Endorsement

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for details on the E&M process including the measure evaluation procedures the E&M Committees uses to evaluate measures and whether they meet endorsement criteria. The E&M Management of Acute Events, Chronic Disease, Surgery, and Behavioral Health Committee⁵⁹³ convened in the Fall 2023 cycle to review the Hospital Harm - Falls with Injury measure (CBE #4120e) submitted to the CBE for endorsement. The E&M Management of Acute Events, Chronic Disease, Surgery, and Behavioral Health Committee ultimately voted to endorse the measure on January 29, 2024.⁵⁹⁴

(5) Measure Specifications

This ratio measure is reported as the number of inpatient hospitalizations with falls with moderate or major injury per 1,000 patient days. The measure is calculated using the following:

(Total number of encounters with falls with moderate or major injury / total number of eligible

⁵⁹¹ Hshieh, T. T., Yue, J., Oh, E., Puella, M., Dowal, S., Trivison, T., & Inouye, S. K. (2015). Effectiveness of multicomponent nonpharmacological delirium interventions: a meta-analysis. *JAMA internal medicine*, 175(4), 512–520. <https://doi.org/10.1001/jamainternmed.2014.7779>.

⁵⁹³ Battelle - Partnership for Quality Measurement. Hospital Harm - Fall Injury Measure Specifications. Available at: <https://p4qm.org/measures/4120e>.

⁵⁹⁴ Battelle - Partnership for Quality Measurement. 2023 Management of Acute and Chronic Events Meeting Summary.

<https://p4qm.org/sites/default/files/Management%20of%20Acute%20Events%2C%20Chronic%20Disease%2C%20Surgery%2C%20and%20Behavioral%20Health/material/EM-Acute-Chronic-Events-Fall2023-Endorsement-Meeting-Summary.pdf>

hospital days) x 1,000. To calculate the numerator (that is, the total number of encounters with falls with moderate or major injury): 1) identify the initial population (inpatient hospitalizations for patients aged 18 and older with a length of stay less than or equal to 120 days that ends during the measurement period), 2) remove exclusions (patients who had a fall diagnosis present at the time the order for inpatient admission occurs), and 3) determine if the patient meets numerator criteria (patient has both a fall diagnosis and major or moderate injury diagnosis not present on admission). Hospital days are measured in 24-hour periods starting from the time of arrival at the hospital (including time in the emergency department and or observation). The number of hospital days is rounded down to whole numbers; any fractional periods are dropped. All data elements necessary to calculate the numerator and denominator are defined within value sets available in the Value Set Authority Center (VSAC).⁵⁹⁵

The measure was tested in 12 hospital test sites with two different EHR vendors (Epic and Allscripts) with varying bed size, geographic location, and teaching status. Risk-adjusted rates showed substantial variation in performance scores across the 12 test hospitals indicating ample room for quality improvement.⁵⁹⁶ Test results using one year of data indicated strong measure reliability and validity (including agreement between data exported from the EHR and data in the patient chart).⁵⁹⁷ As PSI 08 uses a two-year performance period, this eCQM would allow hospitals to receive more timely information about measure performance.

We recognize there may be concern regarding measure duplication with PSI 08 (a component of PSI 90 that is currently measured and publicly reported in the HAC Reduction Program). However, as described earlier, the Hospital Harm - Falls with Injury eCQM assesses the rate of falls with a wider range of injuries in a larger population compared to PSI 08. We envision the potential future use of patient safety eCQMs not only in the Hospital IQR Program,

⁵⁹⁵ To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at <https://vsac.nlm.nih.gov/>.

⁵⁹⁶ Battelle - Partnership for Quality Measurement. Hospital Harm - Falls with Injury. Available at: <https://p4qm.org/measures/4120e>.

⁵⁹⁷ Ibid.

but also pay-for-performance programs such as the HAC Reduction Program, including as a potential replacement for the claims-based PSI 90 measure. However, until that time we are retaining PSI 08 (within the PSI 90 composite) in the HAC Reduction Program as well as include the Hospital Harm - Falls with Injury eCQM in the Hospital IQR Program.

(6) Data Submission and Reporting

This eCQM uses data collected through hospitals' EHRs. The measure is designed to be calculated by the hospitals' certified electronic health record technology (CEHRT) using patient-level data and then submitted by hospitals to CMS. As with all quality measures we develop, testing was performed to confirm the feasibility of the measure, data elements, and validity of the numerator, using clinical adjudicators who validated the EHR data compared with medical chart-abstracted data. Testing demonstrated that all critical data elements were reliably and consistently captured in hospital EHRs, and measure implementation is feasible.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36306 through 36341), we proposed the adoption of the Hospital Harm - Falls with Injury eCQM as part of the eCQM measure set beginning with the CY 2026 reporting period/FY 2028 payment determination. The eCQM measure set is the measure set from which hospitals can self-select measures to report to meet the eCQM reporting requirement. We refer readers to section IX.C.9.c. of this final rule for a discussion of our previously finalized eCQM reporting and submission requirements, as well as proposed modifications to these requirements. Additionally, we refer readers to section IX.F.6.a.(2). of the preamble of this final rule for a discussion of a similar measure adoption in the Medicare Promoting Interoperability Program.

We invited public comment on our proposal to adopt the Hospital Harm - Falls with Injury eCQM beginning with the CY 2026 reporting period/FY 2028 payment determination.

Comment: Many commenters supported adopting the measure. Specifically, commenters stated that the measure represents an important measurement area that targets one of the most common hospital harms, promotes patient safety, captures a broader population than PSI 08, and

would allow a timelier delivery of information than claims data. A commenter stated that the measure can be used to identify gaps in care, optimize care delivery, and improve patient outcomes. Another commenter stated that the measure would raise awareness of fall rates and lower healthcare costs. A commenter supported our consideration of malnutrition in the risk adjustment. Another commenter stated that the implementation timeline is consistent with the amount of time the industry needs to implement the measure.

Response: We thank the commenters for their support.

Comment: A commenter supported our proposal to adopt the Hospital Harm - Falls with Injury eCQM beginning with the CY 2026 reporting period. The commenter stated that malnutrition is a risk factor for severe clinical events and suggested that some of its effects, such as loss of lean body mass, can contribute to frailty and possible falls.

Response: We thank the commenter for their support for including the measure's risk-adjustment model.

Comment: A commenter supported the adoption of the Hospital Harm - Falls with Injury eCQM but encouraged CMS to consider the workflow and education impact of the proposed volume of new measures and to align adoption and attestation timelines accordingly. Another commenter had concerns with the proposals to adopt new eCQMs and recommended adopting only one new eCQM per reporting period due to the burdensome process for building, tracking, and implementing new eCQMs.

Response: We carefully consider the benefit of adopting new measures and transitioning to eCQMs with attention to the burden on hospitals. The program's progressive shift toward digital measures would ultimately decrease the burden for hospitals because eCQMs use electronic standards, which help reduce the burden of manual abstraction and reporting for measured entities. We additionally note that hospitals would initially have the option to self-select whether to report this measure, which provides sufficient flexibility for those hospitals that may need more time to implement this measure before being able to report it.

Comment: A commenter supported the addition of the Hospital Harm - Falls with Injury eCQM in the Hospital IQR Program but cautioned CMS against moving this measure into pay-for-performance programs such as the Hospital VBP Program. The commenter stated that there is a limited evidence base for best practices on fall prevention within the hospital.

Response: We note that we proposed adopting the Hospital Harm - Falls with Injury eCQM in the Hospital IQR and Medicare Promoting Interoperability Programs. We have not proposed to adopt this measure in a pay-for-performance program. If we decide to use this measure for additional CMS programs, such as the Hospital VBP Program, we would do so through notice-and-comment rulemaking.

Comment: A commenter supported adoption of the Hospital Harm - Falls with Injury eCQM into the Hospital IQR Program as an eCQM that hospitals can select to meet the eCQM reporting requirements but encouraged CMS to work with technical experts to improve risk standardization under the measure. The commenter stated that fall risk varies considerably based on the patient's diagnoses, procedures and other aspects of care (for example, medications) and stated that the measure could be enhanced using indirect standardization (as the method of risk adjustment), whereby the expected value is conditioned on MS-DRG and potentially other patient- and visit-level factors.

Response: We note that the measure, as proposed, is risk-adjusted for several factors including medications active on admission, medications administered during the hospitalization, diagnoses present on admission which may increase the risk for a fall with injury, and physical traits, such as body mass index. Additional information regarding the measure specifications and risk methodology is available at the eCQI Resource Center (<https://ecqi.healthit.gov/eh-cah>). We will monitor measure performance and consider any future adjustments to the measure, including adjustments to the measure's risk-adjustment methodology.

Comment: A commenter supported the implementation of the Hospital Harm - Falls with Injury eCQM, stating that falls are an important patient safety issue, that the measure is risk-

adjusted so that outcome rates can be compared across hospitals, and that pilot testing revealed that hospitals were able to map key elements for reporting without changes to current workflow. However, the commenter recommended that the 120-day length of stay exclusion be removed in alignment with most eCQMs where this exclusion has already been removed.

Response: We thank the commenter for their support. We note that several eCQMs such as Venous Thromboembolism Prophylaxis, Safe Use of Opioids – Concurrent Prescribing, and Discharged on Antithrombotic Therapy eCQMs specify a length of stay less than or equal to 120 days; therefore, this measure is in alignment with those eCQMs.

Comment: A few commenters supported the Hospital Harm - Falls with Injury eCQM, as an outcome measure of patient falls while hospitalized, which is an important measure area, but did not support the fact that the measure excludes patients admitted due to a fall diagnosis from the measure calculation. Those commenters were concerned that the measure excluded the patients most vulnerable to falls and stated that a hospital should be able to document and separate when a fall happened prior to admission and while hospitalized. The commenters also stated that these falls are preventable. Another commenter stated that a more reasonable approach to categorizing these events would be to stratify the measure by unit, allowing comparison within ICU, medical surgical, or other specific units where patients are of similar risks.

Response: We thank the commenters for this feedback. As currently specified, the Hospital Harm - Falls with Injury eCQM excludes patients from the numerator and the denominator who have a fall diagnosis which is present on admission. Therefore, a patient who had a fall present on admission and then had a subsequent fall during the inpatient hospitalization would be excluded from both the numerator and denominator. Patients who have a fall present on admission are excluded from the denominator population because the measure focuses on falls with injury that occurred during hospitalization. This measure exclusion is necessary to reduce the measure's false positive rate and to prevent hospitals from being penalized by

including falls that occurred prior to the encounter, when injuries resulting from these falls may be diagnosed later in a hospital stay.

For a patient safety measure that may be used to compare hospital performance, it is important to aim for some level of case mix uniformity across hospitals and therefore stratifying by unit may not be practical, but we will consider whether such stratification is appropriate in future measure updates. Although the measure already uses risk adjustment, including a highly heterogeneous group of patients already admitted for a fall may exceed the ability of the risk adjustment model to provide a level playing field and complicate the use of the measure for comparing hospital performance. However, we recognize the importance of assessing fall risk for all hospitalized patients, including those patients with a fall present on admission. We also refer readers to the discussion of the Domain 3: Frailty Screening and Intervention domain of the finalized Age Friendly Hospital measure where hospitals will be required to attest to whether they screen patients for risks regarding mobility and whether data is collected on the rate of falls. We will consider removing the exclusion of patients admitted due to a fall diagnosis from the Hospital Harm – Falls with Injury eCQM in future updates to the measure.

Comment: Several commenters raised concerns regarding unintended consequences of the measure. A few commenters supported the measure but encouraged CMS to monitor results carefully to ensure the measure does not result in unintended consequences associated with immobilization, such as pressure injuries or patient restraints. A commenter did not support the measure due to concerns that the measure could inadvertently discourage early patient mobilization, which the commenter stated is vital for recovery.

Response: We agree that the potential for unintended consequences exists and note that we consistently monitor all the measures in the Hospital IQR Program for unintended consequences. We note that various programs have been instituted that reduce hospital falls

without decreasing mobility (such as the Hospital Elder Life Program).⁵⁹⁸ We also note that the Hospital IQR Program adopted a Hospital Harm - Pressure Injury eCQM in the FY 2024 IPPS/LTCH PPS final rule as one of the eCQMs hospitals have the option to self-select for reporting beginning with the CY 2025 reporting period/FY 2027 payment determination (88 FR 59149), which will also encourage early patient mobilization.

Comment: A few commenters supported adding the measure to the list of available eCQMs that hospitals can choose to self-select to report but urged CMS not to require its reporting until questions about variations in the capture of data by EHR vendors can be answered.

Response: As finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49299 through 49302), hospitals must report on six total eCQMs beginning with the CY 2024 reporting period and subsequent years. Hospitals must report on the following three eCQMs: (1) Hospital Harm—Severe Hypoglycemia eCQM; (2) Hospital Harm—Severe Hyperglycemia eCQM; and (3) Hospital Harm—Opioid-Related Adverse Events eCQM. Hospitals must also report three additional eCQMs that are self-selected from the list of remaining eCQMs. We proposed this measure would be included as one of the eCQMs hospitals have the option to self-select for reporting beginning with the CY 2026 reporting period/FY 2028 payment determination. We note that in section IX.C.9.c., we proposed to increase progressively the number of eCQMs a hospital must report beginning with the CY 2026 reporting period/FY 2028 payment determination, however the Hospital Harm - Falls with Injury eCQM would remain one of the eCQMs hospitals can self-select to report. Future changes to the eCQM reporting requirements, including any additional eCQMs for mandatory reporting, would go through notice-and-comment rulemaking.

Comment: A few commenters discussed differences in how falls are documented by

⁵⁹⁸ Hsieh, T. T., Yue, J., Oh, E., Puelle, M., Dowal, S., Trivison, T., & Inouye, S. K. (2015). Effectiveness of multicomponent nonpharmacological delirium interventions: a meta-analysis. *JAMA internal medicine*, 175(4), 512–520. <https://doi.org/10.1001/jamainternmed.2014.7779>.

hospitals and expressed concerns that the documentation does not lend itself to eCQMs. Some commenters stated that falls are not necessarily captured as discrete data points in the hospital EHR, but may be documented in narrative notes, and to capture falls they would need a discrete field in the EHR. The commenters stated that clinicians may be using structured fields differently to input data and documentation may not be captured in a standardized manner. The commenter stated this could lead to measure performance being more dependent on the sensitivity of the screening technologies and approaches used than on underlying performance. Another commenter stated that details about patient falls, and resultant injuries are often captured more reliably in a hospital's safety event reporting database than in a patient's medical record. Further, commenters noted that sometimes when a fall happens, it is not immediately known if there is an injury, or the extent of the injury and this information would need to be manually entered into the record after getting test or imaging results. A commenter raised a concern that hospitals with better, more complete, data would be punished because their results would compare unfavorably against hospitals that failed to accurately capture falls with injury.

A commenter stated that information related to a fall prior to arrival could be recorded in the EHR and could be pulled into the numerator falsely by key words if the process is not set up correctly and staff are not educated to enter the information correctly. Another commenter encouraged CMS to assess the feasibility of collecting the required data elements from EHRs and determine if the measure is reliable and valid across a broader set of EHR vendors and hospitals. The commenter stated that assessing measure performance using only two vendor systems and 12 hospitals is insufficient.

Response: Data element feasibility was assessed during testing, where all 13 hospital sites that participated in the evaluation of feasibility confirmed that the data elements used in the proposed measure can be captured within the electronic health record in a structured and codified manner either using nationally accepted terminology standards or local system codes that could

be mapped.⁵⁹⁹ While one hospital did not always use its structured fields to capture a fall that occurred during hospitalization, the three other sites using an EHR from the same vendor did not encounter the same workflow challenges. The remaining 12 hospitals proceeded with validity testing that evaluated electronic clinical data compared to manually extracted data. The results indicate that the positive predictive value for the numerator was 98.77 percent, meaning that in 98.77 percent of the cases where the patient was identified as experiencing the harm using EHR data, the result was confirmed using the manually extracted data.⁶⁰⁰ These results generally indicate that most hospitals would have the data available to calculate the measure accurately in structured fields in their EHR and to provide complete data for measurement. Resources such as the QRDA implementation guide that can assist with eCQM implementation, including ensuring that data is captured in a consistent format, can be found on the eCQI Resource Center.⁶⁰¹

Comment: A commenter raised concerns about the measure definitions. The commenter acknowledged that the published measure definitions include examples of injuries categorized as moderate or major but questioned whether the definitions would be applied universally by all reporting hospitals. Another commenter stated that standardization of national operational definition of a fall, moderate injury, and severe injury must occur before adopting the measure into the Hospital IQR Program.

Response: The measure specifications include definitions for the terms fall, moderate injury, and major injury. A fall is defined as: A sudden, unintentional descent, with or without injury to the patient, that results in the patient coming to rest on the floor, on or against some other surface (for example, a counter), on another person, or on an object (for example, a trash can). A fall with moderate or major injury is defined as: A fall and a diagnosis of moderate or major injury during the inpatient hospitalization. Examples of moderate injuries include

⁶⁰¹ QRDA – Quality Reporting Document Architecture, https://ecqi.healthit.gov/qrda?qt-tabs_qrda=about.

lacerations, open wounds, dislocations, sprains, and muscle strains. Examples of major injuries include fractures, closed head injuries, and internal bleeding. These definitions are available on the eCQI Resource Center at: https://ecqi.healthit.gov/ecqm/eh/2026/cms1017v1?qt-tabs_measure=measure-information.

Comment: Several commenters raised concerns that the Hospital Harm - Falls with Injury eCQM overlaps with the PSI 08 component of the PSI 90 measure in the HAC Reduction Program. These commenters asked CMS to consider the potential burden of overlapping eCQMs and claims-based measures that could give differing results and require duplicative reporting. A commenter stated that we should consider removing PSI 90 in the future when replacement eCQMs have been implemented or that we could allow hospitals to choose whether to report a claims-based or electronic measure. A commenter added that if the Hospital Harm - Falls with Injury eCQM is included, CMS should outline a clear timeline for elimination of duplicative PSI measures. A commenter recommended CMS not finalize the Hospital Harm - Falls with Injury eCQM and instead retain PSI 08 within the HAC Reduction Program.

Response: As we discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36319) and in this final rule, the Hospital Harm - Falls with Injury eCQM would assess the rate of falls with a wider range of injuries in a larger population compared to PSI 08 and uses more timely information from patients' electronic medical records instead of administrative claims data. In addition to these two measurement improvements, the development and implementation of the Hospital Harm - Falls with Injury eCQM aligns with CMS's commitment to moving to digital quality measurements as highlighted in the FY 2022 IPPS/ LTCH PPS final rule (87 FR 49181 through 49190). We envision the potential future use of patient safety eCQMs not only in the Hospital IQR Program, but also pay-for-performance programs such as the HAC Reduction Program, including as a potential replacement for the claims-based PSI 90 measure. However, until that time, we are retaining PSI 08 (within the PSI 90 composite) in the HAC Reduction Program while hospitals gain experience with the Hospital Harm - Falls with Injury eCQM in the

Hospital IQR Program.

Comment: A few commenters stated that the performance scores ranged from 0.0 to 0.258 across 12 hospitals and questioned whether this measure demonstrates a sufficient performance gap to support its use in the Hospital IQR Program. The commenters recommended that CMS continue to test this measure across a broad range of hospitals and vendor systems to determine the extent to which there is sufficient variation in performance scores to warrant the measure's use in the Hospital IQR Program.

Response: The data from 12 hospitals demonstrates wide performance variation, suggesting room for improvement. Specifically, the median risk-adjusted measure rate was 0.053 falls per 1,000 encounter days, ranging from 0 falls to 0.257 falls per 1000 encounter days. The sample data show that the average number of encounter days per year per hospital is about 100,000. Using that assumption, the mean risk-adjusted number of falls per year across the 12 hospitals was approximately 8, with a range of 0 to 26, underscoring the measure's underlying performance gap and variation. In other words, the worst performing hospital has a performance rate that is more than three times higher than the sample average. Additionally, there may be disparities in the rate of in-hospital falls based on certain factors. For example, according to a report from the Leapfrog Group, the rate of in-hospital falls with hip fracture is significantly higher for patients insured by Medicare and Medicaid than for privately insured patients.⁶⁰² This analysis also found the rate of in-hospital falls with hip fracture is also significantly lower for Non-Hispanic Black and Hispanic patients than for White patients.⁶⁰³ During the measure testing, patient and caregiver representatives agreed that the rate of hospital-acquired falls resulting in major or moderate injury is important to measure and can help improve care for

⁶⁰² Gangopadhyaya, A., Pugazhendhi, A., Austin, M., Campione, A., & Danforth, M. (2023) Racial, ethnic, and payer disparities in adverse safety events: Are there differences across Leapfrog Hospital Safety Grades? The Leapfrog Group. <https://www.leapfroggroup.org/racial-ethnic-and-payer-disparities-adverse-safety-events-are-there-differences-across-leapfrog>.

⁶⁰³ Battelle – Partnership for Quality Measurement. (2024). Hospital Harm – Falls with Injury. Available at: <https://p4qm.org/measures/4120e>.

patients.⁶⁰⁴ During an additional TEP meeting, one member additionally stressed that the measure has importance from a patient safety standpoint.⁶⁰⁵

The measure was tested in 12 hospitals, which represented a diversity of hospital characteristics, including teaching status, size, EHR vendor, and geographic location. In terms of teaching status, three hospitals were major teaching hospitals and nine were community teaching hospitals. In terms of size, three hospitals had between 100-199 beds, seven hospitals had between 200-499 beds, and two hospitals had >499 beds. In terms of EHR systems, two different EHR vendors were used in the hospitals. Finally, in terms of geographic locations, hospitals were headquartered in the Southeast, Northeast, and Western parts of the United States.

Comment: A commenter requested that CMS share more details about the Hospital Harm - Falls with Injury eCQM, noting that previous eCQM implementations have had issues with their logic and code sets. The commenter was concerned that the measure's codes may not be robust enough to capture falls and recommended that CMS and the measure steward incorporate more flexibility for rapid cycle improvements into the measure.

Response: We thank the commenter for their feedback. We refer readers to the eCQI Resource Center (<https://ecqi.healthit.gov/>) as well as the PQM's site (<https://p4qm.org/measures/4120e>) for more details on the Hospital Harm - Falls with Injury eCQM specifications, including the logic and value sets used in the specifications. We also reiterate that this eCQM underwent testing which demonstrated that all critical data elements were reliably and consistently captured in patient EHRs, and measure implementation is feasible. We also note that CMS has a process to receive feedback on issues with measure implementation, including a ticketing process, and we will consider how we can incorporate more flexibility for faster measure updates.⁶⁰⁶

⁶⁰⁴ Battelle – Partnership for Quality Measurement. (2024). Hospital Harm – Falls with Injury. Available at: <https://p4qm.org/measures/4120e>.

⁶⁰⁵ Battelle – Partnership for Quality Measurement. (2024). Hospital Harm – Falls with Injury. Available at: <https://p4qm.org/measures/4120e>.

⁶⁰⁶ eCQI Resource Center, ONC Project Tracking System (Jira), <https://ecqi.healthit.gov/tool/onc-project-tracking-system-jira>.

Comment: A commenter did not support the adoption of the measure and suggested that CMS consider a measure that rewards an increase in patient mobility as opposed to a measure that captures falls because encouraging improved mobility is a better approach than tracking higher rates of patient falls.

Response: We thank the commenter for their suggestion. The measure would promote patient safety and encourage hospitals to reduce patient falls through promoting patient mobility. We also note that the Hospital IQR Program adopted a Hospital Harm - Pressure Injury eCQM in the FY 2024 IPPS/LTCH PPS final rule as one of the eCQMs hospitals have the option to self-select for reporting beginning with the CY 2025 reporting period/FY 2027 payment determination (88 FR 59149) which will promote increased patient mobility. We will monitor the measure and will take into consideration whether a measure focusing specifically on increasing patient mobility should be considered in future rulemaking.

Comment: A commenter expressed concerns regarding the expansion of eCQMs in hospital and ambulatory quality reporting programs. The commenter stated that the introduction of new eCQMs is shortsighted, burdensome, and fails to recognize the effort to shift toward digital quality measures (dQMs). The commenter stated that new eCQMs should not be required as part of quality reporting or pay-for-performance programs but that rather, CMS should invest efforts towards the future development of dQMs.

Response: We agree with the commenter in prioritizing investment in dQMs for quality measurement in order to improve accuracy, improve the timeliness of the information, and to reduce reporting burden. In general, CMS considers eCQMs to be a subset of dQMs.⁶⁰⁷ The definition of dQMs is: “Quality measures that use standardized, digital data from one or more sources of health information that are captured and exchanged via interoperable systems; apply quality measure specifications that are standards-based and use code packages; and are

⁶⁰⁷ CMS, Reference Brief: Digital Quality Measurement & eCQMs, https://ecqi.healthit.gov/sites/default/files/Digital%20Quality%20Measurement%20eCQMs%20reference%20brief_508ed.pdf.

computable in an integrated environment without additional effort.”⁶⁰⁸ CMS has developed a dQM Strategic Roadmap to outline the activities required to transition to digital quality measurement.⁶⁰⁹

After consideration of the public comments we received, we are finalizing the measure as proposed beginning with the CY 2026 reporting period/FY 2028 payment determination. We refer readers to section IX.F.6.a.(2). of the preamble of this final rule for a discussion of the adoption of this measure in the Medicare Promoting Interoperability Program. We also refer readers to section XXXX of the preamble of this final rule where we discuss the use of this measure in the Transforming Episode Accountability Model (TEAM).

d. Adoption of Hospital Harm - Postoperative Respiratory Failure eCQM Beginning with the CY 2026 Reporting Period/FY 2028 Payment Determination

(1) Background

Postoperative respiratory failure is defined as unplanned intubation or prolonged mechanical ventilation (MV) after an operation.⁶¹⁰ It is considered to be the most serious of the postoperative respiratory complications because it represents the “end stage” of several types of pulmonary complications (for example, pneumonia, aspiration, pulmonary edema, and acute respiratory distress syndrome) and non-pulmonary problems (for example, sepsis, oversedation, seizures, stroke, heart failure, pulmonary embolism, and fluid overload), and it often results in negative outcomes, including prolonged morbidity, longer hospital stays, increased readmissions,

⁶⁰⁸ CMS, dQMs – Digital Quality Measures, available at https://ecqi.healthit.gov/dqm?qt-tabs_dqm=about-dqms.

⁶⁰⁹ CMS, dQMs – Digital Quality Measures, https://ecqi.healthit.gov/dqm?qt-tabs_dqm=dqm-strategic-roadmap.

⁶¹⁰ Stocking, J. C., Utter, G. H., Drake, C., Aldrich, J. M., Ong, M. K., Amin, A., Marmor, R. A., Godat, L., Cannesson, M., Gropper, M. A., & Romano, P. S. (2020). Postoperative Respiratory Failure: An Update on the Validity of the Agency for Healthcare Research and Quality Patient Safety Indicator 11 in an Era of Clinical Documentation Improvement Programs. *American Journal of Surgery*, 220(1), 222–228. <https://doi.org/10.1016/j.amjsurg.2019.11.019>

higher costs, or death.^{611 612 613} Postoperative respiratory failure is potentially preventable with optimal care, such as carefully managing intraoperative ventilator use and fluids, reducing surgical duration, using regional anesthesia, and preventing wound infection and pain.^{614 615 616} Published data suggest room for improvement; a Nationwide Inpatient Sample (NIS) database study of over 500,000 hospitalizations involving a brain tumor between 2002 and 2010 found the incidence of postoperative respiratory failure varied by hospital characteristics, with higher reported rates of postoperative respiratory failure in nonteaching hospitals than teaching hospitals, and incidence increased with hospital bed size.⁶¹⁷

Currently there are no eCQMs that focus specifically on postoperative respiratory failure in the inpatient setting in any of the hospital quality reporting or value-based purchasing programs. The PSI 90 composite measure,⁶¹⁸ which is currently included in the HAC Reduction Program, does include a postoperative respiratory failure related component, PSI 11: Postoperative Respiratory Failure Rate; however, it is a claims-based measure that uses a two-year performance period, it is focused on the Medicare FFS population, and is dependent upon ICD-10-CM codes. In the FY 2022 IPPS/LTCH PPS final rule, we highlighted our commitment to developing new digital quality measures that assess various aspects of patient safety in the inpatient setting (87 FR 49181 through 49190). The Hospital Harm - Postoperative Respiratory

⁶¹⁸ PSI 90 Technical Specification can be found here: <https://qualitynet.cms.gov/inpatient/measures/psi/resources>.

Failure eCQM provides the opportunity to assess the rate of postoperative respiratory failure in a much larger patient population and use more timely information from patients' electronic medical records instead of administrative claims data.

(2) Overview of Measure

The Hospital Harm - Postoperative Respiratory Failure measure is a risk-adjusted outcome eCQM. The denominator is elective inpatient hospitalizations that end during the measurement period for patients 18 years old and older without an obstetrical condition and at least one surgical procedure was performed within the first three days of the encounter. The numerator is elective inpatient hospitalizations for patients with postoperative respiratory failure: For more detail on how postoperative respiratory failure is determined we refer readers to the measure specifications at the eCQI Resource Center (<https://ecqi.healthit.gov/eh-cah>).

The baseline risk-adjustment model accounts for ten comorbidities present on admission (weight loss, deficiency anemias, heart failure, diabetes with chronic complications, moderate to severe liver disease, peripheral vascular disease, pulmonary circulation disease, valvular disease, American Society of Anesthesiologists categories 3 through 5) and lab values for oxygen (partial pressure), leukocytes, albumin, blood urea nitrogen, bilirubin, and pH of arterial blood.⁶¹⁹ The risk-adjustment ensures that hospitals that care for sicker and more complex patients are evaluated fairly.⁶²⁰ We refer readers to the eCQI Resource Center (<https://ecqi.healthit.gov/eh-cah>) for more details on the measure specifications and risk-adjustment methodology.

(3) Measure Alignment to Strategy

This measure aligns with several goals under the CMS National Quality Strategy in addition to supporting our re-commitment to better patient and healthcare worker safety.⁶²¹ The COVID-19 public health emergency (PHE) highlighted the need to address gaps in safety by

⁶¹⁹ Battelle - Partnership for Quality Measurement. Hospital Harm - Postoperative Respiratory Failure. Available at: <https://p4qm.org/measures/4130e>.

⁶²⁰ Ibid.

⁶²¹ CMS National Quality Strategy. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy>.

putting significant strain on hospitals and health systems which, in turn, negatively impacted patient safety. Adopting the Hospital Harm - Postoperative Respiratory Failure measure is one of several initial actions we are taking in response to the President’s Council of Advisors on Science and Technology (PCAST), call to action to renew “our nation’s commitment to improving patient safety.”⁶²² By establishing additional safety indicators, such as this measure, we are building a stronger, more resilient U.S. healthcare system. We refer readers to section IX.B.1. for more details on other efforts toward better patient and healthcare workers safety practices and the proposed Patient Safety Structural measure into the Hospital IQR Program and the PCHQR Program.

In alignment with the CMS National Quality Strategy ⁶²³ this measure supports the “Safety and Resiliency” goal to achieve zero preventable harm, the “Equity and Engagement” goal to ensure that all individuals have the information needed to make the best choices and complements the HHS National Action Alliance to Advance Patient Safety. By providing hospitals the opportunity to assess postoperative respiratory failure rates in a much larger patient population (all-payer) compared to current measures such as PSI 11 (limited to Medicare FFS), this measure expands the available safety indicator data within CMS programs and promotes equitable care for all. Second, this measure supports the “Outcomes and Alignment” goals to improve quality and health outcomes by providing hospitals a mechanism to track their postoperative respiratory failure incidents and improve harm reduction efforts over time, a key patient safety metric across the care journey. Third, this measure supports CMS’ Interoperability goal to improve quality measure efficiency by transitioning to digital measures in CMS quality reporting programs. As an eCQM, this measure increases the digital measure footprint and can

⁶²² President's Council of Advisors on Science and Technology. (2023). Report to the President: A Transformational Effort on Patient Safety. https://www.whitehouse.gov/wp-content/uploads/2023/09/PCAST_Patient-Safety-Report_Sept2023.pdf.

⁶²³ CMS National Quality Strategy. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy>.

also serve as a potential replacement for the claims-based PSI 11 measure (reported within the PSI-90 composite) in the future.

(4) Pre-rulemaking Process and Measure Endorsement

(a) Recommendation from the PRMR Process

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for details on the PRMR process including the voting used to reach consensus on measure recommendations. The PRMR Hospital Committee met on January 18-19, 2024, to review measures included by the Secretary on a publicly available “2023 Measures Under Consideration List” (MUC List),^{624 625} including the Hospital Harm - Postoperative Respiratory Failure measure (MUC2023-050), and to vote on a recommendation for rulemaking for the Hospital IQR Program.

The committee reached consensus and recommended including this measure in the Hospital IQR Program with conditions. Twelve members of the group voted to adopt the measure into the Hospital IQR Program without conditions; five members voted to adopt with conditions; two committee members voted not to recommend the measure for adoption. Taken together, 89.5 percent of the votes were between recommend and recommend with conditions. The five members who voted to adopt with conditions specified the condition as monitoring unintended consequences, such as avoidance of life-saving procedures with higher risk for respiratory failure. We agree that the potential for unintended consequences exists and note that we consistently monitor all the measures in the Hospital IQR Program for unintended consequences. Furthermore, we note that under our previously finalized measure removal policy, codified at 42 CFR 412.140(g)(2) and (3) (88 FR 59144), if we were to identify unintended consequences related to this measure, we would consider it for removal.

⁶²⁴ Centers for Medicare & Medicaid Services. (December 1, 2023). 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁶²⁵ Centers for Medicare & Medicaid Services. (December 2023). Overview of the List of Measures Under Consideration. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List-Overview.pdf>.

Furthermore, the measure logic allows for the use of mechanical ventilation or intubation or extubation documentation outside of a procedural area to trigger a postoperative respiratory event, thus expanding opportunities for electronic capture of information and accommodating varying clinical documentation workflows.

(b) Measure Endorsement

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for details on the E&M process including the measure evaluation procedures the E&M Committees uses to evaluate measures and whether they meet endorsement criteria. The E&M Management of Acute and Chronic Events Committee convened in the Fall 2023 cycle to review the Hospital Harm - Postoperative Respiratory Failure measure (CBE #4130e) submitted to the CBE for endorsement.⁶²⁶ The E&M Management of Acute and Chronic Events Committee ultimately voted to endorse the measure on January 29, 2024.⁶²⁷

(5) Measure Calculation

Postoperative respiratory failure is evaluated using MV documentation, intubation or extubation documentation to determine if an unplanned initiation of MV occurred or if MV was continued without interruption after a procedure.

The following calculation is applied to report the overall performance rate: [Number of encounters in numerator / (Number of encounters in denominator – Number of encounters in denominator exclusions)] x 1,000. All data elements necessary to calculate the numerator and denominator are defined within value sets available in the VSAC.⁶²⁸

⁶²⁶ Battelle - Partnership for Quality Measurement. Hospital Harm – Postoperative Respiratory Failure. Available at: <https://p4qm.org/measures/4130e>.

⁶²⁷ Battelle - Partnership for Quality Measurement. Fall 2023 Management of Acute and Chronic Events Meeting Summary. Available at: <https://p4qm.org/sites/default/files/Management%20of%20Acute%20Events%2C%20Chronic%20Disease%2C%20Surgery%2C%20and%20Behavioral%20Health/material/EM-Acute-Chronic-Events-Fall2023-Endorsement-Meeting-Summary.pdf>.

⁶²⁸ To access the value sets for the measure, please visit the Value Set Authority Center (VSAC), sponsored by the National Library of Medicine, at <https://vsac.nlm.nih.gov/>.

The measure was tested in 12 hospitals (test sites) with two different EHR vendors (Epic and Cerner) with varying bed size, geographic location, and teaching status. Risk-adjusted rates showed substantial variation in performance scores across the 12 test hospitals.⁶²⁹ Test results indicated high measure reliability and validity (including agreement between data exported from the EHR and data in the patient chart).⁶³⁰

(6) Data Submission and Reporting

This eCQM uses data collected through hospitals' EHRs. The measure is designed to be calculated by the hospitals' CEHRT using patient-level data and then submitted by hospitals to CMS. As with all quality measures we develop, testing was performed to confirm the feasibility of the measure, data elements, and validity of the numerator, using clinical adjudicators who validated the EHR data compared with medical chart-abstracted data. Testing demonstrated that all critical data elements were reliably and consistently captured in patient EHRs, and measure implementation is feasible.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36306 through 36341), we proposed the adoption of the Hospital Harm - Postoperative Respiratory Failure eCQM as part of the eCQM measure set beginning with the CY 2026 reporting period/FY 2028 payment determination. The eCQM measure set is the measure set from which hospitals can self-select measures to report to meet the eCQM reporting requirement. We refer readers to section IX.C.9.c. of this final rule for a discussion of our previously finalized eCQM reporting and submission policies, as well as modifications for these requirements. Additionally, we refer readers to section IX.F.6.a.(2). of the preamble of this final rule for a discussion of a similar measure adoption in the Medicare Promoting Interoperability Program.

We invited public comment on our proposal to adopt the Hospital Harm - Postoperative Respiratory Failure eCQM beginning with the CY 2026 reporting period/FY 2028 payment

⁶²⁹ Battelle - Partnership for Quality Measurement. Hospital Harm - Postoperative Respiratory Failure. Available at: <https://p4qm.org/measures/4130e>.

⁶³⁰ Ibid.

determination.

Comment: Many commenters supported our proposal to adopt the Hospital Harm - Postoperative Respiratory Failure eCQM. Specifically, commenters noted that the measure represents an important measurement area, would promote patient safety, provide more timely information than claims data, and advance the use of eCQMs. A commenter also noted that the timeline was consistent with the amount of time that the industry needs to implement the measure.

Response: We thank the commenters for their support.

Comment: A commenter supported the adoption of the Hospital Harm - Postoperative Respiratory Failure eCQM to encourage hospital prevention efforts while minimizing hospital reporting burdens and agreed that postoperative respiratory failure is “the most serious of the postoperative respiratory complications,” representing the end-stage of certain pulmonary complications (for example, pneumonia) and non-pulmonary problems (for example, sepsis). The commenter encouraged CMS to increase focus on preventing non-ventilator hospital-acquired pneumonia, which the commenter stated is a common, costly, and largely avoidable problem that is often unrecognized in hospitals.

Response: We thank the commenter for their support and will take their recommendation into consideration for future rulemaking as appropriate.

Comment: A commenter supported the measure but recommended that CMS consider expanding the exclusion criteria to include patients who are placed on mechanical ventilation for airway protection rather than respiratory failure. The commenter stated that examples of this population would include patients who experience a seizure or a cardiopulmonary event and require resuscitative measures and mechanical ventilatory support. Another commenter was also concerned that it may be inappropriate to consider any reintubation or mechanical ventilation after a procedure to be a postoperative respiratory failure, especially if the patient is recovering well or if the event occurs several days after the procedure.

Response: We thank the commenters for their feedback regarding the expansion of the denominator exclusion criteria. Regarding the appropriateness of considering any reintubation or mechanical ventilation after a procedure to be a postoperative respiratory failure, we note that high-quality, routine post-operative medical care and monitoring, including among patients who are stable or doing well several days after surgical procedures, should reduce the incidence of postoperative respiratory failure requiring reintubation and/or mechanical ventilation.⁶³¹ While we recognize that there will always be rare, unavoidable emergencies that require reintubation or mechanical ventilation, high quality post-operative nursing and medical care can typically catch the preventable problems that could lead to these situations. We will consider the recommendation to include patients placed on mechanical ventilation for airway protection and investigate the possibility of eliciting the nuances of intubation for airway protection versus intubation for respiratory failure from EHR data and existing codes for future measure updates.

Comment: A commenter supported adoption of the Hospital Harm - Postoperative Respiratory Failure eCQM in the Hospital IQR Program and encouraged the measure developer to consider including non-elective hospitalizations with appropriate risk stratifications and denominator exclusions to further improve postoperative respiratory failure monitoring.

Response: We thank the commenters for their feedback regarding the expansion of the denominator criteria to include non-elective hospitalizations. We will consider this expansion for future updates to the eCQM. The measure currently focuses on elective hospitalizations as postoperative respiratory failure may be more avoidable after elective procedures, which tend to be more clinically homogenous. Postoperative respiratory failure is generally considered a significant marker for complications after elective surgeries.

Comment: A commenter supported the adoption of the measures but encouraged CMS to consider the workflow and education impact of new measures and to align adoption and

⁶³¹ Ruscic KJ, Grabitz SD, Rudolph MI, Eikermann M. Prevention of respiratory complications of the surgical patient: actionable plan for continued process improvement. *Curr Opin Anaesthesiol.* 2017 Jun;30(3):399-408.

attestation timelines accordingly. Another commenter had concerns with the proposals to adopt new eCQMs and recommended adopting only one new eCQM per reporting period due to the burdensome process for building, tracking, and implementing new eCQMs.

Response: We carefully consider the benefit of adopting new measures in relation to any burden on hospitals. The program's shift toward digital measures would ultimately decrease the burden for hospitals because eCQMs use electronic standards, which help reduce the burden of manual abstraction and reporting for measured entities. We additionally note that the hospitals would initially have the option to self-select whether to report this eCQM to meet the eCQM reporting requirement for the Hospital IQR Program, providing flexibility for those hospitals that may need more time to implement this measure before being able to report it.

Comment: A few hospitals raised concerns about how hospitals capture the data used in the measure and how that data would be mapped to an eCQM. A commenter stated that hospital staff may write post-operative respiratory failure when the condition is due to an underlying condition and not related to the surgery. Another commenter stated that the relevant terminology is not well understood by physicians and is frequently documented incorrectly. Another commenter stated that the measure relies on procedure timing and stated that timestamps on measure components can complicate measure accuracy. The commenter stated that timestamps are metadata about an event and are not as easily mapped to eCQM logic as the event itself. A few commenters stated that the pre-rulemaking review of this measure raised concerns about variations in the capture of data by EHR vendors and that, as a result, clinicians may be using structured fields differently to input data, and documentation may not be captured in a standardized manner. The commenters stated that this could lead to measure performance being more dependent on the sensitivity of the screening technologies and approaches used than on underlying performance. A commenter said that it was important that CMS first align the data capture across a variety of vendors to allow ample time for hospitals to evaluate their EHR capabilities. A commenter stated that hospitals may require additional guidance to capture

anesthesia data elements, stating that operating room documentation frequently uses notes or scanned paper records. That commenter stated that, as a result, anesthesia data are not always documented in a structured field or system that is interoperable with the certified EHR used for measure reporting.

Response: Feasibility testing was performed at 13 hospitals across three different EHR systems, and reliability and validity testing was performed at 12 hospitals across two different EHR systems.⁶³² This testing sample exceeds minimum testing requirements for an eCQM.⁶³³ Feasibility testing results indicated that all the hospital sites confirmed that the data elements used in the measure are captured within the EHR in a structured and codified manner using nationally accepted terminology standards or local system codes that could be easily mapped.⁶³⁴ Testing results found that while mechanical ventilation was captured in structured fields at all sites, documentation was not standardized. To account for differences in documentation workflows related to mechanical ventilation, the measure also accommodates the use of intubation and extubation outside of a procedural area to trigger a postoperative respiratory event. Additionally, during the 2022 call for public comment on this measure, feedback from interested parties noted that required data elements for the measure are routinely captured in structured data.

Validity testing results evaluated electronic clinical data compared to manually extracted data. The results indicate that in 89.6 percent of the cases where the patient was identified as experiencing the harm using EHR data, the result was confirmed using the manually extracted data. These results are an acceptable level of validity for measure testing and indicate that most hospitals would have the data available to calculate the measure in structured fields in their EHR.

⁶³² One of the 13 hospitals did not always use their structured fields to capture mechanical ventilation. For this reason, the site opted to not proceed with reliability and validity phases of testing.

⁶³³ For more details, see Partnership for Quality Measurement. Endorsement and Maintenance (E&M) Guidebook. (2023). Available at: https://p4qm.org/sites/default/files/2023-12/Del-3-6-Endorsement-and-Maintenance-Guidebook-Final_0_0.pdf.

⁶³⁴ Battelle – Partnership for Quality Measurement. (2024). Hospital Harm – Postoperative Respiratory Failure. Available at: <https://p4qm.org/measures/4130e>

Further, we are proposing to implement the measure beginning with the CY 2026 reporting period, which would provide time for hospitals to review their workflows and make documentation updates if needed.

We acknowledge that certain underlying conditions place some patients at a higher risk of respiratory failure following a surgical procedure. To account for this, the measure excludes inpatient hospitalizations for patients with select underlying conditions and diagnoses that may increase their risk for postoperative respiratory failure. These exclusions, the full list of which can be found in the measure specification published on the eCQI Resource Center, were informed by clinical input received by the measure's technical expert panel and the 2022 public comment period for the measure.

To account for any ambiguity in defining postoperative respiratory failure, the measure's numerator includes explicit conditions that must be met for an event to be considered postoperative respiratory failure. These conditions were also informed by clinical input received by the measure's technical expert panel and the 2022 public comment period for the measure. Specifically, to meet the measure's numerator criteria, patients must have experienced (1) the initiation of mechanical ventilation within 30 days after the first operating room procedure, or (2) mechanical ventilation with a duration of more than 48 hours after the first operating room procedure. To account for differences in documentation workflows related to mechanical ventilation, the measure accommodates the use of intubation and extubation outside of a procedural area to trigger a postoperative respiratory event.

Regarding the commenter's concern related to reliance on procedure timing, eCQMs are updated during the eCQM annual update cycle to modify or improve the measure's logic expressions, value sets, and code systems, as necessary. In future updates to the eCQM, we will consider whether consolidation of this measure's timing elements into definitions, where appropriate, would improve the measure's accuracy by simplifying the measure's logic and making the relationships of these timing elements more evident. Feasibility testing results for

the “Procedure, Performed”: “General and Neuraxial Anesthesia” data element showed 100% scores in data availability, accuracy, standards and in workflow. These results suggest that anesthesia data is typically documented in a structured field and can be accurately captured for the purpose of measure reporting.

Comment: Several commenters suggested that CMS carefully examine the potential for unintended consequences, such as inappropriate use of noninvasive positive pressure ventilation in lieu of mechanical respiration, excessive use of preventive tracheostomy, or avoidance of offering necessary procedures for high-risk patients. A commenter stated that CMS should address these issues before adopting this measure to ensure that the measure effectively enhances patient safety without unintended drawbacks.

Response: We agree that the potential for unintended consequences exists, although none were identified during the measure development and testing process. The intent of this measure is not to dictate clinical practice. Rather, it is to assist healthcare providers in highlighting, tracking, and responding to clinical quality improvement opportunities and to focus on prevention of patient harm. CMS expects hospitals to continue providing appropriate life-saving interventions based on sound clinical judgments. However, we note that we consistently monitor all the measures in the Hospital IQR Program for unintended consequences. Under our previously finalized measure removal policies, codified at 42 CFR 412.140(g)(2) and (3) (88 FR 59144), we could consider this measure for removal if we were to identify unintended consequences related to implementation of this measure.

Comment: Several commenters raised concerns that the Hospital Harm - Postoperative Respiratory Failure eCQM was duplicative of the PSI 11 component of the PSI 90 measure. A few commenters stated that CMS should consider the potential burden of overlapping measures and consider retiring PSI 90 in the future or allowing hospitals a choice of reporting method. A few commenters stated that if the Hospital Harm - Postoperative Respiratory Failure eCQM is adopted, CMS should outline a clear timeline for elimination of duplicative PSI measures. A

commenter stated that the measure was similar to CMS PSI 11, and that they would not want two measures that are too similar but that CMS should not adopt the eCQM in order to replace CMS PSI 90, stating that CMS should not replace a claims-based measure with an eCQM since that shifts the burden to the hospital to build, map, and report the eCQM rather than it being based on claims.

Response: As we discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36306 through 36341) and in this final rule, while the CMS PSI 90 measure in the HAC Reduction Program includes a postoperative respiratory failure related component (PSI 11), it is a claims-based measure that uses a two-year performance period, it is focused on the Medicare FFS population, and is dependent upon ICD-10-CM codes. In the FY 2022 IPPS/LTCH PPS final rule, we highlighted our commitment to developing new digital quality measures that assess various aspects of patient safety in the inpatient setting (87 FR 49181 through 49190). The Hospital Harm - Postoperative Respiratory Failure eCQM provides the opportunity to assess the rate of postoperative respiratory failure in a much larger patient population and use more timely information from patients' electronic medical records instead of administrative claims data. The eCQM logic also allows for the use of mechanical ventilation, intubation, or extubation documentation outside of a procedural area to trigger a postoperative respiratory event, thus expanding opportunities for the electronic capture of information and accommodating varying clinical documentation workflows. In addition to these three measurement improvements, the development and implementation of the Hospital Harm - Postoperative Respiratory Failure eCQM aligns with CMS's commitment to moving to digital quality measures as highlighted in the FY 2022 IPPS/ LTCH PPS final rule (87 FR 49181 through 49190). We note that we did not propose to remove the CMS PSI 90 measure from the HAC Reduction Program, while hospitals gain experience with the Hospital Harm - Postoperative Respiratory Failure eCQM.

Comment: A few commenters raised concerns about the testing of the measure. A commenter encouraged CMS to assess the feasibility of collecting the required data elements

from EHRs and determine if the measure is reliable and valid across a broader set of EHRs vendors and hospitals. The commenter stated that assessment of how the measure performs using only three vendor systems and 13 hospitals is insufficient to generalize the measure's suitability to a broader population of facilities. A few commenters expressed concerns that the measure was tested only in teaching hospitals and thought that raised questions about the feasibility of implementation for all hospital types.

Response: We thank the commenters for their feedback and note that eCQM development must rely on a sample of hospitals. To guide and evaluate measure development and testing, CMS has developed the Measures Management System (MMS) Hub, and we consult the CBE's E&M criteria. The MMS Blueprint and the CBE suggest that the minimum requirement for eCQM testing to test for feasibility of collecting the required data points and to determine if the measure is reliable and valid is to perform testing in at least three testing sites and within two EHR systems.^{635 636} The testing for the Hospital Harm— - Postoperative Respiratory Failure eCQM exceeds these requirements. Specifically, feasibility testing was performed at 13 hospitals across three different EHR systems, and reliability and validity testing was performed at 12 hospitals across two different EHR systems.⁶³⁷ These hospital sites represent a diversity of hospital characteristics, including teaching status, size, electronic health record (EHR) vendor, and geographic location. In terms of teaching status, two hospitals were non-teaching hospitals, five were major teaching hospitals, and six were community teaching hospitals. In terms of size, four hospitals had between 100-199 beds, five hospitals had between 200-499 beds, and four hospitals had >499 beds. In terms of EHR systems, the hospitals used three different EHR vendors, combined these three vendors are used in more than two-thirds of

⁶³⁵Centers for Medicare & Medicaid. Measures Management System Hub. Available at: <https://mmshub.cms.gov>.

⁶³⁶ Partnership for Quality Measurement. Endorsement and Maintenance (E&M) Guidebook. (2023). Available at: https://p4qm.org/sites/default/files/2023-12/Del-3-6-Endorsement-and-Maintenance-Guidebook-Final_0_0.pdf.

⁶³⁷ One of the 13 hospitals did not always use their structured fields to capture mechanical ventilation. For this reason, the site opted to not proceed with reliability and validity phases of testing.

acute care hospitals in the United States.⁶³⁸ Finally, in terms of geographic locations, hospitals were headquartered in the Southeast, Northeast, and Western parts of the United States.

Comment: A commenter asked for a delay in required reporting on the Hospital Harm - Postoperative Respiratory Failure eCQM.

Response: Currently, as finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49299 through 49302), hospitals must report on six total eCQMs beginning with the CY 2024 reporting period and subsequent years. Hospitals must report the following three eCQMs: (1) Hospital Harm—Severe Hypoglycemia eCQM; (2) Hospital Harm—Severe Hyperglycemia eCQM; and (3) Hospital Harm—Opioid-Related Adverse Events eCQM. Hospitals must also report three additional eCQMs that are self-selected from the list of remaining eCQMs. We reiterate this measure would be included as one of the eCQMs hospitals have the option to self-select for reporting beginning with the CY 2026 reporting period/FY 2028 payment determination. In section IX.C.9.c., we are finalizing our proposal to progressively increase the number of eCQMs a hospital must report beginning with the CY 2026 reporting period/FY 2028 payment determination, however, the Hospital Harm - Postoperative Respiratory Failure would remain a measure that hospitals can self-select to report. Future changes to the eCQM reporting requirements, including any additional eCQMs for mandatory reporting, would go through notice-and-comment rulemaking.

Comment: A commenter stated that the measure specification includes imprecise and repetitive data elements and timing expressions that would result in unnecessary administrative burden for EHR vendors, hospitals, and CMS' data receipt system, including the IntubationTime, MVTime, FirstProcedureTime, and GATime definitions. Another commenter requested that CMS share more details about the proposed Hospital Harm - Postoperative Respiratory Failure eCQM, noting that previous eCQM implementations have had issues with their logic and code

⁶³⁸ Becker's Hospital Review. Epic vs. Cerner: EHR Market Share. Available at: https://www.beckershospitalreview.com/ehrs/epic-vs-cerner-ehr-market-share.html?oly_enc_id=3703D1456278B3W.

sets.

Response: We thank the commenters for their feedback regarding the measure's data elements. We refer readers to the eCQI Resource Center (<https://ecqi.healthit.gov>) for more information about the measure's logic and code sets and definitions. The guidance section of the measure specification notes that post respiratory failure is evaluated using mechanical ventilation (MV) documentation or intubation and extubation documentation to allow for hospital documentation variances. Therefore, if MV documentation is not available, intubation and extubation can serve as a proxy for determining if MV occurred and its duration. During future measure development cycles, we will review the data elements included in this measure for specific sets of data (MVTime, AnesthesiaTime, FirstProcedureTime, etc.) and continue to identify opportunities to establish functions or definitions that generalize a number of the common patterns.

Additionally, eCQMs are updated during the eCQM annual update cycle to modify or improve the measure's logic expressions, value sets, and code systems, as necessary. Vendors and implementers have several opportunities throughout the year to provide input on potential measure changes. At any time during the year, implementers can submit specific measure questions through the eCQM Issue Tracker.⁶³⁹ Common issues or questions received through the eCQM Issue Tracker are taken into consideration during the eCQM annual update process. Vendors and implementers are also able to preview and provide feedback on specific measure changes that are being considered each year during the annual update cycle's vendor and implementer review period, via the eCQM Issue Tracker. To receive updates about the vendor and implementer review period, users may create an account with the eCQI Resource Center.

Comment: A commenter expressed concerns regarding the expansion of eCQMs in hospital and ambulatory quality reporting programs. The commenter stated that the introduction of new eCQMs is shortsighted, burdensome, and fails to recognize the impending effort to shift

⁶³⁹ <https://oncprojecttracking.healthit.gov/olp/>

toward digital quality measures (dQMs). The commenter stated that new eCQMs should not be required as part of quality reporting or pay-for-performance programs but that rather, CMS should invest efforts towards the future development of dQMs.

Response: We agree with the commenter in prioritizing investment in dQMs for quality measurement in order to improve accuracy, improve the timeliness of the information, and to reduce reporting burden. We note the definition of dQM that we have published as part of strategic materials on the eCQI Resource Center states that in general, eCQMs are a subset of dQMs. This definition states that dQMs are “quality measures that use standardized, digital data from one or more sources of health information that are captured and exchanged via interoperable systems; apply quality measure specifications that are standards-based and use code packages; and are computable in an integrated environment without additional effort.” This definition of a dQM is available on the eCQI Resource Center at:

https://ecqi.healthit.gov/dqm?qt-tabs_dqm=about-dqms.

After consideration of the public comments we received, we are finalizing our proposal of the Hospital Harm - Postoperative Respiratory Failure eCQM as proposed beginning with the CY 2026 reporting period/FY 2028 payment determination. We refer readers to section IX.F.6.a.(2). of the preamble of this final rule for a discussion of the adoption of this measure in the Medicare Promoting Interoperability Program. We also refer readers to section XXXX of the preamble of this final rule where we discuss the use of this measure in the Transforming Episode Accountability Model (TEAM).

e. Adoption of Thirty-day Risk-Standardized Death Rate Among Surgical Inpatients with Complications (Failure-to-Rescue) Measure Beginning With the FY 2027 Payment Determination

(1) Background

Failure-to-rescue is defined as the probability of death given a postoperative complication.^{640 641 642} Hospitals can implement evidence-supported interventions to improve timely identification of clinical deterioration and treatment of potentially preventable complications, including improved nurse staffing, simulation training, standardized communication tools, electronic monitoring and/or warning systems, and rapid response systems.^{643 644 645 646 647 648} Studies also show that other processes of care can influence failure-to-rescue rates, including a hospital's aggressiveness of care (defined as the level of resources or inpatient spending), with hospitals that treat patients more aggressively (such as providing more inpatient days or ICU days in the last 2 years of life) having lower surgical mortality and failure-to-rescue rates than otherwise similar hospitals that treat patients less aggressively.^{649 650} Hospitals and healthcare providers benefit from knowing not only their institution's mortality rate, but also their institution's ability to rescue patients after an adverse occurrence. Using a

failure-to-rescue measure is especially important if hospital resources needed for preventing complications are different from those needed for rescue.

This Failure-to-Rescue measure was designed to improve upon the CMS Patient Safety Indicator 04 Death Rate Among Surgical Inpatients with Serious Treatable Complications (CMS PSI 04) measure in the Hospital IQR Program. We refer readers to section IX.C.6.a. for our proposal to remove the CMS PSI 04 measure contingent upon the adoption of the Failure-to-Rescue measure. Both the Failure-to-Rescue measure and the CMS PSI 04 measure focus on hospitals' ability to rescue patients who experience clinically significant complications after inpatient operations, so that these complications do not result in death. Both measures are sensitive to factors such as appropriate nurse staffing and nursing skill-mix, which enable hospitals to identify complications earlier and intervene effectively to prevent death.

The Failure-to-Rescue measure directly addresses concerns about the CMS PSI 04 measure, including:

- Complications sometimes develop before the index operation in CMS PSI 04, even before transferring to the index hospital. For example, the operation is part of an effort to “rescue” the patient.
- The heterogeneous cohort includes patients with very high-risk surgery (for example, trauma surgery, burn surgery, organ transplants, intracranial hemorrhage) and very low-risk surgery (for example, eye, ear, urolithiasis).
- Mean length of stay and prevalence of early discharge to post-acute facilities vary across hospitals, causing bias in comparing performance.
- CMS PSI 04 may slightly disadvantage teaching hospitals, even after risk-adjustment, due to residual confounding from unmeasured case-mix differences.

The Failure-to-Rescue measure has four major differences compared to CMS PSI 04:

1. Captures all deaths of denominator-eligible patients within 30 days of the first qualifying operating room procedure, regardless of site.

2. Limits the denominator to patients in general surgical, vascular, and orthopedic Medicare Severity Diagnosis Related Groups (MS-DRGs).

3. Excludes patients whose relevant complications preceded (rather than followed) their first inpatient operating room procedure, while broadening the definition of denominator-triggering complications to include other complications that may predispose to death (for example, pyelonephritis, osteomyelitis, acute myocardial infarction, stroke, acute renal failure, heart failure/volume overload).

4. Measure cohort includes Medicare Advantage patients.

We proposed to adopt the Failure-to-Rescue measure beginning with the performance period of July 1, 2023 – June 30, 2025, affecting the FY 2027 payment determination.

(2) Overview of Measure

The Failure-to-Rescue measure is a risk-standardized measure of death after hospital-acquired complication. The measure denominator includes patients 18 years old and older admitted for certain procedures in the General Surgery, Orthopedic, or Cardiovascular Medicare Severity Diagnosis Related Groups (MS-DRGs) who were enrolled in the Medicare program and had a documented complication that was not present on admission. The measure numerator includes patients who died within 30 days from the date of their first “operating room” procedure, regardless of site of death.

We refer readers to CMS’ QualityNet website:

<https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures#tab2> (or other successor CMS designated websites) for more details on the measure specifications.

(3) Measure Alignment to Strategy

The Failure-to-Rescue measure aligns with several goals under the CMS National Quality Strategy.⁶⁵¹ In alignment with the goal to “Promote Alignment” and “Improved Health

⁶⁵¹ Centers for Medicare & Medicaid Services. (2023). CMS National Quality Strategy. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy>.

Outcomes,” this outcome-based measure would allow hospitals to track their institution’s ability to rescue patients after an adverse occurrence and encourage hospitals to focus on early identification and rapid treatment of complications, thereby improving the overall quality of care and health outcomes of patients in the inpatient setting. In alignment with the goal to “Ensure Safe and Resilient Health Care Systems,” the Failure-to-Rescue measure includes a larger patient population than the CMS PSI 04 measure. The Failure-to-Rescue measure includes Medicare Advantage data, and the denominator includes a much broader range of hospital-acquired complications (for example, kidney dysfunction, seizures, stroke, heart failure, and wound infection) than the CMS PSI 04 measure.

(4) Pre-rulemaking Process and Measure Endorsement

(a) Recommendation from the PRMR Process

We refer readers to section IX.B.1.c. of the preamble of this final rule for details on the PRMR process including the voting procedures the PRMR process uses to reach consensus on measure recommendations. The PRMR Hospital Committee, comprised of the PRMR Hospital Advisory Group and PRMR Hospital Recommendation Group, reviewed measures included by the Secretary on a publicly available “2023 Measures Under Consideration List” (MUC List),^{652 653} including the Failure-to-Rescue measure (MUC2023-049). The PRMR Hospital Recommendation Group reviewed the proposed updates to the Failure-to-Rescue measure (MUC2023-049) during a meeting on January 18-19, 2024.^{654 655}

The committee reached consensus and recommended including this measure in the Hospital IQR Program with conditions. Twelve members of the group voted to adopt the measure into the Hospital IQR Program without conditions; five members voted to adopt with

⁶⁵² Centers for Medicare & Medicaid Services. (December 1, 2023). 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁶⁵³ Centers for Medicare & Medicaid Services. (December 2023). Overview of the List of Measures Under Consideration. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List-Overview.pdf>.

⁶⁵⁴ Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁶⁵⁵ Centers for Medicare & Medicaid Services. (December 2023). Overview of the List of Measures Under Consideration. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List-Overview.pdf>.

conditions; two committee members voted not to recommend the measure for adoption. Taken together, 89.5 percent of the votes were recommend or recommended with conditions. The five members of the voting committee who voted to adopt with conditions specified the condition as collecting data to evaluate possible unintended consequences, such as hospitals encouraging patients to sign a DNR order or enter hospice. We agree with the potential for unintended consequences and note that we consistently monitor all the measures in the Hospital IQR Program for unintended consequences. Furthermore, we note that under our previously finalized measure removal Factor 6, codified at 42 CFR 412.140(g)(3)(i)(F) and (3) (88 FR 59144), collection or reporting of a measure leads to negative unintended consequences other than patient harm, if we were to identify unintended consequences related to this measure we would consider it for removal.

Feedback was generally positive with some discussion around whether the measure was enough of an improvement on CMS PSI 04. The measure developer highlighted several areas of improvement compared to CMS PSI 04, including increased reliability and validity largely due to the application of this measure to both Medicare Advantage and fee-for-service enrollees, as well as the inclusion of deaths after hospital discharge but within 30 days of the index operative procedure.⁶⁵⁶

(b) Measure Endorsement

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for details on the E&M process including the measure evaluation procedures the E&M Committees uses to evaluate measures and whether they meet endorsement criteria. The E&M Management of Acute Events, Chronic Disease, Surgery, and Behavioral Health Committee convened in the Fall Cycle 2023 to review the Failure-to-Rescue measure (CBE #4125) which was submitted to the CBE for endorsement. The E&M Management of Acute

⁶⁵⁶ Battelle - Partnership for Quality Measurement. (February 2024). 2023 Pre-Rulemaking Measure Review (PRMR) Meeting Summary: Hospital Committee. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-Hospital-Recommendation-Group-Meeting-Summary-Final.pdf>

Events, Chronic Disease, Surgery, and Behavioral Health Committee ultimately voted to endorse with conditions on January 29th, 2024.⁶⁵⁷ The condition was: perform additional reliability testing for endorsement review, namely conducting additional simulation analyses of minimum case volume adjustments.⁶⁵⁸ We will monitor the data as part of the standard measure maintenance.

(5) Measure Calculation

The measure is calculated using Medicare fee-for-service (FFS) Part A inpatient claims data and Medicare Inpatient Encounter data for Medicare Advantage enrollees, in combination with validated death data from the Medicare Beneficiary Summary File or equivalent resources. CMS receives death information from several sources: Medicare claims data from the Medicare Common Working File (CWF); online date of death edits submitted by family members; and benefit information used to administer the Medicare program collected from the Railroad Retirement Board (RRB) and the Social Security Administration (SSA). Like the CMS 30-day mortality measures, the "Valid Date of Death Switch" is used to confirm that the exact day of death has been validated.

This measure was tested using Medicare inpatient hospital discharge data from 2,055 IPPS hospitals with at least 25 eligible discharges from January 1, 2021, through June 30, 2022. Hospital-level performance rates are depicted in Table IX.C-2.⁶⁵⁹ Because lower scores are better the lower performance percentiles are better performing hospitals than those in the higher percentiles (for example, the hospitals in the fifth percentile are the best performing hospitals).

⁶⁵⁷ Battelle - Partnership for Quality Measurement. (February 2024). Fall 2023 Management of Acute and Chronic Events Meeting Summary. Available at: <https://p4qm.org/sites/default/files/Management%20of%20Acute%20Events,%20Chronic%20Disease,%20Surgery,%20and%20Behavioral%20Health/material/EM-Acute-Chronic-Events-Fall2023-Endorsement-Meeting-Summary.pdf>

⁶⁵⁸ Battelle - Partnership for Quality Measurement. (February 2024). Fall 2023 Management of Acute and Chronic Events Meeting Summary. Available at: <https://p4qm.org/sites/default/files/Management%20of%20Acute%20Events,%20Chronic%20Disease,%20Surgery,%20and%20Behavioral%20Health/material/EM-Acute-Chronic-Events-Fall2023-Endorsement-Meeting-Summary.pdf>

⁶⁵⁹ Battelle - Partnership for Quality Measurement. Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications (Failure-to-Rescue). Available at: <https://p4qm.org/measures/4125>.

TABLE IX.C.2 HOSPITAL PERFORMANCE IN MEASURE TESTING FOR THE FAILURE-TO-RESCUE MEASURE

Performance Percentile	Deaths per 1,000
5 th	0
25 th	29.33
Weighted mean	43.5
75 th	60.95
95 th	98.0

If hospitals currently in the worst quartile (that is, those at the 75th percentile) were to improve performance to the performance of hospitals in the best quartile (that is, those at the 25th percentile) it would represent a 50 percent decrease in the frequency of deaths after postoperative complications at those hospitals.⁶⁶⁰

Test results indicated moderate measure reliability and strong validity.⁶⁶¹

(6) Data Submission and Reporting

This measure uses readily available administrative claims data routinely generated and submitted to CMS for all Medicare beneficiaries, which includes Medicare Advantage and Medicare fee-for-service patients. Hospitals would not be required to report any additional data. We have used a similarly designed claims-based measure (CMS PSI 04) for over a decade. The Failure-to-Rescue measure would be calculated and publicly reported on annual basis using a rolling 24 months of prior data for the measurement period, consistent with the approach currently used for CMS PSI 04 and PSI 90, the Patient Safety and Adverse Events Composite.

We invited public comment on our proposal to adopt the Thirty-day Risk-Standardized Death Rate Among Surgical Inpatients with Complications measure beginning with the CY 2025 reporting period/FY 2027 payment determination.

Comment: Many commenters supported the proposal to add the Failure-to-Rescue measure as a replacement for CMS PSI 04 in the Hospital IQR Program. Several commenters noted the adoption of this measure would incentivize hospitals to provide patients and family

⁶⁶⁰ Ibid.

⁶⁶¹ Ibid.

members with clear mechanisms to voice their concerns and to empower staff (such as less senior staff) to do so as well. A few commenters noted that the measure can serve as a valuable metric to help hospitals identify areas where they can improve their quality of care, enhance patient outcomes, and prevent death. Another commenter noted that the adoption of this measure would capture additional deaths while employing more precise exclusions than CMS PSI 04. A commenter stated that the adoption of the measure would help to recognize hospitals that are exemplars in patient safety, as well as refine the data collected so that it is meaningfully used to prioritize safety improvement for the most vulnerable populations. A commenter applauded CMS for applying this measure to both Medicare FFS and Medicare Advantage patients. A commenter expressed their support for the removal of CMS PSI 04 contingent on the adoption of the Failure-to-Rescue measure.

Response: We thank commenters for their support.

Comment: A few commenters noted the adoption of the Failure-to-Rescue measure improves upon CMS PSI 04 because it includes a denominator limitation to a more appropriate set of index DRGs for inclusion, adds Medicare Advantage patients to the measure population, and excludes complications that occur prior to surgery rather than focusing on complications that occur post-procedure.

Response: We thank commenters for their support and agree with their feedback. Using the Failure-to-Rescue measure instead of the CMS PSI 04 would allow us to assess an expanded population, encourage safe practices for the widest range of surgical inpatients, and allow hospitals to identify opportunities to improve their quality of care.

Comment: Many commenters expressed concerns about using patient safety measures derived from claims data, because in their view, such data would not accurately reflect hospital performance and would eliminate the clinical components of care from quality calculations. To close this gap, commenters requested that CMS explore alternative data sources other than claims data to ensure an accurate and fair hospital performance assessment. A commenter also

suggested the Failure-to-Rescue measure become an eCQM.

Response: We disagree that patient safety measures derived from claims data eliminate clinical components of care from quality measurement, or that claims-based measures are inaccurate. Studies have shown that using claims data is a robust approach to capturing variation in mortality outcomes across hospital systems.⁶⁶² Additionally, claims data contain all the necessary data elements to accurately calculate the Failure-to-Rescue measure. Testing results for the Failure-to-Rescue measure were shown to have high face-validity; and 90 percent of the TEP members supported the measure's relevance in assessing quality of care and agreed that the measure could improve quality of care by reducing the frequency of failure to rescue.⁶⁶³ Furthermore, the measure exhibited adequate signal-to-noise reliability, indicating its ability to distinguish between the quality of care across facilities. Notably, hospitals with higher nurse staffing levels and skill mix tend to exhibit lower mortality rates following serious postoperative complications. Conversely, hospitals that delay identification or fail to aggressively treat complications are associated with higher rates of 30-day readmissions and mortality post complications.⁶⁶⁴

We note that during the measure development process we are responsible for determining whether to account for variation in factors intrinsic to the patient before comparing outcomes and to determine how to best apply these factors in the quality measure specifications. Additionally, in our view, utilizing claims data where practical helps to minimize the reporting burden on hospitals and provides sufficient and high-quality data and therefore the Failure-to-Rescue measure is appropriate as a claims-based measure rather than an eCQM. However, we will consider exploring alternative data sources for other quality measurement topics in the future.

Comment: A few commenters expressed concerns about the risk adjustment

⁶⁶² <https://doi.org/10.1016/j.jcjq.2017.08.003>

⁶⁶³ <https://p4qm.org/measures/4125>

⁶⁶⁴ Ibid.

methodologies for the Failure-to-Rescue measure. A commenter strongly opposed the risk adjustment for patients who enter the hospital with COVID-19 because the commenter noted that the policy excludes a wide range of patients. A commenter stated that it is unclear whether the revised risk adjustment methodology for the Failure-to-Rescue measure would appropriately account for differences between hospitals. A commenter recommended that CMS risk-adjust the Failure-to-Rescue measure to account for differences in patient populations and case mixes across hospitals. The commenter suggested that such risk adjustment factors should include severity of illness, comorbidity burden, socioeconomic factors, and care setting characteristics. The commenter argued that by incorporating risk adjustment methodologies in the Failure-to-Rescue measure, CMS will ensure a comprehensive and equitable evaluation of hospitals because patient outcomes can be influenced by factors outside the control of healthcare providers.

Response: We thank commenters for their feedback on risk adjustment methodologies. However, as we discussed in the proposed rule (89 FR 36324), measure testing results indicated moderate measure reliability and strong validity. Further, we have used a similarly designed claims-based measure (CMS PSI 04) for over a decade. For additional details on the measure's risk adjustment model, please refer to the measure details available on the Partnership for Quality Measurement website.⁶⁶⁵ The Failure-to-Rescue measure, like all quality measures, would undergo a rigorous maintenance review process, in which we would evaluate the potential inclusion of additional factors into the measure's risk adjustment model. We note that including COVID-19 as a risk factor in the risk adjustment model does not exclude patients with COVID-19. Rather, by including COVID-19 status in the model, we recognize COVID-19 as an important risk factor within the model. This approach ensures that hospitals are not penalized for treating a higher number of COVID-19 patients, but we agree with the commenter that all patients deserve quality care, including patients with COVID-19. Additionally, we have ensured

⁶⁶⁵ <https://p4qm.org/measures/4125>

the Failure-to-Rescue measure appropriately accounts for differences between hospitals, as we recognize this is an important risk factor within the model.

Comment: A few commenters requested CMS consider the workflow and education impact of the high volume of measures proposed for FY2025 and ensure adoption alignment.

Response: We thank commenters for their input. We are mindful of the reporting burden for participants in the Hospital IQR Program. Adopting a measure can result in changes in workflow as well as staff training. However, those changes are necessary where quality measures ensure that hospitals meet the applicable standard of care. We remind commenters that the Failure-to-Rescue measure is a claims-based hospital measure, calculated using Medicare Advantage data and Medicare FFS claims that are already reported to the Medicare program for payment purposes. Adopting this measure would not result in a change in hospitals' reporting burden.

Comment: Several commenters requested that CMS release the full measure specifications as soon as possible to ensure that interested parties have sufficient clinical documentation of coding. Commenters suggested that providing documentation regarding justification for each surgical complication used in the Failure-to-Rescue measure along with their respective ICD-10 based definitions would be helpful to program participants.

Response: We thank the commenters for their feedback regarding measure specifications. As described in the proposed rule, we refer readers to CMS' QualityNet website: <https://qualitynet.cms.gov/inpatient/iqr/measures> (or other successor CMS designated websites) for the measure specifications. The measure specifications detail the surgical complications included in the Failure-to-Rescue measure along with their respective ICD-10 based definitions and their relevant exclusions. Any future updates to the technical measure specification will be announced through the QualityNet website and listserv announcements.

Comment: A few commenters expressed concern that the abbreviated name of the measure, Failure-to-Rescue, may not appropriately describe the underlying measure's focus.

Commenters suggested that the name of the measure is misleading to consumers and may evoke an image of disregard for human suffering and elicit feelings of distrust or avoidance of any hospital with a non-zero performance rate. A commenter suggested that the abbreviated name uses blaming language that implies hospitals are directly at fault for patients who may die within the 30 days of surgical complication. To close this gap, a commenter requested that CMS work with patients and communities to determine whether the measure's name appropriately meets patients' understanding of the measure and suggested CMS rename the measure to something that adequately correlates to patients' understanding of the measure. The commenter further requested CMS identify how the Failure-to-Rescue measure would be used among patients to make determinations about where to seek inpatient surgical care.

Response: We thank commenters for their feedback on the abbreviated name of the measure, Failure-to-Rescue, and will take this suggestion into consideration during future measure updates. The measure's full name is Thirty-Day Risk-Standardized Death Rate Among Surgical Inpatients With Complications, and we will consider the most appropriate way to display measure performance on this clinical topic for purposes of public reporting. Additionally, we acknowledge the suggestion to identify how the measure would be used to make determinations about where to seek inpatient surgical care. We reiterate that this measure assesses the percentage of surgical inpatients who experienced a complication and then died within 30-days from the date of their first "operating room" procedure. Hospitals can use the measure to identify opportunities to improve their quality of care and patient safety. With strategies that focus on improving patient centered care, the measure would ensure that the decisions from these hospitals respect patients' needs and preferences to make the appropriate determinations for their care.

Comment: A commenter requested that CMS provide clarity in defining the Failure-to-Rescue measure. The commenter suggested the Failure-to-Rescue measure's definition should provide a comprehensive understanding of what constitutes as a "failure to rescue" event, including specific criteria for identifying such events.

Response: We thank commenters for their feedback on clarifying the definition of a “failure to rescue” event. The Failure-to-Rescue measure is a risk-standardized measure of death after a hospital-acquired complication. However, we note that, as we discussed in the proposed rule (89 FR 36322), the measure’s denominator includes patients 18 years old and older admitted for certain procedures in the General Surgery, Orthopedic, or Cardiovascular Medicare Severity Diagnosis Related Groups (MS-DRGs) who were enrolled in the Medicare program and had a documented complication that was not present on admission. The measure’s numerator includes patients who died within 30 days from the date of their first “operating room” procedure, regardless of site of death. We will work with interested parties to ensure that the measure’s documentation is as clear as possible to ensure that hospitals can provide the best possible care to their patients. Additional details about the Failure-to-Rescue measure can be found on the QualityNet website: <https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures#tab2> and the Partnership for Quality Measurement website: <https://p4qm.org/measures/4125>. We consistently monitor all the measures in the Hospital IQR Program for unintended consequences, and we will monitor performance on this measure to ensure that those unintended consequences do not result from its adoption.

Comment: Several commenters expressed concerns that the proposed performance period for the Failure-to-Rescue measure would begin on July 1, 2023, more than a year prior to the measure’s adoption in the Hospital IQR Program. Commenters questioned if it was appropriate for CMS to utilize claims data from July 2023 for quality measurement purposes. A commenter elaborated and requested that CMS reconsider the timeline of the Failure-to-Rescue measure proposal to avoid incorporating claims data for years in which the measure had not been adopted in the Hospital IQR Program. The commenters further requested that CMS delay the measure’s adoption for at least one year to allow hospitals time to familiarize and educate staff around the Failure-to-Rescue measure requirements and changes compared to CMS PSI 04 and to align with the other Hospital IQR Program proposals this year.

Response: We thank the commenters for their feedback on the proposed measurement period. As we noted in the proposed rule (89 FR 36324), the measure is calculated and publicly reported on an annual basis using a rolling 24 months of prior data for the measurement period. This performance period is consistent with the CMS PSI 04 measure and the CMS PSI 90 composite measure. We acknowledge that the Failure-to-Rescue measure's performance period would begin on July 1, 2023, as with many other quality measures whose performance period occurs in the past and whose calculations are incorporated into payment determinations for future years. However, because this measure is calculated and publicly reported on an annual basis using a rolling 24 months of prior data, this policy is necessary to ensure that we calculate the measure with sufficient reliability and validity using a sufficiently large claims data set. Additionally, by adopting the measure with this performance period, we can ensure that we continue assessing hospitals on this important clinical subject rather than delaying the measure's adoption until the FY 2028 payment determination, as would be necessary if we adopted the measure with a performance period beginning on July 1, 2024. Since this measure will replace CMS PSI 04, it would be appropriate to delay measurement of the clinical topic when we have an improved measure available. We remain confident that hospitals and hospital staff will be able to familiarize themselves with the measure's requirements in comparison to CMS PSI 04, particularly because the measure represents an improvement on CMS PSI 04 rather than a fundamental change to the clinical topic's measurement.

Comment: A commenter requested that CMS provide hospitals with a dry run of their Failure-to-Rescue measure results prior to adoption and mandatory reporting in the Hospital IQR Program.

Response: We thank the commenter for their feedback. We intend to provide hospitals with information on their performance on the measure as part of the Hospital IQR Program's preview period process prior to public reporting. As finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50776), quality data displayed for each quarter on Care Compare are made

available to providers for a 30-day preview period approximately two months in advance of display.

Comment: A few commenters did not support the measure's adoption, citing concerns with its reliability. Commenters stated that testing for this measure demonstrated that the reliability was 0.231 using the measure's case minimum of 25 patients and that it required roughly 600 patients to achieve a high level of reliability (0.7 at minimum). Commenters further noted that the low reliability results were questioned during the recent CBE endorsement review. Commenters explained that the committee placed conditions to perform additional reliability testing, and to conduct additional simulation on the measure's endorsement. The commenters requested CMS conduct the recommended additional testing and that the conditions be removed from endorsement before the Failure-to-Rescue measure is used in the Hospital IQR Program.

Response: We appreciate commenters' feedback regarding the reliability of the Failure-to-Rescue measure. The committee placed conditions on the measure's endorsement to perform additional reliability testing for endorsement review, namely, to conduct additional simulation analyses of minimum case volume adjustments. During the E&M committee review, the measure developer responded to concerns regarding low reliability by emphasizing that the Failure-to-Rescue measure is an improvement compared to the CMS PSI 04 measure due to increased reliability and validity largely due to the application of this measure to both Medicare Advantage and fee-for-service enrollees, as well as the inclusion of deaths after hospital discharge but within 30 days of the index operative procedure.⁶⁶⁶ Additional details related to the Failure-to-Rescue measure's reliability results can be found on the Partnership for Quality Measurement website.⁶⁶⁷ As discussed earlier, we agree with the potential for unintended consequences and note that we consistently monitor all the measures in the Hospital IQR

⁶⁶⁶ Battelle - Partnership for Quality Measurement. (February 2024). Fall 2023 Management of Acute and Chronic Events Meeting Summary. ⁶⁶⁷ <https://p4qm.org/measures/4125>

Program for unintended consequences. Furthermore, we note that under our previously finalized measure removal Factor 6, codified at 42 CFR 412.140(g)(3)(i)(F) and (3), collection or reporting of a measure leads to negative unintended consequences other than patient harm, if we were to identify unintended consequences related to this measure we would consider it for removal.

Comment: A few commenters expressed concerns with the exclusion of various patient populations in the Failure-to-Rescue measure. A commenter noted the Failure-to-Rescue measure excludes the most vulnerable patients, who it stated are often at the highest risk of death. To close this gap, the commenter recommended that CMS add a measure to the Hospital IQR Program that gauges hospital mortality performance, observing the most vulnerable cases that are at a heightened risk of death. The commenter expressed they do not support the adoption of the measure unless CMS provides an alternative method to account for the most vulnerable patients. A commenter noted concerns with the exclusion of patients whose complications preceded a surgical event. A commenter also requested that CMS consider expanding the Failure-to-Rescue measure to include other populations and procedures, such as recipients of inpatient cellular therapy services that experience complications. The commenter further suggested that CMS consider adding stratifications for interested parties to better understand performance by procedure.

Response: We thank the commenters for their feedback on the exclusion of various patient populations. The Hybrid Hospital-Wide All-Cause Risk-Standardized Mortality (Hybrid HWM) measure in the Hospital IQR Program complements the Failure-to-Rescue measure and meets the need the commenter suggested for a measure of mortality that can account for the most vulnerable cases that are at a heightened risk of death. Currently, we do not plan to expand the Failure-to-Rescue measure to include other populations or stratify the measure. The Failure-to-Rescue measure, like all quality measures, would undergo a rigorous maintenance review process, in which the measure steward would evaluate the need for changes to the measure.

Comment: A commenter expressed concerns about the data challenges to reliably measure the quality of care for Medicare Advantage patients. The commenter elaborated that the Medicare Payment Advisory Commission has consistently noted challenges with the completeness and accuracy of MA encounter data. To close this gap, the commenter recommended CMS consider policies to ensure that Medicare Advantage plans would be able to provide complete encounter data for quality measurement.

Response: We thank the commenter for their feedback. However, as we stated in the proposed rule (89 FR 36323), the measure developer highlighted the measure's increased reliability and validity in comparison to CMS PSI 04 largely due to the application of this measure to both Medicare Advantage and fee-for-service enrollees as well as the inclusion of deaths after hospital discharge but within 30 days of the index operative procedure. As required under § 422.504(l), Medicare Advantage organizations certify the accuracy, completeness, and truthfulness of their encounter data (based on best knowledge, information, and belief).⁶⁶⁸ Medicare Advantage plans conduct self-assessments regarding the accuracy and completeness of their encounter data submissions for each contract they have with CMS, and each year Medicare Advantage plans apply the findings from their self-assessments to improve the accuracy and completeness of their submissions.⁶⁶⁹ There is an established compliance framework, including identification of initial metrics for assessing completeness and accuracy,⁶⁷⁰ to ensure that the encounter data provided is as reliable and as complete as possible for the Failure-to-Rescue measure.

⁶⁶⁸ Centers for Medicare & Medicaid Services. (November 2022). Encounter Data Submission and Processing Guide Version 5.0. Available at: [https://cssoperations.com/internet/csscw3_files.nsf/F2/2022ED_Submission_Processing_Guide_20221130.pdf/\\$FILE/2022ED_Submission_Processing_Guide_20221130.pdf](https://cssoperations.com/internet/csscw3_files.nsf/F2/2022ED_Submission_Processing_Guide_20221130.pdf/$FILE/2022ED_Submission_Processing_Guide_20221130.pdf)

⁶⁶⁹ Centers for Medicare & Medicaid Services. (November 2022). Encounter Data Submission and Processing Guide Version 5.0. Available at: [https://cssoperations.com/internet/csscw3_files.nsf/F2/2022ED_Submission_Processing_Guide_20221130.pdf/\\$FILE/2022ED_Submission_Processing_Guide_20221130.pdf](https://cssoperations.com/internet/csscw3_files.nsf/F2/2022ED_Submission_Processing_Guide_20221130.pdf/$FILE/2022ED_Submission_Processing_Guide_20221130.pdf)

⁶⁷⁰ Centers for Medicare & Medicaid Services. (November 2022). Encounter Data Submission and Processing Guide Version 5.0. Available at: [https://cssoperations.com/internet/csscw3_files.nsf/F2/2022ED_Submission_Processing_Guide_20221130.pdf/\\$FILE/2022ED_Submission_Processing_Guide_20221130.pdf](https://cssoperations.com/internet/csscw3_files.nsf/F2/2022ED_Submission_Processing_Guide_20221130.pdf/$FILE/2022ED_Submission_Processing_Guide_20221130.pdf)

Comment: A commenter suggested that CMS maintain transparency and actively engage with interested parties throughout the development and implementation process of the Failure-to-Rescue measure to ensure the success of measures aimed at enhancing high-quality, patient-centered care. The commenter further recommended that CMS seek input from a diverse range of interested parties, including clinicians, researchers, and patient advocacy groups, to ensure the measure aligns with its objectives and reflects the need to prioritize all those involved.

Response: We thank the commenter for their feedback. To ensure transparency throughout the measure development process, a Technical Evaluation Panel (TEP) provided direction and input from interested parties to the measure developer in every phase of the measure development process. Measure developers incorporated feedback from TEPs upon their review of the measure testing results. We also submitted this measure through the PRMR process for input from a multistakeholder group of clinicians, patients, and other interested parties. We refer readers to section IX.B.1.c. of the preamble of this final rule for details on the PRMR process including the voting procedures the PRMR process uses to reach consensus on measure recommendations.

Comment: A commenter expressed concerns with the Failure-to-Rescue measure having exclusions regarding documentation errors and missing demographic information, which in the commenter's opinion allows too much leeway for hospitals to remove such cases from the measure's calculation.

Response: We thank the commenter for their input on excessive exclusions. However, we note that because the measure is claims-based, hospitals do not have the discretion to withhold cases from its calculation so long as they have submitted those claims for payment. We will monitor the data that underpins this measure carefully to ensure that the measure's exclusions are implemented appropriately.

Comment: A commenter suggested it would be helpful for CMS to provide hospitals

with additional guidance and resources for support in implementing evidence-based practices that aim to reduce Failure-to-Rescue rates and improve patient outcomes.

Response: We thank the commenter for their feedback and the recommendation to provide additional guidance and resources to support hospitals in implementing evidence-based practices that aim to reduce Failure-to-Rescue measure rates and improve patient outcomes. As noted in the Partnership for Quality Measurement website (<https://p4qm.org/measures/4125>), there are evidence-supported interventions that hospitals can implement to improve timely identification of clinical deterioration and treatment of preventable complications, including improved nurse staffing, simulation training, standardized communication tools, electronic monitoring or warning systems, and rapid response systems.

Comment: A commenter recommended that CMS exclude Medicare Advantage patients from the Failure-to-Rescue measure's calculations because, in the commenter's view, this population is subject to quality initiatives under specific managed care payer contracts.

Response: While the commenter is correct that we implement other quality initiatives for Medicare Advantage patients, the measure's incorporation of Medicare Advantage patients improves its reliability and validity and appropriately provides Medicare beneficiaries with additional information about the quality of care that they receive from hospitals.

Comment: Several commenters expressed concerns that the Failure-to-Rescue measure may hold hospitals accountable for factors outside of their control. Commenters elaborated on how a person may die within 30 days of a hospital procedure for various reasons unrelated to the hospital's quality of care, including self-harm or trauma, which may increase the risk of skewing the data. To address this issue, commenters requested CMS to consider adding additional exclusions to the Failure-to-Rescue measure to ensure the measure is reflective of the hospital's performance. A commenter also noted concerns with deaths outside the hospital system may have missing information, ultimately creating challenges for hospitals for potential improvement.

Response: The measure's denominator exclusions control for factors affecting patients'

clinical care that are beyond the hospital's control, such as a patient age of over 90 years, a "do not resuscitate (DNR)" status present on admission, or a departure against medical advice. We refer readers to the Failure-to-Rescue Measure Specifications on the QualityNet website at: <https://qualitynet.cms.gov/inpatient/iqr/measures> for more details and a complete list of the denominator exclusions. We note additionally that the complications in the Failure-to-Rescue measure are all serious adverse health events. We will monitor the measure's effects on the provision of clinical care to avoid any unintended consequences of its adoption.

Comment: A commenter urged CMS to ensure that healthcare providers have access to sufficient resources and support to enable accurate data collection and reporting. To encourage participation and compliance, the commenter stated that CMS must minimize any administrative burdens and streamline data submission mechanisms wherever possible.

Response: We are mindful of the administrative burden for participants in the Hospital IQR Program. We reiterate the Failure-to-Rescue measure would be included as one of the claims-based hospital measures, calculated using Medicare Advantage data and Medicare FFS claims that are already reported to the Medicare program for payment purposes. Hospitals would not be required to report any additional data, so adoption of this measure would not result in a change in burden.

Comment: A commenter expressed concerns with the unintended consequences that may arise based on the well-known limitations in measurement science. The commenter further elaborated that measures should be assessed regularly for their effectiveness, impact, and overall performance, which are all an essential part of measurement science. To address this issue, the commenter recommended that CMS utilize an unbiased party to conduct such assessments, and to track and report any issues that arise in a timely manner.

Response: We agree that the potential for unintended consequences exists and note that we consistently monitor and evaluate all the measures in the Hospital IQR Program for unintended consequences. With respect to the concern regarding the use of unbiased parties to

assess the measure for potential unintended consequences and enhancements, the current CBE (which consists of a variety of experts including clinicians, measure experts, and health IT specialists) conducts annual reviews to provide recommendations regarding the quality and efficiency measures in CMS programs.⁶⁷¹ Common issues or questions received are taken into consideration during the annual update process. Additionally, the CBE's Measure Set Review process provides additional recommendations for us to consider as we refine our programs.

Comment: A commenter did not support the adoption of the Failure-to-Rescue measure because they stated that the measure lacks insight into post discharge care or related complications. The commenter argued that CMS PSI 04 and the current 30-day mortality measures provide hospitals with opportunities to improve their care and post-discharge planning and therefore adoption of the Failure-to-Rescue measure is not necessary.

Response: As we stated in the proposed rule (89 FR 36323), the measure aligns with several goals under the CMS National Quality Strategy and is outcome-based. We consider the Failure-to-Rescue measure as an improvement on CMS PSI 04 and therefore, in connection with the proposal to adopt this measure in the Hospital IQR Program, we also proposed to remove the CMS PSI 04 measure from the Hospital IQR Program. We discuss removal of the CMS PSI 04 measure in detail in the next section.

After consideration of the public comments we received, we are finalizing adoption of the Failure-to-Rescue measure as proposed beginning with the July 1, 2023 – June 30, 2025, reporting period/FY 2027 payment determination. We also refer readers to section XXXX of the preamble of this final rule where we discuss the use of this measure in the Transforming Episode Accountability Model (TEAM).

6. Measure Removals for the Hospital IQR Program Measure Set

We proposed to remove five measures: (1) Death Among Surgical Inpatients with Serious Treatable Complications (CMS PSI 04) measure beginning with the July 1, 2023 – June

⁶⁷¹ For more information on the CBE measure review process we refer readers to <https://p4qm.org/MSR>

30, 2025 reporting period/FY 2027 payment determination; (2) Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI) measure beginning with the July 1, 2021 – June 30, 2024 reporting period/ FY 2026 payment determination; (3) Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Heart Failure (HF) measure beginning with the July 1, 2021 – June 30, 2024 reporting period/FY 2026 payment determination; (4) Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Pneumonia (PN) measure beginning with the July 1, 2021 – June 30, 2024 reporting period/FY 2026 payment determination; and (5) Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) measure beginning with the April 1, 2021 – March 31, 2024 reporting period/FY 2026 payment determination. We provide more details on each of these proposals in the subsequent sections.

a. Removal of Death Among Surgical Inpatients with Serious Treatable Complications (CMS PSI 04) Measure Beginning with the FY 2027 Payment Determination

We proposed to remove the Death Among Surgical Inpatients with Serious Treatable Complications (CMS PSI 04) measure, beginning with the FY 2027 payment determination associated with the performance period of July 1, 2023 – June 30, 2025, based on removal Factor 3,⁶⁷² the availability of a more broadly applicable measure (across settings, populations), or the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic. The CMS PSI 04 measure was adopted into the Hospital IQR Program in the FY 2009 IPPS/LTCH PPS final rule (73 FR 48607). The CMS PSI 04 measure records in-hospital deaths per 1,000 elective surgical discharges, among patients ages 18 through 89 years old or obstetric patients with serious treatable complications (shock/cardiac arrest, sepsis,

⁶⁷² We refer readers to the FY 2019 IPPS/ LTCH PPS final rule (83 FR 41540 through 41544) for a summary of the Hospital IQR Program's removal Factors. Removal Factors were codified at 42 CFR 412.140(g)(2) and (3). (88 FR 59144).

pneumonia, deep vein thrombosis/pulmonary embolism, or gastrointestinal hemorrhage/acute ulcer).⁶⁷³ It is a claims-based measure which uses claims and administrative data to calculate the measure without any additional data collection from hospitals. The measure was previously endorsed (CBE #0351), but given the measurement's limitations, endorsement was not maintained by the measure steward, and the measure has not been updated since 2017.⁶⁷⁴

In the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25579 through 25580), we proposed to remove this measure under removal Factor 3, codified at 42 CFR 412.140(g)(3)(i)(C), noting at that time that the Hybrid Hospital-Wide Mortality measure (Hybrid HWM) (CBE #3502) was more broadly applicable. Some public commenters, however, expressed concerns about replacing CMS PSI 04 with the Hybrid HWM measure since the Hybrid HWM measure would report on the mortality rate of the entire hospital, instead of specifically measuring the deaths of surgical inpatients in an effort to assess postoperative mortality distinct from hospital-wide mortality (86 FR 45391). Other commenters elaborated on this concern stating that by removing a postoperative-specific mortality measure, hospitals may lose the ability to account for what resources they need to better care for surgical inpatients since that population's needs often differs from the needs of non-surgical IPPS hospital patients (86 FR 45390 through 45391).⁶⁷⁵ Some commenters suggested modifications to the existing CMS PSI 04 measure such as changing its methodology to refine the types of surgical patients and complications included in the measure and to expand the measure beyond surgical inpatients (86 FR 45390 through 45391). Other commenters suggested keeping CMS PSI 04 unchanged because of the importance of evaluating patient deaths when assessing patient safety and suggested adding more patient safety measures to the Hospital IQR Program measure set,

⁶⁷³ Agency for Healthcare Research and Quality. (2023). AHRQ Quality Indicators™ (AHRQ QI™) ICD-9-CM Specification Version 6.0. Available at: https://qualityindicators.ahrq.gov/Downloads/Modules/PSI/V2023/TechSpecs/PSI_04_Death_Rate_among_Surgical_Inpatients_with_Serious_Treatable_Complications.pdf.

⁶⁷⁴ Partnership for Quality Measurement. (2023). Death Rate among Surgical Inpatients with Serious Treatable Complications (PSI 04). Available at: <https://p4qm.org/measures/0351>.

⁶⁷⁵ Nilsson, U., Gruen, R., & Myles, P. S. (2020). Postoperative recovery: The importance of the team. *Anesthesia*, 75(S1). <https://doi.org/10.1111/anae.14869>.

expressing that there were too few patient safety measures in the program (86 FR 45391). After consideration of the public comments on our proposal to remove CMS PSI 04 in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25579 through 25580) we decided not to finalize removal of the measure at that time.

Since then, we have developed the Thirty-Day Risk-Standardized Death Rate Among Surgical Inpatients with Complications (Failure-to-Rescue) (CBE #4125) measure, as proposed for adoption in section IX.C.5.e. of this final rule beginning with the FY 2027 payment determination. The Failure-to-Rescue measure is a more broadly applicable measure that would be more appropriate for inclusion in the Hospital IQR Program. Recent studies have indicated that the CMS PSI 04 measure does not consistently recognize preventable in-hospital deaths (failure to rescue cases). A 2023 study indicated that CMS PSI 04 is being used to an unknown extent outside of postoperative cases, and there is often erroneous categorization of patients as having a CMS PSI 04 complication.⁶⁷⁶ This same study found significant variation in the identification of CMS PSI 04 complications at different procedure locations (For example: bedside versus operating room procedures).⁶⁷⁷ Therefore, both the temporal and causal relationship attributing a CMS PSI 04 complication to patient mortality has been found to be poorly understood, particularly because CMS PSI 04 relates to a complication being deemed treatable.⁶⁷⁸

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36322 through 36324), we proposed to adopt the Failure-to-Rescue measure to replace CMS PSI 04 as a more broadly applicable patient safety indicator and one which can better address concerns previously raised by interested parties. The Failure-to-Rescue measure assesses the percentage of surgical inpatients who experienced a complication and then died within 30-days from the date of their

⁶⁷⁶ Azad, T. D., Rodriguez, E., Raj, D., Xia, Y., Materi, J., Rincon-Torroella, J., Gonzalez, L. F., Suarez, J. I., Tamargo, R. J., Brem, H., Haut, E. R., & Bettegowda, C. (2023). Patient Safety Indicator 04 Does Not Consistently Identify Failure to Rescue in the Neurosurgical Population. *Neurosurgery*, 92(2), 338–343. <https://doi.org/10.1227/neu.0000000000002204>.

⁶⁷⁷ Ibid

⁶⁷⁸ Ibid.

first “operating room” procedure. We refer readers to section IX.C.5.e. of this final rule for more detail on the Failure-to-Rescue measure including the timeline for its initial performance, reporting, and payment determination periods.

While CMS PSI 04 only measures the rate of in-hospital deaths among surgical inpatients within a set of serious treatable conditions, the Failure-to-Rescue measure assesses the probability of death given a postoperative complication and is inclusive of a broader range of conditions commonly experienced by surgical inpatients. To best address the needs of a broader scope of surgical inpatients and conditions, it allows for more context-specific approaches to measure preventable deaths due to the highly variable nature of surgical procedures between specialties. This highly variable and context-specific nature of postoperative cases has been considered a challenge of using CMS PSI 04 as an effective universal patient safety metric.⁶⁷⁹ There would be minimal burden for hospitals associated with replacing CMS PSI 04 with the Failure-to-Rescue measure due to the Failure-to-Rescue measure’s data sources, including its use of Medicare Advantage encounter data. Thus, the Failure-to-Rescue measure would include a wider range of patients and better reflect the true nature of postoperative patient safety at institutions. In addition, multiple failure-to-rescue measures have been repeatedly validated by their consistent association with nurse staffing, nursing skill mix, technological resources, rapid response systems, and other activities that improve early identification and prompt intervention when complications arise after surgery.^{680 681 682}

⁶⁷⁹ Azad, T. D., Rodriguez, E., Raj, D., Xia, Y., Materi, J., Rincon-Torroella, J., Gonzalez, L. F., Suarez, J. I., Tamargo, R. J., Brem, H., Haut, E. R., & Bettegowda, C. (2023). Patient Safety Indicator 04 Does Not Consistently Identify Failure to Rescue in the Neurosurgical Population. *Neurosurgery*, 92(2), 338–343. <https://doi.org/10.1227/neu.0000000000002204>.

⁶⁸¹ Rosero, E. B., Romito, B. T., & Joshi, G. P. (2021). Failure to rescue: A quality indicator for postoperative care. *Best Practice & Research Clinical Anesthesiology*, 35(4), 575–589. <https://doi.org/10.1016/j.bpa.2020.09.003>.

⁶⁸² Hall KK, Lim A, Gale B. Failure To Rescue. In: Hall KK, Shoemaker-Hunt S, Hoffman L, et al. Making Healthcare Safer III: A Critical Analysis of Existing and Emerging Patient Safety Practices [Internet]. Rockville (MD): Agency for Healthcare Research and Quality (US); 2020 Mar. 2. Available at: <https://www.ncbi.nlm.nih.gov/books/NBK555513/>.

By using the Failure-to-Rescue measure, hospitals can identify opportunities to improve their quality of care and patient safety. Hospitals and healthcare providers can benefit from knowing not only their institution's mortality rate, but also their institution's ability to provide each patient with the appropriate and necessary standard of care after an adverse occurrence.⁶⁸³ Using the Failure-to-Rescue measure as opposed to the current CMS PSI 04 measure is especially important if the hospital resources needed for preventing and treating 30-day postoperative complications among surgical inpatients are different from those needed for targeted care after an adverse event, such as more skilled care personnel or equipment specific to postoperative care. From a quality improvement perspective, the Failure-to-Rescue measure rate would complement the mortality rate to improve our understanding of mortality statistics and identify opportunities for improvement.⁶⁸⁴ Therefore, the quality-of-care measurement may be improved if both mortality and Failure-to-Rescue measure rates are reported instead of relying on the Hybrid HWM measure alone. Using the Failure-to-Rescue measure instead of the CMS PSI 04 measure would allow us to assess an expanded population and encourage safe practices for the widest range of surgical inpatients.

We proposed to remove the CMS PSI 04 measure from the Hospital IQR Program beginning with the FY 2027 payment determination associated with the performance period of July 1, 2023 – June 30, 2025, contingent upon finalizing our proposal to adopt the Failure-to-Rescue measure beginning with the FY 2027 payment determination so that there is no gap in measuring this important topic area.

We invited public comment on our proposal to remove the CMS PSI 04 measure from the Hospital IQR Program beginning with the FY 2027 payment determination associated with the

⁶⁸³ Rodziewicz TL, Houseman B, Hipskind JE. Medical Error Reduction and Prevention. [Updated 2023 May 2]. In: StatPearls [Internet]. Treasure Island (FL): StatPearls Publishing; 2023 Jan-. Available at: <https://www.ncbi.nlm.nih.gov/books/NBK499956/>.

⁶⁸⁴ Ward, S. T., Dimick, J. B., Zhang, W., Campbell, D. A., & Ghafari, A. A. (2019). Association Between Hospital Staffing Models and Failure to Rescue. *Annals of surgery*, 270(1), 91–94. <https://doi.org/10.1097/SLA.0000000000002744>.

performance period of July 1, 2023 – June 30, 2025, contingent upon finalizing our proposal to adopt the Failure-to-Rescue measure beginning with the FY 2027 payment determination.

Comment: Many commenters broadly supported the removal of the CMS PSI 04 measure. Several commenters supported the removal of the CMS PSI 04 measure contingent upon its replacement with the Failure-to-Rescue measure. A few commenters supported the measure removal, regardless of its replacement with a new measure. A few commenters supported the removal of CMS PSI 04 because they had concerns about the measure's validity and reliability. A commenter stated that the Failure-to-Rescue measure would be more reliable and valid because it includes Medicare Advantage and Medicare fee-for-service participants, as well as deaths after hospital discharge but within 30 days of the index operative procedure.

Response: We thank the commenters for their support. We agree with this feedback.

Comment: A few commenters supported removal of the CMS PSI 04 measure because they stated it is redundant with existing or proposed Hospital IQR Program measures.

Response: We thank commenters for their support. The Failure-to-Rescue measure would be complementary, rather than redundant, to the mortality measures used in the Hospital IQR Program and Hospital VBP Program. We refer readers to sections IX.C.8. and V.L.2. for more details on the previously adopted mortality measures in the Hospital IQR Program and Hospital VBP Program, respectively. Quality of care measurement would be improved through reporting both the Failure-to-Rescue measure and the mortality measures.

Comment: A commenter voiced support for the removal of CMS PSI 04, as well as the four payment-based measures. However, the commenter did not support the addition of eight measures for a net increase of three quality reporting measures.

Response: We thank the commenter for their support. While we understand that there are times when quality reporting poses challenges for hospitals, we view quality-of-care measurement as an essential aspect of improving clinical outcomes and encouraging safe practices for a wide range of surgical inpatients.

Comment: A few commenters raised concerns about removing CMS PSI 04 and replacing it with the Failure-to-Rescue measure. A commenter mentioned that the change from in-hospital deaths to 30-day mortality increases the risk of skewing the data with mortalities that are unrelated to hospital complications. Another commenter stated that an alternate measure must account for the most vulnerable patients since the proposed replacement measure, the Failure-to-Rescue measure, excludes these patients from consideration.

Response: We thank the commenters for their input. Recent studies have indicated that the CMS PSI 04 measure does not consistently recognize preventable in-hospital deaths. A 2023 study indicated that the CMS PSI 04 measure is used outside of postoperative cases, and patients are often erroneously categorized as having a PSI 04 complication.⁶⁸⁵ We understand the Failure-to-Rescue measure is a more broadly applicable patient safety indicator than the CMS PSI 04 measure in that it assesses the probability of death given a postoperative complication. It is not necessarily intended to attribute a causal relationship between the complication and death; rather, it would allow patients to compare hospitals and determine the nature of postoperative patient safety at institutions on a global level. In contrast to the CMS PSI 04 measure, the Failure-to-Rescue measure excludes patients whose relevant complications preceded (rather than followed) their first inpatient operating room procedure. It also limits the patients assessed to the general surgical, vascular, and orthopedic Medicare Severity Diagnosis Related Groups (MS-DRGs). These limitations were implemented in response to specific concerns with CMS PSI 04—namely, that the cohort of patients assessed was too heterogenous and included those who had undergone very high-risk and very low-risk surgeries. In contrast, the exclusion criteria of the Failure-to-Rescue measure would allow prospective patients to make a truer comparison when evaluating hospitals for postoperative safety. The measure’s risk-standardization process appropriately controls for factors impacting patients’ clinical care that are beyond the hospital’s

⁶⁸⁵ Nilsson, U., Gruen, R., & Myles, P. S. (2020). Postoperative recovery: The importance of the team. *Anesthesia*, 75(S1). <https://doi.org/10.1111/anae.14869>.

control. We note that the complications in the Failure-to-Rescue measure are all serious adverse health events. We will monitor the measure's effects on the provision of clinical care to avoid any unintended consequences of its adoption.

Comment: A commenter only supported the removal of the CMS PSI 04 measure if there was no gap in publicly reporting performance between this measure and the implementation of the Failure-to-Rescue measure. The commenter noted that more than 500 people die every day due to hospital errors; therefore, it is critical that no day goes by without reporting on hospital mortality.

Response: We appreciate and agree with the commenter's input. We would like to clarify that there would be no gap in public reporting between the removal of the CMS PSI 04 measure and the implementation of the Failure-to-Rescue measure. The CMS PSI 04 measure would be removed beginning with the July 1, 2023 – June 30, 2025, reporting period/FY 2027 payment determination, and the Failure-to-Rescue measure would be adopted beginning with the July 1, 2023 – June 30, 2025, reporting period/FY 2027 payment determination. Therefore, no gap in reporting would exist.

After consideration of the public comments received, we are finalizing the removal of CMS PSI 04 as proposed beginning with the July 1, 2023 – June 30, 2025, reporting period/FY 2027 payment determination.

b. Removal of Four Clinical Episode-Based Payment Measures Beginning with the FY 2026 Payment Determination

We proposed to remove four clinical episode-based payment measures from the Hospital IQR Program beginning with the FY 2026 payment determination (89 FR 36326 through 36392):

- Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode of Care for Acute Myocardial Infarction (AMI) (CBE #2431) (AMI Payment) (adopted at 78 FR 50802 through 50805). This measure assesses hospital risk-standardized payment

associated with a 30-day episode-of-care for acute myocardial infarction for Medicare FFS patients aged 65 or older for any hospital participating in the Hospital IQR Program;

- Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode of Care for Heart Failure (HF) (CBE #2436) (HF Payment) (adopted at 79 FR 50231 through 50235). This measure assesses hospital risk-standardized payment associated with a 30-day episode-of-care for heart failure for Medicare FFS patients aged 65 or older for any hospital participating in the Hospital IQR Program;

- Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode of Care for Pneumonia (PN) (CBE #2579) (PN Payment) (adopted at 79 FR 50227 through 50231). This measure assesses hospital risk-standardized payment associated with a 30-day episode-of-care for pneumonia for any hospital participating in the Hospital IQR Program and includes Medicare FFS patients aged 65 or older; and

- Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode of Care for Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (CBE #3474) (THA/TKA Payment) (adopted at 80 FR 49674 through 49680; revised at 87 FR 49267 through 49269). This measure assesses hospital risk-standardized payment (including payments made by CMS, patients, and other insurers) associated with a 90-day episode-of-care for elective primary THA/TKA for any hospital participating in the Hospital IQR Program and includes Medicare FFS patients aged 65 or older.

The final performance periods for these four payment measures are indicated in the following table:

TABLE IX.C.3. Final Performance Period & Payment Determination for AMI Payment, HF Payment, PN Payment, and THA/TKA Payment Measures

Measure	Performance Period	Payment Determination
AMI Payment	July 1, 2020 – June 30, 2023	FY 2025
HF Payment	July 1, 2020 – June 30, 2023	FY 2025
PN Payment	July 1, 2020 – June 30, 2023	FY 2025

THA/TKA Payment	April 1, 2020 – March 31, 2023	FY 2025
-----------------	--------------------------------	---------

We proposed to remove the AMI Payment, HF Payment, PN Payment, and THA/TKA Payment measures under measure removal Factor 3, codified at 42 CFR 412.140(g)(3)(i)(C), the availability of a more broadly applicable measure (across settings, populations, or the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic) – specifically, the Medicare Spending Per Beneficiary Hospital measure (CBE #2158) (MSPB Hospital measure) in the Hospital VBP Program (89 FR 36326).⁶⁸⁶ The MSPB Hospital measure has been intermittently included in the Hospital IQR Program’s measure set, most recently to update the measure specifications in the Hospital VBP Program. The Hospital VBP Program’s statute requires that measures be publicly reported for one year in the Hospital IQR Program prior to the beginning of the performance period in the Hospital VBP Program (section 1886(o)(2)(B)(ii) of the Act and 42 CFR 412.164(b)).⁶⁸⁷ In the FY 2023 IPPS/LTCH PPS final rule, we re-adopted the previously removed MSPB Hospital measure into the Hospital IQR Program with refinements (87 FR 28529 through 28532) to update the measure specifications for purposes of the Hospital VBP Program. We subsequently removed it again from the Hospital IQR Program and concurrently adopted the refined version into the Hospital VBP Program (88 FR 59064 through 59067, 59170 through 59171, respectively). We refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49257 through 49263) for more details on this measure’s history in the Hospital IQR and Hospital VBP Programs.

The MSPB Hospital measure evaluates hospitals’ efficiency and resource use relative to the efficiency of the national median hospital. The MSPB Hospital measure is a more broadly

⁶⁸⁶ We refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41540 through 41544) for a summary of the Hospital IQR Program’s removal Factors. Removal Factors were codified at 42 CFR 412.140(g)(3).

⁶⁸⁷ When substantive updates to measure specifications are needed, we have had to readopt the measure and updates into the Hospital IQR Program first. The measure was initially adopted into the Hospital IQR Program in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51618) and then was finalized for removal in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41559 through 41560) to deduplicate the measure sets across programs and reduce burden for hospitals.

applicable measure because it captures the same data as the four clinical episode-based payment measures proposed for removal but incorporates a much larger set of conditions and procedures. We note that we recently adopted refinements to the MSPB Hospital measure to ensure a more comprehensive and consistent assessment of hospital performance (87 FR 49257 through 49263, 88 FR 59064 through 59067). Those refinements allow the measure to capture more episodes and adjusted the measure calculation.⁶⁸⁸

The four clinical episode-based payment measures proposed for removal are condition-specific whereas the MSPB Hospital measure is not. Although the MSPB Hospital measure does not provide the same level of granularity as the four condition-specific measures, the important data elements would be captured more broadly under the Hospital VBP Program by evaluating and publicly reporting the hospitals' efficiency relative to the efficiency of the median national hospital. Specifically, the MSPB Hospital measure assesses the cost to Medicare for services performed by hospitals and other healthcare providers during an episode of care, which includes the three days prior to, during, and 30 days following an inpatient's hospital stay.⁶⁸⁹ Additionally, providers would continue to receive confidential feedback reports containing details on the MSPB Hospital measure.

We note that performance on these four clinical episode-based payment measures has either remained stable or decreased since FY 2019. Based on an internal CMS analysis, the mean performance for the PN Payment, HF Payment, and AMI Payment measures has decreased, while the mean performance for the THA/TKA Payment measure has remained stable. Considering these performance trends, we highlight that these four clinical episode-based payment measures have not been as beneficial in recent years to the Hospital IQR Program.

⁶⁸⁸ These refinements are available in a summary of the measure re-evaluation on the CMS QualityNet website, Medicare Spending Per Beneficiary (MSPB) Measure Methodology. Available at: <https://qualitynet.cms.gov/inpatient/measures/hvbp-mspb>.

⁶⁸⁹ Centers for Medicare & Medicaid Services. (2024). Medicare Spending Per Beneficiary – National <https://data.cms.gov/provider-data/dataset/3n5g-6b7f>.

We invited public comment on our proposal to remove these four clinical episode-based payment measures from the Hospital IQR Program beginning with the FY 2026 payment determination.

Comment: Several commenters expressed general support for the proposal to remove the four clinical episode-based payment measures. Many commenters agreed that the existing and proposed new Hospital IQR Program measures are more broadly applicable and that retaining these four measures would result in program measure redundancies. Several commenters expressed support contingent upon replacement measures as outlined in the proposed rule. A few commenters supported CMS's proposal and noted that removal of the four payment measures aligns with the National Quality Strategy and Meaningful Measures Framework, enabling hospitals to prioritize patient care and quality improvement initiatives more effectively. A few commenters appreciated that removing these four measures would reduce the administrative impact of quality measure reporting and allow hospitals to meet reporting requirements more efficiently. A commenter suggested CMS consider the administrative impact of quality measure reporting and remove measures that are redundant or no longer needed. A commenter noted that removing these measures would allow for other measures to be added in the future.

Response: We thank the commenters for their support. We agree that the MSPB Hospital measure is a more broadly applicable measure such that removing these four clinical episode-based payment measures would enable hospitals to more efficiently report on, and work toward, improved quality of care. We note that we continually assess the Hospital IQR Program's measure set and appreciate feedback regarding removal of measures. We will continue engaging with interested parties through education and outreach opportunities for any feedback about suggested additional measure removals in the future.

Comment: A commenter supported CMS's proposal to remove the four payment measures and stated that the data produced by these measures were difficult to interpret or act

upon for quality improvement purposes. A commenter specifically supported CMS's proposal to remove the AMI Payment and HF Payment measures, expressing concern about whether they had been appropriately risk adjusted.

Response: We thank the commenters for their support and appreciate their feedback regarding their perceived utility as well as the lack of risk adjustment for these measures.

Comment: A few commenters did not support removal of the four clinical episode-based payment measures and expressed concern about adequacy of the MSPB Hospital measure as a replacement. Specifically, commenters expressed concern about whether the MSPB Hospital measure considers patient risk factors, that it does not include non-Medicare costs, and that it lacks granular detail which the four procedure- or condition-based payment measures provide.

Response: We thank the commenters for their feedback, but we respectfully disagree. The MSPB Hospital measure is an adequate replacement for the four clinical episode-based payment measures because it captures the same data as the four clinical episode-based payment measures proposed for removal and incorporates a much larger set of conditions and procedures. The MSPB Hospital measure's risk adjustment methodology also adjusts for several factors, including patient age and severity of illness. We note that we recently adopted refinements to the MSPB Hospital measure to ensure a more comprehensive and consistent assessment of hospital performance (87 FR 49257 through 49263, 88 FR 59064 through 59067). Those refinements allow the measure to capture more episodes and adjust the measure calculation. Although the MSPB Hospital measure does not provide the same level of granularity as the four condition-specific measures, the important data elements would be captured more broadly under the Hospital VBP Program by evaluating and publicly reporting the hospitals' efficiency relative to the efficiency of the median national hospital. Removing the four clinical episode-based payment measures helps ensure that we are moving the Hospital IQR Program forward in the least burdensome manner possible while continuing to encourage improvement in the quality of

care provided to patients. We note that hospitals have access to patient-level information through confidential hospital-specific reports for the MSPB Hospital measure.

Comment: A few commenters recommended that CMS retain all four clinical episode-based payment measures and stated that they provide valuable information for consumers assessing where to pursue care. A commenter specifically did not support removal of the AMI Payment and HF Payment measures, noting that these payment measures, when directly linked with clinical quality measures, help interested parties assess whether reducing costs leads to improved patient outcomes.

Response: We thank the commenters for their input. While we agree that these measures have provided valuable information in the past, we note that performance trends on these four clinical episode-based payment measures indicate that they had not been as beneficial in recent years to the Hospital IQR Program. In alignment with our ongoing effort to implement a more parsimonious measure set while continuing to incentivize improvement in the quality of care provided to patients, we concluded it is appropriate to remove these four clinical episode-based payment measures at this time, resulting in a streamlined set of the most meaningful measures.

Comment: A commenter specifically did not support removal of the PN Payment measure, stating that pneumonia often results from a preventable airborne infection and the measure should remain in the Hospital IQR Program.

Response: While we appreciate the commenter's concern, the PN Payment measure is not currently incentivizing prevention of pneumonia. We do agree that pneumonia is an important topic for quality measurement and note that the Hospital Readmissions Reduction Program includes an unplanned readmission measure for Pneumonia (Hospital 30-day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Pneumonia Hospitalization (NQF #0506), 76 FR 51666 and 51667) and that the Hospital VBP Program includes the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization measure.

After consideration of the public comments we received, we are finalizing our proposal to remove the four clinical episode-based payment measures beginning with the FY 2026 payment determination.

7. Refinements to Current Measures in the Hospital IQR Program Measure Set

We proposed refinements to two measures currently in the Hospital IQR Program measure set: (1) Global Malnutrition Composite Score (GMCS) eCQM, beginning with the CY 2026 reporting period/FY 2028 payment determination and for subsequent years, and (2) the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey measure beginning with the CY 2025 reporting period/FY 2027 payment determination. We provide more details on modifications to the GMCS eCQM in the subsequent sections and details on the modification to HCAHPS Survey measure are in section IX.B.2.e. of this final rule.

a. Modification of the Global Malnutrition Composite Score Measure Beginning with the CY 2026 Reporting Period/FY 2028 Payment Determination

(1) Background

The previously finalized GMCS eCQM (CBE #3592e) assesses the percentage of hospitalizations for adults 65 years old and older prior to the start of the measurement period with a length of stay equal to or greater than 24 hours who received optimal malnutrition care during the current inpatient hospitalizations where care performed was appropriate to the patient's level of malnutrition risk and severity. We adopted the GMCS eCQM in the FY 2023 IPPS/LTCH PPS final rule beginning with the CY 2024 reporting period/FY 2026 payment determination (87 FR 49239 through 49246). We refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49241 through 49242) for more detailed discussion of the CBE review and

endorsement of the current GMCS eCQM, which received CBE endorsement in July 2021 (CBE #3592e).^{690 691}

While we understand the unique challenges malnutrition creates for older adults, we also recognize that hospital and disease-related malnutrition is not limited to that population (87 FR 49239). Data from the Agency for Healthcare Research and Quality (AHRQ) indicate that approximately eight percent of all hospitalized adults have a diagnosis of malnutrition,⁶⁹² and additional research finds that malnutrition and malnutrition risk can be found in 20 to 50 percent of hospitalized adults 18 years old and older.⁶⁹³ Failure to diagnose and insufficient treatment of malnutrition in hospitals is also associated with poor institutional coordination between nurses, physicians, and other hospital staff regarding screening, diagnosis, and treatment, further emphasizing the need to address malnutrition in all hospitalized adults.⁶⁹⁴ Because malnutrition impacts adults of all ages, preventive screening and intervention among all hospitalized adults 18 years old and older would greatly reduce the risk and improve the treatment of malnutrition.⁶⁹⁵ A 2020 study estimated that every dollar spent on nutrition interventions in a hospital setting can result in up to \$99 in savings on subsequent medical care.⁶⁹⁶ Screening all patients over age 18 for malnutrition instead of only those over age 65

⁶⁹⁴ Anghel, S., Kerr, K. W., Valladares, A. F., Kilgore, K. M., & Sulo, S. (2021). Identifying patients with malnutrition and improving use of nutrition interventions: A quality study in four US hospitals. *Nutrition*, 91–92, 111360. <https://doi.org/10.1016/j.nut.2021.111360>.

⁶⁹⁵ Sauer, A. C., Goates, S., Malone, A., Mogensen, K. M., Gewirtz, G., Sulz, I., Moick, S., Laviano, A., & Hiesmayr, M. (2019). Prevalence of malnutrition risk and the impact of nutrition risk on hospital outcomes: Results from nutrition day in the U.S. *Journal of Parenteral and Enteral Nutrition*, 43(7), 918–926. <https://doi.org/10.1002/jpen.1499>.

⁶⁹⁶ Suela Sulo, Leah Gramlich, Jyoti Benjamin, Sharon McCauley, Jan Powers, Krishnan Sriram & Kristi Mitchell (2020) Nutrition Interventions Deliver Value in Healthcare: Real-World Evidence, *Nutrition and Dietary Supplements*, 12:, 139-146, DOI: 10.2147/NDS.S262364.

could result in both improved clinical outcomes for patients and substantial financial savings for the healthcare system.

We, therefore, proposed modifications to the GMCS eCQM to expand the applicable population from hospitalized adults 65 or older to hospitalized adults 18 or older in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36327 through 36329). The modified GMCS eCQM would broaden the measure to assess hospitalized adults 18 years old and older who received care appropriate to their level of malnutrition risk and malnutrition diagnosis, if properly identified.

(2) Measure Alignment to Strategy

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49239), we noted that the adoption of a malnutrition measure may help address several priority areas identified in the CMS Framework for Health Equity⁶⁹⁷ (87 FR 49240 through 49241) and expanding the current measure's population to include all adults over 18 years old would further address these priorities. Malnutrition in the U.S., whether caused by challenges from disease and functional limitations, food insecurity, other factors, or a combination of causes, is more frequently experienced by underserved populations and can thus be a contributing factor to health inequities.⁶⁹⁸ Adopting the updated measure as proposed would lead to a more diverse population being assessed for malnutrition, and by identifying instances of malnutrition among younger populations, the benefits of proper nutrition could be felt over a lifetime. As part of the CMS National Quality Strategy, the modified GMCS eCQM would also address the priority area of "Promote Aligned and Improved Health Outcomes."⁶⁹⁹ Under the CMS Meaningful Measures 2.0 Initiative, which is a key component of the CMS National Quality Strategy, the modified GMCS eCQM addresses

⁶⁹⁷ Centers for Medicare & Medicaid Services. (2023). CMS Framework for Health Equity. Available at: <https://www.cms.gov/priorities/health-equity/minority-health/equity-programs/framework>.

⁶⁹⁸ Blankenship, J., & Blancato, R. B. (2022). Nutrition Security at the Intersection of Health Equity and Quality Care. *Journal of the Academy of Nutrition and Dietetics*, 122(10S), S12–S19. <https://doi.org/10.1016/j.jand.2022.06.017>.

⁶⁹⁹ Centers for Medicare & Medicaid Services. (2023). CMS National Quality Strategy. Available at: <https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy>.

the quality priorities of “Seamless Care Coordination,” “Person-Centered Care,” and “Equity.” It would address these priorities by connecting providers at different levels of care to ensure the largest possible population of adult patients with in-hospital malnutrition are identified and treated using a patient-centered approach.

(3) Overview of Measure Update

The modified GMCS eCQM still includes the four component measures corresponding to documented best practices as described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49241) and in the first column of Table IX.C.4. The only change we proposed is to expand the applicable population for this measure. The measure specifications for the modified GMCS eCQM can be found on the eCQI Resource Center website, available at:

<https://ecqi.healthit.gov/ecqm/eh/2024/cms0986v2>.

(4) Pre-rulemaking Process and Measure Endorsement

(a) Recommendation from the PRMR Process

We refer readers to the proposed Patient Safety Structural measure in section IX.B.1.c. of this final rule for details on the PRMR process including the voting procedures used to reach consensus on measure recommendations. The PRMR Hospital Committee met on January 18-19, 2024, to review measures included by the Secretary on a publicly available “2023 Measures Under Consideration List” (MUC List),^{700 701} including the modified GMCS eCQM (MUC2023-114), to vote on a recommendation regarding use of this measure.^{702 703}

The PRMR Hospital Committee reached consensus and recommended including this measure (MUC2023-114) in the Hospital IQR Program with conditions. Fourteen members of the group recommended adopting the measure into the Hospital IQR Program without

⁷⁰⁰ Centers for Medicare & Medicaid Services. (December 1, 2023). 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁷⁰¹ Centers for Medicare & Medicaid Services. (December 2023). Overview of the List of Measures Under Consideration. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List-Overview.pdf>.

⁷⁰² Centers for Medicare & Medicaid Services. 2023 Measures Under Consideration (MUC) List. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx>.

⁷⁰³ Centers for Medicare & Medicaid Services. (December 2023). Overview of the List of Measures Under Consideration. Available at: <https://mmshub.cms.gov/sites/default/files/2023-MUC-List-Overview.pdf>.

conditions; three members recommended adoption with conditions; two committee members voted not to recommend the measure for adoption. Taken together, 84.2 percent of the votes were recommended with conditions.⁷⁰⁴ The three members who voted to adopt with conditions specified the condition as screening and assessment includes hospital-acquired malnutrition and high-risk nutritional practices in hospitals, such as prolonged fasting for rescheduled procedures, and to obtain more feedback from patient groups. We agree that the potential for unintended consequences exists and note that we consistently monitor all the measures in the Hospital IQR Program for unintended consequences. Furthermore, we note that under our previously finalized measure removal Factor 6, codified at 42 CFR 412.140(g)(3)(i)(F), collection or public reporting of a measure leads to negative unintended consequences other than patient harm, if we were to identify unintended consequences related to this measure, we would consider it for removal.

(b) Measure Endorsement

We refer readers to section IX.B.1.c. of the preamble of this final rule for details on the E&M process including the measure evaluation procedures the E&M Committees, comprised of the E&M Advisory Group and E&M Recommendation Group, uses to evaluate measures and whether they meet endorsement criteria. The GMCS eCQM was initially endorsed in the Fall 2020 cycle by the CBE (CBE #3592e) and is scheduled for endorsement review with the proposed modification in 2024.⁷⁰⁵ Section 1886(b)(3)(B)(viii)(IX)(aa) of the Act requires that measures specified by the Secretary for use in the Hospital IQR Program be endorsed by the entity with a contract under section 1890(a) of the Act. Section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a

⁷⁰⁴ Battelle - Partnership for Quality Measurement. (February 2024). Pre-Rulemaking Measure Review Measures Under Consideration 2023 RECOMMENDATIONS REPORT. Available at: <https://p4qm.org/sites/default/files/2024-02/PRMR-2023-MUC-Recommendations-Report-Final-.pdf>.

⁷⁰⁵ Battelle - Partnership for Quality Measurement. Global Malnutrition Composite Score eCQM. Available at: <https://p4qm.org/measures/3592e>

contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. After reviewing the modified measure, we found no measures, other than the proposed GMCS measure, on this topic. We determined this was an appropriate medical topic for us to propose the adoption of an unendorsed measure because of its general consistency with the current, endorsed measure, and the usefulness of the measure would be substantially improved by the modification.

(5) Measure Calculation

The modified GMCS eCQM would still use data collected through hospitals’ EHRs. The measure is designed to be calculated by the hospitals’ CEHRT using the patient-level data and then submitted by hospitals to CMS.

The modified GMCS eCQM continues to consist of four component measures, which are first scored separately.^{706 707} The overall composite score is derived from averaging the individual performance scores of the four component measures. The malnutrition component measures are all fully specified for use in EHRs. Table IX.C.4 describes each of the four measure components with the expanded population.

TABLE IX.C.4 . MODIFIED GLOBAL MALNUTRITION COMPOSITE SCORE ECQM COMPONENTS’ MEASURE DESCRIPTIONS

Component	Measure Observation
Completion of a Malnutrition Screening.	Patients 18 years old and older in the denominator who have a malnutrition screening documented in the medical record.
Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition.	Patients 18 years old and older in the denominator who have a nutrition assessment documented in the medical record.
Appropriate Documentation of a Malnutrition Diagnosis.	Patients 18 years old and older in the denominator with a diagnosis of malnutrition documented in the medical record.
Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment.	Patients 18 years old and older in the denominator who have a nutrition care plan documented in the medical record.

⁷⁰⁶ Valladares AF, McCauley SM, Khan M, D’Andrea C, Kilgore K, Mitchell K. Development and Evaluation of a Global Malnutrition Composite Score. *J Acad Nutr Diet.* 2022 Feb;122(2):251-258. doi: 10.1016/j.jand.2021.02.002. Epub 2021 Mar 10. PMID: 33714687.

⁷⁰⁷ Centers for Medicare & Medicaid Services Measures Inventory Tool. (2023). Global Malnutrition Composite Score. Available at: <https://cmit.cms.gov/cmit/#/MeasureView?variantId=5120§ionNumber=1>.

The modified GMCS eCQM numerator is comprised of the four component measures, that are individually scored for patients 18 years old and older who are admitted to an acute inpatient hospital. The measure denominator is the composite, or total, of the four component measures for patients 18 years old and older who are admitted to an acute inpatient hospital. The only exclusion for this measure population remains as patients whose length of stay is less than 24 hours, the same as previously adopted in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49244).

Each measure component is a proportion with a possible performance score of 0 to 100 percent (higher percent reflects better performance). After each component score is calculated individually, an unweighted average of all four scores is computed to determine the final composite score for the individual with a total score ranging from 0 to 100 percent (higher percent reflects better performance).⁷⁰⁸

(6) Data Submission and Reporting

We proposed the adoption of the modified GMCS eCQM as part of the Hospital IQR Program measure set from which hospitals can self-select beginning with the CY 2026 reporting period/FY 2028 payment determination. Since this modification uses the same data sources and collection methods as the current version of the GMCS eCQM, there is not expected to be any major impact to workflows or other aspects of data collection. The only anticipated change to data collection processes is that the data would be collected from a larger patient population. We refer readers to section IX.C.9.c. of this final rule for our previously finalized eCQM reporting and submission requirements, as well as proposed modifications for these requirements.

We also refer readers to section IX.F.6.a.(2). of the preamble of this final rule for discussion of a similar adoption of this measure in the Medicare Promoting Interoperability Program.

⁷⁰⁸ Centers for Medicare & Medicaid Services Measures Inventory Tool. (2023). Global Malnutrition Composite Score. Available at: <https://cmit.cms.gov/cmit/#/MeasureView?variantId=5120§ionNumber=1>.

We invited public comment on our proposal to modify the GMCS eCQM to expand the applicable population from hospitalized adults 65 years old or older to hospitalized adults 18 years old or older beginning with the CY 2026 reporting period/FY 2028 payment determination.

Comment: Many commenters supported the proposal to expand the patient population for the GMCS eCQM. Many commenters supported it because they stated that malnutrition has a significant impact on patient outcomes and that this expansion would lead to valuable data, improved patient outcomes for a broader range of patients, and a more comprehensive understanding of malnutrition in the adult population.

Response: We thank the commenters for their support and agree with their feedback.

Comment: A few commenters supported the proposal to expand the patient population for the GMCS eCQM and emphasized that this modification, in addition to enhancing the quality of care for patients with malnutrition, has the potential to advance CMS's goal of reducing health disparities.

Response: We appreciate and agree with the commenters' perspective. As we noted in the FY 2025 IPPS/LTCH PPS proposed rule, malnutrition in the U.S., whether caused by challenges from disease and functional limitations, food insecurity, other factors, or a combination of causes, is more frequently experienced by underserved populations and can thus be a contributing factor to health disparities (89 FR 36328). Expanding the population for the GMCS eCQM would ensure the largest possible population of adult patients with in-hospital malnutrition are identified and treated.

Comment: A commenter appreciated that in this proposal, CMS acknowledged the valuable work of registered dietitians in addressing malnutrition and improving patient care outcomes.

Response: We thank the commenter for their input. Nutrition screening is an important aspect of a patient's health, and it is the responsibility of all clinicians to support appropriate nutrition, particularly in inpatient settings (87 FR 49244 through 49245).

Comment: Many commenters supported the proposal and recommended that CMS accelerate implementation of the expansion from CY 2026 to CY 2025 to encourage hospitals to provide high-quality malnutrition care to all adults. Many commenters who supported accelerating the proposal's implementation noted that the modification to the measure would not impose a burden increase on providers.

Response: We thank the commenters for their feedback; however, in determining the proposed implementation timeline for the GMCS eQIM we considered how this timeline allows hospitals time to review the results of the first full year of reporting on the GMCS eQIM before implementation of the modification. This does not preclude organizations from engaging in preventive screening and intervention for malnutrition in patients 18 years of age and older. We encourage commenters to engage in this work, which could result in both improved clinical outcomes and substantial financial savings on subsequent medical care for hospital systems.⁷⁰⁹

Comment: A commenter recommended that CMS align the GMCS eQIM logic with that of other eQIMs, such that the record is included only if the encounter ends during the measurement period. A few commenters suggested that CMS should further refine GMCS to better capture changes in nutritional status during an inpatient stay because they state that malnutrition may arise during a hospitalization. Another commenter recommended that the measure steward be more flexible for rapid cycle improvements of the measure logic that allow for the measure to function as intended.

Response: We appreciate the input from the commenters. We will continue to evaluate the appropriateness of refinements to the GMCS eQIM, including possible adjustments to the inclusion criteria. In addition, we continually assess the Hospital IQR Program's measure set

⁷⁰⁹ Suela Sulo, Leah Gramlich, Jyoti Benjamin, Sharon McCauley, Jan Powers, Krishnan Sriram & Kristi Mitchell (2020) Nutrition Interventions Deliver Value in Healthcare: Real-World Evidence, Nutrition and Dietary Supplements, 12:, 139–146, DOI: 10.2147/NDS.S262364.

and will take this feedback into consideration.

Comment: A commenter recommended that CMS perform additional feasibility assessments on this measure across a broader set of EHR vendors and hospitals and suggested that the proposed refinement be reviewed and approved by the CBE.

Response: We appreciate the commenter's input regarding feasibility assessments and CBE endorsement. We emphasize that eQMs, like all other types of quality measures in the Hospital IQR Program, undergo rigorous testing during the measure development process for feasibility, validity, and reliability. As we discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49241 through 49242), the measure developer conducted additional testing after the measure was initially reviewed by the CBE, and the testing results demonstrated that the four component measures were usable for identifying key improvement areas in malnutrition care. A subsequent test with additional hospitals showed that the component measures could be implemented in a cohort of diverse hospitals and lead to meaningful improvements in measure performance as all four components were significantly associated with improved outcomes for 30-day readmissions. Notably, the GMCS eCQM is endorsed by the CBE and the modified GMCS eCQM is scheduled for endorsement review in the fall of 2024.

Comment: A commenter did not support the proposed modification to the GMCS eCQM because they stated it would create an undue burden on the hospital and would not adequately address the root cause of malnutrition. The commenter suggested that CMS does not compensate hospitals sufficiently to help address root causes of malnutrition. A commenter expressed concern that hospitals lack the resources to screen and refer the expanded population appropriately.

Response: We appreciate this feedback, and we remind the commenter that reporting on the GMCS eCQM is not required under the current eCQM reporting requirements, as hospitals may self-select to report on this eCQM. Furthermore, the modification to the GMCS eCQM would use the same data sources and collection methods as the current version of the GMCS

eCQM. Therefore, no major impact on workflows or data collection is expected. The only change is that the data would be collected from a larger patient population. A 2020 study estimated that every dollar spent on nutrition interventions in a hospital setting can result in up to \$99 in savings on subsequent medical care.⁷¹⁰ Therefore, we believe that the measure can help address the root cause of malnutrition. While we understand the commenter's concern about hospitals' resources to screen and refer the expanded population, we reiterate that the GMCS eCQM is not required to be reported. We encourage hospitals to consider reporting this eCQM, as it addresses an important clinical topic.

Comment: A commenter did not support modifying the GMCS eCQM because they state it would overlap with the Screening for Social Drivers of Health measure and should instead focus on implementation of that measure to create interoperable data.

Response: The GMCS eCQM and the Screening for Social Drivers of Health measure, while topically related, are not duplicative. The Screening for Social Drivers of Health measure and the GMCS eCQM both address nutrition as a driver of health because it is an important contributor to a healthy population, but they address different goals (87 FR 49245). While the Screening for Social Drivers of Health measure incentivizes the screening and identifying of patients for food insecurity, the GMCS eCQM focuses on screening for malnutrition risk (of which food insecurity may be a contributing factor), but also the performance of a nutrition assessment and development of a care plan for identified malnourished patients (87 FR 49245). The GMCS eCQM and the Screening for Social Drivers of Health measure are complementary to one another but are not duplicative as they measure different aspects of the quality care processes (87 FR 49245). We thank the commenter for their recommendation regarding interoperable data

⁷¹⁰ Suela Sulo, Leah Gramlich, Jyoti Benjamin, Sharon McCauley, Jan Powers, Krishnan Sriram & Kristi Mitchell (2020) Nutrition Interventions Deliver Value in Healthcare: Real-World Evidence, Nutrition and Dietary Supplements, 12:, 139–146, DOI: 10.2147/NDS.S262364.

for the Screening for Social Drivers of Health measure and will take it into consideration as we assess the Hospital IQR Program’s measure set.

After consideration of the public comments received, we are finalizing the GMCS eCQM measure modification as proposed beginning with the CY 2026 reporting period/FY 2028 payment determination. We also refer readers to section IX.F.6.a.(2). of the preamble of this final rule for discussion of adoption of this measure in the Medicare Promoting Interoperability Program.

8. Summary of Previously Finalized and New Hospital IQR Program Measures

a. Summary of Hospital IQR Program Measures for the FY 2026 Payment Determination

This table summarizes the previously finalized Hospital IQR Program measure set for the FY 2026 payment determination updated to reflect the removals of four claims-based payment measures:

TABLE IX.C.5. MEASURES FOR THE FY 2026 PAYMENT DETERMINATION

Short Name	Measure Name	CBE #
National Healthcare Safety Network Measures		
HCP Influenza Vaccination	Influenza Vaccination Coverage Among Healthcare Personnel	0431
HCP COVID-19 Vaccination	COVID-19 Vaccination Coverage Among Healthcare Personnel	3636
Claims-Based Patient Safety Measures		
CMS PSI 04	Death Rate among Surgical Inpatients with Serious Treatable Complications (CMS Recalibrated Death Rate among Surgical Inpatients with Serious Treatable Complications)	0351
Claims-Based Mortality/Complications Measures		
MORT-30-STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality-Rate Following Acute Ischemic Stroke	N/A
COMP-HIP-KNEE	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA	1550
Claims-Based Coordination of Care Measures		
AMI Excess Days	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	2880
PN Excess Days	Excess Days in Acute Care after Hospitalization for Pneumonia	2882
Claims-Based Payment Measures		
MSPB	Medicare Spending Per Beneficiary (MSPB)—Hospital	2158
Claims and Electronic Data Measures		
Hybrid HWM*	Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (HWM)	3502
Hybrid HWR**	Hybrid Hospital-Wide All-Cause Readmission Measure (HWR)	2879e
Chart-Abstracted Clinical Process of Care Measures		
SEP-1	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
Structural Measures		
Maternal Morbidity	Maternal Morbidity Structural Measure	N/A
HCHE	Hospital Commitment to Health Equity	N/A
Electronic Clinical Quality Measures (eCQMs)		
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
PC-02	Cesarean Birth	0471e
PC-07	Severe Obstetric Complications	3687e

Short Name	Measure Name	CBE #
STK-2	Discharged on Antithrombotic Therapy	0435e
STK-3	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436e
STK-5	Antithrombotic Therapy by the End of Hospital Day Two	0438e
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
HH-HYPO	Hospital Harm - Severe Hypoglycemia Measure	3503e
HH-HYPER	Hospital Harm - Severe Hyperglycemia Measure	3533e
HH-ORAE	Hospital Harm - Opioid-Related Adverse Events	3501e
GMCS	Global Malnutrition Composite Score	3592e
Patient Experience of Care Survey Measures		
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems Survey	0166 (0228)
Process Measures		
SDOH-1	Screening for Social Drivers of Health	N/A
SDOH-2	Screen Positive Rate for Social Drivers of Health	N/A

* In the FY 2022 IPPS/LTCH PPS final rule, we finalized the adoption of the Hybrid Hospital-Wide All-Cause Risk Standardized Mortality (HWM) measure beginning with the July 1, 2023-June 30, 2024 reporting period, impacting the FY 2026 payment determination (86 FR 45365 through 45374).

** In the FY 2020 IPPS/LTCH PPS final rule, we finalized removal of the claims-only Hospital-Wide All-Cause Unplanned Readmission (HWR claims-only) measure (CBE #1789) and we will replace it with the Hybrid HWR measure (CBE #2879e), beginning with the FY 2026 payment determination (84 FR 42465 through 42481). In the FY 2024 IPPS/LTCH PPS final rule, we finalized refinements to these measures beginning with the FY 2027 payment determination (88 FR 59161 through 59168).

We refer readers to the CY 2025 OPPS/ASC proposed rule where we are proposing to continue voluntary reporting of the core clinical data elements (CCDEs) and linking variables for both the Hybrid Hospital-Wide Readmission (HWR) and Hybrid Hospital-Wide Standardized Mortality (HWM) measures, for the performance period of July 1, 2023 through June 30, 2024, impacting the FY 2026 payment determination for the Hospital IQR Program (89 FR 59500 through 59502).

b. Summary of Hospital IQR Program Measures for the FY 2027 Payment Determination

This table summarizes the previously finalized and newly finalized Hospital IQR Program measure set for the FY 2027 payment determination including the adoption of two new structural measures, one new claims-based patient safety measure, and the removal of the CMS PSI 04 measure:

TABLE IX.C.6. MEASURES FOR THE FY 2027 PAYMENT DETERMINATION

Short Name	Measure Name	CBE #
National Healthcare Safety Network Measures		
HCP Influenza Vaccination	Influenza Vaccination Coverage Among Healthcare Personnel	0431
HCP COVID-19 Vaccination	COVID-19 Vaccination Coverage Among Healthcare Personnel	3636
Claims-Based Patient Safety Measures		
FTR*	Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications (Failure-to-Rescue) Measure	4125

Short Name	Measure Name	CBE #
Claims-Based Mortality/Complications Measures		
MORT-30-STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality-Rate Following Acute Ischemic Stroke	N/A
COMP-HIP-KNEE	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA	1550
Claims-Based Coordination of Care Measures		
AMI Excess Days	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	2880
PN Excess Days	Excess Days in Acute Care after Hospitalization for Pneumonia	2882
Claims-Based Payment Measures		
MSPB	Medicare Spending Per Beneficiary (MSPB)—Hospital	2158
Claims and Electronic Data Measures		
Hybrid HWM	Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (HWM)	3502
Hybrid HWR	Hybrid Hospital-Wide All-Cause Readmission Measure (HWR)	2879e
Chart-Abstracted Clinical Process of Care Measures		
SEP-1	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
Structural Measures		
Maternal Morbidity	Maternal Morbidity Structural Measure	N/A
HCHE	Hospital Commitment to Health Equity	N/A
Age Friendly Hospital**	Age Friendly Hospital Measure	N/A
Patient Safety***	Patient Safety Structural Measure	N/A
Electronic Clinical Quality Measures (eCQMs)		
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
PC-02	Cesarean Birth	0471e
PC-07	Severe Obstetric Complications	3687e
STK-2	Discharged on Antithrombotic Therapy	0435e
STK-3	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436e
STK-5	Antithrombotic Therapy by the End of Hospital Day Two	0438e
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
HH-HYPO	Hospital Harm - Severe Hypoglycemia Measure	3503e
HH-HYPER	Hospital Harm - Severe Hyperglycemia Measure	3533e
HH-ORAE	Hospital Harm - Opioid-Related Adverse Events	3501e
HH-PI	Hospital Harm - Pressure Injury	3498e
HH-AKI	Hospital Harm - Acute Kidney Injury	3713e
GMCS	Global Malnutrition Composite Score	3592e
IP-ExRad	Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults	3663e
Patient Experience of Care Survey Measures		
HCAHPS****	Hospital Consumer Assessment of Healthcare Providers and Systems Survey	0166 (0228)
Patient-Reported Outcome Performance Measures		
THA/TKA PRO-PM	Hospital-Level Total Hip Arthroplasty and/or Total Knee Arthroplasty Patient-Reported Outcome-Based Performance Measure (PRO-PM)	3559
Process Measures		
SDOH-1	Screening for Social Drivers of Health	N/A
SDOH-2	Screen Positive Rate for Social Drivers of Health	N/A

* In this final rule, we are finalizing removal of the Death Among Surgical Inpatients with Serious Treatable Complications (CMS PSI 04) measure and adoption of its replacement with the Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications (Failure-to-Rescue) measure beginning with the FY 2027 payment determination. We refer readers to section IX.C.5.e. for more detailed discussion.

** In this final rule, we are finalizing adoption of the Age Friendly Hospital measure beginning with the FY 2027 payment determination. We refer readers to section IX.C.5.a. for more detailed discussion.

*** In this final rule, we are finalizing adoption of the Patient Safety Structural measure beginning with the FY 2027 payment determination. We refer readers to section IX.B.1. for more detailed discussion.

**** In this final rule, we are finalizing refinements to the HCAHPS Survey measure beginning with the FY 2027 payment determination. We refer readers to section IX.B.2.e. for more detailed discussion.

c. Summary of Hospital IQR Program Measures for the FY 2028 Payment Determination

This table summarizes the previously finalized and newly finalized Hospital IQR Program measure set for the FY 2028 payment determination including the adoption of two new

Hospital Harm eQMs, two new NHSN measures, modification of the GMCS eQM, and the modification of the HCAHPS Survey measure:

TABLE IX.C.7. MEASURES FOR THE FY 2028 PAYMENT DETERMINATION

Short Name	Measure Name	CBE #
National Healthcare Safety Network Measures		
HCP Influenza Vaccination	Influenza Vaccination Coverage Among Healthcare Personnel	0431
HCP COVID-19 Vaccination	COVID-19 Vaccination Coverage Among Healthcare Personnel	3636
CAUTI-Onc*	Catheter-Associated Urinary Tract Infection (CAUTI) Standardized Infection Ratio Stratified for Oncology Locations	0138
CLABSI-Onc**	Central Line-Associated Bloodstream Infection (CLABSI) Standardized Infection Ratio Stratified for Oncology Locations	0139
Claims-Based Patient Safety Measures		
FTR***	Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications (Failure-to-Rescue)	4125
Claims-Based Mortality/Complications Measures		
MORT-30-STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality- Rate Following Acute Ischemic Stroke	N/A
COMP-HIP-KNEE	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA	1550
Claims-Based Coordination of Care Measures		
AMI Excess Days	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881

HCAHPS*****	Hospital Consumer Assessment of Healthcare Providers and Systems Survey	0166 (0228)
Patient-Reported Outcome Performance Measures		
THA/TKA PRO-PM	Hospital-Level Total Hip Arthroplasty and/or Total Knee Arthroplasty Patient-Reported Outcome-Based Performance Measure (PRO-PM)	3559
Process Measures		
SDOH-1	Screening for Social Drivers of Health	N/A
SDOH-2	Screen Positive Rate for Social Drivers of Health	N/A

* In this final rule, we are finalizing adoption of the Catheter-Associated Urinary Tract Infection (CAUTI) Standardized Infection Ratio Stratified for Oncology Locations measure beginning with the FY 2028 payment determination. We refer readers to section IX.C.5.b.(1). for more detailed discussion.

** In this final rule, we are finalizing adoption of the Central Line-Associated Bloodstream Infection (CLABSI) Standardized Infection Ratio Stratified for Oncology Locations measure beginning with the FY 2028 payment determination. We refer readers to section IX.C.5.b.(2). for more detailed discussion.

*** In this final rule, we are finalizing removal of the Death Among Surgical Inpatients with Serious Treatable Complications (CMS PSI 04) measure and adoption of its replacement with the Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications (Failure-to-Rescue) measure beginning with the FY 2027 payment determination. We refer readers to section IX.C.5.e. for more detailed discussion.

**** In this final rule, we are finalizing adoption of the Age Friendly Hospital measure beginning with the FY 2027 payment determination. We refer readers to section IX.C.5.a. for more detailed discussion.

***** In this final rule, we are finalizing adoption of the Patient Safety Structural measure beginning with the FY 2027 payment determination. We refer readers to section IX.B.1. for more detailed discussion.

***** In this final rule, we are finalizing adoption of the Hospital Harm - Falls with Injury eCQM beginning with the FY 2028 payment determination. We refer readers to section IX.C.5.c. for more detailed discussion.

***** In this final rule, we are finalizing adoption of the Hospital Harm - Postoperative Respiratory Failure eCQM beginning with the FY 2028 payment determination. We refer readers to section IX.C.5.d. for more detailed discussion.

***** In this final rule, we are finalizing refinements to the GMCS measure beginning with the FY 2028 payment determination. We refer readers to section IX.C.7.a. for more detailed discussion.

***** In this final rule, we are finalizing refinements to the HCAHPS Survey measure beginning with the FY 2027 payment determination. We refer readers to section IX.B.2.e for more detailed discussion.

9. Form, Manner, and Timing of Quality Data Submission

We proposed changes to our reporting and submission requirements for eCQMs. There are no proposed changes to the following requirements, and thus have been omitted from the Form, Manner, and Timing of Quality Data Submission section: procedural requirements; data submission requirements for chart-abstracted measures; data submission and reporting

requirements for hybrid measures; sampling and case thresholds for chart-abstracted measures; HCAHPS Survey administration and submission requirements; data submission requirements for structural measures; data submission and reporting requirements for CDC NHSN measures; and data submission and reporting requirements for Patient-Reported Outcome-Based Performance Measures (PRO-PMs). We refer readers to the QualityNet website at:

<https://qualitynet.cms.gov/inpatient/iqr> (or other successor CMS designated websites) for more details on the Hospital IQR Program data submission and procedural requirements.

a. Background

Section 1886(b)(3)(B)(viii)(I) and (b)(3)(B)(viii)(II) of the Act state that the applicable percentage increase for FY 2015 and each subsequent year shall be reduced by one-quarter of such applicable percentage increase (determined without regard to sections 1886(b)(3)(B)(ix), (xi), or (xii) of the Act) for any subsection (d) hospital that does not submit data required to be submitted on measures specified by the Secretary in a form and manner and at a time specified by the Secretary. To successfully participate in the Hospital IQR Program, hospitals must meet specific procedural, data collection, submission, and validation requirements.

b. Maintenance of Technical Specifications for Quality Measures

Section 412.140(c)(1) of title 42 of the Code of Federal Regulations generally requires that a subsection (d) hospital participating in the Hospital IQR Program must submit to CMS data on measures selected under section 1886(b)(3)(B)(viii) of the Act in a form and manner, and at a time, specified by CMS. The data submission requirements, specifications manual, measure methodology reports, and submission deadlines are posted on the QualityNet website at:

<https://qualitynet.cms.gov> (or other successor CMS designated websites). The CMS Annual Update for the Hospital Quality Reporting Programs (Annual Update) contains the technical specifications for eCQMs. The Annual Update contains updated measure specifications for the year prior to the reporting period. For example, for the CY 2024 reporting period/FY 2026 payment determination, hospitals are collecting and would submit eCQM data using the May

2023 Annual Update and any applicable addenda. The Annual Update and implementation guidance documents are available on the Electronic Clinical Quality Improvement (eCQI) Resource Center website at: <https://ecqi.healthit.gov/>.

Hospitals must register and submit quality data through the HQR System (previously referred to as the QualityNet Secure Portal) (42 CFR 412.140(a)). The HQR System is safeguarded in accordance with the HIPAA Privacy and Security Rules to protect submitted patient information. See 45 CFR parts 160 and 164, subparts A, C, and E.

c. Reporting and Submission Requirements for eCQMs

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36336 through 36339), we proposed a progressive increase in the number of mandatory eCQMs a hospital must report beginning with the CY 2026 reporting period/FY 2028 payment determination. We did not propose any changes to the current eCQM reporting or submission requirements for the CY 2024 reporting period/FY 2026 payment determination or the CY 2025 reporting period/FY 2027 payment determination. We provide additional detail in our proposal later in this section of the preamble.

(1) Background

We began requiring hospitals to report on eCQMs in the CY 2016 reporting period, with a goal of progressively increasing the number of eCQMs hospitals are required to report in the Hospital IQR Program while also being responsive to hospitals' concerns about timing, readiness, and burden associated with the increased number of measures (80 FR 49693 through 49698, and 81 FR 57150 through 57157). To allow hospitals and their vendors time to gain experience with reporting eCQMs we gradually increased the number of eCQMs on which hospitals were required to report over the course of several years. We required hospitals to report on certain specific eCQMs that we prioritized while retaining an element of choice by allowing hospitals to self-select some eCQMs. We also gradually increased the number of reporting quarters to improve measure reliability for public reporting of performance information

(84 FR 42503 through 42505, 85 FR 58932 through 58939, 86 FR 45418, and 87 FR 49299 through 49302).

Under previously adopted eCQM reporting policies, hospitals must report four calendar quarters of data for each required eCQM: (1) the Safe Use of Opioids - Concurrent Prescribing eCQM; (2) the Cesarean Birth eCQM; (3) the Severe Obstetric Complications eCQM; and (4) three self-selected eCQMs; for a total of six eCQMs for the CY 2024 reporting period/FY 2026 payment determination and subsequent years (85 FR 58932 through 58939, 86 FR 45418, and 87 FR 49298 through 49302). We refer readers to the QualityNet website for additional information on previous reporting and submission requirements policies for eCQMs at:

<https://qualitynet.cms.gov/inpatient/measure/ecqm> (or other successor CMS designated websites).

In the CY 2024 Medicare Physician Fee Schedule (PFS) final rule (88 FR 79307 through 79312), we finalized the revisions to the definition of CEHRT for the Medicare Promoting Interoperability Program at 42 CFR 495.4. Specifically, we finalized the addition of a reference to the revised name of “Base Electronic Health Record (EHR) definition,” proposed in the Health Data, Technology, and Interoperability: Certification Program Updates, Algorithm Transparency, and Information Sharing (HTI–1) proposed rule (88 FR 23759, 23905), to ensure, if the HTI–1 proposals were finalized, the revised name of “Base EHR definition” would be applicable for the CEHRT definitions going forward (88 FR 79309 through 79312). We also finalized the replacement of our references to the “2015 Edition health IT certification criteria” with “ONC health IT certification criteria,” and the addition of the regulatory citation for ONC health IT certification criteria in 45 CFR 170.315. We finalized the proposal to specify that technology meeting the CEHRT definition must meet ONC's health IT certification criteria “as adopted and updated in 45 CFR 170.315” (88 FR 79553). This approach is consistent with the definitions and approach subsequently finalized in ONC’s HTI–1 final rule, which appeared in the Federal Register on January 9, 2024 (89 FR 1205 through 1210). For additional background

and information on this update, we refer readers to the discussion in the CY 2024 PFS final rule on this topic (88 FR 79307 through 79312).

(2) Progressive Increase of Mandatory eCQM Reporting Beginning with CY 2026 Reporting Period/FY2028 Payment Determination

Increasing the number of mandatory eCQMs, specifically to include the five previously adopted Hospital Harm eCQMs, would support our re-commitment to better safety practices for both patients and healthcare workers to save lives from preventable harms.⁷¹¹ Proposing mandatory reporting of these Hospital Harms eCQMs are a part of our initial actions in responding and joining the President’s Council of Advisors on Science and Technology (PCAST) call to action to renew “our nation’s commitment to improving patient safety.”⁷¹² We refer readers to section IX.B.1. for more details on other efforts toward better patient and healthcare worker safety practices and the Patient Safety Structural measure for the Hospital IQR and PCHQR Programs.

We developed our proposal to also align with CMS’ National Quality Strategy priority area of “Patient Safety and Resiliency,” that seeks to “improve performance on key patient safety metrics through the applications of CMS levers such as quality measurement, payment, health and safety standards, and quality improvement support.”⁷¹³ It is important to more comprehensively collect data on these measures from all hospitals participating in the Hospital IQR and Medicare Promoting Interoperability Programs instead of limiting data collection to just those hospitals that chose to report it. Capturing this important quality information is crucial to improve surveillance on safety metrics in hospitals and support the CMS National Quality

⁷¹¹ AHRQ. (2023). National Action Alliance To Advance Patient and Workforce Safety. Available at: <https://www.ahrq.gov/cpi/about/otherwebsites/action-alliance.html>.

⁷¹² President's Council of Advisors on Science and Technology. (2023). Report to the President: A Transformational Effort on Patient Safety. Available at: https://www.whitehouse.gov/wp-content/uploads/2023/09/PCAST_Patient-Safety-Report_Sept2023.pdf.

⁷¹³ Centers for Medicare & Medicaid Services. (2023). CMS National Quality Strategy. Available at: <https://www.cms.gov/files/document/cms-national-quality-strategy-handout.pdf>.

Strategy target success goal of reducing preventable harm.⁷¹⁴ Additionally, the proposal was developed in alignment with the “Interoperability” goal outlined in the National Quality Strategy that eQMs use standard and interoperable data requirements that are less burdensome than other types of measures. By increasing the number of required eQMs, and prioritizing the measures focused on preventable hospital harms, we are progressing towards our goal of using all digital measures. Thus, we proposed to increase the number of mandatory eQMs over a two-year period to ultimately require reporting on five additional eQMs (89 FR 36336 through 36339).

(a) Proposed Reporting and Submission Requirements for eQMs for the CY 2026 Reporting Period/FY 2028 Payment Determination

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36336 through 36339), beginning with the CY 2026 reporting period/FY 2028 payment determination, we proposed to modify the eQCM reporting and submission requirements to require hospitals to report on the following three eQCMs in addition to the existing eQCMs: (1) Hospital Harm - Severe Hypoglycemia eQCM; (2) Hospital Harm - Severe Hyperglycemia eQCM; and (3) Hospital Harm - Opioid-Related Adverse Events eQCM. This proposal would require hospitals to report four calendar quarters of data for a total of nine eQCMs (six specified eQCMs and three self-selected eQCMs).

(b) Proposed Reporting and Submission Requirements for eQMs for the CY 2027 Reporting Period/FY 2029 Payment Determination and for Subsequent Years

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36336 through 36339), beginning with the CY 2027 reporting period/FY 2029 payment determination, we proposed to modify the eQCM reporting and submission requirements to require hospitals to report on the following two eQCMs in addition to the eQCMs proposed for the CY 2026 reporting period/FY 2028 payment determination: (1) Hospital Harm - Pressure Injury eQCM; and (2) Hospital Harm - Acute

⁷¹⁴ Centers for Medicare & Medicaid Services. (2023). CMS National Quality Strategy. Available at: <https://www.cms.gov/files/document/cms-national-quality-strategy-handout.pdf>.

Kidney Injury eCQM. This proposal would require hospitals to report four calendar quarters of data for a total of eleven eCQMs (eight specified eCQMs and three self-selected eCQMs).

We proposed this stepwise approach to increasing the number of required eCQMs in response to public comments noting the burden and resources necessary to implement new eCQMs (88 FR 59145 through 59149, and 88 FR 59149 through 59154), while also balancing the need to prioritize more comprehensive reporting on important safety and preventable harm metrics. Waiting until the CY 2027 reporting period/FY 2029 payment determination to require that hospitals report on these two Hospital Harm eCQMs would allow hospitals to experience 2 years of self-selecting to report on these relatively new eCQMs and build the infrastructure necessary to report these measures (88 FR 59145 through 59149, and 88 FR 59149 through 59154). Therefore, we proposed to require these two measures in the CY 2027 reporting period instead of the CY 2026 reporting period to provide hospitals with additional time to gain experience with these newer measures (89 FR 36336 through 36339).

(c) Summary of Proposed Changes to the eCQM Reporting and Submission Requirements

We refer readers to section IX.C.8. for the full list of eCQMs by payment determination in the Hospital IQR Program. If a hospital does not have patients that meet the denominator criteria for any of the eCQMs included in this proposal, the hospital would submit a zero-denominator declaration for the measure that allows a hospital to meet the reporting requirements for a particular eCQM. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708), and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170) for our previously adopted eCQM file format requirements. A QRDA Category I file with patients meeting the initial patient population of the applicable measures, a zero-denominator declaration, and/or a case threshold exemption all count toward a successful submission for eCQMs for the Hospital IQR Program (82 FR 38387). The following Table IX.C.9 summarizes the proposed policies:

TABLE IX.C.9. PROPOSED eCQM REPORTING AND SUBMISSION REQUIREMENTS FOR THE CY 2026 REPORTING PERIOD/FY 2028 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Reporting Period/ Payment Determination	Total Number of eCQMs Reported	eCQMs Required to be Reported
Proposed: CY 2026/FY 2028	Nine	<ul style="list-style-type: none"> • Three self-selected eCQMs; and • Safe Use of Opioids - Concurrent Prescribing eCQM; and • Cesarean Birth eCQM; and • Severe Obstetric Complications eCQM; and • Hospital Harm - Severe Hyperglycemia eCQM; and • Hospital Harm - Severe Hypoglycemia eCQM; and • Hospital Harm - Opioid-Related Adverse Events eCQM
Proposed: CY 2027/FY 2029 (and for subsequent years)	Eleven	<ul style="list-style-type: none"> • Three self-selected eCQMs; and • Safe Use of Opioids - Concurrent Prescribing eCQM; and • Cesarean Birth eCQM; and • Severe Obstetric Complications eCQM; and • Hospital Harm - Severe Hyperglycemia eCQM; and • Hospital Harm - Severe Hypoglycemia eCQM; and • Hospital Harm - Opioid-Related Adverse Events eCQM; and • Hospital Harm - Pressure Injury eCQM; and • Hospital Harm - Acute Kidney Injury eCQM

We invited public comment on our proposal to increase the number of mandatory eCQMs over a two-year period to ultimately require reporting on five additional eCQMs beginning with CY 2026 Reporting Period/FY 2028 Payment Determination. We refer readers to section IX.F.6.b. of this final rule, in which we outline similar reporting and submission requirements under the Medicare Promoting Interoperability Program.

Comment: Many commenters supported our proposal to modify eCQM reporting requirements. A few commenters supported modifying eCQM requirements because it is a reasonable step in moving towards the goal to transition all quality measure reporting to digital quality measures (dQMs). Another commenter supported the proposed requirements because they would support transition to dQMs, which would in turn provide more real-time, actionable data, and reduce the burden of chart-abstracted measures.

Many commenters specifically supported making the Hospital Harm - Severe Hypoglycemia and the Hospital Harm - Severe Hyperglycemia eCQMs mandatory, noting that both conditions are serious adverse events that can be avoided with proper glycemic management through tracking blood glucose levels. A few commenters support modifying eCQM requirements specifically because the proposed mandatory eCQMs are patient safety

outcome eQMs and mandatory reporting ensures data collected are useful to beneficiaries and the public.

A commenter supported the proposed addition of the Hospital Harm - Opioid-Related Adverse Events eQMs for mandatory reporting because opioids have dangerous adverse effects in the inpatient hospital setting, are among the most frequently implicated medications in adverse drug events among hospitalized patients, and most opioid-related adverse events are preventable with better monitoring and response.

A few commenters strongly supported incorporation of the Hospital Harm - Pressure Injury eQEM into the expanded mandatory eQEM measure set and recommended accelerating the timeline for mandatory reporting to CY 2026 reporting period/FY 2028 payment determination. Commenters noted that accelerating the timeline would enhance prevention efforts and improve care for Medicare patients. A few commenters recommended making all patient safety outcome eQEMs mandatory.

Response: We thank commenters for their support. We agree that modifications to eQEM reporting requirements to include patient safety outcome eQEMs would increase public reporting on quality and safety, thus empowering individuals to make decisions about where to go for care, which is one of our key actions to drive improvements in safety as outlined in the CMS National Quality Strategy.⁷¹⁵ While we did not propose to make all patient safety outcome eQEMs mandatory at this time, we will continue to prioritize improving safety and consider additional eQEMs that focus on safety in future program years. In addition, we encourage hospitals to voluntarily report on as many patient safety eQEMs as feasible to support efforts toward improving patient safety in the hospital inpatient setting. As we note in section IX.C.5.c. and IX.C.5.d. of this final rule, we are adopting two new hospital harm eQEMs, Hospital Harm - Falls with Injury eQEM and Hospital Harm - Postoperative Respiratory Failure eQEM,

⁷¹⁵ Centers for Medicare & Medicaid Services. (April 2024). Quality in Motion: Acting on the CMS National Quality Strategy. Available at: <https://www.cms.gov/files/document/quality-motion-cms-national-quality-strategy.pdf>

beginning with the CY 2026 reporting period/FY 2028 payment determination to provide additional reporting options for patient safety.

Comment: Many commenters did not support this proposal and recommended building out the digital quality strategy further and ensuring that new requirements align with its future data collection approach. A few commenters expressed concerns about modifying eCQM reporting requirements and recommended providing greater clarity on the vision for digital quality and how eCQM reporting fits within that vision. A commenter recommended pausing new requirements to focus on efforts towards the future development of dQMs.

Response: We acknowledge commenters' concerns and requests for clarification regarding our digital quality strategy and how modifying eCQM reporting aligns with this strategy. We wish to highlight that in the FY 2022 IPPS/LTCH PPS final rule, we discussed our goal of moving to digital quality measurement for all CMS quality reporting and value-based purchasing programs (86 FR 45342). In the FY 2023 IPPS/LTCH PPS final rule, we further described our goals to transition to dQMs, which include: reducing burden of reporting; provision of multi-dimensional data in a timely fashion, rapid feedback, and transparent reporting of quality measures; leveraging digital measures for advanced analytics to define, measure, and predict key quality issues; and employing quality measures that support development of a learning health system, which uses key data that are also used for care, quality improvement, public health, and research (87 FR 49181 through 49188). We also wish to highlight that our previously described vision for future dQMs would leverage interoperability standards to decrease mapping burden and align standards for quality measurement with interoperability standards used in other healthcare exchange methods (87 FR 49181 through 49188).

The definition of dQM that we have published as part of strategic materials on the eCQI Resource Center states that in general, eCQMs are a subset of dQMs. As defined, dQMs are quality measures that use standardized, digital data from one or more sources of health

information that are captured and exchanged via interoperable systems; apply quality measure specifications that are standards-based and use code packages; and are computable in an integrated environment without additional effort.⁷¹⁶ As we previously described, increasing eCQM reporting requirements are a part of CMS' National Quality Strategy to "accelerate and support the transition to a digital and data-driven health care system" by taking action to annually increasing the percentage of digital quality measures used in quality programs.⁷¹⁷ Regarding the recommendation to pause new eCQM reporting requirements to focus efforts on the future development of dQMs, we wish to note that the addition of these eCQMs to our reporting requirements further advances CMS' goal of transition toward a fully digital quality measurement landscape promoting interoperability that would help decrease burden.^{718 719}

Comment: A commenter did not support this proposal because feedback to hospitals about their performances on eCQMs is infrequent and seldom helpful as a basis for performance improvement. The commenter recommended that CMS provide more frequent and actionable eCQM performance feedback.

Response: We disagree with the commenter that eCQM performance feedback is infrequent and not useful for performance improvement. We note that eCQMs provide real or near-real-time performance information because they are calculated using data in hospitals' EHRs. By using eCQMs, hospitals are not reliant on calculations provided by CMS and do not need to wait until they receive performance reports from CMS the way that they do with claims-based measures. Based on this immediate, or near-immediate, feedback embodied in eCQMs, hospitals should receive frequent and actionable feedback on their measured performance.

⁷¹⁶ Definition of dQM available on the eCQI Resource Center at: https://ecqi.healthit.gov/dqm?qt-tabs_dqm=about-dqms.

⁷¹⁸ Centers for Medicare & Medicaid Services. (March 2022). Digital Quality Measurement Strategic Roadmap. Available at: https://ecqi.healthit.gov/sites/default/files/CMSdQMStrategicRoadmap_032822.pdf

⁷¹⁹ Centers for Medicare & Medicaid Services. (April 2024). Quality in Motion: Acting on the CMS National Quality Strategy. Available at: <https://www.cms.gov/files/document/quality-motion-cms-national-quality-strategy.pdf>

Comment: A commenter requested clarification regarding whether the number of voluntary eCQMs is being reduced.

Response: We interpret the commenter's question as asking for clarification about the number of self-selected eCQMs hospitals would have to report as part of the eCQM reporting requirements. In response, we did not propose any changes; hospitals would continue to report three self-selected eCQMs, as described in the proposal to modify eCQM reporting requirements in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36336 through 36339).

Comment: Several commenters did not support the proposed modifications to eCQM reporting, stating that the required reporting of the previously adopted Hospital Harm eCQMs is premature, noting the proposed mandatory eCQMs are very new to the Hospital IQR Program. These commenters recommended maintaining the current requirements until important issues with the existing Hospital Harm eCQMs have been addressed. Several commenters similarly expressed concern about the feasibility of implementing the two Hospital Harm glycemic control eCQMs and recommended additional testing for these measures. A commenter noted that three of the proposed mandatory eCQMs (Hospital Harm - Opioid-Related Adverse Events, Hospital Harm - Pressure Injury, and Hospital Harm - Acute Kidney Injury) are measures that hospitals do not yet have in use, noting hospitals have not had an adequate opportunity to receive feedback on these measures. A commenter expressed concern that a one-year voluntary reporting period for new eCQMs may not be sufficient to implement and validate.

Response: Regarding the recommendation to delay mandatory reporting requirements for both the Hospital Harm - Severe Hyperglycemia eCQM and Hospital Harm - Severe Hypoglycemia eCQM, we wish to note that hospitals will have had three years to self-select to report these eCQMs as we adopted these eCQMs beginning with the CY 2023 reporting period/FY 2025 payment determination (86 FR 45382 through 45390). We have thus provided three years for hospitals to report and incorporate feedback, and we continue to encourage hospitals to self-select to report on these eCQMs as feasible to support efforts toward patient

safety in the hospital inpatient setting. We acknowledge the Hospital Harm - Opioid-Related Adverse Events, Hospital Harm - Pressure Injury, and Hospital Harm - Acute Kidney Injury eCQMs are relatively newer to the Hospital IQR Program eCQM measure set.

Comment: Many commenters did not support eCQM reporting modifications and expressed concern with the burden associated with implementing new eCQMs per the proposed timeline. Many commenters, stressing the importance of flexibility and incremental change to quality reporting, recommended adopting a more phased approach to implement the new requirements. Commenters maintained that participants in the Hospital IQR Program required additional time to implement workflow changes and required updates to keep pace with this impactful increase in eCQM reporting. Several commenters recommended additional time specifically for staff training, education, and rollout.

Many commenters expressed concerns about the burden associated with meeting these new requirements with limited health IT resources available. Many commenters noted that hospitals have experienced a significant increase in requirements over a short period of time and that they must invest significant time and staff resources, noting this places a significant burden on hospitals. Commenters expressed concern that the volume of changes being implemented introduces a significant administrative burden for small and rural hospitals, including critical access hospitals (CAHs). A few commenters described the intensive process to meet new eCQM reporting requirements, particularly for small teams, noting IT staff in hospitals is often very limited and that EHR vendor lead-times to implement changes can often take several years to go-live. Commenters noted that EHR vendors need considerable advance notice to complete upgrades and programming to meet new eCQM reporting requirements and that CMS should incrementally ramp up eCQM reporting requirements in order to advance digital quality measurement. A commenter recommended allowing more time for hospitals and EHR vendors to focus on eCQM optimization as they currently exist before adding new eCQMs and further increasing administrative burdens. Another commenter emphasized that the hospital workforce

is under tremendous strain, noting quality and health IT resources are stretched thin, and that adding more reporting mandates to hospitals may prove unsustainable. Another commenter recommended considering providing direct funding for increased efforts by hospitals to implement eCQMs.

Several commenters had specific recommendations for a further phased approach. A commenter recommended that CMS require only one additional eCQM in CY 2026 and only one additional eCQM in CY 2027 to reduce the burden and resources necessary to comply with the proposal. A commenter requested delay of the Hospital Harm - Pressure Injury eCQM Requirement and the Hospital Harm - Acute Kidney Injury eCQM for an additional year, noting the additional year would provide hospitals time to implement these measures and respond to feedback. This commenter specifically suggested adopting the Hospital Harm - Opioid-Related Adverse Events measure next year and Hospital Harm - Pressure Injury as well as Hospital Harm - Acute Kidney Injury the following year. Another commenter recommended transitioning fewer eCQMs to mandatory reporting. A commenter noted that hospitals should be able to self-select the majority of their reported eCQMs.

Response: We acknowledge the concerns of commenters related to the burden that the proposed timeline imposes on hospitals to implement a set of new eCQMs, particularly on small and rural hospitals, including CAHs. We further acknowledge comments regarding needing time to map EHR data and that there is often novel data collection involved in implementing new eCQMs that can be challenging and burdensome for providers. We also recognize that there are many new requirements placing burden on hospital IT staff, including working through the challenges associated with the implementation of the Hybrid Hospital-Wide Readmission and Hybrid Hospital-Wide Mortality measures.

After considering these comments, and in response to commenters' feedback recommending additional time for implementing new eCQMs, we are finalizing a modification of our proposal on eCQM reporting requirements.

Specifically, we are finalizing a modification of our proposal such that for the CY 2026 reporting period/FY 2028 payment determination, hospitals would be required to submit data for eight total eCQMs: three self-selected, Safe Use of Opioids, Severe Obstetric Complications, Cesarean Birth, Hospital Harm - Severe Hypoglycemia, and Hospital Harm - Severe Hyperglycemia. For the CY 2027 reporting period/FY 2029 payment determination, hospitals would be required to submit data for these eight eCQMs in addition to the Hospital Harm - Opioid-Related Adverse Events eCQM, for a total of nine eCQMs. Lastly, beginning with the CY 2028 reporting period/FY 2030 payment determination, hospitals would be required to submit data for these nine eCQMs in addition to the Hospital Harm - Pressure Injury and Hospital Harm - Acute Kidney Injury eCQMs, for a total of eleven eCQMs. We refer readers to Table IX.C.XXXX for a summary of the newly finalized eCQM reporting and submission requirement policies. We reiterate that we are fully committed to our National Quality Strategy priority area of “Patient Safety and Resiliency” and, likewise, taking action to expand the collection and use of safety indicator data across programs, including data on key areas such as adverse events.⁷²⁰ In finalizing eCQM reporting requirements with revisions, we sought to balance the need for hospitals and their vendors to prepare for reporting the new eCQMs with the urgency of measuring at a national scale and addressing important patient safety events in hospital inpatient settings in the U.S.

The following Table IX.C.XXXX summarizes the newly finalized policies:

TABLE IX.C.XXXX. NEWLY FINALIZED eCQM REPORTING AND SUBMISSION REQUIREMENTS FOR THE CY 2026 REPORTING PERIOD/FY 2028 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Reporting Period/ Payment Determination	Total Number of eCQMs Reported	eCQMs Required to be Reported
CY 2026/FY 2028	Eight	<ul style="list-style-type: none"> • Three self-selected eCQMs; and • Safe Use of Opioids - Concurrent Prescribing eCQM; and • Cesarean Birth eCQM; and • Severe Obstetric Complications eCQM; and • Hospital Harm - Severe Hyperglycemia eCQM; and • Hospital Harm - Severe Hypoglycemia eCQM

⁷²⁰ Centers for Medicare & Medicaid Services. (2023). CMS National Quality Strategy. Available at: <https://www.cms.gov/files/document/cms-national-quality-strategy-handout.pdf>.

CY 2027/FY 2029	Nine	<ul style="list-style-type: none"> • Three self-selected eQMs; and • Safe Use of Opioids - Concurrent Prescribing eCQM; and • Cesarean Birth eCQM; and • Severe Obstetric Complications eCQM; and • Hospital Harm - Severe Hyperglycemia eCQM; and • Hospital Harm - Severe Hypoglycemia eCQM; and • Hospital Harm - Opioid-Related Adverse Events eCQM
CY 2028/FY 2030 (and for subsequent years)	Eleven	<ul style="list-style-type: none"> • Three self-selected eQMs; and • Safe Use of Opioids - Concurrent Prescribing eCQM; and • Cesarean Birth eCQM; and • Severe Obstetric Complications eCQM; and • Hospital Harm - Severe Hyperglycemia eCQM; and • Hospital Harm - Severe Hypoglycemia eCQM; and • Hospital Harm - Opioid-Related Adverse Events eCQM; and • Hospital Harm - Pressure Injury eCQM; and • Hospital Harm - Acute Kidney Injury eCQM

10. Validation of Hospital IQR Program Data

We proposed changes to our policies for eCQM validation scoring processes beginning with validation of eQMs affecting the FY 2028 payment determinations.

a. Background

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539 through 53553), we finalized the processes and procedures for validation of chart-abstracted measures in the Hospital IQR Program for the FY 2015 payment determination and subsequent years. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38398 through 38403), we finalized several requirements for the validation of eCQM data, including a policy requiring submission of at least 75 percent of sampled eCQM medical records in a timely and complete manner for validation (81 FR 57181). In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58950 through 58952), we finalized the existing Hospital IQR Program validation scoring processes such that a combined score is calculated based on a weighted combination of a hospital's validation performance for chart-abstracted measures and eQMs. Under the aligned validation policies, each hospital selected for validation is expected to submit medical record data for both chart-abstracted measures and eQMs (85 FR 58942 through 58953). Beginning with validation procedures affecting the FY 2024 payment determination, we finalized a policy to annually identify one pool of up to 200 hospitals selected through random selection and one pool of up to 200 hospitals selected using

targeting criteria to participate in both chart-abstracted measure and eCQM validation (85 FR 58942 through 58953).

We refer readers to 42 CFR 412.140(d) for our codification of validation policies and to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49308 through 49310) for a discussion of the most recent changes to chart-abstracted and eCQM data validation requirements for the Hospital IQR Program wherein we finalized the requirement that hospitals selected for validation must submit timely and complete data for 100 percent of requested records for eCQM validation. We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57178 through 57180) for details on the Hospital IQR Program data submission requirements for chart-abstracted measures.

b. Modification of eCQM Data Validation Beginning with the CY 2025 Reporting Period/ FY 2028 Payment Determination

(1) Modification of eCQM Validation Scoring Beginning with CY 2025 eCQM data affecting the FY 2028 Payment Determination

Under the existing eCQM data validation policy, as described in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57180 through 57181), the accuracy of eCQM data (the extent to which data abstracted for validation matches the data submitted in the QRDA I file) has not affected a hospital's validation score. Instead, hospitals have been scored on the completeness of eCQM medical record data that were submitted for the validation process. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38401), we noted our intention for the accuracy of eCQM data validation to affect validation scores in the future.

We have assessed agreement rates, or the rates by which hospitals' reported eCQM data agree with the data resulting from the review process that we conduct as part of validation. The agreement rates for validation accuracy, which have been confidentially reported to hospitals selected for eCQM validation in recent years, are consistently robust overall. For example, around 90 percent (national average agreement rate) for current eCQMs that would be validated in FY 2028 (ranging from a low average of about 84 percent for the Anticoagulation Therapy for

Atrial Fibrillation/Flutter eCQM to a high of average of about 94 percent for the Antithrombotic Therapy by the End of Hospital Day Two eCQM), based on FY 2024 validation results. With the low end of the average accuracy range being well above a passing threshold of 75 percent, it is now appropriate to move forward with scoring hospitals' eCQM data based on the accuracy of the data submitted for purposes of determining whether a hospital has met the validation requirements under the Hospital IQR Program. Therefore, in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36339), we proposed to implement eCQM validation scoring based on the accuracy of eCQM data beginning with CY 2025 eCQM data affecting the FY 2028 payment determination. By the time our eCQM validation scoring methodology would go into effect, we would have been validating eCQM data for completeness for 8 years, which is ample time for hospitals to have prepared for data to be validated based on its accuracy. We also noted that because hospitals are already required to submit 100 percent of requested eCQM medical records to pass the eCQM validation requirement, there is no additional burden to hospitals associated with this policy to begin scoring the submitted records.

In addition, in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36339 through 36340), we proposed to remove the requirement at § 412.140(d)(2)(ii) that hospitals submit 100 percent of the requested eCQM medical records to pass the eCQM validation requirement and proposed that missing eCQM medical records would be treated as mismatches, beginning with the validation of CY 2025 eCQM data affecting the FY 2028 payment determination. This is the same methodology that is applied for missing medical records in chart-abstracted measure validation to incentivize the timely submission of requested medical records. Because mismatches count against the agreement rate, by treating missing eCQM medical records as mismatches, we can ensure our validation scoring methodology clearly requires that hospitals submit all necessary eCQM data for our review without also requiring medical records submissions.

In the proposed rule (89 FR 39339), we proposed that eCQM validation scores be determined using the same methodology that is currently used to score chart-abstracted measure validation. Hospitals' eCQM data would be used to compute an agreement rate and its associated confidence interval. The upper bound of the two-tailed 90 percent confidence interval would be used as the final eCQM validation score for the selected hospital. A minimum score of 75 percent accuracy would be required for the hospital to pass the eCQM validation requirement. Based on the FY 2024 results, most measures had national agreement rates well above the proposed 75 percent threshold, however these FY 2024 results are based on only two quarters of data and included data only from eCQMs that have been in the Hospital IQR Program for several years. We anticipate that the average agreement rates may decrease with a full year of data and the introduction of newer eCQMs that hospitals may have less experience reporting. As such, while we may consider raising the minimum passing threshold from 75 percent in future years, at this time we have determined that the 75 percent threshold is appropriate for initial scoring of eCQMs in Hospital IQR Program validation.

We invited public comment on our proposal to Modify eCQM Validation Scoring beginning with CY 2025 eCQM data affecting the FY 2028 payment determination. We summarize the public comments that we received, along with our responses, in the next subsection.

(2) Modification of the Combined Validation Scoring Process Beginning with CY 2025 Data Affecting the FY 2028 Payment Determination

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36339), we proposed to remove the existing combined validation score based on a weighted combination of a hospital's validation performance for chart-abstracted measures and eCQMs and replace it with two separate validation scores, one for chart-abstracted measures, and one for eCQMs. Based on our current policies, the eCQM portion of the combined agreement rate is multiplied by zero percent,

and the chart-abstracted measure agreement rate is weighted at 100 percent. A minimum passing score for this combined score is set at 75 percent.

Reporting requirements and procedures for eCQMs are different than those for chart-abstracted measures. For instance, hospitals implement electronic algorithms to query eCQM data and submit eCQM measure results using a custom file layout for quality data reporting to CMS. In contrast, validation of chart-abstracted measures is conducted using measure specifications written to support manual abstraction processes. As such, separate validation scores are consistent with the distinct requirements and procedures for the reporting of quality measure data. Moreover, CMS intends to retain an emphasis on data accuracy through the validation efforts across both measure types (that is, chart-abstracted measures and eCQMs). It is important to ensure necessary analysis and resources are placed on chart-abstracted measures that are still currently being validated, especially because of their use within the Hospital Value-Based Purchasing (VBP) Program. Therefore, in the proposed rule (89 FR 36339 through 36340), we proposed to implement two separate scoring processes, one for chart-abstracted measures and one for eCQMs, for the FY 2028 payment determination and subsequent years. Hospitals would be required to receive passing validation scores for both chart-abstracted measure data and eCQM data to pass validation.

Under our proposal, beginning with the validation of CY 2025 data affecting the FY 2028 payment determination, hospitals would receive separate validation scores for both chart-abstracted measure data and eCQM data, which would be used to determine a hospital's overall annual payment update. As established in the FY 2006 IPPS final rule (70 FR 47420 through 47428), a hospital that fails to meet validation requirements may not receive the full annual payment update. Under our proposal, if a hospital fails either chart-abstracted validation requirements or eCQM validation requirements, it may not receive the full annual payment update. To be eligible for a full annual payment update, provided all other Hospital IQR Program requirements are met, a hospital would have to attain at least a 75 percent validation

score for chart-abstracted measure validation and at least a 75 percent validation score for eCQM data validation.

Our existing and newly proposed validation scoring changes are summarized in Table IX.C.10.

TABLE IX.C.10. SUMMARY OF CURRENT AND NEWLY MODIFIED VALIDATION SCORING POLICIES

Validation Process Description	Quarters of Data Required for Validation	Scoring
Current Validation Scoring for the FY 2025 – FY 2027 Payment Determinations (87 FR 49308 through 49310)		
COMBINED Process (Chart-Abstracted Measures and eCQM Validation): up to 200 Random Hospitals + up to 200 Targeted Hospitals	1Q 2022 – 4Q 2022	Chart-Abstracted Measures: at least 75% validation score (weighted at 100%) And eCQMs: Successful submission of 100% of requested medical records
Update to eCQM Validation Scoring for the FY 2028 Payment Determination and Subsequent Years		
Up to 200 Random Hospitals + up to 200 Targeted Hospitals selected for both Chart-Abstracted Measures and eCQM Validation	1Q 2025 – 4Q 2025	Chart-Abstracted Measures: at least 75% validation score And eCQMs: at least 75% validation score

We invited public comment on our eCQM validation proposals.

Comment: Some commenters supported our eCQM validation proposals in alignment with other validation scoring standards, including changing the weighting of the eCQM validation score from 0 percent to 50 percent.

Response: We thank the commenters for their support.

Comment: Some commenters appreciated that the proposed eCQM validation requirements are meant to align with other validation criteria in the Hospital IQR Program. However, commenters had some concerns about eCQM validation scoring, noting that hospitals have little detail about validation decisions and questioned the value of the feedback reports provided to hospitals. Commenters requested that CMS publish a resource guide and requested that CMS not penalize hospitals for issues outside their control, like measure definition issues. Some commenters requested that CMS allow a grace period for new validation of new eCQMs since many new eCQMs have been introduced into the Hospital IQR Program in recent years.

Response: We thank the commenters for this feedback. However, our experience in validating eCQMs in previous years, coupled with consistently high agreement rates, confirms

that these measures are ready for validation. We have a number of resources related to validation located on our QualityNet website at: <https://qualitynet.cms.gov/inpatient/data-management/data-validation/resources>, and will consider publishing additional resources to support hospitals' efforts to report eCQM data accurately in the future.

Comment: Some commenters requested that CMS consider changing the timeline for validation of eCQM data. A commenter requested additional time for review and validation of measure data to avoid incorrect validation decisions. The commenter argued that hospitals and vendors often need six or more weeks to complete coding, leaving little time for validation prior to data submission deadlines under the current practice. The commenter suggested that CMS align the eCQM reporting deadline with MIPS' deadline for March 31 instead of the current February 28th. Another commenter requested that the increased number of eCQMs should be delayed to avoid coinciding with increased validation requirements and called for an extended timeline for eCQM data submissions. The commenter also suggested analyzing how charts submitted for eCQM validation are being assessed to ensure that correct validation methods are used.

Response: We thank the commenters for this feedback. However, as stated earlier, our experience with validating eCQMs in previous years, coupled with consistently high agreement rates, confirms that the measures are ready for validation, and correspondingly, that hospitals are sufficiently prepared to submit their eCQM data and for those data to be sufficiently accurate for validation. We do not agree that we should delay implementation of additional validation requirements for eCQMs because we continue to believe that accurate and complete eCQM data are crucial to informing members of the public about the care quality that Medicare beneficiaries receive in hospitals. We understand that hospitals would need to adjust processes and workflows to account for additional eCQM reporting requirements, but delaying validation would not impact hospitals' efforts to deliver the highest quality care to their patients. We will continue to work with hospitals to ensure that they are fully informed about the validation program and that

they continue to report their eCQM data accurately.

Comment: Some commenters opposed CMS's eCQM validation proposals, arguing that validation imposes a significant administrative burden on hospitals and that validating eCQMs for accuracy would increase that burden. Commenters noted that targeted reviews during eCQM validation would require additional cases per quarter to be submitted during the 30-day window to retrieve and review records and suggested that CMS allow up to 45 days for those processes.

Response: We thank the commenters for this feedback. However, while we understand that validation imposes some reporting burden on hospitals, we have determined, based on the power analysis for the confidence interval calculation, that a final sample size of eight eCQM cases per quarter is essential to achieve sufficient and accurate validation results. We do not intend to increase the hospital sample size for eCQM validation because we have attempted to ensure that our eCQM validation proposals achieve both the objectives of minimizing reporting burden on participating hospitals and ensuring that hospitals report fully accurate data. We will consider whether to extend the timeframe for hospitals' retrieval of records for validation purposes in the future. However, we note that we are required by section 1886(b)(3)(B)(viii)(XI) to establish a process to validate measure data submitted by hospitals under the Program, with the process to include random audits. Our validation program continues to ensure that the data reported by hospitals, and that we report publicly, are as accurate as feasible and to the extent that the commenters oppose validation requirements in their entirety do not understand that such a position would adhere to our statutory direction.

Comment: Some commenters requested that CMS consider requiring validation of fewer measures for selected hospitals and start with a required validation score lower than 75 percent. A commenter suggested that CMS delay eCQM validation scoring until after some chart-abstracted measures are removed from the program. Another commenter argued that the 75 percent threshold is more appropriate for chart-abstracted measures with which hospitals have more experience than eCQMs.

Response: We proposed the 75 percent agreement rate for eCQM validation scoring in alignment with common standards that we have adopted in other validation programs, including chart-abstracted measure validation previously adopted in the Hospital IQR Program (81 FR 57179 through 57180), to ensure sufficient accuracy of the measures. Given the high overall agreement rates that we have observed for eCQMs, we anticipate that this threshold would uphold the integrity of the validation process consistently and that its alignment with other validation programs would help hospitals meet validation requirements consistently across measure types. We will continue observing hospitals' experience with eCQM validation and will consider whether we should propose further refinements in future years.

Comment: Some commenters opposed eCQM validation scoring changes for measures that have been adopted for their first or second year of reporting, arguing that validation is more reasonable for measures that hospitals have reported for at least two years. Commenters suggested that CMS consider a phased-in approach to eCQM validation starting in CY 2026 or later. Commenters noted that hospitals often receive their eCQM data at the very end of the calendar year and thus do not have time for their staff to review their performance and work to implement improvements.

Response: We thank commenters for this feedback. However, as we stated earlier, our experience in validating eCQMs in previous years, coupled with consistently high agreement rates, confirms that these measures are ready for validation and that hospitals can successfully report eCQM data accurately. We understand that hospitals must adjust their processes to account for new eCQMs, but ensuring that hospitals report accurately on their eCQMs necessitates the validation policies that we have proposed. We will continue to observe hospitals' experience with eCQM validation and will consider whether to revisit these policies in future years.

Comment: A commenter opposed CMS's eCQM validation proposals, arguing that hospitals have never received any feedback on eCQM validation from the agency.

Response: We would like to clarify that, as we discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36339), we have confidentially reported agreement rates for validation accuracy to hospitals selected for eCQM validation in recent years. Those agreement rates range between about 84 percent to about 94 percent based on FY 2024 validation results.

Comment: A commenter was concerned about the time it takes CMS to make changes to quality measure specifications and the speed with which eCQMs can be adopted thereafter. The commenter noted that, in one case, it took CMS five years to make a change to the perinatal care eCQM specifications, but the measure became a requirement the following year. The commenter argued that this timeframe is too short for hospitals to adjust and ensure data integrity, particularly for eCQMs where the commenter stated that hospitals and CMS must partner to identify and correct issues with measure specifications.

Response: We thank the commenter for this feedback. We note that quality measure specifications changes are the purview of the measure steward, which may be CMS in some cases or may be a third party. Minor or technical changes to quality measure specifications are not significant enough to impair hospitals' delivery of high-quality care to their patients while those changes are implemented in EHR systems. Based on the high agreement rates we have observed to date, hospitals have been successful at implementing the necessary updates to their systems and care practices. We agree with the commenter that we must partner with hospitals to ensure that issues identified in measure specifications are appropriately captured in eCQMs so that hospitals report data successfully and accurately to CMS and we will continue to engage collaboratively with hospitals to that end.

Comment: A commenter expressed concerns about eCQM validation when, in the commenter's view, hospitals are at the mercy of measure developers and EHR vendors. The commenter argued that, unless code sets are fully updated, hospitals are unable to capture patient chart data accurately. The commenter requested that CMS provide examples of inaccurately reported data to inform hospitals and requested that CMS consider a confidential feedback period

before penalizing hospitals over eCQM data accuracy.

Response: As stated earlier, minor or technical changes to quality measure specifications are not significant enough to alter hospitals' ability to provide care in accordance with the applicable clinical standard. We understand that hospitals must rely on measure developers and EHR vendors for their eCQMs reporting, and we work closely with both groups to ensure that the measures that we propose to adopt and that we propose to validate are fully ready for hospitals' implementation. We will consider whether we should provide additional confidential feedback to hospitals in the future, potentially including examples of inaccurately reported data, as we continue working to keep hospitals fully informed about our validation programs.

After consideration of the comments that we have received, we are finalizing our eCQM validation policies as proposed.

11. Data Accuracy and Completeness Acknowledgement (DACA) Requirements

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53554) for previously adopted details on DACA requirements. We did not propose any changes to this policy in this final rule. We refer readers to the QualityNet website at: <https://qualitynet.cms.gov> (or other successor CMS designated websites) for more details on DACA requirements.

12. Public Display Requirements

Section 1886(b)(3)(B)(viii)(VII) of the Act requires the Secretary to report quality measures of process, structure, outcome, patients' perspectives on care, efficiency, and costs of care that relate to services furnished in inpatient settings in hospitals on the Internet website of CMS. Section 1886(b)(3)(B)(viii)(VII) of the Act also requires that the Secretary establish procedures for making information regarding measures available to the public after ensuring that a hospital can review its data before they are made public. Our current policy is to report data from the Hospital IQR Program as soon as it is feasible on CMS websites such as the Compare tool hosted by HHS, currently available at: <https://www.medicare.gov/care-compare>, or its successor website, after a 30-day preview period (78 FR 50776 through 50778).

We did not propose any changes to these policies or the public reporting of eCQM data or overall hospital star ratings in this final rule. We also refer readers to the QualityNet website at: <https://qualitynet.cms.gov/inpatient/public-reporting> (or other successor CMS designated websites) for details on public display requirements.

We refer readers to the CY 2025 OPPTS/ASC proposed rule where we are soliciting input on potential future methodological modifications regarding the Safety of Care measure group within the Overall Hospital Quality Star Rating (89 FR 59509 through 59515).

13. Reconsideration and Appeal Procedures

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650 through 51651), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836), and 42 CFR 412.140(e), we established an approach for reconsideration and appeal procedures for the Hospital IQR Program. As part of this reconsideration process, hospitals can request reconsideration if CMS determines that the hospital did not meet the Hospital IQR Program's validation requirements. Under these requirements as established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50225 through 50229), for purposes of validation, hospitals are required to resubmit copies of all medical records that were originally submitted to the Clinical Data Abstraction Center (CDAC) each relevant quarter. With the transition to all electronic submission of copies of medical records for Hospital IQR Program validation as established in the FY 2021 IPPS/LTCH final rule (85 FR 58949 through 58950), both through eCQMs and digitized charts, the current reconsideration requirement to resubmit records used for validation results is no longer necessary and creates duplicative files and work.

Therefore, we proposed to revise § 412.140(e)(2)(vii)(A) to no longer require hospitals to resubmit medical records as part of their request for reconsideration of validation, beginning with CY 2023 discharges affecting the FY 2026 payment determination.

Under our proposal, hospitals that need to submit a revised medical record may still do so, but those hospitals that would otherwise be resubmitting copies of the previously submitted

records would no longer be required to submit them. Removing record submission as a requirement for validation reconsideration would reduce hospital administrative burden for most hospitals that do not have revised records to submit. Making this step optional would also reduce the burden for CMS to collect and track medical records that are already available.

We invited public comment on our proposal to remove the requirement for hospitals to resubmit medical records as part of their request for reconsideration of validation, beginning with CY 2023 discharges affecting the FY 2026 payment determination.

Comment: A commenter supported our proposal to remove the requirement to resubmit records for validation, agreeing with us that this change would reduce burden on participating hospitals.

Response: We thank the commenter for their support.

After consideration of the comment that we received, we are finalizing this policy as proposed beginning with the CY 2023 discharges affecting the FY 2026 payment determination.

14. Hospital IQR Program Extraordinary Circumstances Exceptions (ECE) Policy

We did not propose any changes to this policy in this final rule. We refer readers to § 412.140(c)(2) and the QualityNet website at: <https://qualitynet.cms.gov> (or other successor CMS designated websites) for our current requirements for submission of a request for an exception.

D. Changes to the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

1. Background

The PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program, authorized by section 1866(k) of the Act, applies to hospitals described in section 1886(d)(1)(B)(v) of the Act (referred to as “PPS-Exempt Cancer Hospitals” or “PCHs”). In the FY 2025 IPPS/LTCH PPS proposed rule (86 FR 36341), we proposed to adopt the Patient Safety Structural measure beginning with the CY 2025 reporting period/FY 2027 program year as described in section IX.B.1. of this final rule. We also proposed to modify the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey measure as described in section IX.B.2. of this final rule and proposed to move up the start date for publicly displaying hospital performance on the Hospital Commitment to Health Equity measure (86 FR 36341).⁷²¹

2. Adoption of the Patient Safety Structural Measure Beginning with the CY 2025 Reporting Period/FY 2027 Program Year

We refer readers to section IX.B.1. of this final rule where we finalize with modification the adoption of the Patient Safety Structural measure beginning with the CY 2025 reporting period/FY 2027 program year for the PCHQR Program. We are also finalizing with modification the adoption of this measure for the Hospital Inpatient Quality Reporting (IQR) Program, as discussed in that section.

3. Modification of the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey Measure Beginning with the CY 2025 Reporting Period/FY 2027 Program Year

We refer readers to section IX.B.2. of this final rule where we finalize the modification of the HCAHPS Survey measure (CBE #0166) beginning with the CY 2025 reporting period/FY

⁷²¹ To provide clarity and to better align with the Hospital IQR Program, we have changed the name of the Facility Commitment to Health Equity measure in the PCHQR Program to the Hospital Commitment to Health Equity measure. This is a non-substantive change and does not impact the measure’s specifications or reporting requirements.

2027 program year for the PCHQR Program. We are also finalizing the adoption of the same modifications to this measure for purposes of the Hospital IQR Program and the Hospital VBP Program, as discussed in the same section.

4. Summary of Previously Adopted and Newly Finalized PCHQR Program Measures for the CY 2025 Reporting Period/FY 2027 Program Year and Subsequent Years

Table IX.D.-01 summarizes the previously adopted and the newly finalized measures for the PCHQR Program measure set beginning with the CY 2025 reporting period/FY 2027 program year.

TABLE IX.D.-01: PREVIOUSLY ADOPTED MEASURES AND NEWLY FINALIZED MEASURES FOR THE PCHQR PROGRAM MEASURE SET BEGINNING WITH THE CY 2025 REPORTING PERIOD/FY 2027 PROGRAM YEAR

Short Name	CBE Number	Measure Name
Safety and Healthcare-Associated Infection (HAI) Measures		
CAUTI	0138	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure
CLABSI	0139	NHSN Central line-associated Bloodstream Infection (CLABSI) Outcome Measure
Flu HCP Vaccination	0431	Influenza Vaccination Coverage Among Healthcare Personnel (HCP)
COVID-19 HCP Vaccination	N/A	COVID-19 Vaccination Coverage Among HCP
Colon and Abdominal Hysterectomy SSI	0753	American College of Surgeons – Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure (currently includes SSIs following Colon Surgery and Abdominal Hysterectomy Surgery)
MRSA	1716	NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Bacteremia Outcome Measure
CDI	1717	NHSN Facility-wide Inpatient Hospital-onset <i>Clostridium difficile</i> Infection (CDI) Outcome Measure
N/A	N/A	Patient Safety Structural Measure*
Clinical Process/Oncology Care Measures		
EOL-Chemo	0210	Proportion of Patients Who Died from Cancer - Receiving Chemotherapy in the Last 14 Days of Life
EOL-Hospice	0215	Proportion of Patients Who Died from Cancer - Not Admitted to Hospice
Intermediate Clinical Outcome Measures		
EOL-ICU	0213	Proportion of Patients Who Died from Cancer - Admitted to the ICU in the Last 30 Days of Life
EOL-3DH	0216	Proportion of Patients Who Died from Cancer - Admitted to Hospice for Less Than Three Days
Patient Engagement/Experience of Care Measure		
HCAHPS	0166	Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey
N/A	N/A	Documentation of Goals of Care Discussions Among Cancer Patients
Claims Based Outcome Measures		
N/A	N/A	Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy
N/A	3188	30-Day Unplanned Readmissions for Cancer Patients
N/A	N/A	Surgical Treatment Complications for Localized Prostate Cancer
Health Equity Measures		
HCHE	N/A	Hospital Commitment to Health Equity
N/A	N/A	Screening for Social Drivers of Health
N/A	N/A	Screen Positive Rate for Social Drivers of Health

* Indicates new measure finalized in this final rule.

5. New Start Date for Public Display of the Hospital Commitment to Health Equity Measure

In the FY 2024 IPPS/LTCH PPS final rule, we adopted the Hospital Commitment to Health Equity measure for the PCHQR measure set beginning with the CY 2024 reporting period/FY 2026 program year (88 FR 59204 through 59210). We also finalized that we would publicly report PCH performance on this measure beginning with CY 2024 data beginning July 2026 or as soon as feasible thereafter (88 FR 59209; 59228).

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to accelerate the timeline for beginning to publicly report PCH performance on this measure. Specifically, we proposed to start public reporting of PCH performance on this measure using CY 2024 data beginning January 2026 or as soon as feasible thereafter. We stated that the public could benefit from having access to the information sooner because the data provide an opportunity to recognize PCHs that have attested to their commitment to health equity at an earlier date. We also stated that the modification of the date for public reporting would promote efficiencies through alignment of the performance periods, data submission periods, and the anticipated public reporting release with the Inpatient Psychiatric Facility Quality Reporting (IPFQR) Program that adopted the Facility Commitment to Health Equity measure (which requires the same attestations as the Hospital Commitment to Health Equity measure) beginning with reporting of CY 2024 data for the FY 2026 payment determination and would provide this information for providers participating in the PCHQR Program and the IPFQR Program simultaneously. We invited public comment on this proposal.

Comment: A few commenters supported moving up the public reporting timeline for the Hospital Commitment to Health Equity measure because they believe that patients will benefit from being able to access the information sooner, and that the earlier publication timeframe will promote greater efficiencies through alignment with other CMS quality reporting programs without changing the submission timeline for PCH data.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing the start of public reporting of the Hospital Commitment to Health Equity measure to January 2026 or as soon as feasible thereafter.

6. Summary of Previously Finalized Public Display Policies and Newly Finalized Public Display Start Date Change for the PCHQR Program

Our previously finalized public display policies and newly finalized public display start date change for the Hospital Commitment to Health Equity measure for the PCHQR Program are described in Table IX.D.-02:

TABLE IX.D.-02: PREVIOUSLY FINALIZED PUBLIC DISPLAY POLICIES AND NEWLY FINALIZED PUBLIC DISPLAY CHANGE FOR THE PCHQR PROGRAM

Measures	Public Display Dates
<ul style="list-style-type: none"> • HCAHPS (CBE #0166) 	2016 subsequent years
<ul style="list-style-type: none"> • American College of Surgeons – Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure [currently includes SSIs following Colon Surgery and Abdominal Hysterectomy Surgery] (CBE #0753) • NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant <i>Staphylococcus aureus</i> Bacteremia Outcome Measure (CBE #1716) • NHSN Facility-wide Inpatient Hospital-onset <i>Clostridium difficile</i> Infection (CDI) Outcome Measure (CBE #1717) • NHSN Influenza Vaccination Coverage Among Healthcare Personnel (CBE #0431) 	2019 and subsequent years
<ul style="list-style-type: none"> • Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy 	April 2020 and subsequent years
<ul style="list-style-type: none"> • COVID-19 Vaccination Coverage Among Healthcare Personnel 	October 2022 and subsequent years
<ul style="list-style-type: none"> • CAUTI (CBE #0138) 	October 2022 and subsequent years
<ul style="list-style-type: none"> • CLABSI (CBE #0139) 	October 2022 and subsequent years
<ul style="list-style-type: none"> • 30-day Unplanned Readmissions for Cancer Patients (CBE #3188) 	October 2023 and subsequent years
<ul style="list-style-type: none"> • Proportion of Patients Who Died from Cancer Receiving Chemotherapy in the Last 14 Days of Life (CBE #0210) • Proportion of Patients Who Died from Cancer Not Admitted to Hospice (CBE #0215) • Proportion of Patients Who Died from Cancer Admitted to the ICU in the Last 30 Days of Life (CBE #0213) • Proportion of Patients Who Died from Cancer Admitted to Hospice for Less Than Three Days (CBE #0216) 	July 2024 or as soon as feasible thereafter
<ul style="list-style-type: none"> • Surgical Treatment Complications for Localized Prostate Cancer Measure (PCH-37) 	July 2024 or as soon as feasible thereafter
<ul style="list-style-type: none"> • Hospital Commitment to Health Equity* 	January 2026 or as soon as feasible thereafter
<ul style="list-style-type: none"> • Documentation of Goals of Care Discussions Among Cancer Patients 	July 2026 or as soon as feasible thereafter
<ul style="list-style-type: none"> • Screening for Social Drivers of Health 	July 2027 or as soon as feasible thereafter
<ul style="list-style-type: none"> • Screen Positive Rate for Social Drivers of Health 	July 2027 or as soon as feasible thereafter

* Newly finalized start date for publicly displaying this measure.

E. Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

1. Background and Statutory Authority

The Long-Term Care Hospital Quality Reporting Program (LTCH QRP) is authorized by section 1886(m)(5) of the Act, and it applies to all hospitals certified by Medicare as Long-Term Care Hospitals (LTCHs). Section 1886(m)(5)(C) of the Act requires LTCHs to submit to the Secretary quality measure data specified under section 1886(m)(5)(D) in a form and manner, and at a time, specified by the Secretary. In addition, section 1886(m)(5)(F) of the Act requires LTCHs to submit data on quality measures under section 1899B(c)(1) of the Act, resource use or other measures under section 1899B(d)(1) of the Act, and standardized patient assessment data required under section 1899B(b)(1) of the Act. LTCHs must submit the data required under section 1886(m)(5)(F) of the Act in the form and manner, and at the time, specified by the Secretary. Under the LTCH QRP, the Secretary must reduce by two percentage points the annual update to the LTCH PPS standard federal rate for discharges for an LTCH during a fiscal year (FY) if the LTCH has not complied with the LTCH QRP requirements specified for that FY. Section 1890A of the Act requires that the Secretary establish and follow a pre-rulemaking process, in coordination with the consensus-based entity (CBE) with a contract under section 1890(a) of the Act, to solicit input from certain groups regarding the selection of quality and efficiency measures for the LTCH QRP. We have codified our program requirements in our regulations at 42 CFR 412.560.

We proposed to require LTCHs to report four new items to the LTCH Continuity Assessment and Record of Evaluation (CARE) Data Set (LCDS) and modify one item on the LCDS as described in section IX.E.4. of the preamble of this final rule. Second, we proposed to extend the Admission assessment window for the LCDS as described in section IX.E.7.c. Third, we sought information on future measure concepts for the LTCH QRP, and finally, we sought information on a future LTCH Star Rating system.

2. General Considerations Used for the Selection of Quality Measures for the LTCH QRP

For a detailed discussion of the considerations, we historically use for the selection of LTCH QRP quality, resource use, and other measures, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49728).

3. Quality Measures Currently Adopted for the FY 2025 LTCH QRP

The LTCH QRP currently has 18 adopted measures, which are set out in Table IX.E.-01. For a discussion of the factors used to evaluate whether a measure should be removed from the LTCH QRP, we refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41624 through 41634) and to the regulations at 42 CFR 412.560(b)(3).

TABLE IX.E.-01. QUALITY MEASURES CURRENTLY ADOPTED FOR THE LTCH QRP

Short Name	Measure Name & Data Source
LTCH CARE Data Set	
Pressure Ulcer/Injury	Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury
Application of Falls	Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay)
Change in Mobility	Functional Outcome Measure: Change in Mobility Among Long-Term Care Hospital (LTCH) Patients Requiring Ventilator Support
DRR	Drug Regimen Review Conducted With Follow-Up for Identified Issues—Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)
Compliance with SBT	Compliance with Spontaneous Breathing Trial (SBT) by Day 2 of the LTCH Stay
Ventilator Liberation	Ventilator Liberation Rate
TOH—Provider	Transfer of Health Information to the Provider Post-Acute Care (PAC)
TOH—Patient	Transfer of Health Information to the Patient Post-Acute Care (PAC)
DC Function	Discharge Function Score
Patient/Resident COVID-19 Vaccine	COVID-19 Vaccine: Percent of Patients/Residents Who Are Up to Date
NHSN	
CAUTI	National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure
CLABSI	National Healthcare Safety Network (NHSN) Central Line-associated Bloodstream Infection (CLABSI) Outcome Measure
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset <i>Clostridium difficile</i> Infection (CDI) Outcome Measure
HCP Influenza Vaccine	Influenza Vaccination Coverage among Healthcare Personnel
HCP COVID-19 Vaccine	COVID-19 Vaccination Coverage among Healthcare Personnel (HCP)
Claims-Based	
MSPB LTCH	Medicare Spending Per Beneficiary (MSPB)—Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)
DTC	Discharge to Community (DTC)—Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)
PPR	Potentially Preventable 30-Day Post-Discharge Readmission Measure for Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)

We did not propose to adopt any new measures for the LTCH QRP.

4. Collection of Four New Items as Standardized Patient Assessment Data Elements and Modification of One Item Collected as a Standardized Patient Assessment Data Element Beginning with the FY 2028 LTCH QRP

In the proposed rule, we proposed to add four new items⁷²² to be collected as standardized patient assessment data elements under the social determinants of health (SDOH) category under the LTCH QRP: Living Situation (one item); Food (two items); and Utilities (one item). We also proposed to modify one of the current items collected as a standardized patient assessment data element under the SDOH category (the Transportation item).⁷²³

a. Definition of Standardized Patient Assessment Data

Section 1886(m)(5)(F)(ii) of the Act requires LTCHs to submit standardized patient assessment data required under section 1899B(b)(1) of the Act. Section 1899B(b)(1)(A) of the Act requires post-acute care (PAC) providers to submit standardized patient assessment data under applicable reporting provisions (which, for LTCHs, is the LTCH QRP) with respect to the admission and discharge of an individual (and more frequently as the Secretary deems appropriate). Section 1899B(a)(1)(C) of the Act requires, in part, the Secretary to modify the PAC assessment instruments in order for PAC providers, including LTCHs, to submit standardized patient assessment data under the Medicare program. LTCHs are currently required to report patient assessment data through the LCDS. Section 1899B(b)(1)(B) of the Act describes standardized patient assessment data as data required for at least the quality measures described in section 1899B(c)(1) of the Act and that is with respect to the following categories: (1) functional status, such as mobility and self-care at admission to a PAC provider and before discharge from a PAC provider; (2) cognitive function, such as ability to express ideas and to understand, and mental status, such as depression and dementia; (3) special services, treatments,

⁷²² Items may also be referred to as “data elements.”

⁷²³ As noted in section IX.E of the proposed rule and section IX.E. of this final rule, hospitals are required to report whether they have screened patients for five standardized SDOH categories: housing instability, food insecurity, utility difficulties, transportation needs, and interpersonal safety.

and interventions, such as need for ventilator use, dialysis, chemotherapy, central line placement, and total parenteral nutrition; (4) medical conditions and comorbidities, such as diabetes, congestive heart failure, and pressure ulcers; (5) impairments, such as incontinence and an impaired ability to hear, see, or swallow; and (6) other categories deemed necessary and appropriate by the Secretary.

b. Social Determinants of Health Collected as Standardized Patient Assessment Data Elements

Section 1899B(b)(1)(B)(vi) of the Act authorizes the Secretary to collect standardized patient assessment data elements with respect to other categories deemed necessary and appropriate. Accordingly, we finalized the creation of the SDOH category of standardized patient assessment data elements in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42577 through 42581), and defined SDOH as the socioeconomic, cultural, and environmental circumstances in which individuals live that impact their health.⁷²⁴ According to the World Health Organization, research shows that the SDOH can be more important than health care or lifestyle choices in influencing health, accounting for between 30-55% of health outcomes.⁷²⁵ This is a part of a growing body of research that highlights the importance of SDOH on health outcomes. Subsequent to the FY 2020 IPPS/LTCH PPS final rule, we expanded our definition of SDOH: SDOH are the conditions in the environments where people are born, live, learn, work, play, worship, and age that affect a wide range of health, functioning, and quality-of-life outcomes and risks.^{726,727,728} This expanded definition aligns our definition of SDOH with the definition used by HHS agencies, including OASH, the Centers for Disease Control and

⁷²⁸ CMS.gov. Measures Management System (MMS). CMS Focus on Health Equity. Health Equity Terminology and Quality Measures. <https://mmshub.cms.gov/about-quality/quality-at-CMS/goals/cms-focus-on-health-equity/health-equity-terminology>.

Prevention (CDC) and the White House Office of Science and Technology Policy.^{729,730} We currently collect seven items in this SDOH category of standardized patient assessment data elements: ethnicity, race, preferred language, interpreter services, health literacy, transportation, and social isolation (84 FR 42577 through 42581).⁷³¹

In accordance with our authority under section 1899B(b)(1)(B)(vi) of the Act, we similarly finalized the creation of the SDOH category of standardized patient assessment data elements for Skilled Nursing Facilities (SNFs) in the FY 2020 SNF PPS final rule (84 FR 38805 through 38817), for Inpatient Rehabilitation Facilities (IRFs) in the FY 2020 IRF PPS final rule (84 FR 39149 through 39161), and for Home Health Agencies (HHAs) in the Calendar Year (CY) 2020 HH PPS final rule (84 60597 through 60608). We also collect the same seven SDOH items in these PAC providers' respective patient/resident assessment instruments (84 FR 38817, 39161, and 60610, respectively).

Access to standardized data relating to SDOH on a national level permits us to conduct periodic analyses, and to assess their appropriateness as risk adjustors or in future quality measures. Our ability to perform these analyses and to make adjustments relies on existing data collection of SDOH items from PAC settings. We adopted these SDOH items using common standards and definitions across the four PAC providers to promote interoperable exchange of longitudinal information among these PAC providers, including LTCHs, and other providers. We believe this information may facilitate coordinated care, improve patient focused care planning, and allow for continuity of the discharge planning process from PAC settings.

We noted in our FY 2020 IPPS/LTCH PPS final rule that each of the items was identified in the 2016 National Academies of Sciences, Engineering, and Medicine (NASSEM) report as impacting care use, cost, and outcomes for Medicare beneficiaries (84 FR 39150). At that time,

⁷²⁹ Centers for Disease Control and Prevention. Social Determinants of Health (SDOH) and PLACES Data. .

⁷³⁰ "U.S. Playbook To Address Social Determinants Of Health" from the White House Office Of Science And Technology Policy (November 2023).

⁷³¹ These SDOH data are also collected for purposes outlined in section 2(d)(2)(B) of the Improving Medicare Post-Acute Care Transitions Act (IMPACT Act). For a detailed discussion on SDOH data collection under section 2(d)(2)(B) of the IMPACT Act, see the FY 2020 LTCH PPS final rule (84 FR 42577 through 42579).

we acknowledged that other items may also be useful to understand. The SDOH items we proposed to collect as standardized patient assessment data elements under the SDOH category in the proposed rule were also identified in the 2016 NASEM report⁷³² or the 2020 NASEM report⁷³³ as impacting care use, cost, and outcomes for Medicare beneficiaries. These items have the potential to affect treatment preferences and goals of patients and their caregivers. Identification of these SDOH items may also help LTCHs be in a position to offer assistance, by connecting patients and their caregivers with these associated needs to social support programs, as well as inform our understanding of patient complexity.

Health-related social needs (HRSNs) are the resulting effects of SDOH, which are individual-level, adverse social conditions that negatively impact a person's health or health care.⁷³⁴ Examples of HRSNs include lack of access to food, housing, or transportation, and have been associated with poorer health outcomes, greater use of emergency departments and hospitals, and higher health care costs. Certain HRSNs can lead to unmet social needs that directly influence an individual's physical, psychosocial, and functional status.⁷³⁵ This is particularly true for food security, housing stability, utilities security, and access to transportation.⁷³⁶

We proposed to require LTCHs collect and submit four new items in the LCDS as standardized patient assessment data elements under the SDOH category because these items would collect information not already captured by the current SDOH items. Specifically, we

⁷³⁶ Hugh Alderwick and Laura M. Gottlieb, "Meanings and Misunderstandings: A Social Determinants of Health Lexicon for Health Care Systems: Milbank Quarterly," Milbank Memorial Fund, November 18, 2019, <https://www.milbank.org/quarterly/articles/meanings-and-misunderstandings-a-social-determinants-of-health-lexicon-for-health-care-systems/>.

believe the ongoing identification of SDOH would have three significant benefits. First, promoting screening for SDOH could serve as evidence-based building blocks for supporting healthcare providers in actualizing their commitment to address disparities that disproportionately impact underserved communities. Second, screening for SDOH improves health equity through identifying potential social needs so the LTCH may address those with the patient, their caregivers, and community partners during the discharge planning process, if indicated.⁷³⁷ Third, these SDOH items could support our ongoing LTCH QRP initiatives by providing data with which to stratify LTCHs' performance on measures or in future quality measures.

Collection of additional SDOH items would permit us to continue developing the statistical tools necessary to maximize the value of Medicare data and improve the quality of care for all beneficiaries. For example, we recently developed and released the Health Equity Confidential Feedback Reports, which provided data to LTCHs on whether differences in quality measure outcomes are present for their patients by dual-enrollment status and race and ethnicity.⁷³⁸ We note that advancing health equity by addressing the health disparities that underlie the country's health system is one of our strategic pillars⁷³⁹ and a Biden-Harris Administration priority.⁷⁴⁰

c. Collect Four New Items as Standardized Patient Assessment Data Elements Beginning with the FY 2028 LTCH QRP

⁷³⁷ American Hospital Association. (2020). Health Equity, Diversity & Inclusion Measures for Hospitals and Health System Dashboards. December 2020. Accessed: January 18, 2022. Available at: https://ifdhe.aha.org/system/files/media/file/2020/12/ifdhe_inclusion_dashboard.pdf.

⁷³⁸ In October 2023, we released two new annual Health Equity Confidential Feedback Reports to LTCHs: The Discharge to Community (DTC) Health Equity Confidential Feedback Report and the Medicare Spending Per Beneficiary (MSPB) Health Equity Confidential Feedback Report. The PAC Health Equity Confidential Feedback Reports stratified the DTC and MSPB measures by dual-enrollment status and race/ethnicity. For more information on the Health Equity Confidential Feedback Reports, please refer to the Education and Outreach materials available on the LTCH QRP Training webpage at <https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-quality-reporting-training>.

⁷⁴⁰ The White House. The Biden-Harris Administration Immediate Priorities [website]. <https://www.whitehouse.gov/priorities/>

We proposed to require LTCHs to collect four new items as standardized patient assessment data elements under the SDOH category using the LCDS: one item for Living Situation, as described in section IX.E.4.c.(1) of the proposed rule; two items for Food, as described in section IX.E.4.c.(2) of the proposed rule; and one item for Utilities, as described in section IX.E.4.c.(3) of the proposed rule.

We selected the proposed SDOH items from the Accountable Health Communities (AHC) Health Related Social Needs (HRSN) Screening Tool developed for the AHC Model.⁷⁴¹ The AHC HRSN Screening Tool is a universal, comprehensive screening for HRSNs that addresses five core domains as follows: (i) housing instability (for example, homelessness, poor housing quality), (ii) food insecurity, (iii) transportation difficulties, (iv) utility assistance needs, and (v) interpersonal safety concerns (for example, intimate-partner violence, elder abuse, child maltreatment).⁷⁴²

We believe that requiring LTCHs to report new items that are included in the AHC HRSN Screening Tool would further standardize the screening of SDOH across quality programs. For example, our proposal would align, in part, with the requirements of the Hospital Inpatient Quality Reporting (IQR) Program and the Inpatient Psychiatric Facility Quality Reporting (IPFQR) Program. As of January 2024, hospitals are required to report whether they have screened patients for the standardized SDOH categories of housing stability, food security, utility difficulties, transportation needs, and interpersonal safety to meet the Hospital IQR Program requirements.⁷⁴³ Beginning January 2025, IPFs will also be required to report whether they have screened patients for the same set of SDOH categories.⁷⁴⁴ As we continue to standardize data collection across PAC settings, we believe using common standards and

⁷⁴¹ The AHC Model was a five year demonstration project run by the Centers for Medicare & Medicaid Innovation between May 1, 2017 and April 30, 2022. For more information go to <https://www.cms.gov/priorities/innovation/innovation-models/ahcm>.

definitions for new items is important to promote interoperable exchange of longitudinal information between LTCHs and other providers to facilitate coordinated care, continuity in care planning, and the discharge planning process.

Below we describe each of the four proposed items in more detail.

(1) Living Situation

Healthy People 2030 prioritizes economic stability as a key SDOH, of which housing stability is a component.^{745,746} Lack of housing stability encompasses several challenges, such as having trouble paying rent, overcrowding, moving frequently, or spending the bulk of household income on housing.⁷⁴⁷ These experiences may negatively affect one’s physical health and access to health care. Housing instability can also lead to homelessness, which is housing deprivation in its most severe form.⁷⁴⁸ On a single night in 2023, roughly 653,100 people, or 20 out of every 10,000 people in the United States, were experiencing homelessness.⁷⁴⁹ Studies also found that people who are homeless have an increased risk of premature death and experience chronic disease more often than among the general population.⁷⁵⁰

We believe that LTCHs can use information obtained from the Living Situation item during a patient’s discharge planning. For example, LTCHs could work in partnership with community care hubs and community-based organizations to establish new care transition workflows, including referral pathways, contracting mechanisms, data sharing strategies, and

implementation training that can track HRSNs to ensure unmet needs, such as housing, are successfully addressed through closed loop referrals and follow-up.⁷⁵¹ LTCHs could also take action to help alleviate a patient’s other related costs of living, like food, by referring the patient to community-based organizations that would allow the patient’s additional resources to be allocated towards housing without sacrificing other needs.⁷⁵² Finally, LTCHs could use the information obtained from the Living Situation item to better coordinate with other healthcare providers, facilities, and agencies during transitions of care, so that referrals to address a patient’s housing stability are not lost during vulnerable transition periods.

Due to the potential negative impacts housing instability can have on a patient’s health, we proposed to adopt the Living Situation item as a new standardized patient assessment data element under the SDOH category. This proposed Living Situation item is based on the Living Situation item collected in the AHC HRSN Screening Tool,^{753,754} and was adapted from the Protocol for Responding to and Assessing Patients' Assets, Risks, and Experiences (PRAPARE) tool.⁷⁵⁵ The proposed Living Situation item asks, “What is your living situation today?” The proposed response options are: (1) I have a steady place to live; (2) I have a place to live today, but I am worried about losing it in the future; (3) I do not have a steady place to live; (7) Patient declines to respond; and (8) Patient unable to respond. A draft of the proposed Living Situation item to be adopted as a standardized patient assessment data element under the SDOH category can be found in the Downloads section of the LCDS and LTCH Manual webpage at

(2) Food

The U.S. Department of Agriculture, Economic Research Service defines a lack of food security as a household-level economic and social condition of limited or uncertain access to adequate food.⁷⁵⁶ Adults who are food insecure may be at an increased risk for a variety of negative health outcomes and health disparities. For example, a study found that food insecure adults may be at an increased risk for obesity.⁷⁵⁷ Another study found that food insecure adults have a significantly higher probability of death from any cause or cardiovascular disease in long-term follow-up care, in comparison to adults that are food secure.⁷⁵⁸

While having enough food is one of many predictors for health outcomes, a diet low in nutritious foods is also a factor.⁷⁵⁹ The United States Department of Agriculture (USDA) defines nutrition security as “consistent and equitable access to healthy, safe, affordable foods essential to optimal health and well-being.”⁷⁶⁰ Nutrition security builds on and complements long standing efforts to advance food security.⁷⁶¹ Studies have shown that older adults struggling with food security consume fewer calories and nutrients and have lower overall dietary quality than those who are food secure, which can put them at nutritional risk.⁷⁶² Older adults are also at a higher risk of developing malnutrition, which is considered a state of deficit, excess, or imbalance in protein, energy, or other nutrients that adversely impacts an individual’s own body

⁷⁵⁶ U.S. Department of Agriculture, Economic Research Service. (n.d.). *Definitions of food security*. Retrieved March 10, 2022, from <https://www.ers.usda.gov/topics/food-nutrition-assistance/food-security-in-the-u-s/definitions-of-food-security/>

⁷⁶² Ziliak, J. P., & Gundersen, C. (2019). The State of Senior Hunger in America 2017: An Annual Report. Prepared for Feeding America. Available at: <https://www.feedingamerica.org/research/senior-hunger-research/senior>.

form, function, and clinical outcomes.⁷⁶³ About 50% of older adults are affected by malnutrition, which is further aggravated by a lack of food security and poverty.⁷⁶⁴ These facts highlight why the Biden-Harris Administration launched the White House Challenge to End Hunger and Build Health Communities.⁷⁶⁵

We believe that adopting items to collect and analyze information about a patient’s food security at home could provide additional insight to their health complexity and help facilitate coordination with other healthcare providers, facilities, and agencies during transitions of care, so that referrals to address a patient’s food security are not lost during vulnerable transition periods. For example, an LTCH’s dietitian or other clinically qualified nutrition professional could work with the patient and their caregiver to plan healthy, affordable food choices prior to discharge.⁷⁶⁶ LTCHs could also refer a patient that indicates lack of food security to government initiatives such as the Supplemental Nutrition Assistance Program (SNAP) and food pharmacies (programs to increase access to healthful foods by making them affordable), two initiatives that have been associated with lower health care costs and reduced hospitalization and emergency department visits.⁷⁶⁷

We proposed to adopt two Food items as new standardized patient assessment data elements under the SDOH category. These proposed items are based on the Food items collected in the AHC HRSN Screening Tool, and were adapted from the USDA 18-item Household Food

Security Survey (HFSS).⁷⁶⁸ The first proposed Food item states, “Within the past 12 months, you worried that your food would run out before you got money to buy more.”⁷⁶⁹ The second proposed Food item states, “Within the past 12 months, the food you bought just didn’t last and you didn’t have money to get more.” We proposed the same response options for both items: (1) Often true; (2) Sometimes true; (3) Never True; (7) Patient declines to respond; and (8) Patient unable to respond. A draft of the proposed Food items to be adopted as a standardized patient assessment data element under the SDOH category can be found in the Downloads section of the LCDS and LTCH Manual webpage at <https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-care-data-set-ltch-qrp-manual>.

(3) Utilities

A lack of energy (utility) security can be defined as an inability to adequately meet basic household energy needs.⁷⁷⁰ According to the Department of Energy, one in three households in the U.S. are unable to adequately meet basic household energy needs.⁷⁷¹ The consequences associated with a lack of utility security are represented by three primary dimensions: economic, physical, and behavioral. Patients with low incomes are disproportionately affected by high energy costs, and they may be forced to prioritize paying for housing and food over utilities.⁷⁷² Some patients may face limited housing options and therefore are at increased risk of living in lower-quality physical conditions with malfunctioning heating and cooling systems, poor lighting, and outdated plumbing and electrical systems.⁷⁷³ Patients with a lack of utility security may use negative behavioral approaches to cope, such as using stoves and space heaters for

⁷⁶⁸ More information about the HFSS tool can be found at <https://www.ers.usda.gov/topics/food-nutrition-assistance/food-security-in-the-u-s/survey-tools/>.

⁷⁶⁹ The AHC HRSN Screening Tool Food item includes two questions. In an effort to limit LTCH burden, we only proposed the first question.

⁷⁷³ Hernández D. Understanding 'energy insecurity' and why it matters to health. *Soc Sci Med.* 2016 Oct;167:1-10. doi: 10.1016/j.socscimed.2016.08.029. Epub 2016 Aug 21. PMID: 27592003; PMCID: PMC5114037.

heat.⁷⁷⁴ In addition, data from the Department of Energy’s U.S. Energy Information Administration confirm that a lack of energy security disproportionately affects certain populations, such as low-income and African American households.⁷⁷⁵ The effects of a lack of utility security include vulnerability to environmental exposures such as dampness, mold, and thermal discomfort in the home, which have a direct impact on a person’s health.^{776,777} For example, research has shown associations between a lack of energy security and respiratory conditions as well as mental health–related disparities and poor sleep quality in vulnerable populations such as the elderly, children, the socioeconomically disadvantaged, and the medically vulnerable.⁷⁷⁸

We believe adopting an item to collect information about a patient’s utility security upon admission to an LTCH would facilitate the identification of patients who may not have utility security and who may benefit from engagement efforts. For example, LTCHs may be able to use the information on utility security to help connect identified patients in need, such as older adults, to programs that can help pay for home energy (heating/cooling) costs, like the Low-Income Home Energy Assistance Program (LIHEAP). LTCHs may also be able to partner with community care hubs and community-based organizations to assist the patient in applying for these and other local utility assistance programs, as well as helping them navigate the enrollment process.⁷⁷⁹

We proposed to adopt a new item, Utilities, as a new standardized patient assessment data element under the SDOH category. This proposed item is based on the Utilities item collected in

the AHC HRSN Screening Tool and was adapted from the Children’s Sentinel Nutrition Assessment Program (C-SNAP) survey.⁷⁸⁰ The proposed Utilities item asks, “In the past 12 months, has the electric, gas, oil, or water company threatened to shut off services in your home?” The proposed response options are: (1) Yes; (2) No; (3) Already shut off; (7) Patient declines to respond; and (8) Patient unable to respond. A draft of the proposed Utilities item to be adopted as a standardized patient assessment data element under the SDOH category can be found in the Downloads section of the LCDS and LTCH Manual webpage at <https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-care-data-set-ltch-grp-manual>.

d. Stakeholder Input

We developed our proposal to add these items after considering feedback we received in response to our request for information (RFI) on Closing the Health Equity Gap in CMS Hospital Quality Programs in the FY 2022 IPPS/LTCH PPS final rule ([86 FR 45349](#) through [45362](#)). This RFI sought to update providers on CMS initiatives to make reporting of health disparities more comprehensive and actionable for LTCHs, providers, and patients. The RFI also invited public comment on future potential stratification of quality measures and improving demographic data collection. In response to the solicitation of public comment on future potential stratification and improving demographic data collection, commenters generally supported and recommended that CMS collect additional social and demographic data, like gender expression, disability status, language including English proficiency, housing security, food security, and forms of economic or financial insecurity to help provides address health equity in LTCHs. In addition, some commenters suggested CMS use standardized data collection across agencies when incorporating health equity initiatives, while also expressing

⁷⁸⁰ This validated survey was developed as a clinical indicator of household energy security among pediatric caregivers. Cook, J.T., D.A. Frank., P.H. Casey, R. Rose-Jacobs, M.M. Black, M. Chilton, S. Ettinger de Cuba, et al. “A Brief Indicator of Household Energy Security: Associations with Food Security, Child Health, and Child Development in US Infants and Toddlers.” *Pediatrics*, vol. 122, no. 4, 2008, pp. e874–e875. <https://doi.org/10.1542/peds.2008-0286>

concern about the burden additional data collection efforts would place on providers (86 FR 45358).

Furthermore, we considered feedback we received when we proposed the creation of the SDOH category of standardized patient assessment data elements in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19545). Many commenters were generally in favor of the concept of collecting SDOH items and noted the inclusion of additional SDOH would provide greater breadth and depth of data when developing policies to address social factors related to health. Many commenters also recommended including additional factors, such as food insecurity, housing insecurity, and independent living status, to ensure the full spectrum of social needs is examined. The FY 2020 IPPS/LTCH PPS final rule (84 FR 42578 through 42581) includes a summary of the public comments that we received and our responses to those comments. We incorporated this input into the development of this proposal.

We solicited comment on the proposal to adopt four new items as standardized patient assessment data elements under the SDOH category beginning with the FY 2028 LTCH QRP: one Living Situation item; two Food items; and one Utilities item.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters expressed support for the proposed new SDOH assessment items, viewing this proposal as an important step towards improving patient outcomes, advancing health equity, advancing patient-centered care, improving health outcomes, and early identification of important areas that affect downstream health costs, health outcomes, and quality of life. One of these commenters also emphasized the importance of understanding the patient's environmental and personal factors to guide the selection of interventions provided through the plan of care.

Several commenters also noted the importance of the proposed new SDOH assessment items in facilitating discharge planning strategies that can account for an individual's housing,

food, utilities, and transportation needs. Three of these commenters noted that the information obtained from these proposed new SDOH assessment items will help LTCHs identify future needs in collaboration with the patient and their caregivers during the discharge planning process. Two of these commenters also highlighted how SDOH influence a patient's ability to execute post-discharge recommendations and could impact patient recovery and readmission rates. These commenters said that by addressing these non-medical factors during the LTCH stay, they can help connect patients to the resources they may need, resulting in successful discharges to the community or improved health outcomes.

Response: We appreciate the support from commenters. We agree that the collection of the proposed SDOH assessment items will support LTCHs that want to understand and address health disparities that affect their patient population, facilitate coordinated care, foster continuity in care planning, and assist with the discharge planning process from the LTCH setting.

Comment: Several commenters appreciated CMS' efforts at standardizing collection of patient assessment data elements related to SDOH by proposing to adopt the four new assessment items, Living Situation, Food, and Utilities, in the LCDS. Three of these commenters recognized that the standardized collection of the proposed SDOH assessment items will support interoperability and comparability across LTCHs and within facilities for different patient populations. A couple of these commenters noted that the standardized SDOH assessment items are essential to reducing practice variance, which can lead to inconsistencies in data collection and reporting. Further, a commenter highlighted that a unified approach to SDOH can ensure that those critical social and economic factors are accurately captured and utilized to inform care decisions, ultimately leading to a more effective and equitable healthcare system.

Response: We thank the commenters for recognizing the importance of standardized SDOH assessment items in the LTCH QRP. As we continue to standardize data collection across settings, we believe using common standards and definitions for new assessment items is

important to promote interoperable exchange of longitudinal information between LTCHs and other providers, including hospitals. We also believe collecting this information may facilitate coordinated care, continuity in care planning, and the discharge planning process from PAC settings, including LTCHs.

Comment: A commenter suggested that feedback from patients on their experiences of SDOH-related screenings should be used to inform updates to quality measures, while another commenter suggested that CMS could use the SDOH-related screening data in quality programs to stratify patient data.

Response: We thank the commenters for their recommendations and agree that the standardized SDOH assessment items will be valuable sources of information that would permit us to continue developing the statistical tools necessary to maximize the value of Medicare data and improve the quality of care for all beneficiaries. We will take the commenters' recommendations into consideration for future rulemaking.

Comment: Two commenters acknowledged there would be an increase in burden in collecting these four new assessment items. However, one of these commenters said that they still support the proposal because the adoption of consistent, standardized questions will reduce the burden of implementation and have a positive impact on discharge planning. The other commenter noted that the additional burden on their LTCHs will be relatively low because they are already collecting most of this information through their electronic medical record system.

Two commenters did not support the proposal to collect the new SDOH assessment items and noted significant concerns about the cumulative collection burden for critically ill patients, the cost of updating the data collection systems, and training staff members. One of these commenters noted that asking the proposed SDOH assessment items **will increase burden on their only discharge planner and reduce the time they can spend on actual discharge planning.** Another one of these commenters noted that their facility already has concerns with the high administrative burden of LCDS data collection and its impact on patient care, particularly

considering ongoing workforce challenges.

Response: We acknowledge the addition of four new SDOH assessment items will increase the burden associated with completing the LCDS, and we carefully weighed the burden of collecting new assessment items against the benefits of adopting those assessment items for the LCDS. We prioritized balancing the reporting burden for LTCHs with our policy objective to collect additional SDOH standardized patient assessment data elements that will inform care planning and coordination and quality improvement across care settings. We interpret the commenters who acknowledged the increase in burden associated with collecting these four new assessment items while still supporting the proposal to recognize this important balance. We interpret the comment regarding the reduction of burden associated with the adoption of consistent, standardized questions to be supportive of the proposal to adopt four new SDOH assessment items from the AHC HRSN Screening Tool since implementing standardized questions across all LCDS will be easier on staff administering the assessment. .

As we noted in section IX.E.4.b., the proposed new SDOH assessment items were identified in either the 2016 NASEM report⁷⁸¹ or the 2020 NASEM report⁷⁸² as impacting care use, cost, and outcomes for Medicare beneficiaries. In addition, Healthy People 2030⁷⁸³ and related work across HHS⁷⁸⁴ underscores that social risk factors and unmet social needs contribute to wide health and health care disparities and inequities. Stakeholders across the health care spectrum have a role to play in addressing SDOH. We believe by integrating the proposed new SDOH assessment items into routine practice and, when indicated, facilitating referrals to downstream interventions informed by patient data, then the risk for negative outcomes, such as

⁷⁸¹ National Academies of Sciences, Engineering, and Medicine. 2016. Accounting for Social Risk Factors in Medicare Payment: Identifying Social Risk Factors. Washington, DC: The National Academies Press. <https://doi.org/10.17226/21858>.

⁷⁸² National Academies of Sciences, Engineering, and Medicine. 2020. Leading Health Indicators 2030: Advancing Health, Equity, and Well-Being. Washington, DC: The National Academies Press. <https://doi.org/10.17226/25682>.

⁷⁸³ Healthy People 2030 Framework. Healthy People 2030. <https://health.gov/healthypeople/about/healthy-people-2030-framework>.

⁷⁸⁴ Green K, Zook M. When Talking About Social Determinants, Precision Matters. HealthAffairs. Published October 29, 2019. <https://www.healthaffairs.org/doi/10.1377/hblog20191025.776011/full/>

hospital readmissions, can be reduced. Collection of these new SDOH items will provide key information to LTCHs to support effective discharge planning. Therefore, we hope that the proposed new SDOH assessment items, when collected at admission, can inform the discharge planning process for LTCHs, reducing discharge planning burden overall, rather than negatively impacting the time LTCHs spend on discharge planning.

In response to the commenters with concerns about the cumulative collection burden on critically ill patients, we interpret the comments to be referring to LTCH patients on admitted on ventilators or other critically ill LTCH patients who may be unable to respond to interview questions at the time of admission. We note that we did propose these new and modified SDOH items to include additional response options for patients that decline to respond or are unable to respond (89 FR 36347 through 36350). We encourage LTCHs to assess all patients and select the appropriate response options for the SDOH items on the LCDS.

In response to the commenters with concerns about the cost of updating the data collection systems, CMS continually looks for opportunities to minimize the cost to LTCHs associated with collection and submission of the LCDS through strategies that simplify collection and submission requirements. This includes standardizing instructions, providing a help desk, hosting a dedicated webpage, communication strategies, free data specifications, and free on-demand reports.

Finally, in response to the commenters with concerns about training their staff on collecting the proposed new SDOH assessment items, we plan to provide training resources in advance of the initial collection of the assessment items to ensure that LTCHs have the tools necessary to administer the new SDOH assessment items in a respectful way and reduce the burden to LTCHs in creating their own training resources. These training resources may include online learning modules, tip sheets, questions and answers documents, and recorded webinars and videos, and would be available to providers as soon as technically feasible, allowing LTCHs several months to ensure their staff take advantage of the learning opportunities.

Comment: Three commenters who did not support the proposal suggested that the proposed SDOH assessment items need further testing and refinement to ensure they work as intended in the LTCH setting, and referred to the CMS second evaluation of the AHC Model from 2018 through 2021 as evidence of this suggestion.⁷⁸⁵ These commenters interpret the Findings at a Glance to conclude that the AHC HRSN Screening Tool “did not appear to increase beneficiaries’ connection to community services or HRSN resolution.”

Response: The HRSN domains in the AHC HRSN Screening Tool were chosen based upon literature review and expert consensus utilizing the following criteria: (1) availability of high-quality scientific evidence linking a given HRSN to adverse health outcomes and increased healthcare utilization, including hospitalizations and associated costs; (2) ability for a given HRSN to be screened and identified in the inpatient setting prior to discharge, addressed by community-based services, and potentially improve healthcare outcomes, including reduced readmissions; and (3) evidence that a given HRSN is not systematically addressed by healthcare providers.⁷⁸⁶ In addition to established evidence of their association with health status, risk, and outcomes, these domains were selected because they can be assessed across the broadest spectrum of individuals in a variety of settings.^{787,788}

The commenters also referred to the two-page summary of the AHC Model 2018-2021⁷⁸⁹ which describes the results of testing whether systematically identifying and connecting beneficiaries to community resources for their HRSNs improved health care utilization outcomes and reduced costs. To ensure consistency in the screening offered to beneficiaries across both an individual community’s clinical delivery sites and across all the communities in the model, CMS

⁷⁸⁷ Billioux, A., Verlander, K., Anthony, S., & Alley, D. (2017). Standardized Screening for Health-Related Social Needs in Clinical Settings: The Accountable Health Communities Screening Tool. *NAM Perspectives*, 7(5). Available at: <https://doi.org/10.31478/201705b>. Accessed on June 9, 2024.

⁷⁸⁸ Centers for Medicare & Medicaid Services. (2021). Accountable Health Communities Model. Accountable Health Communities Model | CMS Innovation Center. Available at: <https://innovation.cms.gov/innovation-models/ahcm>. Accessed on February 20, 2023.

⁷⁸⁹ <https://www.cms.gov/priorities/innovation/data-and-reports/2023/ahc-second-eval-rpt-fg>.

developed a standardized HRSN screening tool. This AHC HRSN Screening Tool was used to screen Medicare and Medicaid beneficiaries for core HRSNs to determine their eligibility for inclusion in the AHC Model. If a Medicare or Medicaid beneficiary was eligible for the AHC Model, they were randomly assigned to one of two tracks: (1) Assistance; or (2) Alignment. The Assistance Track tested whether navigation assistance that connects navigation-eligible beneficiaries with community services results in increased HRSN resolution, reduced health care expenditures, and unnecessary utilization. The Alignment Track tested whether navigation assistance, combined with engaging key stakeholders in continuous quality improvement (CQI) to align community service capacity beneficiaries' HRSNs, results in greater increases in HRSN resolution and greater reductions in health expenditures and utilization than navigation assistance alone. Regardless of assigned track, all beneficiaries received HRSN screening, community referrals, and navigation to community services.⁷⁹⁰

We believe the commenter inadvertently misinterpreted the findings, believing these findings were with respect to the effectiveness and scientific validity of the AHC HRSN Screening Tool itself. The findings section of this two-page summary described six key findings from the AHC Model, which examined whether the Assistance Track or the Alignment Track resulted in greater increases in HRSN resolution and greater reductions in health expenditures and utilization. Particularly, the AHC Model reduced emergency department visits among Medicaid and FFS Medicare beneficiaries in the Assistance Track, which was suggestive that navigation may help patients use the health care system more effectively. We acknowledge that navigation alone did not increase beneficiaries' connection to community services or HRSN resolution, and this was attributed to gaps between community resource availability and beneficiary needs. The AHC HRSN Screening Tool use in the AHC Model was limited to identifying Medicare and Medicaid beneficiaries with at least one core HRSN who could be

⁷⁹⁰ Accountable Health Communities (AHC) Model Evaluation, Second Evaluation Report. May 2023. This project was funded by the Centers for Medicare & Medicaid Services under contract no. HHSM-500-2014-000371, Task Order75FCMC18F0002. <https://www.cms.gov/priorities/innovation/data-and-reports/2023/ahc-second-eval-rpt>.

eligible to participate in the AHC Model. Our review of the AHC Model did not identify any issues with the validity and scientific reliability of the AHC HRSN Screening Tool.

Finally, as part of our routine item and measure monitoring work, we continually assess the implementation of new assessment items, and we will include the four new proposed SDOH assessment items in our monitoring work.

Comment: Three commenters requested we articulate our vision for how we plan to use the data collected from the SDOH standardized patient assessment data elements in quality and payment programs. These commenters noted concern that CMS may use the SDOH assessment data to develop an LTCH QRP measure that would hold LTCHs solely accountable to address the social drivers of health that require resources and engagement across an entire community.

Response: We proposed the four new SDOH assessment items because collection of additional SDOH items would permit us to continue developing the statistical tools necessary to maximize the value of Medicare data and improve the quality of care for all beneficiaries. For example, we recently developed and released the Health Equity Confidential Feedback Reports, which provided data to LTCHs on whether differences in quality measure outcomes are present for their patients by dual-enrollment status and race and ethnicity.⁷⁹¹ We note that advancing health equity by addressing the health disparities that underlie the country's health system is one of our strategic pillars⁷⁹² and a Biden-Harris Administration priority.⁷⁹³ Furthermore, any updates to the LTCH QRP measure set or payment system would be addressed through future notice-and-comment rulemaking, as necessary.

⁷⁹¹ In October 2023, we released two new annual Health Equity Confidential Feedback Reports to LTCHs: The Discharge to Community (DTC) Health Equity Confidential Feedback Report and the Medicare Spending Per Beneficiary (MSPB) Health Equity Confidential Feedback Report. The PAC Health Equity Confidential Feedback Reports stratified the DTC and MSPB measures by dual-enrollment status and race/ethnicity. For more information on the Health Equity Confidential Feedback Reports, please refer to the Education and Outreach materials available on the LTCH QRP Training webpage at <https://www.cms.gov/medicare/quality/long-term-care-hospital/lch-quality-reporting-training>.

⁷⁹² Brooks-LaSure, C. (2021). My First 100 Days and Where We Go from Here: A Strategic Vision for CMS. Centers for Medicare & Medicaid. Available at <https://www.cms.gov/blog/my-first-100-days-and-where-we-go-here-strategic-vision-cms>.

⁷⁹³ The Biden-Harris Administration's strategic approach to addressing health related social needs can be found in The U.S. Playbook to Address Social Determinants of Health (SDOH) (2023): <https://www.whitehouse.gov/wp-content/uploads/2023/11/SDOH-Playbook-3.pdf>.

Comment: Five commenters were concerned that the proposed SDOH assessment items are not applicable to LTCH patients because many LTCH patients are generally unable to respond to questioning due to mechanical ventilation or sedation and are more severely ill than the average Medicare beneficiary for which the AHC HRSN Screening Tool was developed. Two of these commenters do not think LTCHs are the appropriate reporting and accountability entity for the SDOH assessment items unless the items are used in patient reporting or case-mix adjustment of measures or the healthcare entity can redress the disadvantage because LTCHs generally see patients at the end of the care continuum and have very little control over the SDOH of patients. These commenters were also concerned with the stigma patients may feel when they are asked about their living situation, and food and utilities availability, and the potential risk of violence against their staff due to having to ask sensitive and repetitive questions.

Response: We believe the proposed SDOH assessment items are important to collect on all LTCH patients. We acknowledge that many patients are admitted to LTCHs on mechanical ventilation. However, based on our internal analysis of LTCH data reported from October 1, 2021 through September 30, 2023 (Quarter 4 of CY 2021 through Quarter 3 CY 2023), over 70% of patients were not on invasive mechanical ventilation support when they were admitted to an LTCH. While we acknowledge the medical complexity of LTCH patients, we believe LTCHs are accustomed to working with patients with very complex medical conditions, including those who are on mechanical ventilation, sedated, or severely ill, and we are confident in their ability to collect this data in a consistent manner. There are currently several patient interview assessment items on the LCDS, and LTCHs are accustomed to administering these questions to impaired patients. In addition, the new and modified assessment items we proposed include additional response options for patients that decline to respond or are unable to respond (89 FR 36347 through 36350) We encourage LTCHs to assess all patients and select the appropriate response options for the SDOH.

In response to the commenters that stated LTCHs are not the appropriate entity for these SDOH assessment items because LTCHs generally see patients at the end of the care continuum and have very little control over the SDOH for that reason, we refer the commenters to section IX.E.4.b of this final rule. In section IX.E.4.b of this final rule, we noted that the assessment items we proposed to collect as standardized patient assessment data elements under the SDOH category were identified in the 2016 NASEM report⁷⁹⁴ or the 2020 NASEM report⁷⁹⁵ as impacting care use, cost, and outcomes for Medicare beneficiaries. These items have the potential to affect treatment preferences and goals of patients and their caregivers, and therefore will support LTCHs in implementing an effective discharge planning process. The discharge planning process requires that the LTCH must identify, at an early stage of hospitalization, those patients who are likely to suffer adverse health consequences upon discharge in the absence of adequate discharge planning and must provide a discharge planning evaluation for those patients so identified.

Finally, we respectfully disagree that the proposed SDOH assessment items are inherently stigmatizing. We understand the potentially sensitive nature of these questions, and we want patients to feel comfortable answering the questions. We plan to provide training resources in advance of the initial collection of the assessment items to ensure that LTCHs have the tools necessary to administer the new SDOH assessment items in a respectful way and reduce the burden to LTCHs in creating their own training resources. These training resources may include online learning modules, tip sheets, questions and answers documents, and recorded webinars and videos, and would be available to providers as soon as technically feasible, allowing LTCHs several months to ensure their staff take advantage of the learning opportunities. Finally, as previously noted, we proposed that these new and modified SDOH

⁷⁹⁴ Social Determinants of Health. Healthy People 2020. <https://www.healthypeople.gov/2020/topics-objectives/topic/social-determinants-of-health>. (February 2019).

⁷⁹⁵ National Academies of Sciences, Engineering, and Medicine. 2020. Leading Health Indicators 2030: Advancing Health, Equity, and Well-Being. Washington, DC: The National Academies Press. <https://doi.org/10.17226/25682>.

items include response options for patients that decline to respond or are unable to respond (89 FR 36347 through 36350).

Comment: Two commenters noted the opportunities to advance interoperability through the adoption of the items. One of these commenters supported the proposal to adopt four SDOH assessment items as standardized patient assessment data elements, but encouraged CMS to ensure that the data generated by the LCDS is interoperable with existing screening standards, like the Gravity Project, to ensure that consumers are not asked multiple times for the same information. The other commenter encouraged CMS to consider supporting data portability and screening interoperability across acute hospitals, LTCHs, and other PAC settings to avoid unnecessary duplication of screenings and assessments. This commenter recognized that repeating screenings and assessments at appropriate intervals can support the identification of emerging or changing needs, but also noted that duplication may lead to patient mistrust.

Response: We appreciate the statements from commenters encouraging CMS to support data portability and screening interoperability. As we have noted in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28122 and 28123), to further interoperability in post-acute care settings, CMS and the Office of the National Coordinator for Health Information Technology (ONC) participate in the Post-Acute Care Interoperability Workgroup (PACIO) to facilitate collaboration with interested parties to develop Health Level Seven International® (HL7) Fast Healthcare Interoperability Resource® (FHIR) standards. These standards could support the exchange and reuse of patient assessment data derived from the post-acute care (PAC) setting assessment tools, such as the Minimum Data Set (MDS), Inpatient Rehabilitation Facility - Patient Assessment Instrument (IRF-PAI), LCDS, Outcome and Assessment Information Set (OASIS), and other sources. The CMS Data Element Library (DEL)⁷⁹⁶ continues to be updated and serves as a resource for PAC assessment data elements, as well as furthers CMS' goal of data

⁷⁹⁶ The CMS Data Element Library (DEL) is the centralized resource for CMS assessment instrument data elements (e.g. questions and responses) and their associated health information technology (IT) standards. <https://del.cms.gov/DELWeb/pubHome>.

standardization and interoperability. We acknowledge that there are still opportunities to advance these goals, and we will take these comments into consideration.

We find the commenter's statement unclear that repeating screenings and assessments may lead to patient mistrust. We interpret the commenter to mean that patients may become concerned that the LTCH does not have the necessary information to appropriately care for the patient if the LTCH asks similar questions as the previous healthcare setting. We disagree and believe that patient trust can be strengthened when interview questions are introduced appropriately by the LTCH clinical staff, including explain the reason for asking the question again. We note that LTCH patients may experience changing needs over the course of their hospital stay. For example, some patients may have been housing secure prior to their condition, but their prior living situation may no longer be suitable for their current needs, which may include specific requirements such as mobility equipment.

Comment: Three commenters did not agree with CMS that the proposed SDOH assessment items would produce interoperable data within Medicare's quality reporting programs because the proposed requirements for LTCH are not aligned with the SDOH screening requirements in the Hospital IQR Program and IPFQR Program. Specifically, these commenters noted that the Screening for SDOH measures in the Hospital IQR and IPFQR Programs do not specify when a patient is screened (for example, at admission) nor how the screening questions are asked (that is, specific wording and responses). Instead, these providers are only asked to document that a patient was screened for the following domains: housing instability, food insecurity, transportation difficulties, utility assistance needs, and interpersonal safety concerns. These commenters contrast requirements for reporting the Screening for SDOH measures with our proposal to add assessment items to the LCDS with standardized questions and responses and would require screening at admission.

Response: We disagree that the proposed collection of four new SDOH assessment items and one modified SDOH assessment item for the LTCH QRP and the requirements for the

Hospital IQR and IPFQR Programs do not promote standardization. Although hospitals and IPFs participating in these programs can use a self-selected SDOH screening tool, the Screening for SDOH and Screen Positive Rate for SDOH measures we have adopted for the Hospital IQR and IPFQR Programs address the same SDOH domains that we proposed to collect as standardized patient assessment data under the LTCH QRP: housing instability, food insecurity, utility difficulties, transportation needs. We believe that this partial alignment will facilitate longitudinal data collection on the same topics across healthcare settings. As we continue to standardize data collection, we believe using common standards and definitions for new assessment items is important to promote interoperable exchange of longitudinal information between LTCHs and other providers to facilitate coordinated care, continuity in care planning, and the discharge planning process. This is evidenced by our recent proposals to add these four SDOH assessment items and one modified SDOH assessment item in the SNF QRP (89 FR 23462 through 23468), IRF QRP (89 FR 22275 through 22280), and Home Health QRP (89 FR 55383 through 55388).

(a) Comments on the Living Situation Assessment Item

Comment: Two commenters specifically supported the proposal to adopt the Living Situation assessment item as a standardized patient assessment data element in the LCDS. These commenters emphasized that having information on living situation is critical for understanding social and environmental factors that affect their patient's health outcomes. One of these commenters suggested that having information related to a patient's living situation would enable LTCHs to better understand the social and environmental factors that impact their patient's outcomes. They also agree with CMS that it will support LTCHs in their efforts to partner with community care hubs and community-based organizations (CBOs) to tailor transitions of care plans and ensure that patients are able to access resources from community providers. The other commenter also highlighted how understanding the patient's living situation can ensure patients' adaptive equipment needs are addressed.

Response: We thank the commenters and agree that the collection of the Living Situation item will support LTCHs in collecting information to integrate into their admission and discharge processes in order to facilitate partnerships with community care hubs and community-based organizations, continuity in care planning, and their discharge planning process.

Comment: A commenter noted that the cognitive function of patients might not allow them to accurately recall their living situation prior to being in the LTCH. They also noted the possibility that patients would be confused with the item which asks the person to identify their living situation “today.” This commenter suggested that, depending on the person’s condition or cognitive status, they may not be able to recall or determine this, nor might they be able to say whether they will be able to return to the living situation they had before their illness or injury.

Response: We thank the commenters for their input. We acknowledge the complex medical conditions of most LTCH patients. However, there are other patient interview assessment items that LTCHs are already collecting, and we believe LTCHs have experience in managing these complex scenarios successfully in order to obtain the information required. We encourage LTCHs to assess all patients and select the appropriate response options for the SDOH, and remind commenters that we specifically proposed additional response options for patients that are unable to respond or decline to respond to the Living Situation item (89 FR 36347).

Comment: Another commenter recommended that CMS simplify the responses for the Living Situation assessment item because they are likely to lead to confusion. This commenter suggested that CMS align the responses for the Living Situation assessment item with the proposed Food assessment item that has a “Often true,” “Sometimes true,” and “Never true” response option or the modified Transportation assessment item that has a “Yes” or “No” response. They believe this would be simpler for patients to answer and easier on the LTCH staff to collect the information.

Response: We agree that standardized patient assessment data elements should be easy

to understand and have clear response options. However, we believe that including the specific distinction in the Living Situation item's response options is needed. Specifically, we believe that additional response options to indicate whether a patient is worried about their living situation in the future helps reduce ambiguity for patients who may only have temporary housing. For example, having a "Yes" and "No" response and eliminating an option for "I have a place to live today, but I am worried about losing it in the future" would not capture those patients that may be at risk of losing their place to live due to lost income because of the traumatic injury or event precipitating their admission to the LTCH. Identifying these patients who are worried about losing their housing in the future would help LTCHs facilitate discharge planning and make the appropriate community referrals.

(b) Comments on the Food Assessment Items

Comment: Three commenters supported the collection of the two proposed Food assessment items because of the importance of nutrition and food access to LTCH patients' health outcomes, and the usefulness of this information for treatment and discharge planning. One of these commenters commended CMS for acknowledging within the proposed rule how older adults grappling with food insecurity experience lower dietary quality, placing them at nutritional risk. The commenter acknowledged that inadequate access to nutritious food elevates the risk of health issues such as malnutrition, diabetes, and cardiovascular diseases, and when issues with access to food can be addressed, patients may experience better health outcomes and enhanced quality of life. Another one of these commenters noted that information from the two proposed Food assessment items can give healthcare professionals a greater understanding of a patient's complex needs and improve coordination with other healthcare providers, such as dietitians, or referring patients to SNAP and food pharmacies to increase access to healthy foods. Finally, the other commenter noted that the responses to the proposed Food assessment items would help providers incorporate treatment strategies that may be necessary to address a patient's ability to physically access food sources.

Response: We thank the commenters for their responses and we agree that an individual's access to food affects their health outcomes and risk for adverse events. Understanding the potential needs of patients admitted to LTCH through the collection of the two proposed Food assessment items can help LTCHs facilitate resources for LTCH patients, if indicated, when discharged.

Comment: Several commenters expressed concerns that the proposed Food assessment items ask patients to rate the frequency of their food shortage using a three-point scale, which is inconsistent with other questions on the LCDS such as the patient mood, behavioral symptoms, and daily preference assessment items, which use a four-point scale to determine frequency. This commenter suggested this inconsistency may lead to confusion for staff and patients.

Response: We clarify that the proposed Food assessment items include three frequency responses in addition to response options in the event the patient declines to respond or is unable to respond: (0) Often true; (1) Sometimes true; (2) Never True; (7) Patient declines to respond; and (8) Patient unable to respond. We acknowledge there are several patient interview assessment items on the LCDS that use a four-point scale, but there are also assessment items on the LCDS that do not use a four-point scale. For example, the Health Literacy (B1300), Social Isolation (D0700), and the Pain Interference with Therapy Activities (J0520) assessment items currently use a five-point scale. We chose the proposed Food assessment items from the AHC HRSN Screening Tool, and they were tested and validated using a three-point response scale.

Since the LCDS currently includes assessment items that use varying response scales, we do not believe staff and patients will be confused. We will develop coding guidance for these new assessment items and develop training resources for LTCH staff in advance of the initial collection of the assessment items to ensure LTCHs have the tools necessary to administer the new SDOH assessment items. Additionally, we plan to develop resources LTCH staff can use to ensure patients understand the proposed assessment item questions and response options. For example, CMS developed cue cards to assist LTCHs in conducting the Brief Interview for

Mental Status (BIMS) in Writing, the Patient Mood Interview (PHQ-2 to 9), the Pain Assessment Interview, and the Interview for Daily and Activity Preference.⁷⁹⁷

Comment: A commenter was concerned with the 12-month look back period of the proposed Food assessment items, noting that this broad look back period may capture needs that occurred in the past that have already been resolved. This commenter recommended a three-month look back period instead, to capture true concerns that should inform LTCHs' care and discharge planning.

Response: We disagree that the 12-month look back period for the proposed Food assessment items is too long and that it will not result in reliable responses. We believe a 12-month look back is more appropriate than a shorter, three-month look back period, since it is common for a person's Food situation to fluctuate over time and especially throughout the treatment journey. One study of Medicare Advantage beneficiaries found that approximately half of U.S. adults report one or more HRSNs over four quarters.⁷⁹⁸ However, at the individual level, participants had substantial fluctuations: 47.4 percent of the participants fluctuated between 0 and 1 or more over the four quarters, and 21.7 percent of participants fluctuated between one, two, three, or four or more over the four quarters. The researchers noted that the dynamic nature of individual-level HRSNs requires consideration by healthcare providers screening for HRSNs.

To account for potentially changing Food needs over time, we believe it is important to use a longer lookback window to comprehensively capture any Food needs an LTCH patient may have had, so that LTCHs may consider them in their care and discharge planning.

(c) Comments on the Utilities Assessment Item

Comment: Two commenters who support the proposal to add a new Utility assessment

⁷⁹⁷ These cue cards are currently available on the LTCH QRP Training webpage at

<https://www.cms.gov/medicare/quality/inpatient-rehabilitation-facility/LTCH-quality-reporting-training>

⁷⁹⁸ Haff, N, Choudhry, N.K., Bhatkhande, G., Li, Y., Antol, D., Renda, A., Lauffenburger, J. Frequency of Quarterly Self-reported Health-Related Social Needs Among Older Adults, 2020. JAMA Network Open. 2022;5(6):e2219645. Doi:101001/jamanetworkopen.2022.19645. Accessed June 9, 2024.

item to the LCDS stated that understanding patient's access to utilities is crucial for maintaining good health. Specifically, a commenter pointed out that understanding patients' living situation can ensure appropriate provision of adaptive equipment and engagement with community partners. The other commenter highlighted that access to utilities like electricity, heating, and water are necessary to maintain a safe and healthy living environment. This commenter noted that by collecting information about a patient's utility security at admission, an LTCH may be able to assist their patients in addressing their basic needs by referring them to agencies and programs like the Low-Income Home Energy Assistance Program (LIHEAP) or organizations like community care hubs that are well-positioned to support patients in applying for related assistance programs.

Response: We thank the commenters for their support and agree that patients' utilities needs can affect LTCH patients' health outcomes, and the collection of the proposed Utilities assessment item can equip providers with information to inform care plans and discharge planning.

Comment: A commenter was concerned that the 12-month look back period of the proposed Utility assessment item is too broad to result in reliable or valid responses. Specifically, patients may have difficulty remembering if a relevant event, such as a utility shut off threat, occurred within such a long period or the issue may no longer be valid for the person at time of discharge. In addition, if the patient is experiencing cognitive deficits, they may be unable to provide reliable responses to the Utilities assessment item. This commenter recommended that CMS consider a shorter look back period for the Utilities assessment item and reconsider the inclusion of all utilities, including electric, gas, oil, or water, in the assessment item to truly capture concerns that need to be part of the coordination of an appropriate discharge.

Response: We disagree that the 12-month look back period for the proposed Utility assessment item is too long and that it will not result in reliable responses. We believe a 12-

month look back is more appropriate than a shorter, three-month look back period, because an individual's Utilities situation may fluctuate over time and especially throughout the treatment journey. One study of Medicare Advantage beneficiaries found that approximately half of U.S. adults report one or more HRSNs over four quarters.⁷⁹⁹ However, at the individual level, participants had substantial fluctuations: 47.4 percent of the participants fluctuated between 0 and 1 or more over the four quarters, and 21.7 percent of participants fluctuated between one, two, three, or four or more over the four quarters. The researchers noted that the dynamic nature of individual-level HRSNs requires consideration by healthcare providers screening for HRSNs. To account for potentially changing Utilities needs over time, we believe it is important to use a longer look back period to comprehensively capture any Utilities needs an LTCH patient may have had, so that LTCHs may consider them in their care and discharge planning.

We note that LTCHs are accustomed to working with patients with very complex medical conditions, including those with cognitive deficits, and we are confident in their ability to collect this data in a consistent manner. There are currently several patient interview assessment items on the LCDS, and LTCHs are accustomed to administering these questions to impaired patients.

We also believe it is important to capture utility needs across electric, gas, oil, and water services, in order to comprehensively understand patients' access to necessary utility services, especially since patients' needs for utilities may vary depending on their equipment needs at discharge. We note that although we proposed to require the collection of the Utilities item for the LTCH QRP, nothing would preclude LTCHs from choosing to screen their patients for additional SDOH they believe are relevant to their patient population and the community they serve. For example, if it is useful to understand patients' access to a specific type of utility service (for example, water or electricity capacity), LTCHs may consider follow-up questions to collect granular information.

⁷⁹⁹ Haff, N, Choudhry, N.K., Bhatkhande, G., Li, Y., Antol, D., Renda, A., Lauffenburger, J. Frequency of Quarterly Self-reported Health-Related Social Needs Among Older Adults, 2020. *JAMA Network Open*. 2022;5(6):e2219645. Doi:101001/jamanetworkopen.2022.19645. Accessed June 9, 2024.

After careful consideration of the public comments we received, we are finalizing our proposal to adopt four new items as standardized patient assessment data elements under the SDOH category beginning with the FY 2028 LTCH QRP: one Living Situation item; two Food items; and one Utilities item.

e. Modification of the Transportation Item Beginning with the FY 2028 LTCH QRP

Beginning October 1, 2022, LTCHs began collecting seven standardized patient assessment data elements under the SDOH category on the LCDS.⁸⁰⁰ One of these items, A1250. Transportation, collects data on whether a lack of transportation has kept a patient from getting to and from medical appointments, meetings, work, or from getting things they need for daily living. This item was adopted as a standardized patient assessment data element under the SDOH category in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42587). As we discussed in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42586), we continue to believe that access to transportation for ongoing health care and medication access needs, particularly for those with chronic diseases, is essential to successful chronic disease management and the collection of a Transportation item would facilitate the connection to programs that can address identified needs.

As part of our routine item and measure monitoring work, we continually assess the implementation of the new SDOH items. We have identified an opportunity to improve the data collection for A1250. Transportation by aligning it with the Transportation category collected in our other programs.^{801,802} Specifically, we proposed to modify the current Transportation item so that it aligns with a Transportation item collected on the AHC HRSN Screening Tool available to the IPFQR and Hospital IQR Programs.

A1250. Transportation currently collected in the LCDS asks: “Has lack of transportation

⁸⁰⁰ The seven SDOH items are ethnicity, race, preferred language, interpreter services, health literacy, transportation, and social isolation (84 FR 42577 through 42579)

⁸⁰¹ Centers for Medicare & Medicaid Services, FY2024 Inpatient Psychiatric Prospective Payment System – Rate Update (88 FR 51107 through 51121).

⁸⁰² Centers for Medicare & Medicaid Services, FY2023 IPPS/LTCH PPS final rule (87 FR 49202 through 49215).

kept you from medical appointments, meetings, work, or from getting things needed for daily living?” The response options are: (A) Yes, it has kept me from medical appointments or from getting my medications; (B) Yes, it has kept me from non-medical meetings, appointments, work, or from getting things that I need; (C) No; (X) Patient unable to respond; and (Y) Patient declines to respond. The Transportation item collected in the AHC HRSN Screening Tool asks, “In the past 12 months, has lack of reliable transportation kept you from medical appointments, meetings, work or from getting things needed for daily living?” The two response options are: (1) Yes; and (2) No. Consistent with the AHC HRSN Screening Tool, we proposed to modify the A1250. Transportation item currently collected in the LCDS in two ways: (1) revise the look back period for when the patient experienced lack of reliable transportation; and (2) simplify the response options.

First, the proposed modification of the Transportation item would use a defined 12-month look back period, while the current Transportation item uses a look back period of six to 12 months. We believe the distinction of a 12-month look back period would reduce ambiguity for both patients and clinicians, and therefore improve the validity of the data collected. Second, we proposed to simplify the response options. Currently, LTCHs separately collect information on whether a lack of transportation has kept the patient from medical appointments or from getting medications, and whether a lack of transportation has kept the patient from non-medical meetings, appointments, work, or from getting things they need. Although transportation barriers can directly affect a person’s ability to attend medical appointments and obtain medications, a lack of transportation can also affect a person’s health in other ways, including accessing goods and services, obtaining adequate food and clothing, and social activities.⁸⁰³ The proposed modified Transportation item would collect information on whether a lack of reliable transportation has kept the patient from medical appointments, meetings, work, *or* from getting

⁸⁰³ Centers for Medicare & Medicaid Services, FY2024 Inpatient Psychiatric Prospective Payment System – Rate Update (88 FR 51107 through 51121).

things needed for daily living, rather than collecting the information separately. As discussed previously, we believe reliable transportation services are fundamental to a person's overall health, and as a result, the burden of collecting this information separately outweighs its potential benefit.

For the reasons stated, we proposed to modify A1250. Transportation based on the Transportation item adopted for use in the AHC HRSN Screening Tool and adapted from the PRAPARE tool. The proposed Transportation item asks, "In the past 12 months, has a lack of reliable transportation kept you from medical appointments, meetings, work or from getting things needed for daily living?" The proposed response options are: (0) Yes; (1) No; (7) Patient declines to respond; and (8) Patient unable to respond. A draft of the proposed modified Transportation item⁸⁰⁴ to be adopted as a standardized patient assessment data element under the SDOH category can be found in the Downloads section of the LCDS and LTCH Manual webpage at <https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-care-data-set-ltch-qrp-manual>.

We solicited comment on the proposal to modify the current Transportation item previously adopted as a standardized patient assessment data element under the SDOH category beginning with the FY 2028 LTCH QRP.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposal to modify the Transportation assessment item. Three of these commenters noted various reasons for their support for the new 12-month lookback period, including that it would help clarify the intent of the question, reduce provider burden associated with collecting the information, and identify transportation needs that

⁸⁰⁴ In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36350), we inadvertently stated here that a draft of the proposed Living Situation item could be found at the LCDS and LTCH Manual webpage. We have corrected this typographical error here in this final rule to refer to the proposed modified Transportation item.

might fluctuate throughout the year. Two of these commenters supported the simplified response options, noting that it would make it easier for patients to answer the question.

Three commenters also agreed with CMS' proposal to simplify the response options and agreed it would reduce data collection burden. One of these commenters acknowledged the important relationship between transportation and an individual's ability to access food. This commenter noted that having transportation to access nutritious food is important and can improve patient outcomes related to chronic conditions, such as diabetes and hypertension.

Finally, several commenters supported the modification to the Transportation item because it would align better with other CMS quality reporting programs which would permit comparability of data between providers and settings, and across patients.

Response: We thank the commenters for their support of the proposed modification of the Transportation assessment item. We agree that simplifying the response options would help streamline the data collection process for both patients and staff collecting the data. We also believe specifying a 12-month look back period would reduce ambiguity for both patients and staff and improve the validity of the data collected.

Comment: A commenter did not support the proposal to modify the Transportation assessment item due to concerns with the 12-month look back period and the simplified response options, "Yes" and "No." The commenter noted that the responses do not collect information about the frequency of patients' concerns and the reasons why they do not have reliable transportation, which does not allow for nuanced understanding of the patient's transportation needs. They also noted the lack of consideration for patients with a disability that requires special accommodations for transportation. Therefore, this commenter recommended that CMS shorten the look back period to three months and reconsider the reliability and validity of the proposed modifications.

Response: We believe a 12-month look back is more appropriate than a shorter, three-month look back period, since a person's Transportation needs may fluctuate over time and

especially throughout the treatment journey. As we have previously noted in an earlier response, a study of Medicare Advantage beneficiaries found that approximately half of U.S. adults report one or more HRSNs over four quarters.⁸⁰⁵ However, at the individual level, participants had substantial fluctuations: 47.4 percent of the participants fluctuated between 0 and 1 or more HRSNs over the four quarters, and 21.7 percent of participants fluctuated between one, two, three, or four or more HRSNs over the four quarters. The researchers noted that the dynamic nature of individual-level HRSNs requires consideration by healthcare providers screening for HRSNs. To account for potentially changing Transportation needs over time, we believe it is important to use a longer lookback window to comprehensively capture any Transportation needs an LTCH patient may have had, so that LTCHs may consider them in their care and discharge planning.

Regarding the comment on the response options and the commenter's concern there is not enough information in the responses, we remind LTCHs that although the proposal would require the collection of the Transportation assessment item at admission, we hope that the interview would cultivate future conversations between LTCHs and their patients about the patient's specific transportation needs, rather than being the only time the LTCH discusses the patient's specific transportation needs. Additionally, LTCHs may collect any additional information they believe relevant for their patient population and to inform their care and discharge planning process.

Finally, in response to the comment that we reconsider the reliability and validity of the proposed modified Transportation item, the AHC HRSN Screening Tool was tested across many care delivery sites in diverse geographic locations across the United States. More than one million Medicare and Medicaid beneficiaries have been screened using the AHC HRSN

⁸⁰⁵ Haff, N, Choudhry, N.K., Bhatkhande, G., Li, Y., Antol, D., Renda, A., Lauffenburger, J. Frequency of Quarterly Self-reported Health-Related Social Needs Among Older Adults, 2020. JAMA Network Open. 2022;5(6):e2219645. Doi:101001/jamanetworkopen.2022.19645. Accessed June 9, 2024.

Screening Tool, which was evaluated psychometrically and demonstrated evidence of both reliability and validity, including inter-rater reliability and concurrent and predictive validity.

After careful consideration of the public comments we received, we are finalizing our proposal to modify the current Transportation item previously adopted as a standardized patient assessment data element under the SDOH category beginning with the FY 2028 LTCH QRP.

5. LTCH QRP Quality Measure Concepts Under Consideration for Future Years: Request for Information (RFI)

In the proposed rule, we solicited input on the importance, relevance, appropriateness, and applicability of each of the concepts under consideration listed in Table IX.E.-02 for future years in the LTCH QRP. The FY 2024 IPPS/LTCH PPS proposed rule (88 FR 27150 through 27153) included a request for information (RFI) on a set of principles for selecting and prioritizing LTCH QRP measures, identifying measurement gaps, and suitable measures for filling these gaps. Within this proposed rule, we also sought input on data available to develop measures, approaches for data collection, perceived challenges or barriers, and approaches for addressing identified challenges. We refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 59250 and 59251) for a summary of the public comments we received in response to the RFI.

Subsequently, our measure development contractor convened a Technical Expert Panel (TEP) on December 15, 2023 to obtain expert input on future measure concepts that could fill the measurement gaps identified in the FY 2024 RFI.⁸⁰⁶ The TEP also discussed the alignment of PAC and Hospice measures with CMS's "Universal Foundation" of quality measures.⁸⁰⁷

In consideration of the feedback we received through these activities, we solicited input on three measure concepts for the LTCH QRP (see Table IX.E.-02). One is a composite of

⁸⁰⁶ The Post-Acute Care (PAC) and Hospice Quality Reporting Program Cross-Setting TEP summary report will be published in early summer or as soon as technically feasible. LTCHs can monitor the Partnership for Quality Measurement website at <https://mmshub.cms.gov/get-involved/technical-expert-panel/updates-for-updates>.

⁸⁰⁷ Centers for Medicare & Medicaid Services. Aligning Quality Measures Across CMS - the Universal Foundation. November 17, 2023. <https://www.cms.gov/aligning-quality-measures-across-cms-universal-foundation>

vaccinations,⁸⁰⁸ which could represent overall immunization status of patients such as the Adult Immunization Status measure⁸⁰⁹ in the Universal Foundation. A second concept on which we sought feedback is the concept of depression for the LTCH QRP, which may be similar to the Clinical Screening for Depression and Follow-up measure⁸¹⁰ in the Universal Foundation. Finally, we sought feedback on the concept of pain management.

TABLE IX.E.-02: FUTURE MEASURE CONCEPTS UNDER CONSIDERATION FOR THE LTCH QRP

Quality Measure Concepts
Vaccination Composite
Pain Management
Depression

We received several public comments with feedback on these measure concepts. The following is a summary of the comments we received.

1. Vaccination Composite

Comments: We received many comments on the vaccination composite measure, and several commenters supported the concept of a vaccination composite measure. One commenter noted that it could improve vaccination rates for those vaccines recommended by the Advisory Committee on Immunization Practices (ACIP), reduce administrative burden through alignment with the Universal Foundation,⁸¹¹ and potentially improve immunization rates in PAC settings, including LTCHs. Another commenter noted how the Adult Immunization Status measure is a well-tested and reliable means of assessing routine adult vaccinations recommended by the ACIP, and would emphasize the importance of vaccination as a core prevention intervention, streamline existing adult immunization measures, and provide meaningful data to better assess gaps in vaccine coverage.

⁸⁰⁸ A composite measure can summarize multiple measures through the use of one value or one piece of information. More information can be found at <https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/mms/downloads/composite-measures.pdf>.

⁸⁰⁹ CMS Measures Inventory Tool. Adult immunization status measure found at <https://cmit.cms.gov/cmit/#/FamilyView?familyId=26>.

⁸¹⁰ CMS Measure Inventory Tool. Clinical Depression Screening and Follow-Up measure found at <https://cmit.cms.gov/cmit/#/FamilyView?familyId=672>.

⁸¹¹ Centers for Medicare & Medicaid Services. Aligning Quality Measures Across CMS—the Universal Foundation. November 17, 2023. <https://www.cms.gov/aligning-quality-measures-across-cms-universal-foundation>.

Several commenters, however, did not support the idea of adding a composite vaccination measure to the LTCH QRP and noted a number of reasons why it was not a good fit for the LTCH setting. Most of these commenters do not believe the LTCH is the appropriate setting for collecting vaccination rates, and other commenters noted that adding such a measure potentially could increase LTCHs' administrative burden in collecting and reporting the data. Finally, two of these commenters questioned how the information provided by patients would be verified.

Several commenters noted that reporting vaccination rates and documenting patients' vaccine status is more appropriate as a measure in the primary care setting, and suggested the information could be shared with other health care providers. Commenters also suggested that a vaccination composite measure would be of fairly low value and not indicative of the quality of LTCH patient care. Finally, a few commenters noted there are numerous reasons patients may decide to decline vaccinations, including cultural preferences and norms, and these reasons are largely dependent on factors outside of an LTCH's control.

2. Pain Management

Comments: We received several comments that supported the pain management measure concept, favoring the idea of further probes to identify a patient's depression status in the LTCH QRP. A commenter encouraged aligning a pain management measure with the CDC Clinical Practice Guideline for Prescribing Opioids for Pain since LTCH patients may appropriately need pain medications. Another commenter underscored the importance of understanding the impact of pain on therapy and other daily activities in order to improve the quality of services provided. A commenter agreed with the importance of measuring pain management, but recommended CMS consider appropriate exclusions for patient-reported measures. This commenter also recommended exploring ways to promote pain management for patients who may have challenges communicating.

Several commenters opposed the concept of a pain management measure in the LTCH QRP and provided several reasons why they believe it would not be an appropriate measure

concept for the LTCH QRP. Four of these commenters noted that pain is often an unavoidable part of a patient's recovery and is not an indicator for whether the patient is improving. These commenters also explained that any kind of pain management measure would need to consider implications for the use of opioids or other pain medications, to avoid unintentionally incentivizing the use of pain medication. One of these commenters recommended that a pain management measure should not include an expectation of an improvement of pain. Another commenter suggested that a pain management measure may not be necessary since LTCHs currently collect data on the frequency that pain affects a patient's sleep and the frequency of pain interference with a patient's ability to participate with therapy activities and with day-to-day activities in Section J of the LCDS.

3. Depression

Comments: We received several comments on the concept of depression for a future LTCH QRP measure, and over half of these commenters supported the concept and favored the idea of further probes in identifying depression measures in the LTCH QRP. One of these commenters noted that their organization had recently revised its policy priorities to advocate for physical and mental health parity, and therefore supported the work to develop a depression measure for the LTCH QRP. Two of these commenters noted that depression can strongly affect health and quality of life and an LTCH stay can specifically impact a patient both mentally and physically. However, one of these commenters recommended that, in developing a depression measure, CMS carefully consider exclusion criteria and timing of a screen for depression since patients are often admitted to an LTCH on a ventilator.

Several commenters, however, opposed the measure concept of depression for reasons related to potential redundancy in data collection, concern about the lack of resources to treat depression, and the administrative burden of collecting the information. Five of these commenters noted that LTCHs already screen for depression through the Patient Health

Questionnaire (PHQ-2 to-9)⁸¹² on the LCDS and use information in the patient’s chart to identify mental health conditions or other behavioral health issues. Several commenters also noted that, since LTCHs already screen for depression, a depression quality measure is not necessary. Three commenters also noted that LTCHs do not generally have psychiatrists or psychologists on staff or available to provide the comprehensive services needed to treat behavioral health problems, and one of these commenters expressed concern that adding a measure for depression screening would result in consumers expecting that they should have these resources available. Finally, one of these commenters encouraged CMS to consider all aspects of data collection and reporting when prioritizing the appropriateness of the measures selected for the LTCH QRP, suggesting that collecting the same data as other entities when it is not suited to the LTCH patient population is alignment for alignment’s sake without benefit to patients or CMS.

4. Other suggestions for Future Measure Concepts

Comments: In addition to comments received on the three measure concepts of pain, depression, and composite vaccinations, we also received several comments recommending other measures for future inclusion. A commenter recommended CMS develop and utilize metrics associated with ventilator, dialysis, wound, and nutritional issues. Two commenters recommended the addition of a Patient Experience of Care/Patient Satisfaction measure, highlighting that patient self-report is the gold standard to assess care quality. Commenters also recommended other measure concepts for development and inclusion in the LTCH QRP, including: a “Needs Navigation” measure for the new Principal Illness Navigation codes⁸¹³ in the 2024 Physician Fee Schedule (88 FR 78937 through 78950), an Advance Care Planning

⁸¹² The Patient Health Questionnaire (PHQ-2 to-9) is a validated interview for symptoms of depression. It provides a standardized severity score and a rating for evidence of a depression disorder. Chapter 3, Section D, LCDS Manual.

⁸¹³ Principal Illness Navigation (PIN) services describe services that auxiliary personnel, including care navigators or peer support specialists, may perform incidental to the professional services of a physician or other billing practitioner, under general supervision. Two codes describe PIN services, and two codes describe Principal Illness Navigation-Peer Support (PIN-PS) services, which are intended more for patients with high-risk behavioral health conditions and have slightly different service elements that better describe the scope of practice of peer support specialists. In general, where we describe aspects of PIN, it also applies to PIN-PS unless otherwise specified. MLN9201074 January 2024. <https://www.cms.gov/files/document/mln9201074-health-equity-services-2024-physician-fee-schedule-final-rule.pdf-0>

measure,⁸¹⁴ LTCH-acquired COVID-19 infection morbidity and deaths, a patient safety structural measure, palliative care access and utilization, and timely and appropriate referral to hospice.

Response: We thank all commenters for responding to this RFI. We will take this feedback into consideration regarding our future measure development efforts for the LTCH QRP.

6. Future LTCH Star Rating System: Request for Information (RFI)

In the proposed rule, we sought feedback on the development of a five-star methodology for LTCHs that can meaningfully distinguish between quality of care offered by LTCHs. We refer readers to the RFI in the proposed rule (89 FR 36351). Specifically, we invited public comment on the following questions:

1. Are there specific criteria CMS should use to select measures for a star rating system?
2. How should CMS present star ratings information in a way that it is most useful to consumers?

We received several comments in response to this RFI, which are summarized below.

1. Specific Criteria To Use In Measure Selection

Comments: We received a few comments that offered a wide range of recommendations on the criteria we should use for selecting measures to include in a future LTCH Star Ratings system. Several commenters suggested selecting measures that focus on patient and diagnostic safety outcomes. Three commenters recommended CMS align selected measures with the Universal Foundation measure set and stated they believe a consistent approach will make the rating more understandable for all interested parties. One of these three commenters specifically

⁸¹⁴ The Patient Safety Structural Measure (PSSM) is proposed for the Hospital IQR Program and PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35937 through 35938). It is an attestation-based measure that assesses whether hospitals have a structure and culture that prioritizes safety as demonstrated by the following five domains: (1) leadership commitment to eliminating preventable harm; (2) strategic planning and organizational policy; (3) culture of safety and learning health system; (4) accountability and transparency; and (5) patient and family engagement.

recommended CMS consider the Universal Foundation PAC Add-On Set,⁸¹⁵ noting that it would allow CMS to compare quality of care more easily and consistently to other settings. Several commenters recommended utilizing existing measures in the LTCH QRP. However, four commenters disagreed, suggesting the measures available in the LTCH QRP were never selected to create a holistic picture of LTCH care. They stated the measures in the LTCH QRP have been added to the program to achieve disparate goals, ranging from agency priorities to statutory requirements, such as the Improving Medicare Post-Acute Care Transformation Act of 2014 (IMPACT Act).⁸¹⁶ Therefore, they are concerned that an overall rating may reflect performance on measures that are irrelevant to the reasons a patient is seeking care. Several commenters recommended an LTCH Star Rating system include measures of patient experience. However, other commenters were not in favor of including measures of patient experience, suggesting the reliability would be low since many LTCH patients have undergone traumatic brain injuries and may not be able to respond to patient experience questions in the same way as in general acute care. A commenter suggested an LTCH Star Rating system should align with the CMS Meaningful Measures framework focused on person-centered care, equity, safety, affordability, efficiency, chronic conditions, wellness and prevention, seamless care coordination, and behavioral health.

Other commenters provided more general recommendations, such as selecting measures that matter most to patients and families, and utilizing LTCH-specific measures, such as the Ventilator Liberation Rate measure. Two commenters emphasized the need to minimize the burden of data collection when selecting measures for a star ratings system. Other commenters recommended including measures that focus on nutrition, function, staff turnover, data reported to NHSN, patient reported experiences of discrimination or bias and missed or delayed

⁸¹⁵ The Universal Foundation PAC Add-On Set can be found at: <https://www.cms.gov/medicare/quality/cms-national-quality-strategy/aligning-quality-measures-across-cms-universal-foundation>.

⁸¹⁶ Improving Medicare Post-Acute Care Transformation Act of 2014. Public Law 113–185—OCT. 6, 2014 <https://www.govinfo.gov/content/pkg/PLAW-113publ185/pdf/PLAW-113publ185.pdf>

diagnoses, vaccination, cardiovascular disease, and diabetes.

2. Presentation of LTCH Star Ratings Information

Comments: We received several comments strongly recommending we engage with patients, caregivers, providers, and specialty societies to inform the development and display of the LTCH Star Rating system. Most of these commenters suggested holding a TEP, while one recommended a listening session. Additionally, three commenters urged CMS to ensure full transparency for consumers, including how scores are converted into ratings and reporting periods for each of the reported measures.

We also received comments about the timeliness of data reported and LTCHs' need for additional reports to support their efforts at improving patient outcomes. Several commenters suggested that the age of the LTCH quality measures currently displayed does not represent the current performance of the providers, which patients need to make care decisions. Three of these commenters specifically suggested that LTCHs should receive patient-level results for claims-based measures on a quarterly basis and, without these reports they are limited in their ability to implement tailored improvements to the care they provide. They also note that CMS currently provides this level of information to hospitals.

Several commenters also raised concerns about the limited number of LTCH quality measures and lower patient volumes as compared to other settings with a Star Rating System. These commenters were concerned about CMS' ability to develop an overall star rating that is reliable and valid for consumers. Two of these commenters also highlighted their concern that there would be even more instability in an LTCH five-star rating system, which would undermine confidence in the rating system.

3. Other Comments Received about an LTCH Star Ratings System

Comments: Commenters also provided feedback for CMS to consider when developing a potential methodology and shared their insights and experience with other CMS Star Ratings Systems. Several commenters recommended accounting for factors that differentiate LTCHs,

such as patient characteristics and complexities; whether an LTCH is located within another hospital or is freestanding; and the number of patients admitted requiring dialysis. These commenters were concerned that a future star rating methodology that did not incorporate appropriate “risk adjustment” or weighting methodologies would be ineffective in appropriately differentiating between LTCH providers. Although a commenter recommended aligning the methodology used in an LTCH Star Ratings system with other existing star ratings to help consumers navigate the ratings, a number of commenters shared their concerns about developing an LTCH Star Rating system given what they described as issues with CMS’ other star rating systems. Two of these commenters suggested CMS apply lessons learned from the development and maintenance of the existing star ratings programs and urged CMS to allow for a sufficient timeline for development and implementation.

Response: We thank all the commenters for responding to our RFI on this important CMS priority. We will take these recommendations into consideration in our future star rating development efforts.

7. Form, Manner, and Timing of Data Submission under the LTCH QRP

a. Background

We refer readers to the regulatory text at 42 CFR 412.560(b) for information regarding the current policies for reporting specified data for the LTCH QRP.

b. Reporting Schedule for the New Items as Standardized Patient Assessment Data Elements and the Modified Transportation Item Beginning with the FY 2028 LTCH QRP

As discussed in section IX.E.4. of this final rule, we proposed to adopt four new items as standardized patient assessment data elements under the SDOH category (one Living Situation item, two Food items, and one Utilities item), and to modify the Transportation standardized patient assessment data elements previously adopted under the SDOH category beginning with the FY 2028 LTCH QRP.

We proposed that LTCHs would be required to report these new items and the modified

Transportation item using the LCDS beginning with patients admitted on October 1, 2026 for purposes of the FY 2028 LTCH QRP. Starting in CY 2027, LTCHs would be required to submit data for the entire calendar year for purposes of the FY 2029 LTCH QRP.

We also proposed that LTCHs who submit the Living Situation, Food, and Utilities items proposed for adoption as standardized patient assessment data elements under the SDOH category with respect to admission only would be deemed to have submitted those items with respect to both admission and discharge. We proposed that LTCHs would be required to submit these items at admission only (and not at discharge), because it is unlikely that the assessment of those items at admission will differ from the assessment of the same item at discharge. This would align the data collection for these proposed items with other SDOH items (that is, Race, Ethnicity, Preferred Language, and Interpreter Services) which are only collected at admission.⁸¹⁷ A draft of the proposed items is available in the Downloads section of the LCDS and LTCH Manual webpage at <https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-care-data-set-ltch-qrp-manual>.

As we noted in Section IX.E.4.e. of this proposed rule, we continually assess the implementation of the new SDOH items, including A1250. Transportation, as part of our routine item and measure monitoring work. We received feedback from stakeholders in response to the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19551) noting their concern with the burden of collecting the Transportation item at admission and discharge. Specifically, commenters stated that a patient's access to transportation is unlikely to change between admission and discharge. We analyzed the data LTCHs reported from October 1, 2022 to June 30, 2023 (Q4 CY 2022 through Q2 CY 2023) and found that patient responses did not significantly change from admission to discharge.⁸¹⁸ Specifically, the proportion of patients⁸¹⁹ who responded "Yes" to the

⁸¹⁷ FY 2020 IPPS/LTCH PPS final rule (84 FR 42588 through 42590)

⁸¹⁸ Due to data availability of LTCH SDOH standardized patient assessment data elements, this is based on three quarters of Transportation data .

⁸¹⁹ The analysis is limited to patients who responded to the Transportation item at both admission and discharge.

Transportation item at admission versus at discharge differed by only 1.65 percentage points during this period. We find these results convincing, and therefore we proposed to require LTCHs to collect and submit the proposed modified standardized patient assessment data element, Transportation, at admission only.

We solicited public comment on our proposal to collect data on the following items proposed as standardized patient assessment data elements under the SDOH category at admission beginning October 1, 2026 with the FY 2028 LTCH QRP: (1) Living Situation as described in section IX.E.4.c.(1) of the proposed rule and this final rule; (2) Food as described in section IX.E.4.c.(2) of the proposed rule and this final rule; and (3) Utilities as described in section IX.E.4.c.(3) of the proposed rule and this final rule. We also invited comment on our proposal to submit the proposed modified standardized patient assessment data element, Transportation, at admission only beginning October 1, 2026 with the FY 2028 LTCH QRP as described in section IX.E.4.e. of the proposed rule and this final rule.

We received a number of comments related to our proposals for the collection of the proposed SDOH assessment items. The following is a summary of the comments we received and our responses.

Comment: Two commenters supported the proposed collection of the four new SDOH assessment items once, upon admission, noting that it would mitigate the administrative burden of data collection and reduce redundancy.

Response: We appreciate the commenters' support of our proposal to collect the four new SDOH items at admission only. We are mindful of provider burden and appreciate the support from several commenters who agreed that collection upon admission would mitigate the administrative burden of data collection for this item.

Comment: A commenter suggested that CMS offer flexibility for LTCHs on how to collect the proposed SDOH assessment items, rather than requiring LTCHs to use assessment items from the AHC HRSN Screening Tool. This commenter stated they believed CMS' focus

should be on whether the information is collected and less on the specific vendor or tool used for collection. Similarly, another commenter encouraged CMS to have flexibility in collection and reporting, such as obtaining data from existing items in electronic medical record systems and case management systems, and allowing caregivers to provide responses to the SDOH assessment items. Another commenter noted that these items are also collected by referring hospitals, and stated it therefore would be duplicative to collect the same information in the LTCH.

Response: We interpret these commenters to be suggesting that CMS should not require LTCHs to use a specific tool to collect the information if it is collected elsewhere, such as in previous healthcare settings, rather than CMS requiring LTCHs to question patients and collect their verbal responses on the LCDS upon the patient's admission to the LTCH.

In response to the comments suggesting CMS should not require LTCHs to use a specific tool to collect the information as long as it is collected, we disagree and believe it is important to collect standardized information. As we continue to standardize data collection across settings, we believe using common standards and definitions for new assessment items is important to promote interoperable exchange of patient information between and within LTCHs and other providers. This will facilitate standardized patient data to enhance coordinated care, continuity in care planning, and the discharge planning process. Section 1899B(b) of the Act already requires LTCHs to collect standardized patient assessment data via the LCDS or another assessment instrument. The proposed and modified SDOH assessment items will be added to a future version of the LCDS, in the same way other standardized patient assessment data elements are collected, which will contribute to further standardized data collection across LTCHs. This is important to supporting our ongoing LTCH QRP initiatives by providing standardized data with which to stratify LTCH's performance on current measures and or in future quality measures.

In response to the comments suggesting LTCHs should be able to utilize information collected in previous healthcare settings, we are intentional in our efforts to increase the patient's

voice in the assessment process and the LTCH QRP. Obtaining information about the Living Situation, Food, Utilities, and Transportation assessment items directly from the patient, sometimes called "hearing the patient's voice," is more reliable and accurate than obtaining it from a health care provider that previously cared for the patient for several reasons: the LTCH would not know whether it was collected from the patient or from a family member or other source; the LTCH would not know how the SDOH domain was defined – for example, whether utilities included electricity, gas, oil, or water or only asked about electricity; and the LTCH would not be able to determine whether the potential problem had been resolved since then. Most importantly, we believe that by asking the patient these questions at admission, it may prompt further discussion with the patient about their needs and help formulate an appropriate discharge care plan. We also clarify that LTCHs may use different methods to collect the information from the patient, if they are consistent with the requirements for these new and modified SDOH items set forth in sections IX.E.4 and IX.E.7.b of this final rule.

Comment: A commenter noted that it would be helpful if SDOH item collection requirements were focused on patients that are being discharged home from the LTCH, because patients who go from LTCHs to IRFs or SNFs could have their SDOH information collected in their next setting of care.

Response: While we understand that some LTCH patients may be transferred to IRFs or SNFs, we believe that it is important to collect the proposed SDOH items at admission to the LTCH. This information may support LTCHs in effective discharge planning. Patients receiving services in an LTCH may have a longer length of stay than in other PAC settings, and therefore, LTCHs may not know whether a patient will be discharged home or transferred to another PAC setting at the time they are admitted to the LTCH. It is also possible that a patient's living situation, food, utilities, and transportation needs could change over the course of their treatment or the patient's discharge plans may change due to lost income as a result of the traumatic injury or event precipitating their admission to the LTCH. Collecting this information

at admission equips the LTCH to adjust their discharge plans as needed.

Comment: A commenter encouraged CMS to ensure this requirement includes that these data elements be standardized and documented in patients' medical records.

Response: We thank the commenter for their support and input. We proposed these SDOH assessment items as standardized patient assessment data elements to ensure they are standardized. The Living Situation, Food, and Utilities assessment items will be collected on the LCDS and electronically submitted to CMS' data submission system, in the same way other standardized patient assessment data elements are collected. Additionally, we recommend that an LTCH maintain the original LCDS as part of the patient's medical record.

Comment: Four commenters offered suggestions or recommendations for guidance related to collecting the proposed SDOH assessment items. Three of these commenters recommended that CMS include coding logic to allow skipping the Utilities assessment item if a patient indicated that they do not have a steady place to live, since it would be inappropriate to ask about utilities if a patient has no place to live. One of the commenters asked CMS to work with LTCHs to ensure the data are collected in a respectful and person-centered way, and encouraged CMS to educate and build trust with beneficiaries on why LTCHs are collecting this data. This commenter also encouraged CMS to work with the National Committee for Quality Assurance and other organizations to develop frameworks, workflows, and guidance to collect this data.

Response: We acknowledge that the proposed SDOH assessment items require the patient to be asked potentially sensitive questions. We will provide training materials and guidance for LTCH staff to collect the information from LTCH patients on these new and modified SDOH items. However, we decline the recommendation to add a skip pattern if a patient responds to the Living Situation item that they either have a steady place to live today, but are worried about losing it in the future (Response 2) or they do not have a steady place to live (Response 3). We are concerned that patients that provide such responses may live

somewhere, temporarily, that may or may not have adequate utilities. For example, a patient may be living in temporary housing that does or does not have adequate utilities, or their situation may be that they have electricity but no running water. Therefore, we believe that asking both questions of every patient (that is, the Living Situation and Utilities items) provides a more complete assessment for LTCHs to use in their discharge planning. We also note that we proposed a response option for patients that decline to respond for each of the new and modified SDOH items (89 FR 36347 through 36350).

Comment: Several commenters suggested that CMS consider adopting additional items from the AHC HRSN Screening Tool in the LTCH QRP, especially those addressing disability and financial strain. These commenters noted that both factors can affect patient safety outcomes or be HRSNs that contribute to bias. Additionally, another commenter suggested assessing family caregiver burden and whether referrals resulted in actual service delivery, both of which can be a factor in both the patient's health and the use of emergency department visits or hospitalization.

Response: We appreciate the comments and suggestions provided by the commenters, and we agree that it is important to understand the needs of patients with disabilities. While disability is not currently assessed through the LCDS, it is comprehensively assessed as part of existing protocols around care plans and health goals. However, as we continue to evaluate SDOH standardized patient assessment data elements, we will consider this feedback. We note that, although we proposed to require the collection of these new and modified SDOH items for the LTCH QRP, nothing would preclude LTCHs from choosing to screen their patients for additional SDOH they believe are relevant to their patient population and the community they serve, including screening for lack of financial strain and caregiver burden. For example, the AHC HRSN Screening Tool includes questions for eight supplemental domains, including financial strain.

After careful consideration of the public comments we received, we are finalizing our

proposal to collect data on the following items adopted as standardized patient assessment data elements under the SDOH category at admission only beginning with October 1, 2026 LTCH admissions: (1) Living Situation as described in section IX.E.4(c)(1) of this final rule; (2) Food as described in section IX.E.4(c)(2) of this final rule; and (3) Utilities as described in section IX.E.4(c)(3) of this final rule. We are also finalizing our proposal to collect the modified standardized patient assessment data element, Transportation, at admission only beginning with October 1, 2026 LTCH admissions as described in section IX.E.4(e) of this final rule.

c. Modification of the LCDS Admission Assessment Window to Four Days Beginning with the FY 2028 LTCH QRP

Since the FY 2012 IPPS/LTCH PPS final rule, LTCHs have collected information for the LTCH QRP utilizing the LCDS.⁸²⁰ Since 2012, the LTCH QRP has evolved in response to both quality initiatives and statutory requirements, and as a result, the LCDS has evolved to support data collection for evaluation of health outcomes in the LTCH. The LCDS Version 5.0 was implemented on October 1, 2022, and is currently in use.⁸²¹

As specified in the LCDS Manual, the LCDS Admission assessment has a maximum three-day assessment period, beginning with the date of admission, in which the patient's assessment must be conducted to obtain information for the LCDS Admission assessment items. All LTCHs are required to record the Assessment Reference Date (ARD) (A0210) on each LCDS, which is defined as the end point of the assessment period for the LCDS assessment record. LTCHs can set their own ARD, as long as it is no later than the third calendar day (date of admission plus two calendar days) of the patient's stay.

We continually look for opportunities to minimize LTCHs' burden associated with

⁸²⁰ Office of the Federal Register of the National Archives and Records Administration and the U.S. Government Publishing Office. *Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System and FY 2012 Rates; Hospitals' FTE Resident Caps for Graduate Medical Education Payment*. 2011. <https://www.federalregister.gov/d/2011-19719/p-3517>

⁸²¹ Centers for Medicare & Medicaid Services (CMS). *Long-Term Care Hospital (LTCH) Continuity Assessment Record and Evaluation (CARE) Data Set (LCDS) & LCDS Manual*. 2023. <https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-care-data-set-ltch-qrp-manual>

collection of the LCDS through strategies that include improving communication and conducting outreach with users, as well as simplifying collection and submission requirements. In recent years, we have received feedback regarding the difficulty of collecting the required LCDS data elements within the three-day assessment window when medically complex patients are admitted prior to and on weekends. On October 17th, 2023, our measure development contractor hosted an LTCH Listening Session on the Administrative Burden of the LTCH QRP, and invited providers to comment on several LTCH QRP topics, including a potential expansion of the assessment period to four days.⁸²² During the listening session, we received support for revising the Admission assessment window, with participants suggesting that extending the assessment window would ease the difficulties noted above.

We proposed to extend the Admission assessment period from three days to four days, beginning with LTCH admissions on October 1, 2026. For example, if a patient was admitted on Friday, October 19, the ARD for the LCDS Admission assessment could be no later than Monday, October 22. This change to the assessment period would only apply to the LCDS Admission assessment and have no impact on burden.

We solicited public comment on our proposal to extend the LCDS Admission assessment window from three to four days beginning with the FY 2028 LTCH QRP.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: We received support from all interested parties who commented on our proposal for modifying the LTCH Admission assessment window from three days to four days. Several commenters noted that patient assessments are extremely time consuming, and support the extension, especially when medically complex patients are transferred to an LTCH during an evening or weekend. Several commenters stated that an additional day to conduct a patient

⁸²² A summary of the LTCH Listening Session can be found on the LTCH QRP Measures Information webpage at: <https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-quality-reporting-measures-information>.

assessment will ease the administrative burden associated with completing assessments on their workforce, particularly for patients admitted on a Friday or Saturday. Two of these commenters noted their appreciation that CMS considered the comments from interested parties and acted to ease some of the administrative burden of completing the LCDS.

Response: We thank commenters for their support to modify the assessment window from three days to four days and for recognizing that our proposal is in response to LTCHs' requests to reconsider the admission assessment window. We are also pleased to hear that many LTCHs will find this modification supports their admission process, especially when a patient is admitted on a Friday or Saturday. As part of our routine item and measure monitoring work, we continually assess the implementation of the LCDS to look for opportunities to improve and streamline the data collection process.

Comment: We received several comments requesting that the proposed modification to the assessment window be implemented earlier than the proposed date of October 1, 2026, and three commenters requested this change be implemented on October 1, 2024. Two other commenters requested it be implemented as soon as possible, especially since CMS has acknowledged that completing the assessment within three days of admission is a burdensome requirement, and believes CMS has confirmed through its proposal that a four-day assessment window for completing the LCDS is feasible for the agency.

Response: We acknowledge the commenters' requests that we implement the modification earlier than October 1, 2026 and understand that completing the LCDS within three days of admission imposes some burden on LTCHs. However, our proposal to modify the Admission assessment window does not decrease the overall burden of collecting the data in the LCDS. With this proposed modification, LTCHs would have more time to collect the same data in a response to LTCHs' concerns. However, it is not feasible for us to implement this change earlier than the proposed date of October 1, 2026 for the FY 2028 LTCH QRP. Any modification to the LCDS has downstream logistical implications. For example, CMS has

already finalized and published the LCDS 5.1 item set that will be effective October 1, 2024, approximately 12 months early, to allow providers adequate time for preparation. The LCDS Manual Version 5.1 and LTCH data specifications V4.00.1 were published over 7 months early on February 1 and February 14, 2024, respectively. Additionally, we typically follow a 2-year cycle of updates/modifications to the item sets. We proposed that this modification be effective beginning with patients admitted on October 1, 2026 for FY 2028 LTCH QRP because it is the earliest feasible date to implement this modification

After careful consideration of the public comments we received, we are finalizing our proposal to modify the LCDS Admission assessment from three to four days beginning with the FY 2028 LTCH QRP.

8. Policies Regarding Public Display of Measure Data for the LTCH QRP

As described in the proposed rule, we did not propose any new policies regarding the public display of measure data at this time. For a more detailed discussion about our policies regarding public display of LTCH QRP measure data and procedures for the opportunity to review and correct data and information, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57231 through 57236).

F. Medicare Promoting Interoperability Program

1. Statutory Authority for the Medicare Promoting Interoperability Program for Eligible Hospitals and Critical Access Hospitals (CAHs)

Sections 1886(b)(3)(B)(ix) and 1814(l)(4) of the Social Security Act (as amended by the Health Information Technology for Economic and Clinical Health Act, Title XIII of Division A and Title IV of Division B of the American Recovery and Reinvestment Act of 2009, Public Law 111-5) authorize downward payment adjustments under Medicare, beginning with fiscal year (FY) 2015 for eligible hospitals and CAHs that do not successfully demonstrate meaningful use of certified electronic health record technology (CEHRT) for the applicable electronic health record (EHR) reporting periods. Section 602 of Title VI, Division O of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) added subsection (d) hospitals in Puerto Rico as eligible hospitals under the Medicare EHR Incentive Program and extended the participation timeline for these hospitals such that downward payment adjustments were authorized beginning in FY 2022 for section (d) Puerto Rico hospitals that do not successfully demonstrate meaningful use of CEHRT for the applicable EHR reporting periods.

2. Changes to the Antimicrobial Use and Resistance (AUR) Surveillance Measure Beginning with the EHR Reporting Period in Calendar Year (CY) 2025

a. Modification of the AUR Surveillance Measure Beginning with the EHR Reporting Period in CY 2025

The Medicare Promoting Interoperability Program encourages healthcare data exchange for public health purposes through the Public Health and Clinical Data Exchange objective. In the FY 2023 IPPS/LTCH PPS final rule, we finalized the requirement for eligible hospitals and CAHs to report the AUR Surveillance measure with a modification to begin reporting with the EHR reporting period in CY 2024 (87 FR 49337). Under the AUR Surveillance measure, eligible hospitals and CAHs are required to report two kinds of data to the Centers for Disease Control and Prevention (CDC) National Healthcare Safety Network (NHSN): Antimicrobial Use

(AU) data and Antimicrobial Resistance (AR) data (87 FR 49335). Separate data elements and technical capabilities are required for reporting the AU data and AR data, and we refer readers to the CDC NHSN AUR protocols for technical details regarding implementation.⁸²³ Eligible hospitals and CAHs that report a “yes” response indicate that they have submitted data for both AU and AR, and will receive credit for reporting the measure, unless they claim an exclusion for which they are eligible. Eligible hospitals and CAHs must also use technology certified to the criterion at 45 CFR 170.315(f)(6), “Transmission to public health agencies— antimicrobial use and resistance reporting” for data submission (87 FR 49337).

After finalizing the AUR Surveillance measure, we received feedback from some eligible hospitals and CAHs seeking clarity regarding reporting requirements and exclusion eligibility for eligible hospitals and CAHs. Comments and questions included whether eligible hospitals or CAHs with an applicable exclusion preventing their participation in reporting either AU data or AR data were required or able to report any available data to receive credit under the AUR Surveillance measure. Under this policy, if an eligible hospital or CAH meets the exclusion criteria with respect to reporting either AU data or AR data, the hospital is excluded from the entire AUR Surveillance measure (87 FR 49337).

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36352 through 36353), in collaboration with the CDC, we identified the need to separate the AUR Surveillance measure into two measures, to clarify reporting requirements and to incentivize greater data reporting from eligible hospitals and CAHs. In addition, because AU and AR reporting rely on different data sources, such as an electronic medication administration record (eMAR) or bar-coded medication administration (BCMA) for AU, and lab information systems (LISs) for AR, we discussed how separating the measure into two measures will more appropriately target the availability of exclusions for participants who have difficulty with data transmission using a single data source.

⁸²³ <https://www.cdc.gov/nhsn/psc/aur/index.html>

Specifically, we proposed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36352 through 36353) to separate the AUR Surveillance measure into two measures, beginning with the EHR reporting period in CY 2025:

- AU Surveillance measure: The eligible hospital or CAH is in active engagement with CDC's NHSN to submit AU data for the selected EHR reporting period and receives a report from NHSN indicating its successful submission of AU data for the selected EHR reporting period.

- AR Surveillance measure: The eligible hospital or CAH is in active engagement with CDC's NHSN to submit AR data for the selected EHR reporting period and receives a report from NHSN indicating its successful submission of AR data for the selected EHR reporting period.

Under the AU Surveillance measure, eligible hospitals and CAHs would be required to report AU data to CDC's NHSN. Under the AR Surveillance measure, eligible hospitals and CAHs would also be required to report AR data to CDC's NHSN. Eligible hospitals and CAHs would be required to report a "yes" response or claim an applicable exclusion, separately, to receive credit for reporting on the AU Surveillance measure and the AR Surveillance measure. For both measures, eligible hospitals and CAHs would be required to use technology certified to the Office of the National Coordinator for Health Information Technology (ONC) Certification Program for Health Information Technology (health IT) certification criterion at 45 CFR 170.315(f)(6), "Transmission to public health agencies—antimicrobial use and resistance reporting," as they are for the AUR Surveillance measure. We believe that separating the AUR Surveillance measure into two measures would encourage participation from eligible hospitals and CAHs that could report data for only the AU Surveillance measure or for only the AR Surveillance measure that might previously have been excluded because of their inability to report both AU data and AR data as required by the AUR Surveillance measure.

Under the requirements for the AUR Surveillance measure, eligible hospitals and CAHs that meet one of the exclusion criteria with respect to reporting data of one kind (for example, AR), are excluded from all AUR Surveillance measure reporting requirements, even if they could report data of the other kind (for example, AU). Offering an exclusion based on an eligible hospital's or CAH's inability to report only one kind of data results in eligible hospitals and CAHs being unable to report on the entire AUR Surveillance measure, even when they could report either AU or AR data. This result is contrary to the goals of the Public Health and Clinical Data Exchange objective because it discourages the sending of partial data as available. Separating the single AUR Surveillance measure into two measures better reflects the reality that AU data reporting and AR data reporting rely on different data sources that require different types of exclusions to reflect the separate clinical and data domains of prescribing and microbiological testing. Separation of AU data reporting and AR data reporting into two measures also supports the Medicare Promoting Interoperability Program's administrative requirements with respect to scoring, because the scoring approach for the Public Health and Clinical Data Exchange objective does not grant partial credit for reporting on individual measures. We note that separating the AUR Surveillance measure into two measures does not expand on the previously finalized requirements of the measure. Separating one measure into two measures allows eligible hospitals and CAHs the opportunity to submit data for either AU or AR if the eligible hospital or CAH can only submit data for one of the two, versus an all or nothing approach.

We invited public comment on our proposal to separate the AUR Surveillance measure into two measures, AU Surveillance and AR Surveillance, beginning with the EHR reporting period in CY 2025.

Comment: Many commenters supported our proposal to split the AUR Surveillance measure into two measures for a variety of reasons. Several commenters supported the change because they stated it would increase the number of eligible hospitals and CAHs that could

report on one of the measures, or conversely, it could reduce the number of facilities that are excluded from reporting on the existing singular measure. Several commenters appreciated separating the single measure into two measures because it allows eligible hospitals and CAHs to submit data for either measure versus an all or nothing approach given the different technical requirements and data sources for each measure. A few commenters stated the separation would allow more time for health organizations and EHR vendors to develop additional technologies necessary for reporting on both measures. In addition, a few commenters supported separating the AUR Surveillance measure because they stated CAHs, smaller hospitals, and hospitals serving socioeconomically vulnerable populations often can report AU data but cannot report AR as discrete data due to the investments required in EHR and laboratory information systems, and the lack of discrete electronic access to required data elements for complete AR reporting. One of these commenters stated this change could allow hospitals, particularly those serving socioeconomically vulnerable populations, to more meaningfully participate in reporting AU and AR data to support national public health goals. A few commenters supported the separation because it aligns with other NHSN reporting requirements or furthers the goals of public health and development of robust interoperability programs. A commenter agreed that this change is clinically appropriate and allows for more comprehensive reporting by eligible hospitals and CAHs. Another commenter supported the change because they stated it could provide the flexibility necessary for continued data exchange. Another commenter agreed with separating the measure as the additional reporting burden associated with the proposed change is less than a minute per year for each eligible hospital and CAH. A commenter supported separating the measure as they stated it supports the Medicare Promoting Interoperability Program's administrative requirements by providing a clear, achievable path for eligible hospitals and CAHs to earn credit for their reporting efforts, even if they can only report one type of data. A commenter stated the change will support the ability to separately assess compliance and rates of exclusions for each component separately.

Response: We thank the commenters for their support of the proposal to split the AUR Surveillance measure into two measures. We agree that this approach allows eligible hospitals and CAHs the opportunity to report on data that is available to them and offers additional time without penalty to address technological updates required for reporting data that are not currently available.

Comment: A commenter thanked CMS for recognizing the challenges associated with the consolidated AUR Surveillance measure and expressed interest in learning how an exclusion for one component of the consolidated measure (that is, either AU or AR) currently affords exclusion to both AU and AR reporting.

Response: We thank the commenter for their feedback. In order to report AU data, an eligible hospital or CAH must have an eMAR or a BCMA, and an electronic admission discharge transfer (ADT). To report AR data, an eligible hospital or CAH must have an LIS and an ADT. When we finalized the AUR Surveillance measure, we established an exclusion for eligible hospitals and CAHs that lack an eMAR, BCMA, or ADT. We also established an exclusion for eligible hospitals and CAHs that lack an LIS or ADT. As a result, and for example, even if an eligible hospital or CAH had an LIS and ADT and could report AR data, it could receive an exclusion from the entire AUR Surveillance measure if it did not have an eMAR or BCMA.

Comment: Several commenters who supported the proposed change to the AUR Surveillance measure provided recommendations for the Medicare Promoting Interoperability Program. A few commenters suggested CMS consider making the AU and AR Surveillance measures bonus measures to reward early adopters and to allow more time for the remaining eligible hospitals and CAHs to report. A commenter recommended evaluating the need for partial credit if one of the two new measures is disproportionately reported. A commenter suggested adding complementary measures such as sepsis-associated antibiotic use and

nephrotoxic acute kidney injury, to better understand antibiotic prescribing patterns in healthcare.

Response: We thank the commenters for their support and feedback and may consider some of these recommendations in the future. We disagree, however, with the recommendation to establish a bonus for the AU Surveillance and AR Surveillance measures because the AUR Surveillance measure is currently required for reporting for the EHR reporting period in CY 2024. Because the separated measures would be treated as new measures with respect to level of active engagement, eligible hospitals and CAHs would have an additional year of Pre-production and Validation (Option 1) before progressing to Validated Data Production (Option 2). We believe this offers eligible hospitals and CAHs the additional time requested to gain more familiarity with the new measures. We continue to work closely with the CDC regarding how best to support eligible hospitals and CAHs in AU Surveillance and AR Surveillance reporting. For implementation questions regarding reporting issues, we recommend contacting CDC's NHSN (nhsn@cdc.gov), or contacting CMS through the "Help" page at the CMS QualityNet website at https://cmsqualitysupport.servicenowservices.com/qnet_qa.

Comment: A few commenters recommended adopting the measure change beginning with CY 2024 instead of CY 2025 as they stated adopting the change in CY 2024 would benefit more eligible hospitals and CAHs.

Response: We thank commenters for their support and feedback; however, we believe that by adopting this change in CY 2025, eligible hospitals and CAHs will have had an additional year of experience in the Pre-production and Validation stage (Option 1). In the Medicare and Medicaid Programs; Electronic Health Record Incentive Program-Stage 3 and Modifications to Meaningful Use in 2015 Through 2017 final rule (80 FR 62862 through 62864), beginning with the EHR reporting period in CY 2016, we defined active engagement under the Public Health and Clinical Data Registry Reporting objective as when an eligible hospital or CAH is in the process of moving towards sending "production data" to a public health agency or

clinical data registry, or is sending production data to a public health agency or clinical data registry. In the FY 2023 IPPS/LTCH PPS final rule, we required that eligible hospitals and CAHs report their level of active engagement as either Option 1: Pre-production and Validation, or Option 2: Validated Data Production for each required or optional Public Health and Clinical Data Exchange objective measure they report, beginning with the EHR reporting period in CY 2023 (87 FR 49338 through 49340). We also adopted the requirement that eligible hospitals and CAHs may spend only one EHR reporting period at the Option 1: Pre-production and Validation level of active engagement per measure, and that they must progress to the Option 2: Validated Data Production level for the next EHR reporting period for which they report a particular measure, beginning with the EHR reporting period in CY 2024 (87 FR 49342).

Our proposal to treat the AU Surveillance measure and AR Surveillance measure as new measures, as finalized in section IX.F.2.(c) of this final rule, will provide eligible hospitals and CAHs an additional year in Pre-production and Validation (Option 1) before progressing to Validated Data Production (Option 2). This means that eligible hospitals and CAHs could spend two years in Option 1 before moving to Validated Data Production (Option 2), while reporting on the same data.

For example, an eligible hospital or CAH submitting data on the AUR Surveillance measure in CY 2024 could be in Option 1. In CY 2025, that eligible hospital or CAH could remain in Option 1 when reporting the separated AU Surveillance and AR Surveillance measures, and in CY 2026, the eligible hospital or CAH would be required to be in Option 2 for the AU Surveillance and AR Surveillance measures.

Comment: A few commenters recommended that CMS continue to work with rural and small hospitals to ensure they have the resources and technical assistance to fulfill the intent of the measure. A commenter requested that CMS provide transparency regarding data submission requirements and implementation guidance in the final rule like what CMS and CDC provided regarding CY 2024 data submission. A commenter described a significant burden in reporting

AU and AR data to NHSN. The commenter stated their belief that the measure does not meet the intent of “interoperable” because of the resources involved to extract reports and file sets to upload to NHSN, difficulties with NHSN reporting software, and the cost to automate the process.

Response: We will continue to work with small and rural hospitals to provide technical assistance and other resources to successfully meet Medicare Promoting Interoperability Program requirements, as commenters recommended. In collaboration with the CDC, we will strive to provide open, transparent communication about how eligible hospitals and CAHs can fulfill the AU Surveillance and AR Surveillance measures. We disagree that a measure to promote the standards-based transmission of AU and AR data does not meet the intent of interoperability. Standards-based interoperability does require investment and configuration of health IT modules and the work of staff skilled in that domain to execute it. Eligible hospitals and CAHs are important contributors to public health efforts to address antibiotic use and resistance. Therefore, we believe that the public health value of antibiotic use and resistance reporting outweighs the burden incurred by reporting eligible hospitals and CAHs. Nevertheless, we agree that the best model of interoperable public health data exchange is one that delivers necessary data in the least burdensome fashion. We will continue to work with CDC and ONC to identify opportunities to reduce the reporting burden for eligible hospitals and CAHs.

After consideration of the public comments we received, we are finalizing our proposal to separate the AUR Surveillance measure into two measures, AU Surveillance and AR Surveillance, beginning with the EHR reporting period in CY 2025.

b. Exclusions for the AU Surveillance Measure and the AR Surveillance Measure Beginning with the EHR Reporting Period in CY 2025

We previously finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49337) the availability of three exclusions for an eligible hospital or CAH reporting on the AUR Surveillance measure that: (1) Does not have any patients in any patient care location for which

data are collected by NHSN during the EHR reporting period; (2) Does not have an eMAR/BCMA records or an ADT system during the EHR reporting period; or (3) Does not have an electronic LIS or electronic ADT system during the EHR reporting period.

We received feedback from eligible hospitals and CAHs requesting clarity on whether an AUR Surveillance exclusion applies when they possess all necessary health IT systems but lack discrete electronic access to data elements necessary for NHSN AUR reporting. For example, an eligible hospital or CAH may possess an LIS, but it may refer AR testing to an outside reference laboratory that does not provide data elements necessary for NHSN AUR reporting results to the referring laboratory. As the eligible hospital or CAH has an LIS system and therefore could not claim the third exclusion, assuming it could not claim another exclusion, the eligible hospital or CAH would be required to manually extract the data elements to successfully report the AUR Surveillance measure.

This policy inadvertently caused difficulties for eligible hospitals and CAHs, such as the one in the example, because manual reporting of NHSN AUR data is both infeasible and against NHSN AUR recommendations.⁸²⁴ In addition, we require that eligible hospitals and CAHs must use technology certified to the criterion at 45 CFR 170.315(f)(6), “Transmission to public health agencies— antimicrobial use and resistance reporting” for data submission (87 FR 49337). We believe an exclusion that applies to eligible hospitals and CAHs that lack discrete electronic access to required data elements, including interface or configuration issues beyond their control, will address the difficulties for eligible hospitals and CAHs engaging in manual data collection to conduct AU or AR reporting. Therefore, in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36353 through 36354), we proposed to add a new exclusion to account for scenarios where eligible hospitals or CAHs lack a data source containing discrete electronic data elements that are required for reporting the AU Surveillance or AR Surveillance measures, meaning an eligible hospital or CAH cannot query, extract, or download the data elements in a discrete, structured

⁸²⁴ <https://www.cdc.gov/nhsn/pdfs/pscmanual/11pscaurcurrent.pdf>

manner from the systems to which it has access. Specifically, under this new exclusion, an eligible hospital or CAH will be excluded from reporting the AU Surveillance measure when it does not have a data source containing the minimal discrete data elements that are required for reporting the AU Surveillance measure. Similarly, an eligible hospital or CAH will be excluded from reporting the AR Surveillance measure when it does not have a data source containing the minimal discrete data elements that are required for reporting the AR Surveillance measure.

Specifically, we proposed to modify the existing exclusions under the AUR Surveillance measure, to maintain applicability to the AU Surveillance and AR Surveillance measures (89 FR 36353 through 36354). For example, we would assign exclusion 2 to the AU Surveillance measure because it relies on eMAR or BCMA data, and exclusion 3 to the AR Surveillance measure because it relies on LIS data. For the AU Surveillance measure, we proposed to adopt three eligible exclusions, as follows: Any eligible hospital or CAH may be excluded from the AU Surveillance measure if the eligible hospital or CAH: (1) Does not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have an eMAR/BCMA electronic records or an electronic ADT system during the EHR reporting period; or (3) Does not have a data source containing the minimal discrete data elements that are required for reporting. For the AR Surveillance measure, we proposed to adopt three eligible exclusions, as follows: Any eligible hospital or CAH may be excluded from the AR Surveillance measure if the eligible hospital or CAH: (1) Does not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have an electronic LIS or electronic ADT system during the EHR reporting period; or (3) Does not have a data source containing the minimal discrete data elements that are required for reporting.

We invited public comment on our proposals to adopt three applicable exclusions for the AU Surveillance measure and for the AR Surveillance measure, of which the third exclusion for

each measure is a new exclusion for eligible hospitals and CAHs that lack discrete electronic access to data elements that are required for reporting.

Comment: Many commenters supported adopting the exclusions for the AU Surveillance and AR Surveillance measures. A few stated the proposal to separate the AUR Surveillance measure into two measures provided clarification for the associated exclusions. A few commenters stated the exclusion criteria would ensure smaller acute care hospitals that lack the infrastructure to report the level of data are not unduly penalized. A few commenters supported the change because the AU Surveillance and AR Surveillance measures rely on different data sources, and there are certain data fields that require a discrete, structured format. A few commenters stated including measure-specific exclusions could provide the flexibility necessary for continued participation and success. A commenter appreciated that eligible hospitals or CAHs could qualify for an exclusion for one or both measures, without penalty. Another commenter stated that the new exclusion for scenarios where eligible hospitals or CAHs lack a data source containing discrete electronic data elements that are required for reporting would reduce the administrative burden by removing the need for eligible hospitals or CAHs to manually extract the data elements needed to successfully report on the measures.

Response: We thank the commenters for their support and feedback. We agree that the new exclusions allow eligible hospitals and CAHs to avoid penalties in situations where reporting on AU Surveillance measure data, AR Surveillance measure data, or both, is infeasible. In proposing to separate the AUR Surveillance exclusions, we tailored the exclusions to the specific measure.

After consideration of the public comments we received, we are finalizing our proposal to adopt three exclusions each, for the AU Surveillance and AR Surveillance measures as follows. For the AU Surveillance measure, we are finalizing our proposal to adopt three exclusions, as follows, beginning with the EHR reporting period in CY 2025: Any eligible hospital or CAH may be excluded from the AU Surveillance measure if the eligible hospital or CAH: (1) Does

not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have an eMAR/BCMA electronic records or an electronic ADT system during the EHR reporting period; or (3) Does not have a data source containing the minimal discrete data elements that are required for reporting. For the AR Surveillance measure, we are finalizing our proposal to adopt three exclusions, as follows, beginning with the EHR Reporting Period in CY 2025: Any eligible hospital or CAH may be excluded from the AR Surveillance measure if the eligible hospital or CAH: (1) Does not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have an electronic LIS or electronic ADT system during the EHR reporting period; or (3) Does not have a data source containing the minimal discrete data elements that are required for reporting.

c. Levels of Active Engagement for the AU Surveillance Measure and AR Surveillance Measure
Beginning with the EHR Reporting Period in CY 2025

In the FY 2023 IPPS/LTCH PPS final rule, we finalized a policy to limit the amount of time an eligible hospital or CAH may spend in the Option 1: Pre-production and Validation level of active engagement to one EHR reporting period (87 FR 49340 through 49342). As finalized, this limitation applies beginning with the EHR reporting period in CY 2024. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36354), we proposed to consider the AU Surveillance and AR Surveillance measures as new measures with respect to level of active engagement beginning with the EHR reporting period in CY 2025, independent of the eligible hospital's or CAH's prior level of active engagement for the AUR Surveillance measure in the EHR reporting period in CY 2024. We proposed that, should we finalize the AU Surveillance and AR Surveillance measures, for each measure, eligible hospitals and CAHs may spend only one EHR reporting period at the Option 1: Pre-production and Validation level of active engagement before they must progress to the Option 2: Validated Data Production level for the next EHR reporting period for which they report the measure. We discussed in our proposal that

this will offer eligible hospitals and CAHs an additional year to gain familiarity with reporting to the NHSN before they are required to move to Option 2: Validated Data Production.

We invited public comment on our proposal to consider the AU Surveillance and AR Surveillance measures as new measures with respect to level of active engagement beginning with the EHR reporting period in CY 2025, independent of the eligible hospital's or CAH's prior level of active engagement for the AUR Surveillance measure.

Comment: Many commenters supported our proposal to treat the AU Surveillance and AR Surveillance measures as new measures with respect to level of active engagement. Several commenters agreed the proposal would allow eligible hospitals and CAHs additional time to gain familiarity with reporting to the NHSN. A commenter stated this proposal would smooth the transition and allow eligible hospitals and CAHs additional time for testing and validation prior to submitting production data for the two new measures. Another commenter stated that treating the AU Surveillance and AR Surveillance measures as new measures with respect to level of active engagement is necessary given the difficulties hospitals have experienced with AR data reporting and the current inability to claim an exclusion specific to AR data.

Response: We thank commenters for their support. We agree that treating the AU Surveillance and AR Surveillance measures as new measures with respect to level of active engagement will be helpful for eligible hospitals and CAHs and will allow them additional time to gain familiarity with reporting to the NHSN.

Comment: A commenter supported the proposal to allow eligible hospitals and CAHs to spend only one EHR reporting period at the "Pre-production and Validation" level of active engagement but recommended that the new measures and their proposed requirements begin in CY 2026 rather than CY 2025 because of expected workflow changes.

Response: We thank the commenter for this feedback. We expect that internal workflow considerations regarding the new AU Surveillance and AR Surveillance measures compared to the prior AUR Surveillance measure will be relatively small because the content of the measures

is unchanged. We believe a delay in the separation of the AUR Surveillance measure by an additional year is unnecessary because eligible hospitals and CAHs already have experience reporting the AUR Surveillance measure beginning with the EHR reporting period in CY 2024. .

After consideration of the public comments we received, we are finalizing our proposal to treat the AU Surveillance and AR Surveillance measures as new measures with respect to level of active engagement, beginning with the EHR reporting period in CY 2025 and subsequent years.

d. Scoring Approach for Reporting Required Measures in the Public Health and Clinical Data Exchange Objective Beginning with the EHR Reporting Period in CY 2025

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36354 through 36355), we stated that we do not believe separating the AUR Surveillance measure into two measures, AU Surveillance and AR Surveillance, should affect scoring or the exclusion redistributions for the Public Health and Clinical Data Exchange objective previously adopted in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59266). We noted that the separation of the AUR Surveillance measure does not expand on the previously finalized requirements of the measure. In other words, eligible hospitals and CAHs are required to report AU and AR data, whether combined under the AUR Surveillance measure, or separated into AU Surveillance and AR Surveillance measures.

Therefore, in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36354 through 36355), we proposed maintaining a scoring value of 25 points for reporting on all required measures in the Public Health and Clinical Data Exchange objective, which would increase from five measures to six measures, including the four previously finalized measures and the two proposed required measures (AU Surveillance and AR Surveillance). We also proposed to maintain the exclusion redistribution policy we adopted in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59267) but modify it to indicate there are six measures as opposed to five measures. If an eligible hospital or CAH claims an exclusion for each of the six required measures, the 25 points

of the Public Health and Clinical Data Exchange objective would continue to be redistributed to the Provide Patients Electronic Access to their Health Information measure.

We invited public comment on our proposal to maintain the approach to scoring and point redistribution for the Public Health and Clinical Data Exchange objective.

Comment: A few commenters supported our proposal to maintain the scoring approach for the Public Health and Clinical Data Exchange objective with the new AU Surveillance and AR Surveillance measures. One of the commenters expressed concern that the scoring approach does not account for challenges in reporting among resource-constrained hospitals. The commenter recommended a weighted scoring system considering each measure's complexity.

Response: We thank the commenters for their feedback and may consider a weighted scoring approach that takes each measure's complexity into account in the future.

After consideration of the public comments we received, we are finalizing our proposal to maintain the approach to scoring for the Public Health and Clinical Data Exchange objective. We are also finalizing our proposal to maintain the existing exclusion redistribution policy for the Public Health and Clinical Data Exchange objective but modify it to indicate there are six measures rather than five measures.

3. Overview of Objectives and Measures for the Medicare Promoting Interoperability Program for the EHR Reporting Period in CY 2025

For ease of reference, Table IX.F.-01 lists the objectives and measures for the Medicare Promoting Interoperability Program for the EHR reporting period in CY 2025, as revised, to reflect the previously finalized and newly finalized measures and objectives in this final rule.

**TABLE IX.F.-01.: SUMMARY OF OBJECTIVES AND MEASURES FOR THE
MEDICARE PROMOTING INTEROPERABILITY PROGRAM FOR THE EHR
REPORTING PERIOD IN CY 2025**

Objective	Measure	Numerator	Denominator	Exclusion	Calculation considerations related to counting unique patients or actions for CY 2025 and subsequent years
Electronic Prescribing (e-Prescribing)	<p>e-Prescribing:</p> <p>For at least one hospital discharge, medication orders for permissible prescriptions (for new and changed prescriptions) are transmitted electronically using CEHRT.*</p>	The number of prescriptions in the denominator generated and transmitted electronically.	The number of new or changed prescriptions written for drugs requiring a prescription in order to be dispensed, other than controlled substances for patients discharged during the EHR reporting period.	Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions, and there are no pharmacies that accept electronic prescriptions within 10 miles at the start of their EHR reporting period.	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
e-Prescribing	<p>Query of Prescription Drug Monitoring Program (PDMP):</p> <p>For at least one Schedule II opioid or Schedule III or IV drug electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses data from CEHRT to conduct a query of a PDMP for prescription drug history.</p>	N/A (measure is Y/N)	N/A (measure is Y/N)	<p>(1) Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances that include Schedule II, III and IV drugs and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period.</p> <p>(2) Any eligible hospital or CAH that could not report on this measure in accordance with applicable law.</p>	N/A (measure is Y/N)

<p>Health Information Exchange (HIE)***</p>	<p>Support Electronic Referral Loops by Sending Health Information:</p> <p>For at least one transition of care or referral, the eligible hospital or CAH that transitions or refers its patient to another setting of care or provider of care: (1) Creates a summary of care record using CEHRT; and (2) Electronically exchanges the summary of care record.</p>	<p>Number of transitions of care and referrals in the denominator where a summary of care record was created using CEHRT and exchanged electronically.</p>	<p>Number of transitions of care and referrals during the EHR reporting period for which the eligible hospital or CAH inpatient or emergency department (Place of Service [POS] 21 or 23) was the transitioning or referring provider.</p>	<p>None</p>	<p>Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.</p>
<p>HIE</p>	<p>Support Electronic Referral Loops by Receiving and Reconciling Health Information:</p> <p>For at least one electronic summary of care record received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, or for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient, the eligible hospital or CAH conducts clinical information reconciliation for medication, medication allergy, and current problem list using CEHRT.</p>	<p>Number of electronic summary of care records in the denominator for which clinical information reconciliation is completed using CEHRT for the following three clinical information sets: (1) Medication – Review of the patient’s medication, including the name, dosage, frequency, and route of each medication; (2) Medication Allergy – Review of the patient’s known medication allergies; and (3) Current Problem List – Review of the patient’s current and active diagnoses.</p>	<p>Number of electronic summary of care records received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the reconciling party of a transition of care or referral, and for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient.</p>	<p>None</p>	<p>Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.</p>

HIE	<p>HIE Bi-Directional Exchange</p> <p>The eligible hospital or CAH must attest to the following:</p> <p>(1) Participating in an HIE in order to enable secure, bi-directional exchange of information to occur for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy.</p> <p>(2) Participating in an HIE that is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs, and not engaging in exclusionary behavior when determining exchange partners.</p> <p>(3) Using the functions of CEHRT to support bi-directional exchange with an HIE.</p>	N/A (measure is Y/N)	N/A (measure is Y/N)	None	N/A (measure is Y/N)
-----	---	----------------------	----------------------	------	----------------------

<p>HIE</p>	<p>Enabling Exchange under the Trusted Exchange Framework and Common Agreement (TEFCA)</p> <p>The eligible hospital or CAH must attest to the following:</p> <p>(1) Participating as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the Federal Register and on ONC's website) in good standing (that is, not suspended) and enabling secure, bi-directional exchange of information to occur, in production, for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy.</p> <p>(2) Using the functions of CEHRT to support bi-directional exchange of patient information, in production, under this Framework Agreement.</p>	<p>N/A (measure is Y/N)</p>	<p>N/A (measure is Y/N)</p>	<p>None</p>	<p>N/A (measure is Y/N)</p>
------------	---	-----------------------------	-----------------------------	-------------	-----------------------------

<p>Provider to Patient Exchange</p>	<p>Provide Patients Electronic Access to Their Health Information:</p> <p>For at least one unique patient discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23):</p> <p>(1) the patient (or patient-authorized representative) is provided timely access to view online, download, and transmit their health information; and</p> <p>(2) the eligible hospital or CAH ensures the patient's health information is available for the patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the application programming interface (API) in the eligible hospital's or CAH's CEHRT.</p>	<p>The number of patients in the denominator (or patient authorized representatives) who are provided timely access to health information to view online, download and transmit to a third party and to access using an application of their choice that is configured to meet the technical specifications of the API in the eligible hospital's or CAH's CEHRT.</p>	<p>The number of unique patients discharged from an eligible hospital or CAH inpatient or emergency department (POS 21 or 23) during the EHR reporting period.</p>	<p>None</p>	<p>Measure must be calculated by reviewing all patient records, not just those maintained using CEHRT.</p>
-------------------------------------	--	---	--	-------------	--

Public Health and Clinical Data Exchange	<p>Immunization Registry Reporting:</p> <p>The eligible hospital or CAH is in active engagement with a public health agency (PHA) to submit immunization data and receive immunization forecasts and histories from the public health immunization registry or immunization information system (IIS).</p>	N/A (measure is Y/N)	N/A (measure is Y/N)	<p>Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the immunization registry reporting measure if the eligible hospital or CAH: (1) Does not administer any immunizations to any of the populations for which data are collected by its jurisdiction's immunization registry or IIS during the EHR reporting period; (2) Operates in a jurisdiction for which no immunization registry or IIS is capable of accepting the specific standards required to meet the CEHRT definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no immunization registry or IIS has declared readiness to receive immunization data as of 6 months prior to the start of the EHR reporting period.</p>	N/A (measure is Y/N)
--	---	----------------------	----------------------	---	----------------------

Public Health and Clinical Data Exchange	<p>Syndromic Surveillance Reporting:</p> <p>The eligible hospital or CAH is in active engagement with a PHA to submit syndromic surveillance data from an emergency department (POS 23).</p>	N/A (measure is Y/N)	N/A (measure is Y/N)	<p>Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the syndromic surveillance reporting measure if the eligible hospital or CAH: (1) Does not have an emergency department; (2) Operates in a jurisdiction for which no PHA is capable of receiving electronic syndromic surveillance data from eligible hospitals or CAHs in the specific standards required to meet the CEHRT definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHA has declared readiness to receive syndromic surveillance data from eligible hospitals or CAHs as of 6 months prior to the start of the EHR reporting period.</p>	N/A (measure is Y/N)
--	--	----------------------	----------------------	--	----------------------

Public Health and Clinical Data Exchange	<p>Electronic Case Reporting (eCR):</p> <p>The eligible hospital or CAH is in active engagement with a PHA to submit case reporting of reportable conditions.</p>	N/A (measure is Y/N)	N/A (measure is Y/N)	<p>Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the case reporting measure if the eligible hospital or CAH: (1) Does not treat or diagnose any reportable diseases for which data are collected by its jurisdiction's reportable disease system during the EHR reporting period; (2) Operates in a jurisdiction for which no PHA is capable of receiving eCR data in the specific standards required to meet the CEHRT definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHA has declared readiness to receive eCR data as of 6 months prior to the start of the EHR reporting period.</p>	N/A (measure is Y/N)
Public Health and Clinical Data Exchange	<p>Electronic Reportable Laboratory (ELR) Result Reporting:</p> <p>The eligible hospital or CAH is in active engagement with a PHA to submit ELR results.</p>	N/A (measure is Y/N)	N/A (measure is Y/N)	<p>Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the ELR result measure if the eligible hospital or CAH: (1) Does not perform or order laboratory tests that are reportable in its jurisdiction during the EHR reporting period; (2) Operates in a jurisdiction for which no PHA is capable of accepting the specific ELR standards required to meet the CEHRT definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHA has declared readiness to receive ELR results from an eligible hospital or CAH as of 6 months prior to the start of the EHR reporting period.</p>	N/A (measure is Y/N)

Public Health and Clinical Data Exchange	AU Surveillance**: The eligible hospital or CAH is in active engagement with CDC's NHSN to submit AU data for the EHR reporting period and receives a report from NHSN indicating its successful submission of AU data for the EHR reporting period.**	N/A (measure is Y/N)**	N/A (measure is Y/N)**	Any eligible hospital or CAH may be excluded from the measure if the eligible hospital or CAH: (1) Does not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have eMAR/BCMA electronic records or an ADT system during the EHR reporting period; or (3) Does not have a data source containing the minimal discrete data elements that are required for reporting.**	N/A (measure is Y/N)**
Public Health and Clinical Data Exchange	AR Surveillance**: The eligible hospital or CAH is in active engagement with CDC's NHSN to submit AR data for the EHR reporting period and receives a report from NHSN indicating its successful submission of AR data for the EHR reporting period.**	N/A (measure is Y/N)**	N/A (measure is Y/N)**	Any eligible hospital or CAH may be excluded from the measure if the eligible hospital or CAH: (1) Does not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have an LIS or ADT system during the EHR reporting period; or (3) Does not have a data source containing the minimal discrete data elements that are required for reporting.**	N/A (measure is Y/N)**

* In the FY 2024 IPPS/LTCH PPS final rule (88 FR 59269), we inadvertently omitted a footnote describing changes to the phrasing of the measure description and description of the numerator in Table IX.F.-03.to align with the technical update finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49327).

** Signifies a measure finalized in this FY 2025 IPPS/LTCH PPS final rule that will apply to the EHR reporting period in CY 2025 and subsequent years.

*** The ePrior Authorization measure will be required beginning with the EHR reporting period in CY 2027 (89 FR 8760).

4. Updates to the Definition of CEHRT in the Medicare Promoting Interoperability Program Beginning with the EHR Reporting Period in CY 2024

In the CY 2024 Medicare Physician Fee Schedule (PFS) final rule (88 FR 79307 through 79312), we finalized revisions to the definition of CEHRT for the Medicare Promoting Interoperability Program at 42 CFR 495.4. Specifically, we finalized the addition of a reference to the revised name of “Base EHR definition,” proposed in the Health Data, Technology, and Interoperability: Certification Program Updates, Algorithm Transparency, and Information Sharing (HTI–1) proposed rule (88 FR 23759, 23905), to ensure, if the HTI–1 proposals were finalized, the revised name of “Base EHR definition” will be applicable for the CEHRT definitions going forward (88 FR 79309 through 79312). We also finalized the replacement of our references to the “2015 Edition health IT certification criteria” with “ONC health IT certification criteria,” and the addition of the regulatory citation for ONC health IT certification criteria in 45 CFR 170.315. We finalized the proposal to specify that technology meeting the CEHRT definition must meet ONC's health IT certification criteria “as adopted and updated in 45 CFR 170.315” (88 FR 79553). This approach is consistent with the definitions and approach subsequently finalized in ONC’s HTI–1 final rule, which appeared in the **Federal Register** on January 9, 2024 (89 FR 1205 through 1210). For additional background and information on this update, we refer readers to the discussion in the CY 2024 PFS final rule on this topic (88 FR 79307 through 79312).

In consideration of the updates finalized in the CY 2024 PFS final rule and the HTI–1 final rule, we refer to “ONC health IT certification criteria” throughout this final rule where we previously would have referred to “2015 Edition health IT certification criteria.” We believe that these revisions to the definition of CEHRT in 42 CFR 495.4 will ensure that updates to the definition of Base EHR in 45 CFR 170.102, and updates to applicable ONC health IT certification criteria in 45 CFR 170.315, will be incorporated into the CEHRT definition without additional regulatory action by CMS. We also believe these updates align with the transition

from designating health IT certification criteria as part of year themed “editions,” to the “edition-less” approach finalized in the ONC HTI–1 final rule. For ease of reference, Table IX.F.-02. lists the ONC health IT certification criteria required to meet the Medicare Promoting Interoperability Program objectives and measures.

We also wish to highlight certain updates to ONC health IT certification criteria finalized in the ONC HTI–1 final rule that impact certification criteria referenced under the CEHRT definition. ONC adopted the certification criterion, “decision support interventions (DSI)” in 45 CFR 170.315(b)(11) to replace the “clinical decision support (CDS)” certification criterion in 170.315(a)(9) included in the Base EHR definition (89 FR 1231). The finalized DSI criterion ensures that Health IT Modules certified to 45 CFR 170.315(b)(11) must, among other functions, enable a limited set of identified users to select (activate) evidence-based and Predictive DSIs (as defined in 45 CFR 170.102) and support “source attributes”—categories of technical performance and quality information—for both evidence-based and Predictive DSIs. ONC further finalized that a Health IT Module may meet the Base EHR definition by either being certified to the existing CDS version of the certification criterion in 45 CFR 170.315(a)(9) or being certified to the revised DSI criterion in 45 CFR 170.315(b)(11), for the period up to, and including, December 31, 2024. On and after January 1, 2025, ONC finalized that only the DSI criterion in 45 CFR 170.315(b)(11) will be included in the Base EHR definition, and the adoption of the criterion in 45 CFR 170.315(a)(9) will expire on January 1, 2025 (89 FR 1281).

In addition to the DSI criterion, which is required to meet the Base EHR definition after January 1, 2025, in the ONC HTI–1 final rule, ONC finalized other updates related to health IT certification criteria referenced in the CEHRT definition. For these updates, health IT developers must update and provide certified Health IT Modules to their customers by January 1, 2026, including updates resulting from the following finalized policies:

- ONC updated the “Transmission to public health agencies—electronic case reporting” criterion in 45 CFR 170.315(f)(5) specifying consensus-based, industry-developed electronic

standards and implementation guides (IGs) to replace functional, descriptive requirements in the existing criterion (89 FR 1226).

- ONC adopted the United States Core Data for Interoperability (USCDI) version 3 in 45 CFR 170.213(b) and finalized that USCDI version 1 in 45 CFR 170.213(a) will expire on January 1, 2026. This change impacts ONC health IT certification criteria that reference the USCDI, including the “transitions of care” certification criteria in 45 CFR 170.315(b)(1)(iii)(A)(I)-(2), “Clinical information reconciliation and incorporation—Reconciliation” (45 CFR 170.315(b)(2)(iii)(D)(I) through (3)); and “View, download, and transmit to 3rd party” (45 CFR 170.315(e)(1)(i)(A)(I)) (89 FR 1210).

- ONC updated the “demographics” certification criterion (45 CFR 170.315(a)(5)), including renaming the criterion to “patient demographics and observations” (89 FR 1295).

- ONC updated the “standardized API for patient and population services” certification criterion in 45 CFR 170.315(g)(10) to include newer versions of certain standards and updated functionality to support the criterion (89 FR 1283).

For complete information about the updates to ONC health IT certification criteria finalized in the HTI–1 final rule, we refer readers to the text of the final rule (89 FR 1192) as well as resources available on ONC’s website.⁸²⁵

We did not propose and are not finalizing any changes to these policies.

⁸²⁵ For more information, see: <https://www.healthit.gov/topic/laws-regulation-and-policy/health-data-technology-and-interoperability-certification-program>

**TABLE IX.F.-02.: MEDICARE PROMOTING INTEROPERABILITY PROGRAM
OBJECTIVES AND MEASURES AND ONC HEALTH IT CERTIFICATION CRITERIA
FOR THE EHR REPORTING PERIOD IN CY 2025**

Objective	Measure	ONC Health IT Certification Criteria as defined in the following sections of Title 45 CFR
e-Prescribing	e-Prescribing	170.315(b)(3) e-Prescribing
	Query of PDMP	170.315(b)(3) e-Prescribing
HIE	Support electronic referral loops by sending health information	170.315(b)(1) Transitions of care
	Support electronic referral loops by receiving and reconciling health information	170.315(b)(1) Transitions of care 170.315(b)(2) Clinical information reconciliation and incorporation
HIE (alternative)	HIE Bi-Directional Exchange	Examples of certified health IT capabilities to support the actions of this measure may include but are <u>not</u> limited to technology certified to the following criteria:
		170.315(b)(1) Transitions of care
		170.315(b)(2) Clinical information reconciliation and incorporation
		170.315(g)(7) Application access — patient selection
		170.315(g)(9) Application access — all data request
HIE (alternative)	Participation in TEFCA	Examples of certified health IT capabilities to support the actions of this measure may include but are <u>not</u> limited to technology certified to the following criteria:
		170.315(b)(1) Transitions of care
		170.315(b)(2) Clinical information reconciliation and incorporation
		170.315(g)(7) Application access — patient selection
		170.315(g)(9) Application access — all data request
Provider to Patient Exchange	Provide patients electronic access to their health information	170.315(e)(1) View, download, and transmit to 3rd party
		170.315(g)(7) Application access — patient selection
		170.315(g)(9) Application access — all data request
		170.315(g)(10) Application access — standardized API for patient and population services
Public Health and Clinical Data Exchange	Immunization registry reporting	170.315(f)(1) Transmission to immunization registries
	Syndromic surveillance reporting	170.315(f)(2) Transmission to public health agencies — syndromic surveillance
	Electronic case reporting	170.315(f)(5) Transmission to public health agencies — electronic case reporting
	Public health registry reporting	170.315(f)(7) Transmission to public health agencies — health care surveys
	Clinical data registry reporting	No ONC health IT certification criteria at this time.
	Electronic reportable laboratory result reporting	170.315(f)(3) Transmission to public health agencies — reportable laboratory tests and value/results

	AU Surveillance*	170.315(f)(6) Transmission to public health agencies — antimicrobial use and resistance reporting
	AR Surveillance*	170.315(f)(6) Transmission to public health agencies — antimicrobial use and resistance reporting
Electronic Clinical Quality measures (eCQMs)	eCQMs for eligible hospitals and CAHs	170.315(c)(1)
		170.315(c)(2)
		170.315(c)(3)(i) and (ii)
Protect Patient Health Information	Security Risk Assessment	No ONC health IT certification criteria at this time.
	SAFER Guides	No ONC health IT certification criteria at this time.

*Signifies a measure finalized in this FY 2025 IPPS/LTCH PPS final rule.

5. Changes to the Scoring Methodology Beginning with the EHR Reporting Period in CY 2025

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41636 through 41645), we adopted a performance-based scoring methodology for eligible hospitals and CAHs reporting under the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2019, which included a minimum scoring threshold of a total score of 50 points or more, that eligible hospitals and CAHs must meet to satisfy the requirement to report on the objectives and measures of meaningful use under 42 CFR 495.24. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45491 through 45492), we increased the minimum scoring threshold from 50 points to 60 points beginning with the EHR reporting period in CY 2022 and adopted corresponding changes to the regulatory text at 42 CFR 495.24(e)(1)(i)(C) for the EHR reporting period in CY 2022. In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49410 through 49411), we extended the 60-point threshold for the EHR reporting period in CY 2023 and subsequent years in the regulatory text at 42 CFR 495.24(f)(1)(i)(B).

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36369 through 36371), we proposed to increase the minimum scoring threshold from 60 points to 80 points and proposed corresponding changes to the regulation text at 42 CFR 495.24(f)(1)(i) for the EHR reporting period in CY 2025 and subsequent years. Our review of the CY 2022 Medicare Promoting

Interoperability Program’s performance results found 98.5 percent of eligible hospitals and CAHs (that is 97 percent of CAHs and 99 percent of eligible hospitals) that reported to the Medicare Promoting Interoperability Program successfully met the minimum scoring threshold of 60 points, and 81.5 percent of eligible hospitals and CAHs (that is 78 percent of CAHs and 83 percent of eligible hospitals) that reported to the Medicare Promoting Interoperability Program exceeded the score of 80 points. Given the widespread success of eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program in CY 2022, we stated that adopting a higher scoring threshold would incentivize more eligible hospitals and CAHs to align their health information systems with evolving industry standards and will encourage increased data exchange. We noted that eligible hospitals and CAHs will have gained 3 years of experience in the Medicare Promoting Interoperability Program (CYs 2022, 2023, and 2024) at the 60-point minimum score threshold to improve performance. We stated that an increase from 60 points to 80 points would encourage higher levels of performance through the advanced use of CEHRT to further incentivize eligible hospitals and CAHs to improve interoperability and health information exchange. We also proposed to make corresponding changes to the regulatory text at 42 CFR 495.24(f)(1)(i) to reflect the scoring threshold change. Specifically, in the proposed rule, we proposed to adopt new regulatory text at 42 CFR 495.24(f)(1)(i)(C), to state “In 2025 and subsequent years, earn a total score of at least 80 points.” We proposed that this change would take effect for the EHR reporting period in CY 2025 and subsequent years.

We invited public comment on our proposals to increase the minimum scoring threshold from 60 points to 80 points for the EHR reporting period in CY 2025 and subsequent years, and to make corresponding changes to the regulatory text at 42 CFR 495.24(f)(1)(i).

Comment: A few commenters expressed support for the proposal to increase the minimum scoring threshold from 60 points to 80 points. These commenters agreed that a higher scoring threshold will incentivize more eligible hospitals and CAHs to align their health

information systems with evolving industry standards, including advanced use of CEHRT, improved interoperability and health information exchange, and increased data exchange.

Response: We thank the commenters for their support.

Comment: Several commenters supported the proposal to increase the scoring threshold from 60 points to 80 points and offered additional recommendations for CMS's consideration. A commenter suggested that CMS conduct further research and release de-identified data on which categories of eligible hospitals and CAHs are performing well to better understand the success rates of participation in the Medicare Promoting Interoperability Program. Another commenter recommended CMS ensure the increased scoring threshold is scaled appropriately, considering the evolving nature of health IT and varying capabilities of organizations. A commenter supported the proposal to raise the scoring threshold to 80 points but recommended raising it to 100 points because they stated that would have the most effect on quality and safety. A few commenters supported the increase in the minimum scoring threshold but noted that beginning with the EHR reporting period in CY 2025 was too soon. A few commenters recommended an incremental increase over two years, from 60 points to 70 points in CY 2025 and from 70 points to 80 points in CY 2026. A commenter recommended CMS consider a three-year phased approach, remaining at 60 points in year one, increasing to 70 points in year two, and finally increasing to 80 points in year three. A few commenters supported raising the scoring threshold but recommended increasing it to 75 points rather than 80 points because of the difficulty smaller hospitals may have with performing on the HIE objective.

Response: We thank the commenters for their support and recommendations. We continue to believe that adopting a higher scoring threshold will incentivize more eligible hospitals and CAHs to align their health information systems with evolving industry standards and will encourage increased data exchange. With regard to the comment requesting release of de-identified data, we remind readers of our previously adopted policy to publicly report total scores for each eligible hospital and CAH, beginning with data from the EHR reporting period in

CY 2023 (87 FR 49347). When these data become publicly available, which we anticipate will be in January 2025, researchers, consumers, and other interested parties will have access to hospitals' scoring information. As we discuss hereafter, we agree with commenters who recommended an incremental increase to the minimum scoring threshold over two years, from 60 points to 70 points for the EHR reporting period in CY 2025 and from 70 points to 80 points for the EHR reporting period in CY 2026. In response to the commenter recommending that we consider increasing the minimum scoring threshold to 100 points, we may consider this for future rulemaking.

Comment: A few commenters did not support the proposal to increase the scoring threshold from 60 points to 80 points. A commenter stated that according to the CY 2022 Medicare Promoting Interoperability Program's performance results CMS cited, over 1000 hospitals would not meet the new scoring threshold and would be adversely impacted by this change. Another commenter stated the additional reporting burden for CY 2025 from past finalized rules, proposed rule changes, as well as changes to requirements of CEHRT increase the program requirements and negate the need to increase the performance threshold. Another commenter stated they did not believe changing the scoring threshold would produce a more comprehensive score of reliable data as EHR developers and vendors are responsible for providing certified functionality to obtain such a score.

Many commenters did not support the proposal to increase the scoring threshold from 60 points to 80 points and offered alternative recommendations for CMS' consideration. Several commenters recommended that CMS consider a delayed implementation of the change in scoring over several years. A few commenters were concerned that hospitals and EHR developers needed more time to adjust to the reporting requirements. A few commenters stated CMS should give hospitals time to independently analyze the Medicare Promoting Interoperability Program performance data CMS referenced. A commenter noted that in past years, CMS has provided fair warning and time for adjustment, and therefore this proposal should be delayed avoiding

increased failure rates and decreased compliance. A commenter stated the most likely path to increased points would be HIE or TEFCA participation, which would require more time and money. Several commenters opposed raising the minimum scoring threshold to 80 points at this time, recommending a smaller increase. A few commenters urged CMS to maintain the 60-point threshold because they stated the proposed increase is too drastic.

Response: We thank the commenters for their feedback and concerns. We disagree with the commenter who stated that over 1,000 hospitals would not meet an 80-point scoring threshold. According to the CY 2022 Medicare Promoting Interoperability Program's performance results we cited in the FY 2025 LTCH/IPPS proposed rule (89 FR 36369 through 36371), 18.5 percent of hospitals did not meet a scoring threshold of at least 80 points. That is 739 hospitals, or 502 eligible hospitals and 236 CAHs. We reiterate that these statistics refer to the CY 2022 performance period and eligible hospitals and CAHs will have gained 3 additional years (CYs 2022, 2023, and 2024) of experience in the Medicare Promoting Interoperability Program with the threshold of 60 points.

We also disagree with the commenter who stated the additional reporting burden for CY 2025 from past finalized rules, proposed rule changes, as well as changes to requirements of CEHRT increase the program requirements and negate the need to increase the minimum performance threshold. We believe that there has been sufficient time since CY 2022 for programmatic stability in the Medicare Promoting Interoperability Program's available objectives and measures to warrant an increase to the minimum scoring threshold. According to the Medicare Promoting Interoperability Program's performance results, the average scores for eligible hospitals and CAHs have steadily increased since 2020; the average final score was 72.5 in 2020 (72.4 for eligible hospitals and 73.8 for CAHs), 74.9 in 2021 (74.5 for eligible hospitals and 76.6 for CAHs), and 94.6 in 2022 (95.5 for eligible hospitals and 91.7 for CAHs). An increase to the minimum scoring threshold represents our goals of encouraging higher levels of

program performance and further advancement toward interoperability, promoting greater health information exchange, and raising overall patient care quality.

While participation in TEFCA or HIE bidirectional exchange are highly scored, we disagree that choosing one of these options under the HIE objective is the most likely path to increasing overall points. We note that there have been several finalized changes in the Medicare Promoting Interoperability Program that allow increased scoring on new measures (for example, the HIE Bi-Directional Exchange, Enabling Exchange under TEFCA, AU Surveillance and AR Surveillance measures) as well as opportunities to earn bonus points that could allow eligible hospitals and CAHs to achieve the 70-point scoring threshold for CY 2025 and 80-point scoring threshold for CY 2026 that we are finalizing as a modification of our proposal. We have balanced this scoring threshold increase against the full scope of the Medicare Promoting Interoperability Program's changes, which consider the role of bonus points in meeting or surpassing the minimum threshold. We believe that these efforts offer more than sufficient opportunity for eligible hospitals and CAHs to earn more points with an increase to the Medicare Promoting Interoperability Program's minimum scoring threshold.

We also disagree with commenters who stated that an increase to the minimum scoring threshold beginning with the EHR reporting period in CY 2025 would be too drastic. As the 60-point threshold has been in place since CY 2022, we maintain that the Program is prepared to adapt and evolve toward an increased standard of participation for eligible hospitals and CAHs to be considered meaningful EHR users. We remind readers that according to CY 2022 Medicare Promoting Interoperability Program performance results, 98.5 percent of eligible hospitals and CAHs (that is 97 percent of CAHs and 99 percent of eligible hospitals) that reported to the Medicare Promoting Interoperability Program successfully met the minimum threshold score of 60 points, and 81.5 percent of eligible hospitals and CAHs (that is 78 percent of CAHs and 83 percent of eligible hospitals) that reported to the Medicare Promoting Interoperability Program exceeded the score of 80 points. According to the same data, 92.8 percent of eligible hospitals

and CAHs (that is 93.8 percent of eligible hospitals and 90.2 percent of CAHs) achieved a scoring threshold of 70 points in CY 2022. We reiterate that the average scores for eligible hospitals and CAHs have remained above 70 since 2020 and have shown upward trends year after year. Such successful Program results signify the need for raising the minimum score. Given the widespread success of eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program in CY 2022, the expanded opportunities to earn points on new measures as well as additional bonus points that have become available since CY 2022, as well as the fact that eligible hospitals and CAHs have gained three years of experience in the Medicare Promoting Interoperability Program at the 60-point minimum score threshold to improve performance (CYs 2022, 2023, and 2024), we believe that an increase to the minimum scoring threshold is more than feasible. Increasing the minimum scoring threshold will encourage higher levels of performance through the advanced use of CEHRT to further incentivize eligible hospitals and CAHs to improve interoperability and health information exchange.

While increasing the minimum scoring threshold is important for incentivizing eligible hospitals and CAHs to improve interoperability and health information exchange, after considering public comments, we concluded that an incremental approach would provide additional time for eligible hospitals, CAHs, and EHR developers to meet updated reporting requirements. Specifically, we agree with commenters who recommended an incremental increase to the minimum scoring threshold over two years, from 60 points to 70 points for the EHR reporting period in CY 2025 and from 70 points to 80 points for the EHR reporting period beginning in CY 2026. We believe this will give eligible hospitals, CAHs, and EHR developers additional time to adjust to an eventual 80-point minimum scoring threshold, while continuing to incentivize more eligible hospitals and CAHs to align their health information systems with evolving industry standards. Increasing the minimum scoring threshold to 70 points for the EHR reporting period in CY 2025 will also be less likely to disproportionately impact eligible

hospitals and CAHs that have struggled to achieve a score of 80 points, especially smaller and under resourced hospitals. This incremental increase will reduce the burden of increased reporting requirements by providing a phased approach. Finally, a 10-point increase for the EHR reporting period in CY 2025, and a subsequent 10-point increase for the EHR reporting period beginning in CY 2026, would align with previous gradual increases to the minimum scoring threshold in the Medicare Promoting Interoperability Program, such as the previous increase from 50 points to 60 points in CY 2022 (86 FR 45492).

After consideration of the public comments we received, we are finalizing, with modification, our proposal to increase the minimum performance-based scoring threshold from 60 points to 80 points, beginning with the EHR reporting period in CY 2025. We are finalizing an increase to the minimum performance-based scoring threshold from 60 points to 70 points for the EHR reporting period in CY 2025, and from 70 points to 80 points beginning with the EHR reporting period in CY 2026 and continuing in subsequent years. We maintain our intent to heighten the required standards for the Medicare Promoting Interoperability Program's performance levels and encourage higher levels of performance through the advanced usage of CEHRT in order to further incentivize eligible hospitals and CAHs to improve interoperability and health information exchange. This gradual increase will be more feasible for eligible hospitals and CAHs, while providing an opportunity to show continued growth in the Program and reflect the success of its participants.

We are therefore also finalizing, with modification, our proposal to adopt regulatory text at 42 CFR 495.24(f)(1)(i)(C), which stated “In 2025 and subsequent years, earn a total score of at least 80 points,”. Instead, we are modifying the regulatory text to align with the finalized policy to increase the performance-based scoring threshold from 60 points to 70 points for the EHR reporting period in CY 2025, and from 70 points to 80 points beginning with the EHR reporting period in CY 2026 and continuing in subsequent years. We are finalizing changes to the regulatory text at 42 CFR 495.24(f)(1)(i)(B) to state “In 2023 and 2024, earn a total score of at

least 60 points”, and modifying our proposal by adding regulatory text at 42 CFR 495.24(f)(1)(i)(C) to state “In 2025, earn a total score of at least 70 points.” and by adding regulatory text at 42 CFR 495.24(f)(1)(i)(D) to state “In 2026 and subsequent years, earn a total score of at least 80 points.”

As shown in Table IX.F.–03., the points associated with the required measures sum to 100 points and reporting one of the optional measures under the Public Health and Clinical Data Exchange objective adds an additional 5 bonus points. The scores for each of the measures are added together to calculate a total score of up to 100 possible points for each eligible hospital or CAH. We refer readers to Table IX.F.–03. in this final rule, which summarizes the objectives, measures, maximum points available, and whether a measure is required or optional for the EHR reporting period in CY 2025 based on our previously adopted policies, and the finalized measure changes included in this final rule.

**TABLE IX.F.-03: SUMMARY OF PERFORMANCE-BASED SCORING
FOR EHR REPORTING PERIODS IN CY 2025 AND SUBSEQUENT YEARS**

Objective	Measure	Maximum Points	Required/Optional
e-Prescribing	e-Prescribing	10 points	Required
	Query of PDMP	10 points	Required
HIE	Support Electronic Referral Loops by Sending Health Information	15 points	Required (eligible hospitals and CAHs must choose one of the three reporting options)
	-AND-		
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	15 points	
	-OR-		
	HIE Bi-Directional Exchange	30 points	
	-OR-		
	Enabling Exchange under TEFCA	30 points	
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	25 points	Required
Public Health and Clinical Data Exchange	Report the following six measures: <ul style="list-style-type: none"> • Syndromic Surveillance Reporting • Immunization Registry Reporting • eCR • Electronic Reportable Laboratory Result Reporting • AU Surveillance* • AR Surveillance* 	25 points	Required
	Report one of the following measures: <ul style="list-style-type: none"> • Public Health Registry Reporting • Clinical Data Registry Reporting 	5 points <i>(bonus)</i>	Optional

Notes: The Security Risk Analysis measure, SAFER Guides measure, and attestations required by section 106(b)(2)(B) of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) are required but will not be scored. Reporting eQMs is required but will not be scored. Eligible hospitals and CAHs must also submit their level of active engagement for measures under the Public Health and Clinical Data Exchange objective. Participants may spend only one EHR reporting period at Option 1: Pre-production and Validation level per measure and must progress to Option 2: Validated Data Production level for the following EHR reporting period. See the FY 2023 IPPS/LTCH PPS final rule (87 FR 49337) for more details about active engagement.

*Signifies a finalized measure in this FY 2025 IPPS/LTCH PPS final rule. For details on our finalized modifications to the AUR Surveillance measure, which we have separated into an AU Surveillance measure and an AR Surveillance measure, we refer readers to section IX.F.2 of this final rule.

The maximum points available, by measure, in this final rule, as shown in Table IX.F.–03, do not include the points that will be redistributed in the event an exclusion is claimed for a given measure. We did not propose any changes to our policy for point redistribution in the event an exclusion is claimed. We did propose and have finalized a revision to the redistribution

for the Public Health and Clinical Data Exchange objective to reflect the six measures under that objective (rather than five) after the division of the AUR Surveillance measure into AU Surveillance and AR Surveillance measures, as discussed in section IX.F.2.a. We refer readers to Table IX.F.-04 in this final rule, which shows how points will be redistributed among the objectives and measures for the EHR reporting period in CY 2025, in the event an eligible hospital or CAH claims an exclusion.

TABLE IX.F.-04: SUMMARY OF EXCLUSION REDISTRIBUTION FOR THE EHR REPORTING PERIOD IN CY 2025 AND SUBSEQUENT YEARS

Objective	Measure	Redistribution if Exclusion is Claimed
e-Prescribing	e-Prescribing	10 points to HIE objective
	Query of PDMP	10 points to e-Prescribing measure
HIE	Support Electronic Referral Loops by Sending Health Information	No exclusion
	-AND-	
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	No exclusion
	-OR-	
	HIE Bi-Directional Exchange	No exclusion
Provider to Patient Exchange	-OR-	
	Enabling Exchange under TEFCA	No exclusion
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	No exclusion
Public Health and Clinical Data Exchange	Report the following six measures: <ul style="list-style-type: none"> • Syndromic Surveillance Reporting • Immunization Registry Reporting • eCR • Electronic Reportable Laboratory Result Reporting • AU Surveillance* • AR Surveillance* 	If an exclusion is claimed for each of the six measures, 25 points are redistributed to the Provide Patients Electronic Access to Their Health Information measure

*Signifies a finalized measure made in this FY 2025 IPPS/LTCH PPS final rule.

6. Clinical Quality Measurement for Eligible Hospitals and CAHs Participating in the Medicare Promoting Interoperability Program

a. Updates to Clinical Quality Measures and Reporting Requirements in Alignment with the Hospital Inpatient Quality Reporting (IQR) Program

(1) Background

Under sections 1814(l)(3)(A) and 1886(n)(3)(A) of the Social Security Act, and the definition of “meaningful EHR user” under 42 CFR 495.4, eligible hospitals and CAHs must report on clinical quality measures selected by CMS using CEHRT (also referred to as eCQMs), as part of being a meaningful EHR user under the Medicare Promoting Interoperability Program.

Tables IX.F.-05. and IX.F.-06 in this final rule summarize the previously finalized eCQMs available for eligible hospitals and CAHs to report under the Medicare Promoting Interoperability Program for the CY 2024 and CY 2025 reporting periods, as finalized in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59280 through 59281). To maintain alignment with the Hospital IQR Program (sections IX.C.5.c and IX.C.5.d of the preamble of this final rule), the order of the eCQMs displayed in Tables IX.F.-05 and IX.F.-06 mirrors that of the Hospital IQR program. In addition, the short names, and the consensus-based entity (CBE) numbers of the measures in the tables match the measures on the Electronic Clinical Quality Improvement Resource Center website at: <https://ecqi.healthit.gov/>.

TABLE IX.F.-05: PREVIOUSLY FINALIZED ECQMS FOR ELIGIBLE HOSPITALS AND CAHS FOR THE CY 2024 THE REPORTING PERIOD

Short Name	Measure Name	CBE #
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
PC-02	Cesarean Birth	0471e
PC-07	Severe Obstetric Complications	3687e
STK-2	Discharged on Antithrombotic Therapy	0435e
STK-3	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436e
STK-5	Antithrombotic Therapy by End of Hospital Day Two	0438e
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
HH-HYPO	Hospital Harm - Severe Hypoglycemia	3503e
HH-HYPER	Hospital Harm - Severe Hyperglycemia	3533e
HH-ORAE	Hospital Harm - Opioid-Related Adverse Events	3501e
GMCS	Global Malnutrition Composite Score	3592e

TABLE IX.F.-06: PREVIOUSLY FINALIZED ECQMS FOR ELIGIBLE HOSPITALS AND CAHS FOR THE CY 2025 REPORTING PERIOD

Short Name	Measure Name	CBE #
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
PC-02	Cesarean Birth	0471e

PC-07	Severe Obstetric Complications	3687e
STK-2	Discharged on Antithrombotic Therapy	0435e
STK-3	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436e
STK-5	Antithrombotic Therapy by End of Hospital Day Two	0438e
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
HH-HYPO	Hospital Harm - Severe Hypoglycemia	3503e
HH-HYPER	Hospital Harm - Severe Hyperglycemia	3533e
HH-OREA	Hospital Harm - Opioid-Related Adverse Events	3501e
HH-PI	Hospital Harm - Pressure Injury	3498e
HH-AKI	Hospital Harm - Acute Kidney Injury	3713e
GMCS	Global Malnutrition Composite Score	3592e
IP-ExRad	Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults (Hospital Level – Inpatient)	3663e

(2) Adoption of Additional eCQMs

As we stated in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38479), we intend to continue to align the eCQM reporting requirements and eCQM measure set for the Medicare Promoting Interoperability Program with similar requirements under the Hospital IQR Program, to the extent feasible. Section 1886(n)(3)(B)(i)(I) of the Act sets forth a preference for the selection of eCQMs that are also used in the Hospital IQR Program or endorsed by the CBE.

In the FY 2025 LTCH/IPPS PPS proposed rule (89 FR 36373 through 36373), we proposed to adopt two new eCQMs for the Medicare Promoting Interoperability Program and to modify one eCQM, beginning with the CY 2026 reporting period, in alignment with the Hospital IQR Program. Specifically, we proposed to add the following two eCQMs to the Medicare Promoting Interoperability Program eCQM measure set from which eligible hospitals and CAHs can self-select to report, beginning with the CY 2026 reporting period: (1) the Hospital Harm - Falls with Injury eCQM (CBE #4120e) and (2) the Hospital Harm - Postoperative Respiratory Failure eCQM (CBE #4130e). We also proposed to modify the Global Malnutrition Composite Score eCQM (CBE #3592e) beginning with the CY 2026 reporting period, by adding patients ages 18 to 64 to the current cohort of patients 65 years or older.

We invited public comment on these proposals for the Medicare Promoting Interoperability Program. We also refer readers to sections IX.C.5 and IX.C.7 where we discuss

comments received on these eCQM proposals for both the Medicare Promoting Interoperability and Hospital IQR Programs or only the Hospital IQR Program.

Comment: Several commenters supported CMS's proposals to adopt the Hospital Harm—Falls eCQM and the Hospital Harm—Postoperative Respiratory Failure eCQM, as well as to modify the Global Malnutrition Composite Score eCQM. A few commenters commended CMS's continued efforts to align clinical quality measures across its public reporting programs. A commenter appreciated the measured scope changes of CMS's proposals. Another commenter emphasized the need for quality measures to monitor populations with cognitive and age-related conditions.

Response: We thank the commenters for their support of these measures.

Comment: A commenter recommended that CMS not add more than one new eCQM per reporting period, stating it is a burdensome process to build, track, and implement new eCQMs to maintain alignment between the Hospital IQR Program and the Medicare Promoting Interoperability Program.

Response: We acknowledge the commenter's concerns about the costs associated with adding new eCQMs to their hospital's EHR. While the initial implementation cost for an eCQM may be higher, we anticipate maintenance costs to be much less costly than chart-abstracted quality measures. We believe that aligning eCQM reporting requirements between the Medicare Promoting Interoperability Program and the Hospital IQR Program allows for improved coordination, burden reduction, and promotes quality care. Eligible hospitals that participate in both the Medicare Promoting Interoperability Program and the Hospital IQR Program only need to report eCQM data once for credit in both programs. In addition, the Hospital Harm—Falls eCQM, Hospital Harm—Postoperative Respiratory Failure eCQM, and the Global Malnutrition Composite Score eCQM are among the eCQMs in the eCQM measure set for which eligible hospitals and CAHs may self-select and choose whether to report on.

Comment: A few commenters did not support the Medicare Promoting Interoperability Program's proposal to add two new eCQMs to the measure set in alignment with the Hospital IQR Program. A commenter stated that allowing hospitals to perform their own data extracts and submit data directly to CMS, instead of mandating that eligible hospitals and CAHs utilize CEHRT, would provide benefits such as decreased vendor reliance, increase agility to adapt to changes, and consume fewer resources.

Response: We thank the commenters for their feedback. By aligning the Hospital IQR Program and Medicare Promoting Interoperability Program measure sets, eligible hospitals and CAHs must utilize CEHRT for the electronic transmission of eCQM data to fulfill reporting requirements. Furthermore, we believe that aligning eCQM reporting requirements between the Medicare Promoting Interoperability Program and the Hospital IQR Program allows for improved coordination, burden reduction, and promotes quality care. While we recognize the perceived independence, flexibility, and potential cost savings associated with allowing eligible hospitals and CAHs to extract and submit their own data to CMS, requiring the use of CEHRT for the transmission of this data helps to ensure standardization, interoperability, data accuracy, and integrity.

After consideration of the public comments we received, we are finalizing our proposal to adopt into the measure set from which eligible hospitals and CAHs could self-select to report (1) the Hospital Harm – Falls with Injury eCQM (CBE #4120e) eCQM beginning with the CY 2026 reporting period, (2) the Hospital Harm – Postoperative Respiratory Failure eCQM (CBE #4130e) beginning with the CY 2026 reporting period, and (3) to modify the Global Malnutrition Composite Score eCQM (CBE #3592e) beginning with the CY 2026 reporting period. Table IX.F.-07 summarizes the newly adopted and previously adopted eCQMs for the Medicare Promoting Interoperability Program for the CY 206 reporting period and for subsequent years.

TABLE IX.F.-07.: NEWLY ADOPTED AND PREVIOUSLY ADOPTED ECQMS FOR ELIGIBLE HOSPITALS AND CAHS FOR THE CY 2026 REPORTING PERIOD AND SUBSEQUENT YEARS

Short Name	Measure Name	CBE #
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
PC-02	Cesarean Birth	0471e
PC-07	Severe Obstetric Complications	3687e
STK-2	Discharged on Antithrombotic Therapy	0435e
STK-3	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436e
STK-5	Antithrombotic Therapy by End of Hospital Day Two	0438e
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
HH-HYPO	Hospital Harm – Severe Hypoglycemia	3503e
HH-HYPER	Hospital Harm – Severe Hyperglycemia	3533e
HH-OREA	Hospital Harm – Opioid-Related Adverse Events	3501e
HH-PI	Hospital Harm – Pressure Injury	3498e
HH-AKI	Hospital Harm – Acute Kidney Injury	3713e
HH-FI*	Hospital Harm – Falls with Injury	4120e
HH-RF**	Hospital Harm – Postoperative Respiratory Failure	4130e
GMCS ***	Global Malnutrition Composite Score	3592e
IP-ExRad	Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults (Hospital Level – Inpatient)	3663e

* In this final rule, we finalized adoption of the Hospital Harm – Falls with Injury eCQM beginning with the CY 2026 reporting period. We refer readers to section IX.C.5.c of this final rule for a more detailed discussion.

** In this final rule, we finalized adoption of the Hospital Harm – Postoperative Respiratory Failure eCQM beginning with the CY 2026 reporting period. We refer readers to section IX.C.5.d of this final rule for more detailed discussion.

*** In this final rule, we finalized modification to the Global Malnutrition Composite Score (GMCS) measure beginning with the CY 2026 reporting period. We refer readers to section IX.C.7.a of this final rule for more detailed discussion.

b. eCQM Reporting and Submission Requirements for the CY 2026 Reporting Period and Subsequent Years

Consistent with our goal to align the eCQM reporting periods and criteria in the Medicare Promoting Interoperability Program with the Hospital IQR Program, eligible hospitals and CAHs have been required to report four calendar quarters of data for each required eCQM: (1) the Safe Use of Opioids – Concurrent Prescribing eCQM; (2) the Severe Obstetric Complications eCQM; (3) the Cesarean Birth eCQM; and (4) three self-selected eCQMs, for the CY 2024 reporting period and subsequent years (87 FR 49365 through 49367).

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36375 through 36376), we proposed that eligible hospitals and CAHs under the Medicare Promoting Interoperability Program would be required to report four calendar quarters of data for each of the following: (1) Three self-selected eQMs; (2) the Safe Use of Opioids – Concurrent Prescribing eQm; (3) the Severe Obstetric Complications eQm; (4) the Cesarean Birth eQm; (5) the Hospital Harm - Severe Hypoglycemia eQm; (6) the Hospital Harm - Severe Hyperglycemia eQm; and (7) the Hospital Harm - Opioid-Related Adverse Events eQm, beginning with the CY 2026 reporting period. This proposal would require eligible hospitals and CAHs to report a total of nine eQMs for the CY 2026 reporting period.

We also proposed that eligible hospitals and CAHs under the Medicare Promoting Interoperability Program would be required to report four calendar quarters of data for each of the following: (1) Three self-selected eQMs; (2) the Safe Use of Opioids – Concurrent Prescribing eQm; (3) the Severe Obstetric Complications eQm; (4) the Cesarean Birth eQm; (5) the Hospital Harm - Severe Hypoglycemia eQm; (6) the Hospital Harm - Severe Hyperglycemia eQm; (7) the Hospital Harm - Opioid-Related Adverse Events eQm; (8) the Hospital Harm - Pressure Injury eQm; and (9) the Hospital Harm - Acute Kidney Injury eQm, for a total of eleven eQMs, beginning with the CY 2027 reporting period and subsequent years.

We invited public comment on our proposals to increase the number of mandatory eQm measures to a total of nine beginning with the CY 2026 reporting period, and to increase the number of mandatory eQm measures to a total of eleven beginning with the CY 2027 reporting period and subsequent years. We also refer readers to sections IX.C.5.c. and IX.C.5.d. where we discuss comments we received on these eQm reporting and submission proposals for both the Medicare Promoting Interoperability and Hospital IQR Programs or only the Hospital IQR Program.

Comment: A few commenters supported CMS's proposals to revise the eCQM reporting and submission requirements for the CY 2026 reporting period and subsequent years.

Response: We thank the commenters for their support for these proposals.

Comment: Several commenters did not support increasing the number of required eCQMs, believing the increase may create additional burden to implement, monitor and maintain. A few commenters recommended CMS delay increased reporting requirements or take a less aggressive and phased approach.

Response: We acknowledge commenters' concerns regarding the burden to implement, monitor and maintain eCQMs. However, while the initial implementation cost for an eCQM may be higher, we anticipate maintenance costs to be much less and overall less costly than chart-abstracted quality measures. We acknowledge commenters' recommendations to provide more time to comply with an increase in reporting requirements and a delayed or phased approach. We are committed to supporting eligible hospitals and CAHs through the eCQM implementation process by providing sufficient time to update their systems to comply with new reporting requirements, while balancing the need of including important new patient safety metrics. We also note that we are finalizing with modification our proposal to increase the required number of eCQMs from eight to eleven eCQMs over two years and we are instead finalizing an increase in the number of required eCQMs from eight to eleven over three years.

Comment: A few commenters supported CMS's efforts to align eCQM reporting requirements for the Hospital IQR Program and the Medicare Promoting Interoperability Program, believing alignment partially mitigates administrative and cost burdens.

Response: We thank the commenters for their comments and support. We remain committed to implementing quality measures to improve healthcare outcomes while reducing the reporting burden by aligning reporting requirements across multiple quality reporting programs.

Comment: A commenter was concerned that eligible hospitals and CAHs are not required to report on all of the eCQMs in the measure set and suggested that CMS consider this in the future.

Response: We thank the commenter for their feedback. CMS is committed to a balanced approach in implementing quality measures, and a considered approach to increasing the number of measures required for reporting over time. Our goal is to ensure that the measures we use are meaningful, actionable, and not overly burdensome for providers. While we understand the desire for comprehensive reporting and faster implementation, we also must consider factors such as the readiness of providers to report new measures, the feasibility of data collection, and the potential impact on patient care. This is particularly important for rural and small hospitals with limited resources, which is why we proposed a stepwise increase in the number of required eCQMs over a two-year period. After considering comments expressing concerns about burden and requests for more lead time to increase the number of required eCQMs, we are modifying and finalizing our proposal by increasing the number of required eCQMs over a three-year period instead of a two-year period as further described below.

Comment: A few commenters suggested that CMS consider implementation timeframes when introducing a new measure, taking into account voluntary versus mandatory reporting, software development requirements, and organizational readiness to operationalize workflows and tracking. These commenters recommended CMS wait at least three years post-introduction of a new measure before requiring it.

Response: We agree on the importance of considering implementation timeframes and providing sufficient time for hospitals to implement new eCQMs into their EHRs, to take into account offering the opportunity for hospitals to self-select measures so they can gain experience with the measures before they become mandatory, and the potential benefits of a phased approach. We disagree with the recommendation to wait at least three years post-introduction of a new measure before requiring it because hospitals can self-select measures to gain experience

with the measures before they become mandatory. CMS is committed to implementing measures in a manner that supports quality improvement while minimizing the burden on providers.

After consideration of the public comments we received, we are finalizing, with modification, our proposal to increase eCQM reporting requirements in the Medicare Promoting Interoperability Program for the CY 2026 reporting period. Specifically, for the CY 2026 reporting period, eligible hospitals and CAHs will be required to report a total of eight eCQMs: three self-selected, and the Safe Use of Opioids, Severe Obstetric Complications, Cesarean Birth, Hospital Harm - Severe Hypoglycemia, and Hospital Harm - Severe Hyperglycemia eCQMs.

We are also finalizing, with modification, our proposal to increase eCQM reporting requirements in the Medicare Promoting Interoperability Program for the CY 2027 reporting period. Specifically, for the CY 2027 reporting period, eligible hospitals and CAHs will be required to submit data for the eight eCQMs finalized for the CY 2026 reporting period as well as the Hospital Harm – Opioid-Related Adverse Events eCQM, for a total of nine eCQMs.

Lastly, we are finalizing, with modification, our proposal to increase eCQM reporting requirements in the Medicare Promoting Interoperability Program beginning with the CY 2028 reporting period. Specifically, beginning with the CY 2028 reporting period and for subsequent years, eligible hospitals and CAHs will be required to submit data for the nine eCQMs required for the CY 2027 reporting period as well as the Hospital Harm - Pressure Injury and Hospital Harm - Acute Kidney Injury eCQMs, for a total of eleven eCQMs.

7. Potential Future Update of the SAFER Guides Measure

a. Background

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45479 through 45481), we adopted the SAFER Guides measure under the Protect Patient Health Information objective beginning with the EHR reporting period in CY 2022. Eligible hospitals and CAHs are required to attest to whether they have conducted an annual self-assessment using all nine SAFER Guides⁸²⁶, at any

⁸²⁶ <https://www.healthit.gov/topic/safety/safer-guides>

point during the calendar year in which the EHR reporting period occurs, with one “yes/no” attestation statement. Beginning in CY 2022, the reporting of this measure was required, but eligible hospitals and CAHs were not scored, and an attestation of “yes” or “no” were both acceptable answers without penalty. For additional information, please refer to the discussion of the SAFER Guides measure in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45479 through 45481). In the FY 2024 IPPS/LTCH PPS final rule, we finalized a proposal to modify our requirement for the SAFER Guides measure beginning with the EHR reporting period in CY 2024 and continuing in subsequent years, to require eligible hospitals and CAHs to attest “yes” to having conducted an annual self-assessment using all nine SAFER Guides, at any point during the calendar year in which the EHR reporting period occurs to be considered a meaningful user (88 FR 59262).

We did not propose and are not finalizing any changes to these policies.

b. Status of Updates to SAFER Guides

We received comments on the FY 2024 IPPS/LTCH PPS proposed rule recommending that we work with ONC to update the SAFER Guides, citing that the SAFER Guides were last updated in 2016 (88 FR 59264). In response to these comments, we noted that, while the current SAFER Guides reflect relevant and valuable guidelines for safe practices with respect to current EHR systems, we would consider exploring updates in collaboration with ONC. We reminded readers to visit the CMS resource library website at <https://www.cms.gov/regulations-guidance/promoting-interoperability/resource-library> and the ONC website at <https://www.healthit.gov/topic/safety/safer-guides> for resources on the content and appropriate use of the SAFER Guides (88 FR 59262). We also noted that future updates to the SAFER Guides would be provided with accompanying educational and promotional materials to notify participants, in collaboration with ONC, when available (88 FR 59265). In this final rule, we seek to make readers aware that efforts to update the SAFER Guides are currently underway. We anticipate that updated versions of the SAFER Guides may become available as early as CY

2025, and we would consider proposing a change to the SAFER Guides measure for the EHR reporting period beginning in CY 2026 to permit use of an updated version of the SAFER Guides at that time. We encourage eligible hospitals and CAHs to become familiar with the updated versions of the SAFER Guides when they become available and consider them as they implement appropriate EHR safety practices.

We did not propose and are not finalizing any changes to these policies.

8. Update the Definition of Meaningful EHR User for Healthcare Providers That Have Committed Information Blocking

The Department of Health and Human Services (HHS) rule, 21st Century Cures Act: Establishment of Disincentives for Health Care Providers That Have Committed Information Blocking final rule (hereafter referred to as the Disincentives final rule) (89 FR 54662), appeared in the **Federal Register** on July 1, 2024. The Disincentives final rule implements the provision of the 21st Century Cures Act specifying that a healthcare provider, determined by the HHS Office of Inspector General (OIG) to have committed information blocking, shall be referred to the appropriate agency to be subject to appropriate disincentives set forth through notice and comment rulemaking. Through policies finalized in the Disincentives final rule, an eligible hospital or CAH will not be considered a meaningful EHR user in an EHR reporting period if the OIG refers, during the calendar year of the EHR reporting period, a determination that the eligible hospital or CAH committed information blocking as defined at 45 CFR 171.103 (89 FR 54663). Accordingly, we revised the definition of “Meaningful EHR User” in 42 CFR 495.4 to state that an eligible hospital or CAH is not a meaningful EHR user in a payment adjustment year if the OIG refers a determination that the eligible hospital or CAH committed information blocking, as defined at 45 CFR 171.103, during the calendar year of the EHR reporting period (89 FR 54687 through 54691). The downward payment adjustment will apply 2 years after the year the referral was made by the OIG, and the EHR reporting period in which the eligible

hospital was not a meaningful EHR user. For CAHs, the downward payment adjustment will apply to the payment adjustment year in which the OIG referral was made (89 FR 54691).

An eligible hospital subject to this disincentive will be subject to a three quarters reduction of the annual market basket increase, while a CAH subject to this disincentive will have its payment reduced to 100 percent of reasonable costs, from the 101 percent of reasonable costs it might have otherwise earned, for failing to qualify as a meaningful EHR user in an applicable year. Additional regulatory provisions have been finalized at 45 CFR 171 Subpart J, related to the application of disincentives (89 FR 74953).

We note the revised definition of Meaningful EHR User in 42 CFR 495.4 became effective on July 31, 2024, when the Disincentives final rule became effective. For additional background and information on this update, we refer readers to the discussion in the Disincentives final rule (89 FR 54687 through 54691).

We did not propose and are not finalizing any changes to these policies in this final rule.

9. Future Goals of the Medicare Promoting Interoperability Program

a. Future Goals with Respect to Fast Healthcare Interoperability Resources® (FHIR) APIs for Patient Access

In partnership with ONC, we envision a future where patients have timely, secure, and easy access to their health information through the health application of their choice. We are working with ONC to enable this type of access to health information by requiring the use of APIs that utilize the Health Level Seven International® (HL7) FHIR. We work with ONC and other federal partners to improve timely and accurate data exchange, partner with industry to enhance digital capabilities, advance adoption of FHIR, support enterprise transformation efforts that increase our technological capabilities, and promote interoperability. In the FY 2021 IPPS/LTCH PPS proposed rule (85 FR 32858), we described our future vision for the Medicare Promoting Interoperability Program and stated that we will continue to consider changes that support a variety of HHS goals, including supporting alignment with the 21st Century Cures Act,

advancing interoperability and the exchange of health information, and promoting innovative uses of health IT. We also solicited public comment on issues relevant to the Medicare Promoting Interoperability Program that related to policies finalized in the 21st Century Cures Act: Interoperability, Information Blocking, and the ONC Health IT Certification Program final rule, including finalization of a new certification criterion for a standards-based API using FHIR, among other health IT topics (85 FR 32858).

ONC finalized the HTI–1 final rule (89 FR 1192), effective March 11, 2024, to further implement the 21st Century Cures Act, among other policy goals. ONC finalized revisions to the “standardized API for patient and population services” certification criterion at 45 CFR 170.315(g)(10). It also adopted the HL7 FHIR US Core Implementation Guide (IG) Standard for Trial Use version 6.1.0 at 45 CFR 170.215(b)(1)(ii), which provides the latest consensus-based capabilities aligned with the USCDI version 3⁸²⁷ data elements for FHIR APIs. The HTI–1 final rule also created the Insights Condition and Maintenance of Certification requirements (Insights Condition) within the ONC Health IT Certification Program to provide transparent reporting on certified health IT (89 FR 1199). This Insights Condition requires developers of certified health IT subject to the requirements to report on measures that provide information about the use of specific certified health IT functionalities by end users. One such measure calculates the number of unique individuals who access their electronic health information overall and by different methods such as through a standardized API for patient and population services.

By adopting these new and updated standards, implementation specifications, certification criteria, and conditions of certification, provisions in the HTI–1 final rule advance interoperability, improve transparency, and support the access, exchange, and use of electronic health information. CMS aims to further advance the use of FHIR APIs through policies in the Medicare Promoting Interoperability Program to advance interoperability, encourage the exchange of health information, and promote innovative uses of health IT. We also hope to gain

⁸²⁷ <https://www.healthit.gov/isa/united-states-core-data-interoperability-uscdi#uscdi-v3>

insights into the adoption and use of FHIR APIs by eligible hospitals and CAHs due to the ONC Health IT Certification Program Insights Condition. We believe maintaining our focus on promoting interoperability, alignment, and simplification will reduce healthcare provider burden while allowing flexibility to pursue innovative applications that improve care delivery. For additional background and information, we refer readers to the discussion in the ONC HTI-1 final rule on this topic (89 FR 1192).

We did not propose and are not finalizing any changes to these policies.

b. Improving Cybersecurity Practices

The Medicare Promoting Interoperability Program encourages the advancement of patient safety by promoting appropriate cybersecurity practices through the Security Risk Analysis and the SAFER Guides measures. On February 14, 2023, the National Institute of Standards and Technology (NIST) published updated guidance for health care entities implementing requirements of the Health Insurance Portability and Accountability (HIPAA) Security Rule (45 CFR Part 160 and Subparts A and C of Part 164; see also, most recently, 75 FR 40868 and 78 FR 5566). The guidance, NIST SP 800-66r2, provides information and resources to HIPAA-covered entities to improve their cybersecurity risk practices.⁸²⁸ We also wish to alert readers of additional HHS resources and activities regarding cybersecurity best practices as recently summarized in an HHS strategy document that provides an overview of HHS recommendations to help the health care sector address cyber threats.⁸²⁹ HHS has also recently published a website detailing recommended cybersecurity performance goals.⁸³⁰ We intend to consider how the Medicare Promoting Interoperability Program can promote cybersecurity best practices for eligible hospitals and CAHs to inform potential future rulemaking proposals.

We did not propose and are not finalizing any changes to these policies.

⁸²⁸ <https://csrc.nist.gov/pubs/sp/800/66/r2/final>

⁸²⁹ <https://aspr.hhs.gov/cyber/Documents/Health-Care-Sector-Cybersecurity-Dec2023-508.pdf>

⁸³⁰ <https://hphcyber.hhs.gov/performance-goals.html>

c. Improving Prior Authorization Processes

We recently released the CMS Interoperability and Prior Authorization final rule (CMS-0057-F), which appeared in the **Federal Register** on February 8, 2024 (89 FR 8758). This final rule aims to enhance health information exchange and access to health records for patients, healthcare providers, and payers, and improve prior authorization processes. In the final rule, we finalized the “Electronic Prior Authorization” measure under the HIE objective of the Merit-based Incentive Payment System (MIPS) Promoting Interoperability performance category and under the HIE objective of the Medicare Promoting Interoperability Program, beginning, for the Medicare Promoting Interoperability Program, in the EHR reporting period in CY 2027 (89 FR 8909 through 8927).

We did not propose and are not finalizing any changes to these policies in this final rule.

10. Request for Information Regarding (RFI) Public Health Reporting and Data Exchange

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36377 through 36381), we sought feedback in response to efforts across HHS to advance the public health information infrastructure, aimed to offer opportunities to further evolve the Medicare Promoting Interoperability Program, in collaboration with the CDC and ONC. We outlined a series of goals, followed by questions for commenters to consider and provide feedback for consideration in future rulemaking.

We received many comments on the RFI regarding public health reporting and data exchange, and we thank the commenters for responding to our request for information. While we are not responding to specific comments submitted in response to this RFI, we believe that this input is valuable in our efforts to continue to promote public health reporting and data exchange. We may consider some of this feedback to inform potential future rulemaking proposals.

X. Other Provisions Included in this Final Rule

A. Transforming Episode Accountability Model (TEAM)

In the May 2, 2024 Federal Register (89 FR 35934), we published the proposed rule titled “Medicare and Medicaid Programs and the Children's Health Insurance Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System and Policy Changes and Fiscal Year 2025 Rates; Quality Programs Requirements; and Other Policy Changes” that would implement a new mandatory Medicare payment model under section 1115A of the Act—the Transforming Episode Accountability Model (TEAM).

As we stated in the proposed rule, we believe that this model will test ways to further our goals of reducing Medicare expenditures while preserving or enhancing the quality of care furnished to beneficiaries. We are finalizing several of the provisions from the proposed rule but not all of them, and we intend to address and finalize some provisions of the proposed rule in future rulemaking. We also note that some of the public comments were outside of the scope of the proposed rule. These out-of-scope public comments are not addressed in this final rule. We have summarized the public comments that are within the scope of the proposed rule and our responses to those public comments. However, we note that in this final rule we are not addressing most comments received with respect to the provisions of the proposed rule that we are not finalizing at this time. Rather, we will address them at a later time, in subsequent rulemaking, as appropriate.

1. General Provisions

a. Introduction

The CMS Innovation Center has designed and tested numerous alternative payment models that each include specific payment, quality, and other policies. However, there are some general provisions that are very similar across models. The general provisions address beneficiary protections, model evaluation and monitoring, audits and record retention, rights in

data and intellectual property, monitoring and compliance, remedial action, model termination by CMS, limitations on review, and miscellaneous provisions on bankruptcy and other notifications.

We proposed to implement the general provisions, described later in this section and in subpart E of part 512, based on similar requirements that have been previously finalized in existing model tests. In addition to the general provisions discussed here, TEAM-specific provisions that are uniquely tailored to this model are described elsewhere in this rule (89 FR 36381).

b. Basis and Scope

In § 512.500 of the proposed rule, we proposed that the general provisions would only be applicable to TEAM. We stated that the proposed general provisions would not, except as specifically noted in proposed part 512, subpart E, affect the applicability of other provisions affecting providers and suppliers under Medicare FFS, including the applicability of provisions regarding payment, coverage, and program integrity (such as those in parts 413, 414, 419, 420, and 489 of chapter IV of 42 CFR and those in parts 1001 through 1003 of chapter V of 42 CFR) (89 FR 36381).

We invited public comment on the general provisions proposed for TEAM.

Summaries of the public comments received, and our responses are set forth in this section of the final rule under the appropriate headings.

c. Definitions

We proposed at § 512.505 of the proposed rule to define certain terms. We proposed to define the term “TEAM participant” to mean an acute care hospital that is identified under the terms of and defined in proposed § 512.505. We proposed to define “downstream participant” to mean an individual or entity that has entered into a written arrangement with a TEAM participant pursuant to which the downstream participant engages in one or more TEAM activities. We further proposed that a downstream participant may include, but would not be limited to, an individual practitioner, as defined for purposes of TEAM. We proposed to define “TEAM

activities” to mean any activities impacting the care of model beneficiaries related to the test of TEAM performed under the terms of proposed 512 subpart E (89 FR 36381).

We describe additional proposed definitions in context throughout this section X.A.1. of the preamble of this final rule.

d. Cooperation with Model Evaluation and Monitoring

Section 1115A(b)(4) of the Act requires the Secretary to evaluate each model tested under the authority of section 1115A of the Act and to publicly report the evaluation results in a timely manner. The evaluation must include an analysis of the quality of care furnished under the model and the changes in program spending that occurred due to the model. Models tested by the CMS Innovation Center are rigorously evaluated. For example, when evaluating models tested under section 1115A of the Act, we require the production of information that is representative of a wide and diverse group of model participants and includes data regarding potential unintended or undesirable effects, such as cost-shifting. The Secretary must take the evaluation into account if making any determinations regarding the expansion of a model under section 1115A(c) of the Act.

In addition to model evaluations, the CMS Innovation Center regularly monitors model participants for compliance with model requirements. For the reasons described in section X.A.1. of the preamble of this final rule, these compliance monitoring activities are an important and necessary part of the model test.

Therefore, we proposed to codify at § 512.584 that TEAM participants and their downstream participants must comply with the requirements of 42 CFR 403.1110(b) (regarding the obligation of entities participating in the testing of a model under section 1115A of the Act to report information necessary to monitor and evaluate the model) and must otherwise cooperate with CMS' model evaluation and monitoring activities as may be necessary to enable CMS to evaluate TEAM in accordance with section 1115A(b)(4) of the Act. Participation in the evaluation may include, but is not limited to, responding to surveys and participating in focus

groups. Additional details on the specific research questions that we proposed that the TEAM evaluation would consider can be found in section X.A.3.o.(4) of the preamble of this final rule. Further, we proposed to conduct monitoring activities according to proposed § 512.590(b), described in section X.A.3.i. of the preamble of this final rule, including obtaining such data as may be required by CMS to evaluate or monitor TEAM, which may include protected health information as defined in 45 CFR 160.103 and other individually identifiable data. (89 FR 36381)

We received no comments on the proposals to require cooperation with model evaluation and monitoring and are finalizing the proposals without modification.

e. Rights in Data and Intellectual Property

In the proposed rule, we proposed to allow CMS to use any data obtained in accordance with proposed § 512.588 to evaluate and monitor the proposed TEAM, as required by section 1115A(b)(4) of the Act and pursuant to § 512.590, described at section X.A.3.i. of the preamble of this final rule. We further proposed that, consistent with section 1115A(b)(4)(B) of the Act, that CMS would be allowed to disseminate quantitative and qualitative results and successful care management techniques, including factors associated with performance, to other providers and suppliers and to the public. We proposed that the data to be disseminated would include, but would not be limited to, patient de-identified results of patient experience of care and quality of life surveys, as well as patient de-identified measure results calculated based upon claims, medical records, and other data sources (89 FR 36381).

In the proposed rule we stated that in order to protect the intellectual property rights of TEAM participants and downstream participants, we proposed in § 512.588(c) to require TEAM participants and their downstream participants to label data they believe is proprietary and should be protected from disclosure under the Trade Secrets Act. We noted that this approach is already in use in other models currently being tested by the CMS Innovation Center, including End Stage

Renal Disease Treatment Choices models. Any such assertions would be subject to review and confirmation prior to CMS acting upon such assertion.

We further proposed to protect such information from disclosure to the full extent permitted under applicable laws, including the Freedom of Information Act. Specifically, in proposed § 512.588(b), we proposed to not release data that has been confirmed by CMS to be proprietary trade secret information and technology of the TEAM participant or its downstream participants without the express written consent of the TEAM participant or its downstream participants, unless such release is required by law (89 FR 36382).

We received no comments on the proposed rights in data and intellectual property provisions and are finalizing the proposals without modification.

f. Remedial Action

As stated in the proposed rule, as part of the CMS Innovation Center's monitoring and assessment of the impact of models tested under the authority of section 1115A of the Act, we have a special interest in ensuring that these model tests do not interfere with the program integrity interests of the Medicare program. For this reason, we monitor for compliance with model terms as well as other Medicare program rules. When we become aware of noncompliance with these requirements, it is necessary for CMS to have the ability to impose certain administrative remedial actions on a noncompliant model participant (89 FR 36382).

In the proposed rule, we stated that the terms of many models currently being tested by the CMS Innovation Center permit CMS to impose one or more administrative remedial actions to address noncompliance by a model participant. We proposed that CMS may impose any of the remedial actions set forth in proposed § 512.592 if we determine that the TEAM participant or a downstream participant—

- Has failed to comply with any or all of the terms of TEAM;
- Has failed to comply with any applicable Medicare program requirement, rule, or regulation;

- Has taken any action that threatens the health or safety of a beneficiary or other patient;
- Has submitted false data or made false representations, warranties, or certifications in connection with any aspect of TEAM;
- Has undergone a change in control (as defined in proposed § 512.505) that presents a program integrity risk;
- Is subject to any sanctions of an accrediting organization or a Federal, state, or local government agency;
- Is subject to investigation or action by HHS (including the HHS-OIG and CMS) or the Department of Justice due to an allegation of fraud, a pattern of improper billing, or significant misconduct, including being subject to the filing of a complaint or filing of a criminal charge, being subject to an indictment, being named as a defendant in a False Claims Act qui tam matter in which the Federal Government has intervened, or similar action; or
- Has failed to demonstrate improved performance following any remedial action imposed by CMS.
- Has misused or disclosed beneficiary-identifiable data in a manner that violates any applicable statutory or regulatory requirements or that is otherwise non-compliant with the provisions of the TEAM data sharing agreement.

At proposed § 512.592(b), we proposed to codify that CMS may take one or more of the following remedial actions if CMS determined that one or more of the grounds for remedial action described in proposed § 512.592(a) had taken place—

- Notify the TEAM participant and, if appropriate, require the TEAM participant to notify its downstream participants of the violation;
- Require the TEAM participant to provide additional information to CMS or its designees;
- Subject the TEAM participant to additional monitoring, auditing, or both;

- Prohibit the TEAM participant from distributing TEAM payments;
- Require the TEAM participant to terminate, immediately or by a deadline specified by CMS, its agreement with a downstream participant with respect to TEAM;
- Terminate the TEAM participant from the model test;
- Require the TEAM participant to submit a corrective action plan in a form and manner and by a date specified by CMS;
- Discontinue the provision of data sharing and reports to the TEAM participant;
- Recoup TEAM payments;
- Reduce or eliminate a TEAM payment otherwise owed to the TEAM participant, as applicable; or
- Such other action as may be permitted under the terms of TEAM.

In the proposed rule, we noted that because TEAM is a mandatory model, we would not expect to use the proposed provision that would allow CMS to terminate a TEAM participant's participation in the model, except in circumstances in which the TEAM participant has engaged, or is engaged in, egregious actions.

We invited public comment on these proposed provisions regarding the proposed grounds for remedial actions, remedial actions generally, and whether additional types of remedial action would be appropriate (89 FR 36382).

We received no comments on the proposed remedial actions and are finalizing the proposals without modification.

g. CMS Innovation Center Model Termination by CMS

In the proposed rule, we proposed certain provisions that would allow CMS to terminate TEAM under certain circumstances. Section 1115A(b)(3)(B) of the Act requires the CMS Innovation Center to terminate or modify the design and implementation of a model, after testing has begun and before completion of the testing, unless the Secretary determines, and the Chief Actuary certifies with respect to program spending, that the model is expected to: improve the

quality of care without increasing program spending; reduce program spending without reducing the quality of care; or improve the quality of care and reduce spending (89 FR 36382).

We proposed at § 512.596 that CMS could terminate TEAM for reasons including, but not limited to, one of the following circumstances:

- CMS determines that it no longer has the funds to support TEAM.
- CMS terminates TEAM in accordance with section 1115A(b)(3)(B) of the Act.

As stated in the proposed rule, section 1115A(d)(2)(E) of the Act and proposed § 512.596 provide that termination of TEAM in accordance with section 1115A(b)(3)(B) of the Act would not be subject to administrative or judicial review.

To ensure model participants had appropriate notice in the case of the termination of TEAM by CMS, we also proposed to codify at § 512.596 that we would provide TEAM participants with written notice of the model termination, which would specify the grounds for termination as well as the effective date of the termination.

We received no comments on the model termination by CMS proposals and are finalizing the proposals without modification.

h. Limitations on Review

In proposed § 512.594, we proposed to codify the preclusion of administrative and judicial review under section 1115A(d)(2) of the Act (89 FR 36382). Section 1115A(d)(2) of the Act states that there is no administrative or judicial review under section 1869 or 1878 of the Act or otherwise for any of the following:

- The selection of models for testing or expansion under section 1115A of the Act.
- The selection of organizations, sites, or participants to test models selected.
- The elements, parameters, scope, and duration of such models for testing or dissemination.
- Determinations regarding budget neutrality under section 1115A(b)(3) of the Act.

- The termination or modification of the design and implementation of a model under section 1115A(b)(3)(B) of the Act.

- Determinations about expansion of the duration and scope of a model under section 1115A(c) of the Act, including the determination that a model is not expected to meet criteria described in paragraph (1) or (2) of such section.

In the proposed rule, we proposed to interpret the preclusion from administrative and judicial review regarding the CMS Innovation Center's selection of organizations, sites, or participants to test TEAM to preclude from administrative and judicial review our selection of a TEAM participant, as well as our decision to terminate a TEAM participant, as these determinations are part of our selection of participants for TEAM. (89 FR 36383)

We invited public comment on the proposed codification of these statutory preclusions of administrative and judicial review for TEAM, as well as our proposed interpretations regarding their scope.

The following is a summary of the comments we received on the limitations on review proposals and our responses:

Comment: A commenter believed the use of administrative and judicial preclusion language is unlawful, beyond the agency's authority, and unenforceable.

Response: We thank the commenter for their feedback. However, we disagree that preclusion of administrative and judicial review is beyond the agency's authority. We note that the language in section 1115A(d)(2) of the Act precludes administrative or judicial review for a range of policies for Innovation Center models, including selection of sites or participants. We also believe that the language in 1115A(d)(2) clearly indicates that the intent of the statute was to ensure that CMS has authority to test models, and precluding administrative or judicial review of the specific policies listed above is necessary to ensure our ability to implement models.

Allowing administrative or judicial review could hinder our ability to test models, if entities are

able to appeal CMS' decisions such as our selection of sites or participants and certain aspects of model design and implementation.

Comment: A commenter stated that administrative and judicial review may be the only effective option available to assure that a TEAM participant's network is adequate. The commenter stated that a beneficiary or downstream participant should have the opportunity to challenge an exclusion of a downstream participant from participating in the model to protect beneficiary choice rights. They are concerned that in the case of a geographically established mandatory bundle, beneficiary choice or provider protection could be seriously eroded in areas where there are a limited number of hospitals, and adversely affect Medicare beneficiaries' access to appropriate downstream care following an acute care hospital stay.

Response: We share the commenter's interest in ensuring that beneficiaries are not negatively affected by model requirements and preserving and protecting beneficiary access but disagree that allowing for administrative or judicial review of certain TEAM policies would address the potential issues raised by the commenter. TEAM does not affect a beneficiary's ability to choose how or where they receive care, and we are finalizing several policies in section X.A.3.i. of this final rule in order to protect beneficiary choice and access for those receiving services from TEAM participants. At § 512.582(a)(1), we are finalizing that TEAM participants and their collaborators and other partners may not restrict beneficiaries' freedom to choose to receive care from any provider or supplier. We are also finalizing (at § 512.582(a)(3)) a requirement that TEAM participants provide, at discharge from the hospital, a list of all local post-acute care providers participating in the Medicare program. In addition, while TEAM participants may recommend certain providers or suppliers, they may not restrict access or limit beneficiary choice to those providers or suppliers with whom they have a relationship.

Finally, we note that the TEAM participants will be acute care hospitals, not downstream care partners such as post-acute care facilities or other providers. In addition, we note that the

model does not require a provider network. We believe our policies referenced above with regard to beneficiary protections, choice, and access, will address the commenter's concern.

After consideration of the public comments we received on the proposed limitations on review, we are finalizing § 512.594 as proposed without modification.

i. Miscellaneous Provisions on Bankruptcy and Other Notifications

We noted in the proposed rule that the proposed TEAM would have a defined period of performance, but final payment under the model might occur long after the end of the performance period. In some cases, a TEAM participant could owe money to CMS. We recognize that the legal entity that is the TEAM participant could experience significant organizational or financial changes during or after the period of performance for TEAM. To protect the integrity of the proposed TEAM and Medicare funds, we proposed a number of provisions to ensure that CMS is made aware of events that could affect a TEAM participant's ability to perform its obligations under TEAM, including the payment of any monies owed to CMS (89 FR 36383).

First, in proposed § 512.595(a), we proposed that a TEAM participant must promptly notify CMS and the local U.S. Attorney Office if it files a bankruptcy petition, whether voluntary or involuntary. Because final payment may not take place until after the TEAM participant ceases active participation in TEAM, we further proposed that this requirement would apply until final payment has been made by either CMS or the TEAM participant under the terms of the model and all administrative or judicial review proceedings relating to any payments under TEAM have been fully and finally resolved.

In the proposed rule, we, specifically, proposed that notice of the bankruptcy must be sent by certified mail within 5 days after the bankruptcy petition has been filed and that the notice must contain a copy of the filed bankruptcy petition (including its docket number), unless final payment has been made under the terms of TEAM and all administrative or judicial review proceedings regarding TEAM payments between the TEAM participant and CMS have been

fully and finally resolved. The notice to CMS must be addressed to the CMS Office of Financial Management, Mailstop C3-01-24, 7500 Security Boulevard, Baltimore, Maryland 21244 or to such other address as may be specified for purposes of receiving such notices on the CMS website.

In the proposed rule, we stated that by requiring the submission of the filed bankruptcy petition, CMS would obtain information necessary to protect its interests, including the date on which the bankruptcy petition was filed and the identity of the court in which the bankruptcy petition was filed. We recognized that such notices may already be required by existing law, but CMS often does not receive them in a timely fashion, and they may not specifically identify TEAM. The failure to receive such notices on a timely basis can prevent CMS from asserting a claim in the bankruptcy case. We were particularly concerned that a TEAM participant may not furnish notice of bankruptcy after it has completed its performance in TEAM, but before final payment has been made or administrative or judicial proceedings have been resolved. We believe our proposal was necessary to protect the financial integrity of the proposed TEAM and the Medicare Trust Funds.

Second, in proposed § 512.595(b), we proposed that the TEAM participant would have to provide written notice to CMS within 30 days of any change in the TEAM participant's legal name becoming effective. The notice of legal name change would have to be in a form and manner specified by CMS and include a copy of the legal document effecting the name change, which would have to be authenticated by the appropriate state official. The purpose of this final notice requirement is to ensure the accuracy of our records regarding the identity of TEAM participants and the entities to whom TEAM payments should be made or against whom payments should be demanded or recouped. We solicited comment on requiring notice to be furnished promptly, that is, within 30 days after a change in legal name has become effective.

Third, in proposed § 512.595(c), we proposed that the TEAM participant would have to provide written notice to CMS at least 90 days before the effective date of any change in control.

We proposed that the written notification must be furnished in a form and manner specified by CMS. For purposes of this notice obligation, we proposed that a “change in control” would mean any of the following: (1) The acquisition by any “person” (as such term is used in sections 13(d) and 14(d) of the Securities Exchange Act of 1934) of beneficial ownership (within the meaning of Rule 13d-3 promulgated under the Securities Exchange Act of 1934), of beneficial ownership (within the meaning of Rule 13d-3 promulgated under the Securities Exchange Act of 1934), directly or indirectly, of voting securities of the TEAM participant representing more than 50 percent of the TEAM participant's outstanding voting securities or rights to acquire such securities; (2) the acquisition of the TEAM participant by any individual or entity; (3) the sale, lease, exchange or other transfer (in one transaction or a series of transactions) of all or substantially all of the assets of the TEAM participant; or (4) the approval and completion of a plan of liquidation of the TEAM participant, or an agreement for the sale or liquidation of the TEAM participant. The proposed requirement and definition of change in control are the same requirements and definition used in certain models that are currently being tested under section 1115A authority. We believe this final notice requirement is necessary to ensure the accuracy of our records regarding the identity of model participants and to ensure that we pay and seek payment from the correct entity. For this reason, we proposed that if CMS determined in accordance with proposed § 512.592(a)(5) that a TEAM participant's change in control would present a program integrity risk, CMS could take remedial action against the TEAM participant under proposed § 512.592(b). In addition, to ensure payment of amounts owed to CMS, we proposed that CMS may require immediate reconciliation and payment of all monies owed to CMS by a model participant that is subject to a change in control.

We received one timely public comment on the proposed bankruptcy and other notifications requirements.

Comment: A commenter requested CMS change the timelines for the bankruptcy and other notifications provision to be consistent with other Medicare reporting timelines, as provider

burden is lessened when timelines are consistent. Specifically, the commenter asked that TEAM provision conform to the timelines set forth in the “Disclosures of Ownership and Additional Disclosable Parties Information for Skilled Nursing Facilities and Nursing Facilities; Definitions of Private Equity Companies and Real Estate Investment Trusts for Medicare Providers and Suppliers” Final Rule published November 17, 2023, which implemented portions of the Affordable Care Act, requiring the disclosure of certain ownership, managerial, and other information and the required timelines associated with each.

Response: While we agree with the commenter that in general, aligning reporting timelines across the various Medicare program requirements is desirable, we note that the specific timelines and parameters of TEAM (and other Innovation Center models) necessitate that we collect many types of information, such as ownership and financial information, on a more frequent basis, as applicable, than those finalized in the regulation referenced by the commenter (88 FR 80141). In the “Disclosures of Ownership and Additional Disclosable Parties Information for Skilled Nursing Facilities and Nursing Facilities; Definitions of Private Equity Companies and Real Estate Investment Trusts for Medicare Providers and Suppliers” Final Rule, CMS finalized certain timelines for reporting of specific information for Medicare-enrolled providers and other entities; such reporting would occur upon initial enrollment into Medicare or Medicaid, upon change of ownership, or during revalidation, which occurs every five years. We do not believe this frequency of reporting would be sufficient for TEAM. We proposed to require reporting on the timelines specified in the proposed rule in order to effectively protect CMS against potential program integrity issues that may arise due to changes in control during model participation, expeditiously make payments (or send demand letters) to TEAM participants, and generally ensure we have accurate information on the entities participating in our models in order to monitor and enforce model requirements. As noted above, our proposed timelines and requirements mirror those utilized by other models tested under section 1115A authority. Given this, we are finalizing at § 512.595 our proposals to require a TEAM participant to (1) promptly

notify CMS and the local U.S. Attorney Office if it files a bankruptcy petition, whether voluntary or involuntary, within 5 days of the bankruptcy petition; (2) provide written notice to CMS within 30 days of any change in the TEAM participant's legal name becoming effective; and (3) provide written notice to CMS at least 90 days before the effective date of any change in control.

2. Transforming Episode Accountability Model (TEAM)--Introduction

As discussed in the proposed rule (89 FR 35934), we proposed the implementation and testing of the Transforming Episode Accountability Model (TEAM), a new mandatory alternative payment model under the authority of section 1115A of the Act, beginning on January 1, 2026, and ending on December 31, 2030. TEAM would test whether an episode-based pricing methodology linked with quality measure performance for select acute care hospitals reduces Medicare program expenditures while preserving or improving the quality of care for Medicare beneficiaries who initiate certain episode categories. Specifically, TEAM proposals included the testing of five surgical episode categories: Coronary Artery Bypass Graft Surgery (CABG), Lower Extremity Joint Replacement (LEJR), Major Bowel Procedure, Surgical Hip/Femur Fracture Treatment (SHFFT), and Spinal Fusion.

As stated in the proposed rule, this model falls within a larger framework of activities initiated by the CMS Innovation Center during the past several years, including the release of the CMS Innovation Center strategic refresh and the comprehensive specialty strategy.^{831,832} The strategic refresh includes a goal of having 100 percent of Medicare FFS beneficiaries and the vast majority of Medicaid beneficiaries in an accountable care relationship by 2030. Episode-based payment models, such as TEAM, can be a tool to support this goal by increasing provider participation in value-based care initiatives with accountability for quality and cost outcomes. To further the goals of the strategic refresh, the CMS Innovation Center released the comprehensive specialty care strategy in 2022, which includes an element to maintain momentum established by

⁸³¹ Innovation Center Strategy Refresh: <https://www.cms.gov/priorities/innovation/strategic-direction-whitepaper>

⁸³² The CMS Innovation Center's Strategy to Support Person-centered, Value-based Specialty Care: <https://www.cms.gov/blog/cms-innovation-centers-strategy-support-person-centered-value-based-specialty-care>

episode-based payment models and supports development of TEAM.⁸³³ In addition, in July 2023, we published a Request for Information (RFI) to gain public input on design elements for a new mandatory bundled payment model.⁸³⁴ Given TEAM's alignment with many strategic facets of the CMS Innovation Center, our proposal to test a new episode-based payment model for acute care hospitals is based on: (1) lessons learned from testing the Bundled Payments for Care Improvement (BPCI) Initiative, the BPCI Advanced Model, and the Comprehensive Care for Joint Replacement (CJR) Model; and (2) comments received from the Episode-based Payment Model RFI (88 FR 45872) published in the Federal Register.

As stated in the proposed rule, and finalized in this final rule, TEAM participants continue to bill Medicare under the traditional FFS system for services furnished to Medicare FFS beneficiaries. However, the TEAM participant may also receive a reconciliation payment amount from CMS depending on their Composite Quality Score (CQS) and if their performance year spending is less than their reconciliation target price. As TEAM is a two-sided risk model, meaning the model requires TEAM participants to be accountable for performance year spending that is above or below their reconciliation target price, TEAM participants may also owe CMS a repayment amount depending on their CQS and if their performance year spending is more than their reconciliation target price.

As stated in the proposed rule, and finalized in this final rule, the model performance period for TEAM will consist of five performance years, beginning January 1, 2026, and ending December 31, 2030, with final data submission of clinical data elements and quality measures in CY 2031 to account for episodes ending in CY 2030, and final reconciliation reports and TEAM reconciliation payment amounts and repayment amounts in CY 2031. Further information about all the proposals in TEAM may be found at (89 FR 35934).

a. Background

⁸³³ <https://www.cms.gov/blog/cms-innovation-centers-strategy-support-person-centered-value-based-specialty-care>

⁸³⁴ <https://www.federalregister.gov/documents/2023/07/18/2023-15169/request-for-information-episode-based-payment-model>

CMS believes an episode-based payment structure may improve beneficiary care by aligning incentives in pursuit of improved quality and reduced spending. A FFS payment system pays health care providers and suppliers for discrete services over a single episode, potentially resulting in fragmented care and duplicative use of resources. Paying for discrete services may also not provide sufficient financial incentive for health care providers and suppliers to invest in quality improvement and care coordination that could help avoid adverse outcomes. Further, providers and suppliers may be paid under different FFS payment systems which may create challenges managing beneficiaries in an episode. Therefore, providers and suppliers have less of an incentive to collaborate to improve the quality of care and decrease the cost and unnecessary utilization of services.

An episode-based payment methodology creates an incentive for participating providers and suppliers to coordinate across care settings as the participating entity takes responsibility for the quality and cost outcomes across the entire episode. All of the projected payments to the physician, hospital, and other health care provider and supplier services are combined into a target price. This target price represents the expected cost of all items and services furnished to a beneficiary during an episode. Health care providers included in such initiatives may either realize a financial gain or loss, based on how successfully they perform on quality measure assessment and manage resources and total costs throughout each episode. Payment models that hold entities accountable for spending and quality performance metrics for an entire episode can motivate health care providers to furnish services more efficiently, to better coordinate care, and to improve the quality of care.

The CMS Innovation Center has tested episode-based payment models for over a decade, including the BPCI initiative, the BPCI Advanced Model, and the CJR Model. The CJR Model and the BPCI Advanced Models are current CMS Innovation Center model tests that are set to end on December 31, 2024, and December 31, 2025, respectively. When considering the future of episode-based payment models, we reviewed results of the CJR Model and the BPCI

Advanced Model given promising evaluation findings that support these models reducing episode payments, before accounting for incentive payments, and maintaining quality of care, as described further in section X.A.2.c. of the preamble of this final rule. However, both models experienced significant model changes, including changes in participation volume, in the later years of their model test and assessing the results of these models based on their current methodologies requires additional evaluation data, which would not be available until after each model has concluded. We also note additional challenges that arise from voluntary models, including the BPCI Advanced model, where selection bias, stemming from self-selection into and out of the model and selection of clinical episode categories or clinical episode service line groups, can make it more difficult to evaluate and produce generalizable results. We believe TEAM will allow the CMS Innovation Center to test a new episode-based payment model that builds upon lessons learned in previous episode-based payment models by incorporating the most promising model features, while also continuing care transformation efforts that we have promoted through the CJR or BPCI Advanced models.

As stated in the proposed rule, if TEAM is successful, we hope this model would establish the framework for managing episodes as a standard practice in Traditional Medicare. TEAM includes features that are attentive to operational feasibility for both participants and CMS, such as how often reconciliation would be conducted to minimize administrative burden, a pricing methodology that would be responsive to providers with varying levels of experience and different patient populations, and the selection of episodes with sufficient volume that would warrant standard care pathways during the acute and post-acute care periods of an episode. In the proposed rule, we stated that any future policy changes to this proposed model test, such as the addition of episode categories, would be implemented through future notice and comment rulemaking.

Increasing quality, patient-centeredness, and cost-effective care requires collaboration among hospitals, physicians, and post-acute care (PAC) providers. To encourage this

collaboration, TEAM proposed to further align incentives between hospitals and physicians by specifying certain types of financial arrangements that participants may elect to pursue to share reconciliation payment amounts received from CMS under the model. By doing so, TEAM participants would be able to share incentives with downstream providers and suppliers when they achieve higher quality and more cost-effective care through collaboration.

b. Evidence Base for Model

Medicare beneficiaries can experience fragmented and costly care, distinguished by frequent diagnostics, imaging, tests and other treatment approaches delivered by different providers across different sites of care.⁸³⁵ A 2022 study examining fragmentation of ambulatory care for Medicare FFS beneficiaries found that four in ten beneficiaries experience highly fragmented care, with a mean of 13 ambulatory visits across seven practitioners in one year.⁸³⁶ Fragmented care is further evident when focusing on the clinical management of Medicare beneficiaries for acute procedural care since these beneficiaries may be receiving care from different physicians in different settings before, during, and after their procedure.⁸³⁷ In the absence of effective communication between patients, families, physicians, hospitals, and other care settings, beneficiaries receiving acute procedural care may not receive comprehensive care management and coordination. TEAM is based on the premise – supported by evidence from the CJR and BPCI Advanced model evaluations – that appropriately aligned financial incentives would improve or maintain quality of care for beneficiaries who are in an episode, while also achieving reductions in episode spending.⁸³⁸

⁸³⁸ <https://www.cms.gov/priorities/innovation/data-and-reports/2022/wp-eval-synthesis-21models>

Care fragmentation in acute surgical procedures in the United States is well documented, leading to care variation and inefficiencies producing unfavorable patient outcomes and increased health spending.^{839, 840, 841} Given the variation in acute surgical care and costs, including post-acute care costs immediately following a procedure, significant literature has been devoted to evaluating opportunities to improve the quality and efficiency of care.^{842,843} This includes the design and implementation of standardized care processes that emphasize high-value care that can support episode-based care initiatives. For example one study found that, “Enhanced Recovery After Surgery protocols have resulted in shorter length of hospital stay by 30 percent to 50 percent and similar reductions in complications, while readmissions and costs are reduced”.⁸⁴⁴ Moreover, other findings focus on perioperative care delivery and indicate, “that through elements that emphasize care coordination, standardization, and patient-centeredness, perioperative surgical home programs can improve patient postoperative recovery outcomes and decrease hospital utilization”.⁸⁴⁵

CMS, commercial payers, and other stakeholders are continuously testing a variety of approaches to constructing episodes of care, including through different patient populations,

clinical episode categories, and pricing methodologies.^{846,847,848} Though the results of alternative payment models focused on episodes of care have been mixed, evidence related to models' ability to realize savings and improve quality is promising, especially given the 10 years of experience yielded from participants and the CMS Innovation Center model tests. The BPCI Advanced and CJR models are still being tested, and the effects of the models' care redesign changes aimed to achieve Medicare savings and maintain or improve quality of care are still being evaluated, see section X.A.2.c. of the preamble of this final rule, but have generated evidence from multiple evaluation reports to support the design of TEAM. Beyond quantitative data, qualitative data collected from model participants and data from site visits indicate care transformation is happening, and quality of care is improving across the spectrum. Qualitative data range from reported improved relationships between inpatient providers and post-acute care (PAC) providers, to reshaping patient and provider expectations about appropriate discharge destinations, to process changes, such as standardized care pathways, identification and mitigation of medical and social risk factors, monitoring patients in the post-discharge period, and connecting patients to primary care providers. As noted in section X.A.2.c. of the preamble of this final rule, evaluation results from the previous and current episode-based payment models consistently indicate that these models can reduce episode payments, before considering incentive payments, and generally without compromising quality of care.

c. ACE, BPCI, BPCI Advanced, and CJR Evaluation Results

The CMS Innovation Center previously tested episode-based payment approaches among acute episodes, including the Medicare Acute Care Episode (ACE) demonstration and the BPCI

Association between a bundled payment program for lower extremity joint replacement and patient outcomes among Medicare Advantage beneficiaries. *JAMA Health Forum*, 4(6), e231495. <https://doi.org/10.1001/jamahealthforum.2023.1495>

Initiative, and currently is testing additional approaches under the BPCI Advanced model and the CJR model.⁸⁴⁹ The ACE demonstration tested a bundled payment approach for cardiac and orthopedic inpatient surgical services and procedures. All Medicare Part A and Part B services pertaining to the inpatient stay were included in the ACE demonstration episodes of care. Evaluations results found that Medicare saved an average of \$585 per episode from the combined Medicare Part A and B expected payments or a total of \$7.3 million across all episodes (12,501 episodes), all ACE MS-DRGs, and four ACE Sites. However, increases in post-acute care spending reduced these savings by approximately 45 percent, resulting in per episode savings of \$319 and total net savings of approximately \$4 million. With respect to quality of care, findings suggest that the ACE sites maintained their quality-of-care levels without any systematic or consistent changes in clinical outcomes or in the type of patients they admitted in response to the demonstration. Despite the lack of strong quantitative evidence for realized improvements in quality, there was qualitative evidence that hospitals worked to improve processes and outcomes.⁸⁵⁰

The BPCI initiative tested whether linking payments for providers that furnish Medicare-covered items and services during an episode related to an inpatient hospitalization could reduce Medicare expenditures while maintaining or improving quality of care.

- Model 1 episodes were limited to the acute inpatient hospitalizations for all MS-DRGs.
- Model 2 episodes began with a hospital admission and extended for 30, 60, or 90 days after discharge.
- Model 3 episodes began with the initiation of post-acute care following a hospital admission and extended for 30, 60, or 90 days.

⁸⁴⁹ Medicare Acute Care Episode Demonstration (<https://innovation.cms.gov/innovation-models/ace>), BPCI Initiative (<https://www.cms.gov/priorities/innovation/innovation-models/bundled-payments>), BPCI Advanced Model (<https://www.cms.gov/priorities/innovation/innovation-models/bpci-advanced>), CJR Model (<https://www.cms.gov/priorities/innovation/innovation-models/CJR>)

⁸⁵⁰ Evaluation of the Medicare Acute Care Episode (ACE) Demonstration. (2013). Centers for Medicare & Medicaid Services. Retrieved December 1, 2023, from <http://downloads.cms.gov/files/cmml/ACE-EvaluationReport-Final-5-2-14.pdf>

- Model 4 episodes began with a hospital admission and included readmissions within 30 days after discharge.

Model 1 was unique, as compared to Models 2-4, in that target prices weren't generated but awardees received a predetermined discount percentage to their Medicare Inpatient Prospective Payment System (IPPS) operating payment rates for episodes at their hospital. Model 1 had a small volume of participants, however, evaluation results found that there were no consistent negative or positive statistically significant impacts to Medicare payments or quality of care effects on Medicare beneficiaries.⁸⁵¹ Similarly, Model 4 had a small volume of participants, and by the end of the model there was no change in allowed payments nor were there any changes in the quality of care as measured by claims-based quality measures.⁸⁵²

Evaluation results for BPCI Models 2 and 3 were more robust given the greater volume of participants in each model. Similar to Model 1 and Model 4, quality of care generally remained unchanged in BPCI Models 2 and 3. With respect to the financial performance of the models, findings demonstrated reductions in FFS payments of \$1,193 million for Model 2 and \$232 million for Model 3. However, Medicare experienced net losses of \$418 million ($p < 0.05$) for Model 2, or \$332 per episode, and \$110 million ($p < 0.05$) for Model 3, or \$714 per episode, after accounting for reconciliation payments to participants. These net losses to Medicare represented 1.3 percent of what payments would have been absent BPCI under Model 2 and 3.1 percent under Model 3. The largest contributing factor to these losses was the elimination of participants' repayment responsibility during the initial part of the model for all participants, and then in later years for certain participants due to episode attribution errors. If CMS had not eliminated repayment responsibility, and assuming model participation remained the same,

⁸⁵¹ Evaluation and Monitoring of the Bundled Payments for Care Improvement Model 1 Initiative. (2016). Centers for Medicare & Medicaid Services. Retrieved December 1, 2023, from <https://www.cms.gov/priorities/innovation/files/reports/bpci-mdl1yr2annrpt.pdf>

⁸⁵² CMS Bundled Payments for Care Improvement Initiative Models 2-4: Year 7 Evaluation & Monitoring Annual Report. (2021). Centers for Medicare & Medicaid Services. Retrieved December 1, 2023, from <https://www.cms.gov/priorities/innovation/data-and-reports/2021/bpci-models2-4-yr7evalrpt>

Model 2 would have resulted in no net losses or savings, and net losses under Model 3 would have been reduced to \$ 66 million ($p < 0.05$), or 1.9 percent of what payments would have been absent BPCI.⁸⁵³

We currently are testing the BPCI Advanced model, which is a voluntary episode-based model based on the BPCI Initiative's Model 2, that tests whether linking payments for an episode will incentivize health care providers to invest in innovation and care redesign to improve care coordination and reduce expenditures, while maintaining or improving the quality of care for Medicare FFS beneficiaries. We are still evaluating the effects of the BPCI Advanced model on patient experience of care, quality outcomes, and cost of care for Medicare FFS beneficiaries. However, evaluation results to date demonstrated reductions in episode payments and maintenance of quality of care, but the model has thus far been unable to generate Medicare savings. As of Model Year 3 (2020), BPCI Advanced participants reduced average episode payments by 3.8 percent or \$1,028 per episode, and more specifically 3.1 percent (\$796 per episode) for medical episodes and 5.8 percent (\$1,800 per episode) for surgical episodes. Despite the reductions in FFS payments, after accounting for reconciliation payments to participants, Medicare had a net loss of \$114 million in 2020, or 0.8 percent of what Medicare payments would have been in absence of the model. When looking at Medicare savings by episode type, surgical episodes resulted in an estimated net savings of \$71.3 million, or 2.3 percent, but those savings were offset by medical episodes which resulted in an estimated net loss of \$200.5 million, or 1.9 percent.⁸⁵⁴ The BPCI Advanced model implemented changes, most notably in 2021-23, and most recently made further changes to extend the model through 2025 and support provider engagement in value-based care.

⁸⁵³ CMS Bundled Payments for Care Improvement Initiative Models 2-4: Year 7 Evaluation & Monitoring Annual Report. (2021). Centers for Medicare & Medicaid Services. Retrieved December 1, 2023, from <https://www.cms.gov/priorities/innovation/data-and-reports/2021/bpci-models2-4-yr7evalrpt>

⁸⁵⁴ CMS Bundled Payments for Care Improvement Advanced Model: Fourth Evaluation Report. (2023). Centers for Medicare & Medicaid Services. Retrieved December 1, 2023, from <https://www.cms.gov/priorities/innovation/data-and-reports/2023/bpci-adv-ar4>

We are also currently testing the CJR model, which is a mandatory episode-based payment model in 34 metropolitan statistical areas (MSAs) for lower extremity joint replacement episodes that encourages hospitals, physicians, and PAC providers to work together to improve the quality and coordination of care from the initial hospitalization or outpatient procedure through recovery. Evaluation results to date have indicated that in the first four performance years, mandatory hospitals generated \$72 million dollars in savings to Medicare, although not statistically significant. But in Performance Year 5, reconciliation payments substantially increased generating \$95.4M in statistically significant Medicare losses, due to adjustments made to the model made during the COVID-19 Public Health Emergency (PHE). CMS enacted these temporary adjustments, which effectively waived downside risk for all CJR episodes, in order to minimize any financial burden associated with model participation given the financial challenges and uncertainties hospitals faced early in the COVID-19 PHE. These adjustments resulted in reconciliation payments being triple what they were in previous years, which reversed the savings trajectory and resulted in statistically significant losses to Medicare for mandatory hospitals. The losses in Performance Year 5 were large enough to offset total estimated savings prior to the public health emergency.⁸⁵⁵ Like the BPCI Advanced model, the CJR model was revised and extended until December 31, 2024.

As stated in the proposed rule, we believe that providers', suppliers', and CMS' experiences with the BPCI Advanced and CJR models support the design of TEAM. Stakeholders both directly and indirectly involved in testing the BPCI Advanced and CJR models have conveyed that they perceive episode-based payments to be an effective mechanism for advancing better, more accountable care through care coordination and opportunities to improve care efficiency. CMS has also heard similar sentiment through other efforts including

⁸⁵⁵ CMS Comprehensive Care for Joint Replacement Model: Performance Year 5 Evaluation Report. (2023). Centers for Medicare & Medicaid Services. Retrieved December 1, 2023, from <https://www.cms.gov/priorities/innovation/data-and-reports/2023/cjr-py5-annual-report>

the CMS Innovation Center's Specialty Care Strategy Listening Session and recent Episode-based Payment Model Request for Information (RFI) (88 FR 45872).⁸⁵⁶

Further information of why specific elements of the models and initiatives were incorporated into TEAM's designs is discussed later in this final rule.

d. CMS Innovation Center Specialty Care Strategy

In 2021, the CMS Innovation Center announced a strategic refresh with a vision of having a health care system that achieves equitable outcomes through high quality, affordable, person-centered care.⁸⁵⁷ To guide this updated vision, the CMS Innovation Center intends to design, implement, and evaluate future models with a focus on five strategic objectives: (i) driving accountable care; (ii) advancing health equity; (iii) supporting innovation; (iv) addressing affordability; and (v) partnering to achieve system transformation. One of the goals established by the strategic refresh was having 100 percent of traditional Medicare beneficiaries and the vast majority of Medicaid beneficiaries in accountable care relationships by 2030. This means that beneficiaries should experience longitudinal, accountable care with providers that are responsible for the quality and total cost of their care. Beneficiaries will experience accountable care relationships mostly through advanced primary care or accountable care organizations (ACOs), and these entities are expected to coordinate with or fully integrate specialty care to deliver whole-person care.

To support specialty care integration, the CMS Innovation Center released a comprehensive specialty strategy to test models and innovations supporting access to high-quality, integrated specialty care across the patient journey—both longitudinally and for procedural or acute services.⁸⁵⁸ Specialty integration cannot be achieved with a single approach

⁸⁵⁶ CMS Innovation Center's Specialty Care Strategy Listening Session (<https://www.cms.gov/priorities/innovation/media/document/spec-care-listening-session-slides>)

⁸⁵⁷ Centers for Medicare & Medicaid Services. (2021). Innovation Center Strategy Refresh. <https://www.cms.gov/priorities/innovation/strategic-direction-whitepaper>

⁸⁵⁸ The CMS Innovation Center's strategy to support person-centered, value-based specialty care | CMS. (2022). https://www.cms.gov/blog/cms-innovation-centers-strategy-support-person-centered-value-based-specialty-care#_ftn1

given a beneficiary's health needs may change influencing the types of providers and settings where they receive care. Therefore, the specialty care strategy consists of four elements: (i) enhancing specialty care performance data transparency; (ii) maintaining momentum on acute episode payment models and condition-based models; (iii) creating financial incentives within primary care for specialist engagement; and (iv) creating financial incentives for specialists to affiliate with population-based models and move to value-based care. As stated in the proposed rule, TEAM falls within the second element of the specialty care strategy and utilizes lessons learned from our experience with the BPCI Advanced model and the CJR model to design TEAM as a new episode-based payment model that would focus on accountability for quality and cost, health equity, and specialty integration. TEAM is further informed by the Episode-Based Payment Model RFI (88 FR 45872) published in July 2023, which gathered public comment on potential model design elements.

As stated in the proposed rule, TEAM represents one aspect of the specialty care strategy, and does not capture all beneficiaries, providers, and care settings to achieve complete person-centered value-based care on its own. Improving the health care system for Medicare beneficiaries requires a comprehensive approach that cannot be addressed by a single model or initiative since beneficiary health care needs are dynamic across the patient care continuum. This means TEAM would center accountability on beneficiary health care needs during narrow, focused periods of acute and post-acute care while health care needs outside of this scope would be addressed with other elements of the specialty care strategy. Therefore, we believe TEAM would complement other elements of the specialty care strategy (for example, another element of the strategy is to share TEAM-style episode data with ACOs) and would promote care transformation that generates standard care pathways and new best practices across broad patient populations (not just Medicare FFS).

The following is a summary of comments we received on the overall goals and evidence supporting the implementation of TEAM, as well as general comments about TEAM, and our responses to these comments:

Comment: Many commenters supported certain model aspects of TEAM while others supported the overarching goals of TEAM and its advancement towards greater value-based care. Some commenters were excited TEAM was built from previous bundled payment models, with a commenter noting successful participation in the CJR model and another commenter providing specific examples how episode-based payment models support medication reconciliation strategies and create incentives to address social needs. A commenter noted that TEAM will bring more hospitals into patient-first care initiatives. Another commenter applauded CMS efforts to financially incentivize performance on safety and quality across the continuum of care through payment models such as TEAM.

Response: We thank these commenters for their support of our efforts to move forward with TEAM. We are finalizing the majority of TEAM's proposals in this final rule and finalizing others with modifications. We are also not finalizing certain proposals and we may undergo notice and comment rulemaking to propose new policies in the future.

Comment: Several commenters requested CMS extend the proposed rule comment period to review TEAM proposals due to the scope and breadth of the model. Of these commenters, a commenter indicated CMS has not heeded calls for heightened engagement with providers as the model is developed and implemented and provided an example of CMS denying a comment period extension for the Episode-Based Payment Model RFI (88 FR 45872). Another commenter indicated that additional time beyond 60 days is necessary to fully evaluate and analyze these proposed policies and their full impact across the health care spectrum, especially in light of CMS proposing another hospital-based mandatory payment model just four weeks after it proposed TEAM.

Response: We acknowledge the commenters request for a comment period extension and considered the request prior to the proposed rule (89 FR 35934) comment period end date. However, we received robust comment on the proposed rule, so we believe the 60-day comment period window provided sufficient time to review TEAM proposals. This time period is consistent with comment period windows for other rules where a CMS Innovation Center model has been proposed. We had publicly signaled during the publication of the Episode-Based Payment Model RFI (88 FR 45872), that a model would be implemented via notice and comment rulemaking, and that we anticipated the model to be implemented no earlier than 2026. Given the desire to start this model in 2026, we wanted to propose TEAM in notice and comment rulemaking well in advance of model implementation to give ample time for participants to prepare for participation. We recognize that stakeholders had to review both the Medicare Program; Alternative Payment Model Updates and the Increasing Organ Transplant Access (IOTA) Model (89 FR 43518) proposed rule, and this proposed rule (89 FR 35934) including TEAM, but feel that staggered, rather than simultaneous, publication of these two proposed rules provided the public more time to review each model's policies.

We will continue to engage the public and stakeholders throughout the implementation of TEAM.

Comment: Some commenters acknowledged the goal of advancing toward more accountable and coordinated care but have overarching concerns for the implementation of TEAM. Many commenters indicated that CMS is placing too much financial risk on providers and that there is not enough opportunity for reward, especially considering the significant upfront investments required. Some commenters suggested that TEAM's focus was on reducing Medicare spending and not enough emphasis on improving patient care. Some commenters suggested TEAM not be finalized unless significant changes are implemented.

Response: We appreciate these commenters concerns, but we disagree that TEAM does not have enough emphasis on improving beneficiary care. As discussed in section X.A.3.c of the

preamble of this final rule, we purposefully selected specific quality measures for TEAM to assess patient safety, care coordination, and patient outcomes. Further, we are finalizing a referral to primary care services policy, in section X.A.3.1 of the preamble of this final rule, because we believe taking steps to link beneficiaries to primary care can lead to positive longer term health outcomes. With respect to commenters' concerns about too much financial risk, we have addressed these comments throughout the applicable sections of this final rule, including in, but not limited to, the discussions about participation tracks in section X.A.3.a.(3), and the pricing methodology in section X.A.3.d of the preamble of this final rule. In response to the commenters who suggested that TEAM not be finalized unless significant changes are implemented, we note that we are finalizing TEAM; we are finalizing some policies as proposed and we are finalizing others with modification. There are also certain proposed policies that we are not finalizing, and we will instead go through rulemaking in the future to promulgate new policies that could be finalized before the model start date.

Comment: A commenter supported the surgical nature of TEAM and looks forward to other APM options for non-surgical conditions and suggested MIPS Value Pathways or total cost of care models tailored to sepsis and Congestive Heart Failure, as these two conditions account for nearly half of all readmissions and take an extensive amount of time to cure or cover. Another commenter is supportive of CMS' efforts to increase opportunities for specialists to engage in APMs and believes episode-based payment models present an opportunity to move specialists off the FFS chassis and increase integration and coordination with broader delivery system reform efforts.

Response: We appreciate the support and agree that TEAM helps to provide opportunities for providers and suppliers to collaborate to improve quality and reduce Medicare spending for beneficiaries receiving specialty-specific care. We may consider including non-surgical (medical) episodes in TEAM in the future. We recognize that TEAM is just one aspect of the CMS Innovation Center's specialty care strategy that aims to test models and innovations that

support access to high-quality, integrated specialty care across the patient journey. We refer readers to a recently released RFI in the CY 2025 Physician Fee Schedule Notice of Proposed Rulemaking to gather public feedback on the design of a potential future model to increase the engagement of specialists in value-based care that supports the specialty care strategy.⁸⁵⁹

Comment: A couple of commenters requested that CMS separate TEAM and future models from the IPPS and other larger payment rules. Commenters specifically requested TEAM be finalized in a separate rule and future models be standalone rules with their own public notice and rulemaking.

Response: We appreciate commenters providing their request for models to be in standalone rules and may consider this request in the future. We note that there may be benefits to proposing models in larger CMS payment rules versus proposing models in standalone rules. For example, because TEAM requires select hospital participation and accountability, we assumed that by proposing and finalizing TEAM in this larger CMS payment rule that is focused on hospital policies, TEAM would capture greater public attention and feedback but also allow for efficient review since we expect most hospitals to already be reading the proposed and final rule.

Comment: A commenter suggested that CMS must provide a final rule with comment period or other avenue for public input because CMS has not specified which geographic areas will be subject to the model and it's critical that the affected hospitals have the opportunity to offer geographic and hospital-specific feedback on TEAM prior to the model's start date.

Response: We disagree that a final rule with a comment period, such as an interim final rule with comment period ("IFC"), would be appropriate for purposes of finalizing TEAM, because the proposed rule for TEAM was published May 2, 2024 (89 FR 35934) and it provided an opportunity to comment on TEAM's policies. We note that we intend to go through

⁸⁵⁹ <https://www.federalregister.gov/public-inspection/2024-14828/medicare-and-medicaid-programs-calendar-year-2025-payment-policies-under-the-physician-fee-schedule>

rulemaking in the future to address certain policies, which would allow another opportunity for the public, including hospitals that are required to participate in TEAM, to share feedback.

We acknowledge that the list of mandatory CBSA's selected for participation was not included in the proposed rule but is included in section X.A.3.a(4) of the preamble of this final rule. However, we did provide the full list of eligible CBSAs, effectively putting all hospitals located in one of the eligible CBSA's on notice for potential participation, as indicated in section X.A.3.a(4) of the preamble of the proposed rule and of this final rule. Given this notice, hospitals located within an eligible CBSA could have provided their comments, including geographic comments, during the proposed rule comment period. Further, we believe TEAM participants have sufficient time to prepare for the model start date, which is January 1, 2026. We are publishing this final rule, which includes a list of the selected mandatory CBSAs in section X.A.3.a.(4) of the preamble of this final rule, approximately 17 months prior to the beginning of the model start date.

Comment: A commenter had questioned how the outcome of other proposed changes to the IPPS contained in the Proposed Rule could affect stakeholder views on the potential impact of TEAM.

Response: We recognize the breadth of proposals included in the proposed rule (89 FR 35934) required time to review and to assess the potential impact of TEAM, especially in light of the uncertainty of whether a proposal would be finalized. However, we believe proposing TEAM in the larger IPPS payment rule provides the public with the most comprehensive set of information to gauge how an episode-based payment model could impact them in conjunction with other potential future changes to Medicare payment policy.

Comment: Some commenters suggested we did not provide sufficient information for them to assess either the impact of our proposals or the potential opportunity for improved performance for their facility. Of those commenters, a commenter indicated the scope of TEAM

is too broad and implementing TEAM would put their hospitals at greater risk of increased financial and operational challenges.

Response: We strived to notify the public of the model's proposed policies in the most comprehensive manner, while balancing the burden that can be associated with regulatory review. We believe we provided sufficient detail in the proposed rule (89 FR 35934) to assess the impact of TEAM. Specifically, our proposed rule defined the type of participant; identified the types of episode categories and eligible beneficiaries, corresponding billing codes, and included items and services; established the quality measures and process for assessment; detailed the methodology used to construct target prices and determine reconciliation payment amounts and repayment amounts; identified health equity reporting; described in detail financial arrangements and Medicare payment policy waivers; specified data sharing requirements, outlined beneficiary monitoring; and numerous other policies to help the public, and potential TEAM participants understand and assess the policies being proposed. We have also published evaluations from prior CMS episode-based payment models that informed the development of this model. While we did not provide a proposed list of hospitals that would be required to participate in the model, we did provide a list of potential CBSAs eligible for selection into TEAM, along with table that identified selection strata probabilities.

We disagree that the scope of TEAM is too broad. TEAM was designed from lessons learned from other CMS episode-based payment models that captures a similar scope and balances policies tested in either voluntary models, mandatory models, or both. For example, TEAM is testing far fewer episode categories than the BPCI Advanced model but only four more than the CJR model.

With respect to commenters concerns about participants' financial risk in TEAM, we have addressed those comments in sections X.A.3.a.(3) and X.A.3.d of the preamble of this final rule.

Comment: A couple of commenters had concerns about what CMS would learn from testing TEAM. A commenter indicated that each of the five TEAM episode categories have been previously tested and analyzed with nearly identical parameters in either in BPCI or CJR, with the salient lesson from evaluations showing the predominant way to achieve Medicare savings is to use a discounted spending benchmark (target price) to force hospitals to send patients to less intensive and less costly post-acute care settings. Another commenter requested CMS indicate what insights and lessons will be garnered from TEAM that have not already emerged through the BPCI and CJR models, particularly when these five clinical episodes have already been tested.

Response: We appreciate the commenters concerns and clarifying questions. We believe the evaluation findings from the BPCI, BPCI Advanced, and CJR models support the continued testing of episode-based payment models. Evaluation findings demonstrated that participants in these episode-based payment models generally maintained quality of care and generated savings by reducing post-acute care spending through mechanisms such as reducing institutional post-acute care length of stay.⁸⁶⁰ While TEAM builds upon lessons learned from episode-based payment models by incorporating the most promising model features, we disagree that TEAM has nearly identical parameters as previous or current episode-based payment models that have been tested in a single model. For example, the five episode categories tested in TEAM have been tested in the BPCI Advanced model, but BPCI Advanced was not a mandatory model and participants self-selected into the model and self-selected into certain clinical episode categories or clinical episode service line groups, making evaluation results much less generalizable. Likewise, the CJR model was a mandatory model for hospitals in 34 MSAs, but it only tested a single episode category. Model 2 of the BPCI initiative tested 30-day post-discharge lengths but very few awardees signed up for that post-discharge length because it was associated with a higher discount factor. We believe TEAM represents the right combination of features tested in

⁸⁶⁰ <https://www.cms.gov/priorities/innovation/data-and-reports/2022/wp-eval-synthesis-21models>

other episode-based payment models, and that if successful, TEAM could potentially be used to establish the framework for managing episodes as a standard practice in Traditional Medicare and could meet criteria to be expanded, as permitted under section 1115A(c) of the Act. Further, TEAM also includes policies and features that have not been tested in other episode-based payment models, including the requirement to refer beneficiaries to primary care services and the novel Decarbonization and Resilience Initiative.

Comment: A commenter indicated the importance of physical therapists in functional care management to promote the connection of Medicare beneficiaries to prescribed community programs that support evidence-based physical activity. A commenter also indicated that for identifying higher risk patient and for whom physical therapist-facilitated early mobilization and ongoing PT care is necessary, a basic frailty screen prior to one of the targeted procedures is recommended.

Response: We agree physical therapists can play a key role in the care management of Medicare beneficiaries. Some TEAM beneficiaries may require physical therapy services after the anchor hospitalization and anchor procedure to improve their physical abilities and functional status. To support collaboration with TEAM participants and drive improved patient outcomes, TEAM allows providers and suppliers of outpatient therapy services, therapists in a private practice, and therapy group practices to be TEAM collaborators in the model. We may also take into consideration the recommendation of including a frailty screen in the future, though we note that in other episode-based models, CMS has generally avoided imposing requirements on participants before the episode is initiated, and ultimately before they are accountable for the cost and quality of the episode. However, TEAM participants are encouraged to implement early screening or intervention for their patients.
