[CMS-1808-F]

RIN 0938-AV34

Medicare and Medicaid Programs and the Children's Health Insurance Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System and Policy Changes and Fiscal Year 2025 Rates; Quality Programs Requirements; and Other Policy Changes

AGENCY: Centers for Medicare & Medicaid Services (CMS), Department of Health and Human Services (HHS).

ACTION: Final rule.

SUMMARY: This final rule revises the Medicare hospital inpatient prospective payment systems (IPPS) for operating and capital-related costs of acute care hospitals; makes changes relating to Medicare graduate medical education (GME) for teaching hospitals; updates the payment policies and the annual payment rates for the Medicare prospective payment system (PPS) for inpatient hospital services provided by long-term care hospitals (LTCHs); and makes other policy-related changes.

DATES: With the exception of instruction 2 (§ 405.1845), instruction 29 (§ 482.42(e)) and instruction 31 (§ 485.640(d)), this final rule is effective October 1, 2024. The regulation at § 405.1845 is effective January 1, 2025. The regulations at §§482.42(e) and 485.640(d) are effective on November 1, 2024.

SUPPLEMENTARY INFORMATION:

Tables Available on the CMS Website

The IPPS tables for this fiscal year (FY) 2025 final rule are available on the CMS website at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html>. Click on the link on the left side of the screen titled “FY 2025 IPPS Final Rule Home Page” or “Acute Inpatient—Files for Download.” The LTCH PPS tables for this FY 2025 final rule are available on the CMS website at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/LongTermCareHospitalPPS/index.html> under the list item for Regulation Number CMS-1808-F. For further details on the contents of the tables referenced in this final rule, we refer readers to section VI. of the Addendum to this FY 2025 IPPS/LTCH PPS final rule.

Readers who experience any problems accessing any of the tables that are posted on the CMS websites, as previously identified, should contact Michael Treitel, DAC@cms.hhs.gov.

I. Executive Summary and Background

A. Executive Summary

1. Purpose and Legal Authority

This FY 2025 IPPS/LTCH PPS final rule makes payment and policy changes under the Medicare inpatient prospective payment system (IPPS) for operating and capital-related costs of acute care hospitals as well as for certain hospitals and hospital units excluded from the IPPS. In addition, it makes payment and policy changes for inpatient hospital services provided by long-term care hospitals (LTCHs) under the long-term care hospital prospective payment system (LTCH PPS). This final rule also makes policy changes to programs associated with Medicare IPPS hospitals, IPPS-excluded hospitals, and LTCHs. In this FY 2025 final rule, we are finalizing our proposal to continue policies to address wage index disparities impacting low wage index hospitals. We are also finalizing our proposed changes relating to Medicare graduate medical education (GME) for teaching hospitals and new technology add-on payments.

We are finalizing our proposal of a separate IPPS payment for establishing and maintaining access to essential medicines.

In the Hospital Value-Based Purchasing (VBP) Program, we are finalizing our proposal to modify scoring of the Person and Community Engagement Domain for the FY 2027 through FY 2029 program years to only score six unchanged dimensions of the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey measure, and we are finalizing our proposal to adopt the updated HCAHPS Survey measure in the Hospital VBP Program beginning with the FY 2030 program year after the updated measure has been publicly reported under the Hospital Inpatient Quality Reporting (IQR) Program for 1 year. We are also finalizing our proposal to modify scoring on the HCAHPS Survey measure beginning with the FY 2030 program year to incorporate the updated HCAHPS Survey measure into nine survey dimensions. Lastly, we provide previously and newly established performance standards for the FY 2027 through FY 2030 program years for the Hospital VBP Program.

In the Hospital IQR Program, we are finalizing our proposals to add seven new measures, with modifications to our proposal to adopt the Patient Safety Structural measure, modify two existing measures including the HCAHPS Survey measure, and remove five measures. We are also finalizing our proposed changes to the validation process for the Hospital IQR Program data. We are finalizing the proposed reporting and submission requirements for electronic clinical quality measures (eCQMs) with modifications.

In the PPS-Exempt Cancer Hospital Quality Reporting Program (PCHQR), we are finalizing the adoption of the Patient Safety Structural measure with modification beginning with the CY 2025 reporting period/FY 2027 program year. We are also finalizing our proposed changes to the HCAHPS Survey measure and our proposal to move up the start date for publicly displaying hospital performance on the Hospital Commitment to Health Equity measure.

In the LTCH Quality Reporting Program (QRP), we are finalizing our proposals to add four assessment items to the LTCH Continuity Assessment Record and Evaluation (CARE) Data Set (LCDS) and modify one assessment item on the LCDS beginning with the FY 2028 LTCH QRP. Additionally, we are finalizing our proposal to extend the admission assessment window for the LCDS beginning with the FY 2028 LTCH QRP. Finally, we summarize the feedback we received on our requests for information on future measure concepts for the LTCH QRP and a future LTCH Star Rating system.

In the Medicare Promoting Interoperability Program, we are finalizing our proposal to separate the Antimicrobial Use and Resistance (AUR) Surveillance measure into two measures, an Antimicrobial Use (AU) Surveillance measure and an Antimicrobial Resistance (AR) Surveillance measure, beginning with the electronic health record (EHR) reporting period in CY 2025. We are also finalizing the following proposals to: increase the performance-based scoring threshold from 60 points to 70 points for the EHR reporting period in CY 2025 and from 70 points to 80 points beginning with the EHR reporting period in CY 2026; adopt two new eCQMs and modify one eCQM, in alignment with the Hospital IQR Program; and change the reporting and submission requirements for eCQMs with modifications, in alignment with the Hospital IQR Program.

We proposed the creation and testing of a new mandatory alternative payment model called the Transforming Episode Accountability Model (TEAM). The intent of TEAM is to improve beneficiary care through financial accountability for episodes categories that begin with one of the following procedures: coronary artery bypass graft surgery (CABG), lower extremity joint replacement (LEJR), major bowel procedure, surgical hip/femur fracture treatment (SHFFT), and spinal fusion. TEAM will test whether financial accountability for these episode categories reduces Medicare expenditures while preserving or enhancing the quality of care for Medicare beneficiaries. We anticipated that TEAM would benefit Medicare beneficiaries

through improving the coordination of items and services paid for through Medicare fee-for-service (FFS) payments, encouraging provider investment in health care infrastructure and redesigned care processes, and incentivizing higher value care across the inpatient and post-acute care settings for the episode. We proposed to test TEAM for a 5-year model performance period, beginning January 1, 2026, and ending December 31, 2030. Under the Quality Payment Program (QPP), we anticipated that TEAM would be an Advanced Alternative Payment Model (APM) for Track 2 and Track 3 and a Merit-based Incentive Payment System (MIPS) APM for all participation tracks. We are finalizing some policies as proposed and we are finalizing others with modification. There are also certain proposed policies that we are not finalizing, and we will instead go through future rulemaking to promulgate new policies before the model start date.

We are also finalizing the proposal requiring respiratory illness reporting for hospitals and critical access hospitals as a condition of participation following the expiration of the COVID-19 public health emergency requirements.

Under various statutory authorities, we either discuss continued program implementation or make changes to the Medicare IPPS, the LTCH PPS, other related payment methodologies and programs for FY 2025 and subsequent fiscal years, and other policies and provisions included in this rule. These statutory authorities include, but are not limited to, the following:

- Section 1886(d) of the Social Security Act (the Act), which sets forth a system of payment for the operating costs of acute care hospital inpatient stays under Medicare Part A (Hospital Insurance) based on prospectively set rates. Section 1886(g) of the Act requires that, instead of paying for capital-related costs of inpatient hospital services on a reasonable cost basis, the Secretary use a prospective payment system (PPS).
- Section 1886(d)(1)(B) of the Act, which specifies that certain hospitals and hospital units are excluded from the IPPS. These hospitals and units are: rehabilitation hospitals and units; LTCHs; psychiatric hospitals and units; children's hospitals; cancer hospitals; extended

neoplastic disease care hospitals; and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa). Religious nonmedical health care institutions (RNHCIs) are also excluded from the IPPS.

- Sections 123(a) and (c) of the Balanced Budget Refinement Act of 1999 (BBRA) (Public Law (Pub. L.) 106-113) and section 307(b)(1) of the Benefits Improvement and Protection Act of 2000 (BIPA) (Pub. L. 106-554) (as codified under section 1886(m)(1) of the Act), which provide for the development and implementation of a prospective payment system for payment for inpatient hospital services of LTCHs described in section 1886(d)(1)(B)(iv) of the Act.

- Section 1814(l)(4) of the Act requires downward adjustments to the applicable percentage increase, beginning with FY 2015, for CAHs that do not successfully demonstrate meaningful use of certified electronic health record technology (CEHRT) for an EHR reporting period for a payment adjustment year.

- Section 1886(a)(4) of the Act, which specifies that costs of approved educational activities are excluded from the operating costs of inpatient hospital services. Hospitals with approved graduate medical education (GME) programs are paid for the direct costs of GME in accordance with section 1886(h) of the Act. Hospitals paid under the IPPS with approved GME programs are paid for the indirect costs of training residents in accordance with section 1886(d)(5)(B) of the Act.

- Section 1886(d)(5)(F) of the Act provides for additional Medicare IPPS payments to subsection (d) hospitals that serve a significantly disproportionate number of low-income patients. These payments are known as the Medicare disproportionate share hospital (DSH) adjustment. Section 1886(d)(5)(F) of the Act specifies the methods under which a hospital may qualify for the DSH payment adjustment.

- Section 1886(b)(3)(B)(viii) of the Act, which requires the Secretary to reduce the applicable percentage increase that would otherwise apply to the standardized amount applicable to a subsection (d) hospital for discharges occurring in a fiscal year if the hospital does not submit data on measures in a form and manner, and at a time, specified by the Secretary.

- Section 1886(b)(3)(B)(ix) of the Act, which requires downward adjustments to the applicable percentage increase, beginning with FY 2015 (and beginning with FY 2022 for subsection (d) Puerto Rico hospitals), for eligible hospitals that do not successfully demonstrate meaningful use of CEHRT for an EHR reporting period for a payment adjustment year.

- Section 1866(k) of the Act, which provides for the establishment of a quality reporting program for hospitals described in section 1886(d)(1)(B)(v) of the Act, referred to as “PPS-exempt cancer hospitals.”

- Section 1886(n) of the Act, which establishes the requirements for an eligible hospital to be treated as a meaningful EHR user of CEHRT for an EHR reporting period for a payment adjustment year or, for purposes of subsection (b)(3)(B)(ix) of the Act, for a fiscal year.

- Section 1886(o) of the Act, which requires the Secretary to establish a Hospital Value-Based Purchasing (VBP) Program, under which value-based incentive payments are made in a fiscal year to hospitals based on their performance on measures established for a performance period for such fiscal year.

- Section 1886(p) of the Act, which establishes a Hospital-Acquired Condition (HAC) Reduction Program, under which payments to applicable hospitals are adjusted to provide an incentive to reduce hospital-acquired conditions.

- Section 1886(q) of the Act, as amended by section 15002 of the 21st Century Cures Act, which establishes the Hospital Readmissions Reduction Program. Under the program, payments for discharges from an applicable hospital as defined under section 1886(d) of the Act will be reduced to account for certain excess readmissions. Section 15002 of the 21st Century

Cures Act directs the Secretary to compare hospitals with respect to the number of their Medicare-Medicaid dual-eligible beneficiaries in determining the extent of excess readmissions.

- Section 1886(r) of the Act, as added by section 3133 of the Affordable Care Act, which provides for a reduction to disproportionate share hospital (DSH) payments under section 1886(d)(5)(F) of the Act and for an additional uncompensated care payment to eligible hospitals. Specifically, section 1886(r) of the Act requires that, for fiscal year 2014 and each subsequent fiscal year, subsection (d) hospitals that would otherwise receive a DSH payment made under section 1886(d)(5)(F) of the Act will receive two separate payments: (1) 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments in section 1886(d)(5)(F) of the Act if subsection (r) did not apply (“the empirically justified amount”), and (2) an additional payment for the DSH hospital’s proportion of uncompensated care, determined as the product of three factors. These three factors are: (1) 75 percent of the payments that would otherwise be made under section 1886(d)(5)(F) of the Act, in the absence of section 1886(r) of the Act; (2) 1 minus the percent change in the percent of individuals who are uninsured; and (3) the hospital’s uncompensated care amount relative to the uncompensated care amount of all DSH hospitals expressed as a percentage.

- Section 1886(m)(5) of the Act, which requires the Secretary to reduce by 2 percentage points the annual update to the standard Federal rate for discharges for a long-term care hospital (LTCH) during the rate year for LTCHs that do not submit data on quality measures in the form, manner, and at a time, specified by the Secretary.

- Section 1886(m)(6) of the Act, as added by section 1206(a)(1) of the Pathway for Sustainable Growth Rate (SGR) Reform Act of 2013 (Pub. L. 113-67) and amended by section 51005(a) of the Bipartisan Budget Act of 2018 (Pub. L. 115-123), which provided for the establishment of site neutral payment rate criteria under the LTCH PPS, with implementation beginning in FY 2016. Section 51005(b) of the Bipartisan Budget Act of 2018 amended section

1886(m)(6)(B) by adding new clause (iv), which specifies that the IPPS comparable amount defined in clause (ii)(I) shall be reduced by 4.6 percent for FYs 2018 through 2026.

- Section 1899B of the Act, which provides for the establishment of standardized data reporting for certain post-acute care providers, including LTCHs.

- Section 1115A of the Act authorizes the testing of innovative payment and service delivery models that preserve or enhance the quality of care furnished to Medicare, Medicaid, and Children's Health Insurance Program (CHIP) beneficiaries while reducing program expenditures.

- Sections 1866 and 1902 of the Act, which requires providers of services seeking to participate in the Medicare or Medicaid program, or both, to enter into an agreement with the Secretary or the state Medicaid agency, as appropriate. Hospitals (all hospitals to which the requirements of 42 CFR part 482 apply, including short-term acute care hospitals, LTC hospitals, rehabilitation hospitals, psychiatric hospitals, cancer hospitals, and children's hospitals) and critical access hospitals (CAHs) seeking to be Medicare and Medicaid providers of services under 42 CFR part 485, subpart F, must be certified as meeting Federal participation requirements (conditions of participation (CoPs) and conditions for coverage (CfCs)). Section 1861(e) of the Act provides the patient health and safety protections established by the Secretary for hospital CoPs. Section 1820(e) of the Act provides similar authority for CAHs.

2. Summary of the Major Provisions

The following is a summary of the major provisions in this final rule. In general, these major provisions are being finalized as part of the annual update to the payment policies and payment rates, consistent with the applicable statutory provisions. A general summary of the changes in this final rule is presented in section I.D. of the preamble of this final rule.

a. Continuation of the Low Wage Index Hospital Policy

To help mitigate growing wage index disparities between high wage and low wage hospitals, in the FY 2020 IPPS/LTCH PPS rule (84 FR 42326 through 42332), we adopted a

policy to increase the wage index values for certain hospitals with low wage index values (the low wage index hospital policy). This policy was adopted in a budget neutral manner through an adjustment applied to the standardized amounts for all hospitals. We indicated our intention that this policy would be effective for at least 4 years, beginning in FY 2020, in order to allow employee compensation increases implemented by these hospitals sufficient time to be reflected in the wage index calculation. As discussed in section III.G.5. of the preamble of this final rule, while we are using the FY 2021 cost report data for the FY 2025 wage index, we are unable to comprehensively evaluate the effect, if any, the low wage index hospital policy had on hospitals' wage increases during the years the COVID-19 public health emergency (PHE) was in effect. We believe it is necessary to wait until we have useable data from fiscal years after the PHE before reaching any conclusions about the efficacy of the policy. Therefore, after consideration of public comments, we are finalizing our proposal that the low wage index hospital policy and the related budget neutrality adjustment would be effective for at least 3 more years, beginning in FY 2025.

b. Separate IPPS Payment for Establishing and Maintaining Access to Essential Medicines

As discussed in section V.J. of the preamble of this final rule, the Biden-Harris administration has made it a priority to strengthen the resilience of medical supply chains and support reliable access to products for public health, including through prevention and mitigation of medical product shortages. As a first step in this initiative, we proposed to establish a separate payment for small, independent hospitals for the IPPS shares of the additional resource costs to voluntarily establish and maintain a 6-month buffer stock of one or more of 86 essential medicines, either directly or through contractual arrangements with a pharmaceutical manufacturer, distributor, or intermediary. For the purposes of this policy, eligibility is limited to small, independent hospitals as hospitals with 100 beds or fewer that are not part of a chain organization. We are finalizing our proposal to make this separate payment in a non-budget neutral manner under section 1886(d)(5)(I) of the Act. We are also finalizing our proposal that

the payment adjustments would commence for cost reporting periods beginning on or after October 1, 2024.

c. DSH Payment Adjustment, Additional Payment for Uncompensated Care, and Supplemental Payment

Under section 1886(r) of the Act, which was added by section 3133 of the Affordable Care Act, starting in FY 2014, Medicare disproportionate share hospitals (DSHs) receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments in section 1886(d)(5)(F) of the Act. The remaining amount, equal to 75 percent of the amount that would have been paid as Medicare DSH payments under section 1886(d)(5)(F) of the Act if subsection (r) did not apply, is paid as additional payments after the amount is reduced for changes in the percentage of individuals that are uninsured. Each Medicare DSH that has uncompensated care will receive an additional payment based on its share of the total amount of uncompensated care for all Medicare DSHs for a given time period. This additional payment is known as the uncompensated care payment.

In this final rule, we are finalizing the proposed update to our estimates of the three factors used to determine uncompensated care payments for FY 2025. We also proposed to continue to use uninsured estimates produced by CMS' Office of the Actuary (OACT) as part of the development of the National Health Expenditure Accounts (NHEA) in conjunction with more recently available data in the calculation of Factor 2, and we are finalizing this approach. Consistent with the regulation at § 412.106(g)(1)(iii)(C)(II), which was adopted in the FY 2023 IPPS/LTCH PPS final rule, for FY 2025, we will use the 3 most recent years of audited data on uncompensated care costs from Worksheet S-10 of the FY 2019, FY 2020, and FY 2021 cost reports to calculate Factor 3 in the uncompensated care payment methodology for all eligible hospitals.

Beginning with FY 2023 (87 FR 49047 through 49051), we also established a supplemental payment for IHS and Tribal hospitals and hospitals located in Puerto Rico. In

section IV.D. of the preamble of this final rule, we summarized the ongoing methodology for supplemental payments.

In this final rule, we are finalizing our proposal to calculate the per-discharge amount for interim uncompensated care payments for FY 2025 and subsequent fiscal years with modification. Specifically, for FY 2025, we will calculate the per-discharge amount for interim uncompensated care payments using the average of the most recent 2 years of discharge data. In light of the commenters' concerns regarding a trend of decreasing discharge volume and possible overestimation of discharges in recent years, we believe that, on balance, omitting FY 2021 data from the calculation of interim uncompensated care payments is likely to more accurately estimate FY 2025 discharges. Therefore, we are finalizing our proposal with modification. We are modifying the text of § 412.106(i)(1) to state that for FY 2025, interim uncompensated care payments will be calculated based on an average of the most recent 2 years of available historical discharge data, and, consistent with the proposed rule,, interim uncompensated care payments for FY 2026 and subsequent fiscal years will be calculated based on an average of the most recent 3 years of available historical discharge data.

d. Adoption of the Patient Safety Structural Measure in the Hospital IQR Program and PCHQR Program

The Patient Safety Structural measure is an attestation-based measure that assesses whether hospitals have a structure and culture that prioritizes safety as demonstrated by the following five domains: (1) leadership commitment to eliminating preventable harm; (2) strategic planning and organizational policy; (3) culture of safety and learning health system; (4) accountability and transparency; and (5) patient and family engagement. Hospitals will attest to whether they engage in specific evidence-based best practices within each of these domains to achieve a score from zero to five out of five points. We proposed that hospitals would be required to report this measure beginning with the CY 2025 reporting period/FY 2027 program year for the PCHQR Program and for the CY 2025 reporting period/FY 2027 payment

determination for the Hospital IQR Program. We are finalizing this proposal, with a modification to one of the domains.

e. Updated Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey Measure in the Hospital IQR Program, Hospital VBP Program, and PCHQR Program

The updated version of the HCAHPS Survey measure aligns with the National Quality Strategy goal to bring patient voices to the forefront by incorporating feedback from patients and caregivers. We proposed that the updated HCAHPS Survey measure would be adopted for the Hospital IQR and PCHQR Programs beginning with the CY 2025 reporting period/FY 2027 payment determination and the CY 2025 reporting period/FY 2027 program year, respectively. For the Hospital VBP Program, we proposed to modify scoring on the Person and Community Engagement Domain for the FY 2027 through FY 2029 program years to only score the six dimensions of the HCAHPS Survey measure that would remain unchanged from the current version of the survey. We proposed to adopt the updated HCAHPS Survey measure beginning with the FY 2030 program year, which would result in nine HCAHPS Survey measure dimensions for the Person and Community Engagement Domain. We also proposed to modify scoring of the Person and Community Engagement Domain beginning with the FY 2030 program year to account for the proposed updates to the HCAHPS Survey measure. We are finalizing all of these proposals.

f. Hospital Value-Based Purchasing (VBP) Program

Section 1886(o) of the Act requires the Secretary to establish a Hospital VBP Program under which value-based incentive payments are made in a fiscal year to hospitals based on their performance on measures established for a performance period for such fiscal year. We proposed to modify scoring on the Person and Community Engagement Domain for the FY 2027 through FY 2029 program years while the updated HCAHPS Survey measure would be publicly reported under the Hospital IQR Program. In addition, we proposed to adopt the updated HCAHPS Survey measure beginning with the FY 2030 program year and modify scoring

beginning with the FY 2030 program year to account for the updated HCAHPS Survey measure.

We are finalizing these proposals.

g. Hospital Inpatient Quality Reporting (IQR) Program

Under section 1886(b)(3)(B)(viii) of the Act, subsection (d) hospitals are required to report data on measures selected by the Secretary for a fiscal year in order to receive the full annual percentage increase. In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed several changes to the Hospital IQR Program. We proposed the adoption of seven new measures: (1) Patient Safety Structural measure beginning with the CY 2025 reporting period/FY 2027 payment determination; (2) Age Friendly Hospital measure beginning with the CY 2025 reporting period/FY 2027 payment determination; (3) Catheter-Associated Urinary Tract Infection (CAUTI) Standardized Infection Ratio Stratified for Oncology Locations beginning with the CY 2026 reporting period/FY 2028 payment determination; (4) Central Line-Associated Bloodstream Infection (CLABSI) Standardized Infection Ratio Stratified for Oncology Locations beginning with the CY 2026 reporting period/FY 2028 payment determination; (5) Hospital Harm - Falls with Injury eCQM beginning with the CY 2026 reporting period/FY 2028 payment determination; (6) Hospital Harm - Postoperative Respiratory Failure eCQM beginning with the CY 2026 reporting period/FY 2028 payment determination; and (7) Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications (Failure-to-Rescue) measure beginning with the July 1, 2023 – June 30, 2025 reporting period/FY 2027 payment determination. We also proposed refinements to two measures currently in the Hospital IQR Program measure set: (1) Global Malnutrition Composite Score (GMCS) eCQM, beginning with the CY 2026 reporting period/FY 2028 payment determination; and (2) the HCAHPS Survey beginning with the CY 2025 reporting period/FY 2027 payment determination. In addition, we proposed the removal of five measures: (1) Death Among Surgical Inpatients with Serious Treatable Complications (CMS PSI 04) measure beginning with the July 1, 2023 – June 30, 2025 reporting period/FY 27 payment determination; (2) Hospital-

level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI) measure beginning with the July 1, 2021 – June 30, 2024 reporting period/ FY 2026 payment determination; (3) Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Heart Failure (HF) measure beginning with the July 1, 2021 – June 30, 2024 reporting period/FY 2026 payment determination; (4) Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Pneumonia (PN) measure beginning with July 1, 2021 – June 30, 2024 reporting period/FY 2026 payment determination, and (5) Hospital-level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) measure beginning with the April 1, 2021 – March 31, 2024 reporting period/FY 2026 payment determination. We are finalizing all of these proposals as proposed with the exception of the Patient Safety Structural measure, which we are finalizing with modifications.

Lastly, we proposed to modify eCQM data reporting and submission requirements by proposing a progressive increase in the number of mandatory eCQMs a hospital would be required to report on beginning with the CY 2026 reporting period/FY 2028 payment determination. We also proposed two changes to current policies related to validation of hospital data: (1) to implement eCQM validation scoring based on the accuracy of eCQM data beginning with the validation of CY 2025 eCQM data affecting the FY 2028 payment determination; and (2) modification of the data validation reconsideration request requirements to make medical records submission optional for reconsideration requests beginning with CY 2023 discharges/FY 2026 payment determination. We are finalizing all of these proposals as proposed with the exception of the proposed progressive increase in the number of mandatory eCQMs, which we are finalizing with modifications.

h. PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

Section 1866(k)(1) of the Act requires, for purposes of FY 2014 and each subsequent fiscal year, that a hospital described in section 1886(d)(1)(B)(v) of the Act (a PPS-exempt cancer hospital, or a PCH) submit data in accordance with section 1866(k)(2) of the Act with respect to such fiscal year. In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed the following:

- To adopt the Patient Safety Structural measure beginning with the CY 2025 reporting period/FY 2027 program year.
- To modify the HCAHPS Survey measure beginning with the CY 2025 reporting period/FY 2027 program year.
- To move up the start date for publicly displaying hospital performance on the Hospital Commitment to Health Equity measure from July 2026 to January 2026 or as soon as feasible thereafter.

We are finalizing all of these proposals as proposed with the exception of the Patient Safety Structural measure, which we are finalizing with modifications.

i. Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

We proposed and are finalizing the following changes to the LTCH QRP: (1) add four assessment items to the LCDS beginning with the FY 2028 LTCH QRP; (2) modify one item on the LCDS beginning with the FY 2028 LTCH QRP; and (3) extend the admission assessment window for the LCDS from 3 days to 4 days beginning with the FY 2028 LTCH QRP. We also summarize the feedback we received on requests for information in the proposed rule on future measure concepts for the LTCH QRP and a future LTCH Star Rating system.

j. Medicare Promoting Interoperability Program

In section X.F. of the preamble of the proposed rule, we proposed several changes to the Medicare Promoting Interoperability Program. Specifically, we proposed: (1) to separate the Antimicrobial Use and Resistance (AUR) Surveillance measure into two measures, an Antimicrobial Use (AU) Surveillance measure and an Antimicrobial Resistance (AR) Surveillance measure, beginning with the EHR reporting period in CY 2025; to add a new

exclusion for eligible hospitals or critical access hospitals (CAHs) that do not have a data source containing the minimal discrete data elements that are required for AU or AR Surveillance reporting; to modify the existing exclusions for the AUR Surveillance measure to apply to the proposed AU Surveillance and AR Surveillance measures, respectively; and to treat the AU Surveillance and AR Surveillance measures as new measures with respect to active engagement beginning with the EHR reporting period in CY 2025; (2) to increase the performance-based scoring threshold for eligible hospitals and CAHs reporting under the Medicare Promoting Interoperability Program from 60 points to 80 points beginning with the EHR reporting period in CY 2025; (3) to adopt two new eQMs that hospitals can select as one of their three self-selected eQMs beginning with the CY 2026 reporting period: the Hospital Harm – Falls with Injury eQm and the Hospital Harm – Postoperative Respiratory Failure eQm; (4) beginning with the CY 2026 reporting period, to modify one eQm, the Global Malnutrition Composite Score eQm; and (5) to modify eQm data reporting and submission requirements by proposing a progressive increase in the number of mandatory eQMs eligible hospitals and CAHs would be required to report on beginning with the CY 2026 reporting period. We are finalizing all proposals as proposed, with the exception of our proposals to increase the performance-based scoring threshold for eligible hospitals and CAHs, and to progressively increase the number of mandatory eQMs required for reporting, which we are finalizing with modification. We are finalizing, with modification, an increase to the performance-based scoring threshold for eligible hospitals and CAHs from 60 points to 70 points for the EHR reporting period in CY 2025 and from 70 points to 80 points beginning with the EHR reporting period in CY 2026, and finalizing, with modification, the regulatory text accordingly. We are also finalizing, with modification, our proposal to increase the eQm reporting requirements in the Medicare Promoting Interoperability Program for the CY 2026, CY 2027, CY 2028, and subsequent years' reporting periods. Specifically, eligible hospitals and CAHs will be required to report a total of eight eQMs for the CY 2026 reporting period, a total of nine eQMs for the

CY 2027 reporting period, and a total of eleven eQMs beginning with the CY 2028 reporting period.

k. Proposed Distribution of Additional Residency Positions Under the Provisions of Section 4122 of Subtitle C of the Consolidated Appropriations Act, 2023 (CAA, 2023)

In the proposed rule, we included a proposal to implement section 4122 of the CAA, 2023. Section 4122(a) of the CAA, 2023, amended section 1886(h) of the Act by adding a new section 1886(h)(10) of the Act requiring the distribution of additional residency positions (also referred to as slots) to hospitals. After consideration of public comments, we are finalizing this proposal, with minor modifications. We refer readers to section V.F.2. of the preamble of this final rule for a summary of the provisions of section 4122 of the CAA, 2023 that we are implementing in this final rule.

l. Extension of the Medicare-dependent, Small Rural Hospital (MDH) Program and the Temporary Changes to the Low-Volume Hospital Payment Adjustment

The Consolidated Appropriations Act, 2024 (CAA, 2024) (Pub. L. 118-42), enacted on March 9, 2024, extended the MDH program and the temporary changes to the low-volume hospital qualifying criteria and payment adjustment under the IPPS for a portion of FY 2025. Specifically, section 306 of the CAA, 2024, further extended the modified definition of low-volume hospital and the methodology for calculating the payment adjustment for low-volume hospitals under section 1886(d)(12) of the Act through December 31, 2024. Section 307 of the CAA, 2024, extended the MDH program under section 1886(d)(5)(G) of the Act through December 31, 2024. Prior to enactment of the CAA, 2024, the low-volume hospital qualifying criteria and payment adjustment were set to revert to the statutory requirements that were in effect prior to FY 2011 at the end of FY 2024 and beginning October 1, 2024, the MDH program would have no longer been in effect.

We recognize the importance of these extensions with respect to the goal of advancing health equity by addressing the health disparities that underlie the health system is one of CMS'

strategic pillars¹ and a Biden-Harris Administration priority.² These provisions are projected to increase payments to IPPS hospitals by approximately \$137 million in FY 2025.

m. Transforming Episode Accountability Model (TEAM)

As discussed in section X.A. of the preamble of this final rule, we are finalizing the Transforming Episode Accountability Model (TEAM). TEAM will be a 5-year mandatory model tested under the authority of section 1115A of the Act, beginning on January 1, 2026, and ending on December 31, 2030. The intent of TEAM is to improve beneficiary care through financial accountability for episode categories that begin with one of the following procedures: coronary artery bypass graft surgery (CABG), lower extremity joint replacement (LEJR), major bowel procedure, surgical hip/femur fracture treatment (SHFFT), and spinal fusion. TEAM will test whether financial accountability for these episode categories reduces Medicare expenditures while preserving or enhancing the quality of care for Medicare beneficiaries.

Under Traditional Medicare, Medicare makes separate payments to providers and suppliers for the items and services furnished to a beneficiary over the course of an episode of care. Because providers and suppliers are paid for each individual item or service delivered, providers may not be incentivized to invest in quality improvement and care coordination activities. As a result, care may be fragmented, unnecessary, or duplicative. By holding hospitals accountable for all items and services provided during an episode, providers would be better incentivized to coordinate patient care, avoid duplicative or unnecessary services, and improve the beneficiary care experience during care transitions.

Under TEAM, all acute care hospitals, with limited exceptions, located within the mandatory Core-Based Statistical Areas (CBSAs) that CMS selected for model implementation will be required to participate in TEAM. CMS will allow a one-time opportunity for hospitals that participate until the last day of the last performance period in the BPCI Advanced model or

¹ <https://www.cms.gov/about-cms/what-we-do/cms-strategic-plan>.

² <https://www.whitehouse.gov/priorities/>.

the last day of the last performance year of the CJR model, that are not located in a mandatory CBSA selected for TEAM participation to voluntarily opt into TEAM.³ TEAM will have a 1-year glide path opportunity for all TEAM participants and a 3-year glide path opportunity for TEAM participants that are safety net hospitals, which will allow TEAM participants to ease into full financial risk. Episodes will include non-excluded Medicare Parts A and B items and services and would begin with an anchor hospitalization or anchor procedure and will end 30 days after hospital discharge. The following episode categories, when furnished by a TEAM participant, will initiate an episode in TEAM: lower extremity joint replacement, surgical hip femur fracture treatment, spinal fusion, coronary artery bypass graft, and major bowel procedure.

TEAM participants will continue to bill Medicare FFS as usual but will receive target prices for episodes prior to each performance year. Target prices will be based on 3 years of baseline data, prospectively trended forward to the relevant performance year, and calculated at the level of MS-DRG/HCPCS episode type and region. Target prices will also include a discount factor, normalization factor, retrospective trend adjustment factor, and beneficiary and provider level risk-adjustment. Performance in the model will be assessed by comparing TEAM participants' actual Medicare FFS spending during a performance year to their reconciliation target price as well as by performance on three quality measures. TEAM participants will earn a payment from CMS, subject to a quality performance adjustment, if their spending is below the reconciliation target price. TEAM participants will owe CMS a repayment amount, subject to a quality performance adjustment, if their spending is above the reconciliation target price. In section X.A. of the preamble of this final rule some policies as proposed, and we are finalizing others with modification. There are also certain proposed policies that we are not finalizing, and we will instead go through rulemaking in the future to promulgate new policies before the model start date.

³ For the BPCI Advanced model, the last day of the last performance period is December 31, 2025. For the CJR model, the last day of the last performance year is December 31, 2024.

n. Maternity Care Request for Information (RFI)

In alignment with the Biden-Harris Administration's commitment to addressing the maternal health crisis, this RFI sought to gather information on differences between hospital resources required to provide inpatient pregnancy and childbirth services to Medicare patients as compared to non-Medicare patients. To the extent that the resources required differ between patient populations, we also wanted to gather information on the extent to which non-Medicare payers, or other commercial insurers may be using the IPPS as a basis for determining their payment rates for inpatient pregnancy and childbirth services and the effect, if any, that the use of the IPPS as a basis for determining payment by those payers may have on maternal health outcomes. We summarize the comments received in section X.C. of the preamble of this final rule.

o. Conditions of Participation Requirements for Hospitals and Critical Access Hospitals to Report Acute Respiratory Illnesses

In section X.F. of the preamble of the proposed rule, we proposed to update the hospital and CAH infection prevention and control and antibiotic stewardship programs conditions of participation (CoPs) to extend a limited subset of the current COVID-19 and influenza data reporting requirements. These proposed reporting requirements ensure that hospitals and CAHs have appropriate insight related to evolving infection control needs. Specifically, we proposed to replace the COVID-19 and Seasonal Influenza reporting standards for hospitals and CAHs with a new standard addressing acute respiratory illnesses to require that, beginning on October 1, 2024, hospitals and CAHs would have to electronically report information about COVID-19, influenza, and RSV. We also proposed that outside of a public health emergency (PHE), hospitals and CAHs would have to report these data on a weekly basis. In section X.F. of the preamble of this final rule, we are finalizing these proposals with revisions.

p. Changes to the Severity Level Designation for Z Codes Describing Inadequate Housing and Housing Instability

As discussed in section II.C. of the preamble of this final rule, we are finalizing the proposed change to the severity level designation for the social determinants of health (SDOH) diagnosis codes describing inadequate housing and housing instability from non-complication or comorbidity (NonCC) to complication or comorbidity (CC) for FY 2025. Consistent with our annual updates to account for changes in resource consumption, treatment patterns, and the clinical characteristics of patients, we recognize inadequate housing and housing instability as indicators of increased resource utilization in the acute inpatient hospital setting.

Consistent with the Administration’s goal of advancing health equity for all, including members of historically underserved and under-resourced communities, as described in the President’s January 20, 2021 Executive Order 13985 on “Advancing Racial Equity and Support for Underserved Communities Through the Federal Government,”^[1] we also continue to be interested in receiving feedback on how we might further foster the documentation and reporting of the diagnosis codes describing social and economic circumstances to more accurately reflect each health care encounter and improve the reliability and validity of the coded data including in support of efforts to advance health equity.

3. Summary of Costs, Transfers, Savings, and Benefits

The following table provides a summary of the costs, transfers, savings, and benefits associated with the major provisions described in section I.A.2. of the preamble of this final rule.

^[1] Available at 86 FR 7009 (January 25, 2021) (<https://www.federalregister.gov/documents/2021/01/25/2021-01753/advancing-racial-equity-and-support-for-underserved-communities-through-the-federal-government>).

Provision Description	Description of Costs, Transfers, Savings, and Benefits
Continuation of the Low Wage Index Hospital Policy	We are finalizing our proposal to continue the low wage index hospital policy and the related budget neutrality adjustment for at least 3 years beginning in FY 2025.
Separate IPPS Payment for Establishing and Maintaining Access to Essential Medicines	We are finalizing our proposal to make an IPPS payment adjustment for the additional resource costs that small, independent hospitals incur in establishing and maintaining access to a 6-month buffer stock of one or more essential medicine(s) beginning in FY 2025. This payment adjustment will not be budget neutral. We estimated that approximately 500 hospitals would qualify under our policy. We estimate that the cost to those hospitals to establish buffer stocks of essential medicines would, in aggregate summed across all 500 hospitals, be approximately \$2.8 million. Under this provision, Medicare will pay its share of those costs (approximately 11 percent of that amount, or \$0.3 million).
Uncompensated Care Payments	For FY 2025, we are finalizing the proposed updates to our estimates of the three factors used to determine uncompensated care payments. We are continuing to use uninsured estimates produced by OACT as part of the development of the NHEA in the calculation of Factor 2. As provided in the regulation at § 412.106(g)(1)(iii)(C)(11), for FY 2025, we are using the 3 most recent years of audited data on uncompensated care costs from Worksheet S-10 of the FY 2019, FY 2020, and FY 2021 cost reports to calculate Factor 3 in the uncompensated care payment methodology for all eligible hospitals.
Update to the IPPS Payment Rates and Other Payment Policies	As discussed in Appendix A of this final rule, acute care hospitals are estimated to experience an increase of approximately \$3.2 billion in FY 2025, primarily driven by the changes in FY 2025 operating payments and capital payments and the expiration of the temporary changes in the low-volume hospital program and the expiration of the MDH program on January 1, 2025.
Update to the LTCH PPS Payment Rates and Other Payment Policies	As discussed in Appendix A of this final rule, based on the best available data for the 331 LTCHs in our database, we estimated that the changes to the payment rates and factors that we presented in the preamble of and Addendum of this final rule, which reflect the update to the LTCH PPS standard Federal payment rate for FY 2025, would result in an estimated increase in payments in FY 2025 of approximately \$58 million.
Distribution of Additional Residency Positions Under the Provisions of Section 4122 of Subtitle C of the Consolidated Appropriations Act, 2023 (CAA, 2023)	Section 4122(a) of the CAA, 2023 amended section 1886(h) of the Act by adding a new paragraph 1886(h)(10) requiring the distribution of additional residency positions (also referred to as slots) to hospitals. We refer readers to section V.J.2. of the preamble of this final rule for a summary of the provisions of section 4122 of the CAA, 2023 that we are implementing in this final rule. We estimate that the provisions we present in the preamble of this final rule to implement section 4122 of the CAA, 2023 will result in an estimated cost of approximately \$10 million for FY 2026.
Updates to the Hospital VBP Program	We estimated that there will be no net financial impact to the Hospital VBP Program for the FY 2025 program year in the aggregate because, by law, the amount available for value-based incentive payments under the program in a given year must be equal to the total amount of base operating MS-DRG payment amount reductions for that year, as estimated by the Secretary. The estimated amount of base operating MS-DRG payment amount reductions for the FY 2025 program year and, therefore, the estimated amount available for value-based incentive payments for FY 2025 discharges is approximately \$1.67 billion.
Changes to the Hospital IQR Program	Across 3,050 IPPS hospitals, we estimate that our changes for the Hospital IQR Program will result in a total information collection burden increase of 40,160 hours at a cost increase of \$1,282,329 associated with our policies across a 4-year period from the CY 2025 reporting period/FY 2027 payment determination through the CY 2028 reporting period/FY 2030 payment determination.
Changes to the PCHQR Program	Across 11 PCHs, we estimated that our changes for the PCHQR Program will result in a total information collection burden increase of 166 hours at a cost increase of \$4,047 beginning with the CY 2025 reporting period/FY 2027 program year.

Provision Description	Description of Costs, Transfers, Savings, and Benefits
Changes to the LTCH QRP	Across 330 LTCHs, we estimated that our proposed changes for the LTCH QRP would result in a total information collection burden increase of 2,177 hours associated with our policies and updated burden estimates and a total cost increase of approximately \$138,231.88 for the FY 2028 LTCH QRP.
Changes to the Medicare Promoting Interoperability Program	Across 4,550 eligible hospitals and CAHs, we estimated that our changes for the Medicare Promoting Interoperability Program will result in an increase of 5,038 hours at a cost increase of \$262,581 to the information collection burden for the EHR reporting period in CY 2028 and subsequent years.
Transforming Episode Accountability Model (TEAM)	We estimated that testing TEAM will result in saving the Medicare program \$481 million across the 5 performance years.
CoP Requirements for Hospitals and CAHs to Report Acute Respiratory Illnesses	Across 6,384 hospitals and CAHs, we estimate that our changes will result in 248,976 hours and a total cost of \$19,420,128 for the weekly reporting, which is \$3,042 per facility yearly. We estimate for PHE reporting, if declared by the Secretary, low to high hours range 1,005,480 to 3,495,240 and total cost ranging from \$ 78,427,440 to \$ 272,628,720 depending on the frequency of reporting required.
Changes for the Add-On Payments for New Services and Technologies	We are changing the April 1 cutoff to October 1 for determining whether a technology would be within its 2- to 3-year newness period. Under the assumption that all of the FY 2025 new technology add-on payment applications that have been FDA-approved or -cleared or have a documented delay in market availability between October 1, 2023 and March 30, 2024 (as discussed in section II.E.5. and section II.E.6. of the preamble of this final rule), and that are first approved for new technology add-on payments in FY 2025, would continue to meet the specified criteria for new technology add-on payments for FY 2026 and FY 2027, based on information from the applicants at the time of this final rule, this change will increase IPPS spending by approximately \$459 million in FY 2027. Also, we will no longer consider a hold status to be an inactive status for the purposes of eligibility for the new technology add-on payment. We note that the cost impact of this provision is not estimable. We expect that some applicants who were ineligible in FY 2025 may apply for new technology add-on payments for FY 2026. Finally, for certain gene therapies indicated for and used in the treatment of sickle cell disease, we are temporarily increasing the new technology add-on payment percentage to 75 percent. We estimate that for the two gene therapy technologies that are approved for new technology add-on payments in this final rule that are indicated and used specifically for the treatment of SCD (as discussed in section II.E.5. of the preamble of this final rule), these changes to the calculation of the inpatient new technology add-on payment will increase IPPS spending by approximately \$38 million in FY 2025.

B. Background Summary

1. Acute Care Hospital Inpatient Prospective Payment System (IPPS)

Section 1886(d) of the Act sets forth a system of payment for the operating costs of acute care hospital inpatient stays under Medicare Part A (Hospital Insurance) based on prospectively set rates. Section 1886(g) of the Act requires the Secretary to use a prospective payment system (PPS) to pay for the capital-related costs of inpatient hospital services for these “subsection (d) hospitals.” Under these PPSs, Medicare payment for hospital inpatient operating and capital-related costs is made at predetermined, specific rates for each hospital discharge. Discharges are classified according to a list of diagnosis-related groups (DRGs).

The base payment rate is comprised of a standardized amount that is divided into a labor-related share and a nonlabor-related share. The labor-related share is adjusted by the wage index applicable to the area where the hospital is located. If the hospital is located in Alaska or Hawaii, the nonlabor-related share is adjusted by a cost-of-living adjustment factor. This base payment rate is multiplied by the DRG relative weight.

If the hospital treats a high percentage of certain low-income patients, it receives a percentage add-on payment applied to the DRG-adjusted base payment rate. This add-on payment, known as the disproportionate share hospital (DSH) adjustment, provides for a percentage increase in Medicare payments to hospitals that qualify under either of two statutory formulas designed to identify hospitals that serve a disproportionate share of low-income patients. For qualifying hospitals, the amount of this adjustment varies based on the outcome of the statutory calculations. The Affordable Care Act revised the Medicare DSH payment methodology and provides for an additional Medicare payment beginning on October 1, 2013, that considers the amount of uncompensated care furnished by the hospital relative to all other qualifying hospitals.

If the hospital is training residents in an approved residency program(s), it receives a percentage add-on payment for each case paid under the IPPS, known as the indirect medical education (IME) adjustment. This percentage varies, depending on the ratio of residents to beds.

Additional payments may be made for cases that involve new technologies or medical services that have been approved for special add-on payments. In general, to qualify, a new technology or medical service must demonstrate that it is a substantial clinical improvement over technologies or services otherwise available, and that, absent an add-on payment, it would be inadequately paid under the regular DRG payment. In addition, certain transformative new devices and certain antimicrobial products may qualify under an alternative inpatient new technology add-on payment pathway by demonstrating that, absent an add-on payment, they would be inadequately paid under the regular DRG payment.

The costs incurred by the hospital for a case are evaluated to determine whether the hospital is eligible for an additional payment as an outlier case. This additional payment is designed to protect the hospital from large financial losses due to unusually expensive cases. Any eligible outlier payment is added to the DRG-adjusted base payment rate, plus any DSH, IME, and new technology or medical service add-on adjustments and, beginning in FY 2023 for IHS and Tribal hospitals and hospitals located in Puerto Rico, the new supplemental payment.

Although payments to most hospitals under the IPPS are made on the basis of the standardized amounts, some categories of hospitals are paid in whole or in part based on their hospital-specific rate, which is determined from their costs in a base year. For example, sole community hospitals (SCHs) receive the higher of a hospital-specific rate based on their costs in a base year (the highest of FY 1982, FY 1987, FY 1996, or FY 2006) or the IPPS Federal rate based on the standardized amount. SCHs are the sole source of care in their areas. Specifically, section 1886(d)(5)(D)(iii) of the Act defines an SCH as a hospital that is located more than 35 road miles from another hospital or that, by reason of factors such as an isolated location, weather conditions, travel conditions, or absence of other like hospitals (as determined by the

Secretary), is the sole source of hospital inpatient services reasonably available to Medicare beneficiaries. In addition, certain rural hospitals previously designated by the Secretary as essential access community hospitals are considered SCHs.

With the recent enactment of section 307 of the CAA, 2024, under current law, the Medicare-dependent, small rural hospital (MDH) program is effective through December 31, 2024. For discharges occurring on or after October 1, 2007, but before January 1, 2025, an MDH receives the higher of the Federal rate or the Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the highest of its FY 1982, FY 1987, or FY 2002 hospital-specific rate. MDHs are a major source of care for Medicare beneficiaries in their areas. Section 1886(d)(5)(G)(iv) of the Act defines an MDH as a hospital that is located in a rural area (or, as amended by the Bipartisan Budget Act of 2018, a hospital located in a State with no rural area that meets certain statutory criteria), has not more than 100 beds, is not an SCH, and has a high percentage of Medicare discharges (not less than 60 percent of its inpatient days or discharges in its cost reporting year beginning in FY 1987 or in two of its three most recently settled Medicare cost reporting years). As section 307 of the CAA, 2024, extended the MDH program through the first quarter of FY 2025 only, beginning on January 1, 2025, the MDH program will no longer be in effect absent a change in law. Because the MDH program is not authorized by statute beyond December 31, 2024, beginning January 1, 2025, all hospitals that previously qualified for MDH status under section 1886(d)(5)(G) of the Act will no longer have MDH status and will be paid based on the IPPS Federal rate.

Section 1886(g) of the Act requires the Secretary to pay for the capital-related costs of inpatient hospital services in accordance with a prospective payment system established by the Secretary. The basic methodology for determining capital prospective payments is set forth in our regulations at 42 CFR 412.308 and 412.312. Under the capital IPPS, payments are adjusted by the same DRG for the case as they are under the operating IPPS. Capital IPPS payments are

also adjusted for IME and DSH, similar to the adjustments made under the operating IPPS. In addition, hospitals may receive outlier payments for those cases that have unusually high costs.

The existing regulations governing payments to hospitals under the IPPS are located in 42 CFR part 412, subparts A through M.

2. Hospitals and Hospital Units Excluded From the IPPS

Under section 1886(d)(1)(B) of the Act, as amended, certain hospitals and hospital units are excluded from the IPPS. These hospitals and units are: Inpatient rehabilitation facility (IRF) hospitals and units; long-term care hospitals (LTCHs); psychiatric hospitals and units; children's hospitals; cancer hospitals; extended neoplastic disease care hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa). Religious nonmedical health care institutions (RNHCIs) are also excluded from the IPPS. Various sections of the Balanced Budget Act of 1997 (BBA) (Pub. L. 105–33), the Medicare, Medicaid and SCHIP [State Children's Health Insurance Program] Balanced Budget Refinement Act of 1999 (BBRA, Pub. L. 106–113), and the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA, Pub. L. 106–554) provide for the implementation of PPSs for IRF hospitals and units, LTCHs, and psychiatric hospitals and units (referred to as inpatient psychiatric facilities (IPFs)). (We note that the annual updates to the LTCH PPS are included along with the IPPS annual update in this document. Updates to the IRF PPS and IPF PPS are issued as separate documents.) Children's hospitals, cancer hospitals, hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa), and RNHCIs continue to be paid solely under a reasonable cost-based system, subject to a rate-of-increase ceiling on inpatient operating costs. Similarly, extended neoplastic disease care hospitals are paid on a reasonable cost basis, subject to a rate-of-increase ceiling on inpatient operating costs.

The existing regulations governing payments to excluded hospitals and hospital units are located in 42 CFR parts 412 and 413.

3. Long-Term Care Hospital Prospective Payment System (LTCH PPS)

The Medicare prospective payment system (PPS) for LTCHs applies to hospitals described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002. The LTCH PPS was established under the authority of sections 123 of the BBRA and section 307(b) of the BIPA (as codified under section 1886(m)(1) of the Act). Section 1206(a) of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) established the site neutral payment rate under the LTCH PPS, which made the LTCH PPS a dual rate payment system beginning in FY 2016. Under this statute, effective for LTCH’s cost reporting periods beginning in FY 2016 cost reporting period, LTCHs are generally paid for discharges at the site neutral payment rate unless the discharge meets the patient criteria for payment at the LTCH PPS standard Federal payment rate. The existing regulations governing payment under the LTCH PPS are located in 42 CFR part 412, subpart O. Beginning October 1, 2009, we issue the annual updates to the LTCH PPS in the same documents that update the IPPS.

4. Critical Access Hospitals (CAHs)

Under sections 1814(l), 1820, and 1834(g) of the Act, payments made to critical access hospitals (CAHs) (that is, rural hospitals or facilities that meet certain statutory requirements) for inpatient and outpatient services are generally based on 101 percent of reasonable cost. Reasonable cost is determined under the provisions of section 1861(v) of the Act and existing regulations under 42 CFR part 413.

5. Payments for Graduate Medical Education (GME)

Under section 1886(a)(4) of the Act, costs of approved educational activities are excluded from the operating costs of inpatient hospital services. Hospitals with approved graduate medical education (GME) programs are paid for the direct costs of GME in accordance with section 1886(h) of the Act. The amount of payment for direct GME costs for a cost reporting

period is based on the hospital's number of residents in that period and the hospital's costs per resident in a base year. The existing regulations governing payments to the various types of hospitals are located in 42 CFR part 413. Section 1886(d)(5)(B) of the Act provides that prospective payment hospitals that have residents in an approved GME program receive an additional payment for each Medicare discharge to reflect the higher patient care costs of teaching hospitals relative to non-teaching hospitals. The additional payment is based on the indirect medical education (IME) adjustment factor, which is calculated using a hospital's ratio of residents to beds and a multiplier, which is set by Congress. Section 1886(d)(5)(B)(ii)(XII) of the Act provides that, for discharges occurring during FY 2008 and fiscal years thereafter, the IME formula multiplier is 1.35. The regulations regarding the indirect medical education (IME) adjustment are located at 42 CFR 412.105.

C. Summary of Provisions of Recent Legislation That Are Implemented in This Final Rule

1. The Consolidated Appropriations Act, 2023 (CAA 2023; Pub. L. 117–328)

Section 4122 of the CAA, 2023, amended section 1886(h) of the Act by adding a new section 1886(h)(10) of the Act requiring the distribution of additional residency positions (also referred to as slots) to hospitals. Section 1886(h)(10)(A) of the Act requires that for FY 2026, the Secretary shall initiate an application round to distribute 200 residency positions. At least 100 of the positions made available under section 1886(h)(10)(A) of the Act shall be distributed for psychiatry or psychiatry subspecialty residency training programs. The Secretary is required, subject to certain provisions in the law, to increase the otherwise applicable resident limit for each qualifying hospital that submits a timely application by the number of positions that may be approved by the Secretary for that hospital. The Secretary is required to notify hospitals of the number of positions distributed to them by January 31, 2026, and the increase is effective beginning July 1, 2026.

In determining the qualifying hospitals for which an increase is provided, section 1886(h)(10)(B)(i) of the Act requires the Secretary to take into account the “demonstrated

likelihood” of the hospital filling the positions made available within the first 5 training years beginning after the date the increase would be effective, as determined by the Secretary.

Section 1886(h)(10)(B)(ii) of the Act requires a minimum distribution for certain categories of hospitals. Specifically, the Secretary is required to distribute at least 10 percent of the aggregate number of total residency positions available to each of four categories of hospitals. Stated briefly, and discussed in greater detail later in this final rule, the categories are as follows: (1) hospitals located in rural areas or that are treated as being located in a rural area (pursuant to sections 1886(d)(2)(D) and 1886(d)(8)(E) of the Act); (2) hospitals in which the reference resident level of the hospital is greater than the otherwise applicable resident limit; (3) hospitals in States with new medical schools or additional locations and branches of existing medical schools; and (4) hospitals that serve areas designated as Health Professional Shortage Areas (HPSAs). Section 1886(h)(10)(F)(iii) of the Act defines a qualifying hospital as a hospital in one of these four categories.

Section 1886(h)(10)(B)(iii) of the Act further requires that each qualifying hospital that submits a timely application receive at least 1 (or a fraction of 1) of the residency positions made available under section 1886(h)(10) of the Act before any qualifying hospital receives more than 1 residency position.

Section 1886(h)(10)(C) of the Act places certain limitations on the distribution of the residency positions. First, a hospital may not receive more than 10 additional full-time equivalent (FTE) residency positions. Second, no increase in the otherwise applicable resident limit of a hospital may be made unless the hospital agrees to increase the total number of FTE residency positions under the approved medical residency training program of the hospital by the number of positions made available to that hospital. Third, if a hospital that receives an increase to its otherwise applicable resident limit under section 1886(h)(10) of the Act is eligible for an increase to its otherwise applicable resident limit under 42 CFR 413.79(e)(3) (or any successor regulation), that hospital must ensure that residency positions received under section

1886(h)(10) of the Act are used to expand an existing residency training program and not for participation in a new residency training program.

2. The Consolidated Appropriations Act, 2024 (CAA, 2024; Pub. L. 118–42)

Section 306 of the CAA, 2024, extended through the first 3 months of FY 2025 the modified definition of a low-volume hospital and the methodology for calculating the payment adjustment for low-volume hospitals in effect for FYs 2019 through 2024. Specifically, under section 1886(d)(12)(C)(i) of the Act, as amended, for FYs 2019 through 2024 and the portion of FY 2025 occurring before January 1, 2025, a subsection (d) hospital qualifies as a low-volume hospital if it is more than 15 road miles from another subsection (d) hospital and has less than 3,800 total discharges during the fiscal year. Under section 1886(d)(12)(D) of the Act, as amended, for discharges occurring in FYs 2019 through December 31, 2024, the Secretary determines the applicable percentage increase using a continuous, linear sliding scale ranging from an additional 25 percent payment adjustment for low-volume hospitals with 500 or fewer discharges to a zero percent additional payment for low-volume hospitals with more than 3,800 discharges in the fiscal year.

Section 307 of the CAA, 2024, amended sections 1886(d)(5)(G)(i) and 1886(d)(5)(G)(ii)(II) of the Act to provide for an extension of the MDH program through the first 3 months of FY 2025 (that is, through December 31, 2024).

D. Issuance of a Notice of Proposed Rulemaking and Summary of the Proposed Provisions

The FY 2025 IPPS/LTCH PPS proposed rule appeared in the May 2, 2024, **Federal Register** (89 FR 35934). In this proposed rule, we set forth proposed payment and policy changes to the Medicare IPPS for FY 2025 operating costs and capital-related costs of acute care hospitals and certain hospitals and hospital units that are excluded from IPPS. In addition, we set forth proposed changes to the payment rates, factors, and other payment and policy-related changes to programs associated with payment rate policies under the LTCH PPS for FY 2025.

The following is a general summary of the changes that we proposed to make:

1. Proposed Changes to MS–DRG Classifications and Recalibrations of Relative Weights

In section II. of the preamble of the proposed rule, we included the following:

- Proposed changes to MS–DRG classifications based on our yearly review for FY 2025.
- Proposed recalibration of the MS-DRG relative weights.
- A discussion of the proposed FY 2025 status of new technologies approved for add-on payments for FY 2024, a presentation of our evaluation and analysis of the FY 2025 applicants for add-on payments for high-cost new medical services and technologies (including public input, as directed by the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) Public Law 108–173, obtained in a town hall meeting for applications not submitted under an alternative pathway), and a discussion of the proposed status of FY 2025 new technology applicants under the alternative pathways for certain medical devices and certain antimicrobial products.
 - A proposed change to the April 1 cutoff to October 1 for determining whether a technology would be within its 2- to 3-year newness period when considering eligibility for new technology add-on payments, beginning in FY 2026, effective for those technologies that are approved for new technology add-on payments starting in FY 2025 or a subsequent year (as discussed in II.E.8. of the preamble of the proposed rule).
 - A proposal that, beginning with new technology add-on payment applications for FY 2026, we will no longer consider a hold status to be an inactive status for the purposes of eligibility for the new technology add-on payment (as discussed in section II.E.9. of the preamble of the proposed rule).
 - A proposal that, subject to our review of the new technology add-on payment eligibility criteria, for certain gene therapies approved for new technology add-on payments in the FY 2025 IPPS/LTCH final rule that are indicated and used specifically for the treatment of sickle cell disease (SCD), effective with discharges on or after October 1, 2024, and concluding

at the end of the 2- to 3-year newness period for such therapy, we would temporarily increase the new technology add-on payment percentage to 75 percent (as discussed in section II.E.10. of the preamble of the proposed rule).

2. Proposed Changes to the Hospital Wage Index for Acute Care Hospitals

In section III. of the preamble of the proposed rule, we proposed revisions to the wage index for acute care hospitals and the annual update of the wage data. Specific issues addressed include, but are not limited to, the following:

- Proposed changes in core-based statistical areas (CBSAs) as a result of new OMB labor market area delineations and proposed policies related to the proposed changes in CBSAs.
- The proposed FY 2025 wage index update using wage data from cost reporting periods beginning in FY 2019.
- Calculation, analysis, and implementation of the proposed occupational mix adjustment to the wage index for acute care hospitals for FY 2025 based on the 2022 Occupational Mix Survey.
- Proposed application of the rural, imputed and frontier State floors, and continuation of the low wage index hospital policy.
- Proposed revisions to the wage index for acute care hospitals, based on hospital redesignations and reclassifications under sections 1886(d)(8)(B), (d)(8)(E), and (d)(10) of the Act.
- Proposed adjustment to the wage index for acute care hospitals for FY 2025 based on commuting patterns of hospital employees who reside in a county and work in a different area with a higher wage index.
- Proposed labor-related share for the FY 2025 wage index.

3. Payment Adjustment for Medicare Disproportionate Share Hospitals (DSHs) for FY 2025

In section IV. of the preamble of this proposed rule, we discuss the following:

- Proposed calculation of Factor 1 and Factor 2 of the uncompensated care payment methodology.

- Proposed methodological approach for determining Factor 3 of the uncompensated care payment for FY 2025, which is the same methodology that was used for FY 2024.

- Proposed methodological approach for determining the amount of interim uncompensated care payments using the average of the most recent 3 years of discharge data.

4. Other Decisions and Proposed Changes to the IPPS for Operating Costs

In section V. of the preamble of the proposed rule, we discussed proposed changes or clarifications of a number of the provisions of the regulations in 42 CFR parts 412 and 413, including the following:

- Proposed inpatient hospital update for FY 2025.

- Proposed updated national and regional case-mix values and discharges for purposes of determining RRC status and clarification of the qualification under the discharge criterion for osteopathic hospitals.

- Proposed implementation of the statutory extension of the temporary changes to the low-volume hospital payment adjustment through December 31, 2024, the statutory expiration beginning January 1, 2025, and the proposed payment adjustments for low-volume hospitals for FY 2025.

- Proposed implementation of the statutory extension of the MDH program through December 31, 2024, and the statutory expiration beginning January 1, 2025.

- A proposal to implement a provision of the Consolidated Appropriations Act relating to payments to hospitals for GME and IME costs, proposed direct graduate medical education (DGME) and IME policy modifications to the criteria for new residency programs; technical fixes to the DGME regulations; and a notice of closure of two teaching hospitals and opportunities to apply for available slots and a reminder of CBSA changes and application to GME policies.

- Proposed nursing and allied health education program Medicare Advantage (MA) add-on rates and direct GME MA percent reductions for CY 2023.

- Proposed update to the payment adjustment for certain clinical trial and expanded access use immunotherapy cases.

- Proposed separate IPPS payment for establishing and maintaining access to essential medicines.

- Proposed update to the estimate of the financial impacts for the FY 2025 Hospital Readmissions Reduction Program.

- Proposed modifications to the scoring of the Person and Community Engagement Domain in the Hospital VBP Program.

++ For the FY 2027 through FY 2029 program years to only score on six unchanged dimensions of the HCAHPS Survey.

++ Beginning with the FY 2030 program year to account for the proposed updated HCAHPS Survey.

- Updating the proposed estimate of the financial impacts for the FY 2025 Hospital-Acquired Conditions Reduction Program.

- Discussion of and proposed changes relating to the implementation of the Rural Community Hospital Demonstration Program in FY 2025.

5. Proposed FY 2025 Policy Governing the IPPS for Capital-Related Costs

In section VI. of the preamble of the proposed rule, we discussed the proposed payment policy requirements for capital-related costs and capital payments to hospitals for FY 2025.

6. Proposed Changes to the Payment Rates for Certain Excluded Hospitals: Rate-of-Increase Percentages

In section VII. of the preamble of the proposed rule, we discussed the following:

- Proposed changes to payments to certain excluded hospitals for FY 2025.

- Proposed continued implementation of the Frontier Community Health Integration Project (FCHIP) Demonstration.

7. Proposed Changes to the LTCH PPS

In section VIII. of the preamble of the proposed rule, we proposed to rebase and revise the LTCH market basket to reflect a 2022 base year, which includes a proposed update to the LTCH PPS labor-related share. In section VIII. of the preamble of the proposed rule, we set forth proposed changes to the LTCH PPS Federal payment rates, factors, and other payment rate policies under the LTCH PPS for FY 2025. We also proposed a technical clarification to the regulations for hospitals seeking to be classified as an LTCH.

8. Proposed Changes Relating to Quality Data Reporting for Specific Providers and Suppliers

In section IX. of the preamble of the proposed rule, we addressed the following:

- Solicitation of comment on adopting measures across the hospital quality reporting and value-based purchasing programs which capture more forms of unplanned post-acute care and encourage hospitals to improve discharge processes.

- Proposed changes to the requirements for the Hospital IQR Program.

- Proposed changes to the requirements for the PCHQR Program.

- Proposed adoption of the Patient Safety Structural measure in the Hospital IQR Program and the PCHQR Program.

- Proposed updated HCAHPS Survey measure in the Hospital IQR Program, PCHQR Program, and Hospital VBP Program.

- Proposed changes to the requirements for the LTCH QRP, and requests for information on future measure concepts for the LTCH QRP and a star rating system for the LTCH QRP.

- Proposed changes to requirements pertaining to eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program.

9. Other Proposals and Comment Solicitations Included in the Proposed Rule

Section X. of the preamble of the proposed rule includes the following:

- Proposed implementation of TEAM that would test whether an episode-based pricing methodology linked with accountability for quality measure performance for select acute care hospitals reduces Medicare program expenditures while preserving or improving the quality of care for Medicare beneficiaries.

- Proposed changes to permit a Provider Reimbursement Review Board (PRRB) member to serve up to 3 consecutive terms (9 consecutive years total), and up to 4 consecutive terms (12 consecutive years total) in cases where a PRRB Member who, in their second or third consecutive term, is designated as Chairperson, to continue serving as Chairperson in the fourth consecutive term.

- Solicitation of comments to gather information on differences between hospital resources required to provide inpatient pregnancy and childbirth services to Medicare patients as compared to non-Medicare patients.

- Solicitation of comments to gather information on potential solutions that can be implemented through the hospital CoPs to address well-documented concerns regarding maternal morbidity, mortality, disparities, and maternity care access in the United States. See the calendar year (CY) 2025 Outpatient Prospective Payment System (OPPS) proposed rule (89 FR XXXXX) for more information about this RFI.

- Proposal to remove the exclusion of Puerto Rico from the Payment Error Rate Measurement (PERM) program found at 42 CFR 431.954(b)(3).

- Proposal for a new hospital CoP to replace the COVID-19 and Seasonal Influenza reporting standards for hospitals and CAHs that were created during PHE.

10. Other Provisions of the Proposed Rule

Section XI.A. of the preamble of the proposed rule includes our discussion of the MedPAC Recommendations.

Section XI.B. of the preamble of the proposed rule includes a descriptive listing of the public use files associated with this proposed rule.

Section XII. of the preamble of the proposed rule includes the collection of information requirements for entities based on our proposals.

Section XIII. of the preamble of the proposed rule includes information regarding our responses to public comments.

11. Determining Prospective Payment Operating and Capital Rates and Rate-of-Increase Limits for Acute Care Hospitals

In sections II. and III. of the Addendum of the proposed rule, we set forth proposed changes to the amounts and factors for determining the proposed FY 2025 prospective payment rates for operating costs and capital-related costs for acute care hospitals. We proposed to establish the threshold amounts for outlier cases. In addition, in section IV. of the Addendum of the proposed rule, we addressed the proposed update factors for determining the rate-of-increase limits for cost reporting periods beginning in FY 2025 for certain hospitals excluded from the IPPS.

12. Determining Prospective Payment Rates for LTCHs

In section V. of the Addendum of the proposed rule, we set forth proposed changes to the amounts and factors for determining the proposed FY 2025 LTCH PPS standard Federal payment rate and other factors used to determine LTCH PPS payments under both the LTCH PPS standard Federal payment rate and the site neutral payment rate in FY 2025. We proposed to establish the adjustments for the wage index (including proposed changes to the LTCH PPS labor market area delineations based on the new OMB delineations), labor-related share, the cost-of-living adjustment, and high-cost outliers, including the applicable fixed-loss amounts and the LTCH cost-to-charge ratios (CCRs) for both payment rates.

13. Impact Analysis

In Appendix A of the proposed rule, we set forth an analysis of the impact the proposed changes would have on affected acute care hospitals, CAHs, LTCHs and other entities.

14. Recommendation of Update Factors for Operating Cost Rates of Payment for Hospital Inpatient Services

In Appendix B of the proposed rule, as required by sections 1886(e)(4) and (e)(5) of the Act, we provided our recommendations of the appropriate percentage changes for FY 2025 for the following:

- A single average standardized amount for all areas for hospital inpatient services paid under the IPPS for operating costs of acute care hospitals (and hospital-specific rates applicable to SCHs and MDHs).
- Target rate-of-increase limits to the allowable operating costs of hospital inpatient services furnished by certain hospitals excluded from the IPPS.
- The LTCH PPS standard Federal payment rate and the site neutral payment rate for hospital inpatient services provided for LTCH PPS discharges.

15. Discussion of Medicare Payment Advisory Commission Recommendations

Under section 1805(b) of the Act, MedPAC is required to submit a report to Congress, no later than March 15 of each year, in which MedPAC reviews and makes recommendations on Medicare payment policies. MedPAC's March 2024 recommendations concerning hospital inpatient payment policies address the update factor for hospital inpatient operating costs and capital-related costs for hospitals under the IPPS. We addressed these recommendations in Appendix B of the proposed rule. For further information relating specifically to the MedPAC March 2024 report or to obtain a copy of the report, contact MedPAC at (202) 220-3700 or visit MedPAC's website at <https://www.medpac.gov>.

E. Public Comments Received in Response to the FY 2025 IPPS/LTCH PPS Proposed Rule

We received approximately 6,180 timely pieces of correspondence containing multiple comments on the proposed rule that appeared in the May 2, 2024 **Federal Register** (89 FR 39534) titled “Medicare and Medicaid Programs and the Children’s Health Insurance Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System and Policy Changes and Fiscal Year 2025 Rates; Quality Programs Requirements; and Other Policy Changes” (hereinafter referred to as the FY 2025 IPPS/LTCH PPS proposed rule). We note that some of these public comments were outside of the scope of the proposed rule. These out-of-scope public comments are not addressed with policy responses in this final rule. Summaries of the public comments that are within the scope of the proposed rule and our responses to those public comments are set forth in the various sections of this final rule under the appropriate heading.

II. Changes to Medicare Severity Diagnosis-Related Group (MS-DRG) Classifications and Relative Weights

A. Background

Section 1886(d) of the Act specifies that the Secretary shall establish a classification system (referred to as diagnosis-related groups (DRGs)) for inpatient discharges and adjust payments under the IPPS based on appropriate weighting factors assigned to each DRG. Therefore, under the IPPS, Medicare pays for inpatient hospital services on a rate per discharge basis that varies according to the DRG to which a beneficiary's stay is assigned. The formula used to calculate payment for a specific case multiplies an individual hospital's payment rate per case by the weight of the DRG to which the case is assigned. Each DRG weight represents the average resources required to care for cases in that particular DRG, relative to the average resources used to treat cases in all DRGs.

Section 1886(d)(4)(C) of the Act requires that the Secretary adjust the DRG classifications and relative weights at least annually to account for changes in resource consumption. These adjustments are made to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources.

B. Adoption of the MS-DRGs and MS-DRG Reclassifications

For information on the adoption of the MS-DRGs in FY 2008, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47140 through 47189).

For general information about the MS-DRG system, including yearly reviews and changes to the MS-DRGs, we refer readers to the previous discussions in the FY 2010 IPPS/rate year (RY) 2010 LTCH PPS final rule (74 FR 43764 through 43766) and the FYs 2011 through 2023 IPPS/LTCH PPS final rules (75 FR 50053 through 50055; 76 FR 51485 through 51487; 77 FR 53273; 78 FR 50512; 79 FR 49871; 80 FR 49342; 81 FR 56787 through 56872; 82 FR 38010 through 38085; 83 FR 41158 through 41258; 84 FR 42058 through 42165; 85 FR 58445 through 58596; 86 FR 44795 through 44961; and 87 FR 48800 through 48891, respectively).

For discussion regarding our previously finalized policies (including our historical adjustments to the payment rates) relating to the effect of changes in documentation and coding that do not reflect real changes in case mix, we refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 48799 through 48800).

Comment: Several commenters requested that CMS make a positive adjustment to the standardized amount to restore the full amount of the documentation and coding recoupment adjustments, which they asserted is required under section (7)(B)(2) and (4) of the TMA [Transitional Medical Assistance], Abstinence Education, and QI [Qualifying Individuals] Programs Extension Act of 2007 (Pub. L. 110–90). Commenters stated that the statute is explicit that CMS may not carry forward any documentation and coding adjustments applied in fiscal years 2010 through 2017 into IPPS rates after FY 2023. Commenters contended that CMS, by its own admission, has restored only 2.9588 percentage points of a total 3.9 percentage point reduction. By not fully restoring the total reductions, commenters believe that CMS is improperly extending payment adjustments beyond the FY 2023 statutory limit.

Response: As of FY 2023, CMS completed the statutory requirements of section 7(b)(1)(B) of Public Law 110–90 as amended by section 631 of the American Taxpayer Relief Act of 2012 (ATRA, Pub. L. 112–240), section 404 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA), and section 15005 of the 21st Century Cures Act (Pub. L. 114–255). As we discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44794 through 44795), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58444 through 58445) and in prior rules, we believe section 414 of the MACRA and section 15005 of the 21st Century Cures Act set forth the levels of positive adjustments for FYs 2018 through 2023. We are not convinced that the adjustments prescribed by MACRA were predicated on a specific adjustment level estimated or implemented by CMS in previous rulemaking. We see no evidence that Congress enacted these adjustments with the intent that CMS would make an additional +0.7 percentage point adjustment in FY 2018 to compensate for the higher than expected final ATRA adjustment made

in FY 2017, nor are we persuaded that it would be appropriate to use the Secretary's exceptions and adjustments authority under section 1886(d)(5)(I) of the Act to adjust payments in FY 2025 to restore any additional amount of the original 3.9 percentage point reduction, given Congress' directive regarding prescriptive adjustment levels under section 414 of the MACRA and section 15005 of the 21st Century Cures Act. Accordingly, in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38009), we implemented the required +0.4588 percentage point adjustment to the standardized amount for FY 2018. In the FY 2019 IPPS/LTCH PPS final rule (FY 2019 final rule) (83 FR 41157), the FY 2020 IPPS/LTCH PPS final rule (FY 2020 final rule) (84 FR 42057), the FY 2021 IPPS/LTCH PPS final rule (FY 2021 final rule) (85 FR 58444 and 58445), the FY 2022 IPPS/LTCH PPS final rule (FY 2022 final rule) (86 FR 44794 and 44795), and the FY 2023 IPPS/LTCH PPS final rule (FY 2023 final rule) (87 FR 48800), consistent with the requirements of section 414 of the MACRA, we implemented 0.5 percentage point positive adjustments to the standardized amount for FY 2019, FY 2020, FY 2021, FY 2022 and FY 2023, respectively. As discussed in the FY 2023 final rule, the finalized 0.5 percentage point positive adjustment for FY 2023 is the final adjustment prescribed by section 414 of the MACRA.

C. Changes to Specific MS-DRG Classifications

1. Discussion of Changes to Coding System and Basis for FY 2025 MS-DRG Updates

a. Conversion of MS-DRGs to the International Classification of Diseases, 10th Revision (ICD-10)

As of October 1, 2015, providers use the International Classification of Diseases, 10th Revision (ICD-10) coding system to report diagnoses and procedures for Medicare hospital inpatient services under the MS-DRG system instead of the ICD-9-CM coding system, which was used through September 30, 2015. The ICD-10 coding system includes the International Classification of Diseases, 10th Revision, Clinical Modification (ICD-10-CM) for diagnosis coding and the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD-10-PCS) for inpatient hospital procedure coding, as well as the ICD-10-CM and ICD-10-PCS Official Guidelines for Coding and Reporting. For a detailed discussion of the conversion of the MS-DRGs to ICD-10, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56787 through 56789).

b. Basis for FY 2025 MS-DRG Updates

As discussed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28127) and final rule (87 FR 48800 through 48801), beginning with FY 2024 MS-DRG classification change requests, we changed the deadline to request changes to the MS-DRGs to October 20 of each year to allow for additional time for the review and consideration of any proposed updates. We also described the new process for submitting requested changes to the MS-DRGs via a new electronic application intake system, Medicare Electronic Application Request Information System™ (MEARIS™), accessed at <https://mearis.cms.gov>. We stated that effective with FY 2024 MS-DRG classification change requests, CMS will only accept requests submitted via MEARIS™ and will no longer consider requests sent via email. Additionally, we noted that within MEARIS™, we have built in several resources to support users, including a “Resources” section available at <https://mearis.cms.gov/public/resources> with technical support available under

“Useful Links” at the bottom of the MEARIS™ site. Questions regarding the MEARIS™ system can be submitted to CMS using the form available under “Contact”, also at the bottom of the MEARIS™ site. Accordingly, interested parties had to submit MS-DRG classification change requests for FY 2025 by October 20, 2023.

We note that the burden associated with this information collection requirement is the time and effort required to collect and submit the data in the request for MS-DRG classification changes to CMS. The aforementioned burden is subject to the Paperwork Reduction Act (PRA) of 1995 and approved under OMB control number 0938-1431, and has an expiration date of 09/30/2025.

As noted previously, interested parties had to submit MS-DRG classification change requests for FY 2025 by October 20, 2023. As we have discussed in prior rulemaking, we may not be able to fully consider all of the requests that we receive for the upcoming fiscal year. We have found that, with the implementation of ICD-10, some types of requested changes to the MS-DRG classifications require more extensive research to identify and analyze all of the data that are relevant to evaluating the potential change. In the proposed rule, we noted those topics for which further research and analysis are required, and which we will continue to consider in connection with future rulemaking as summarized in the discussion that follows.

As discussed in the proposed rule, we received four requests to modify the GROUPER logic in a number of cardiac MS-DRGs under Major Diagnostic Category (MDC) 05 (Diseases and Disorders of the Circulatory System). Specifically, we received requests to:

- Modify the GROUPER logic of new MS-DRG 212 (Concomitant Aortic and Mitral Valve Procedures) to be defined by cases reporting procedure codes describing a single open mitral or aortic valve replacement/repair (MVR or AVR) procedure, plus an open coronary artery bypass graft procedure (CABG) or open surgical ablation or cardiac catheterization procedure plus a second concomitant procedure.

- Modify the GROUPER logic of new MS-DRG 212 by redefining the procedure code list that describes the performance of a cardiac catheterization by either removing the ICD-10-PCS codes that describe plain radiography of coronary artery codes from the logic list or adding ICD-10-PCS procedure codes that involve computed tomography (CT) or magnetic resonance imaging (MRI) scanning using contrast to the list. This requestor also suggested that CMS add ICD-10-PCS procedures codes that describe endovascular valve replacement or repair procedures into the GROUPER logic of MS-DRG 212.

- Modify the GROUPER logic of new MS-DRGs 323, 324, and 325 (Coronary Intravascular Lithotripsy with Intraluminal Device with MCC, without MCC, and without Intraluminal Device, respectively). In two separate but related requests, the requestors suggested that we add procedure codes that describe additional percutaneous coronary intervention (PCI) procedures such as percutaneous coronary rotational, laser, and orbital atherectomy to the GROUPER logic of new MS-DRGs 323, 324, and 325.

In the proposed rule, we stated that we appreciated the submissions and related analyses provided by the requestors for our consideration as we reviewed MS-DRG classification change requests for FY 2025; however, we also noted the complexity of the GROUPER logic for these MS-DRGs in connection with these requests requires more extensive analyses to identify and evaluate all of the data relevant to assessing these potential modifications. Specifically, we noted the list of procedure codes that describe the performance of a cardiac catheterization is in the definition of multiple MS-DRGs in MDC 05. Analyzing the impact of revising this list would necessitate evaluating the impact across numerous other MS-DRGs in MDC 05 that also include this list in their definition, in addition to new MS-DRG 212. Secondly, as discussed further in section II.C.4.c. of the preamble of the proposed rule, we stated that our analysis continues to indicate that, when performed, open cardiac valve replacement and supplement procedures are clinically different from endovascular cardiac valve replacement and supplement procedures in terms of technical complexity and hospital resource use. Lastly, as we have stated in prior

rule making (88 FR 58708), atherectomy is distinct from coronary lithotripsy in that each of these procedures are defined by clinically distinct definitions and objectives. Additional analysis to assess for unintended consequences across the classification is needed as we have made a distinction between the root operations used to describe atherectomy (Extirpation) and the root operation used to describe lithotripsy (Fragmentation) in evaluating other requests in rulemaking. We stated we will need to consider the application of these two root operations in other scenarios where we have also specifically stated that Extirpation is not the same as Fragmentation and do not warrant similar MS-DRG assignment (85 FR 58572 through 58573). Furthermore, as MS-DRG 212 and MS-DRGs 323, 324, and 325 recently became effective on October 1, 2023 (FY 2024), we stated additional time is needed to review and evaluate extensive modifications to the structure of these MS-DRGs.

Comment: Commenters stated that they appreciated CMS' decision to await further data before analyzing the impact of the requested changes to MS-DRG 212 and MS-DRGs 323, 324, and 325, and agreed that any changes to these MS-DRGs should be carefully reviewed, as they stated these changes could have a significant impact on the remaining MS-DRGs in MDC 05. While thanking CMS for the continued consideration of appropriate MS-DRG assignment for concomitant open cardiac procedures, many commenters reiterated the request to modify the GROUPER logic of new MS-DRG 212. Some commenters stated it would be more impactful if cases reporting a single valve procedure, a coronary artery bypass grafting (CABG) procedure, and a procedure code describing surgical ablation were assigned to MS-DRG 212 (Concomitant Aortic and Mitral Valve Procedures). Other commenters stated that they believe that the logic of MS-DRG 212 should be modified to recognize an open aortic valve repair or replacement procedure or a mitral valve repair or replacement procedure when performed with any of the other concomitant procedures currently listed in the logic for MS-DRG 212. Another commenter suggested that MS-DRG 212 be defined by cases reporting either a mitral valve repair or replacement (MVR) procedure or an aortic valve repair or replacement (AVR) procedure, plus

two other concomitant cardiac procedures such as surgical ablation, coronary artery bypass graft surgery, pulmonary valve replacement, or tricuspid valve replacement. This commenter stated that they performed their own analysis of recent MedPAR data, and stated they found that cases for beneficiaries who are not treated for their atrial fibrillation (AF) during open MVR or AVR (or CABG) procedures (currently assigned to MS-DRGs 216, 217, 218, 219, 220, and 221 (Cardiac Valve & Other Major Cardiothoracic Procedure with and without Cardiac Catheterization, with MCC, with CC, and without CC/MCC, respectively)) may have as much as \$7,000 in incremental hospital index costs and 1.6 extra hospital stay days compared to similar non-AF patients during their open MVR or AVR procedures.

Some commenters were not supportive of the suggestion to assign cases reporting a single AVR or MVR procedure and another concomitant procedure to MS-DRG 212. These commenters stated that assigning cases reporting a single AVR or MVR procedure and another concomitant procedure to MS-DRG 212 would have a significant negative impact on the remaining MS-DRGs, notably MS-DRG 216. Other commenters suggested that CMS consider moving the aortic and mitral valve procedure codes with the root operations of “Creation”, “Release”, “Restriction” and “Supplement,” that are currently listed under the Concomitant Procedures list in the GROUPER logic for MS-DRG 212 in the ICD-10 MS-DRG Definitions Manual Version 41.1 to the appropriate logic list of aortic valve or mitral valve procedures. This commenter stated that procedure codes with these other root operations also represent types of valvular repairs and should be included on the aortic valve procedures and mitral valve procedures logic lists rather than the “Concomitant Procedure” logic list. A few commenters urged CMS to devise a broader, more inclusive, supplemental payment mechanism to facilitate incremental payment when two major procedures are performed during the same hospital admission.

In regard to the request to modify the GROUPER logic of new MS-DRGs 323, 324, and 325 (Coronary Intravascular Lithotripsy with Intraluminal Device with MCC, without MCC, and

without Intraluminal Device, respectively), some commenters stated they agreed with CMS' assessment that atherectomy and coronary lithotripsy are mechanistically and clinically distinct. A commenter specifically noted that this distinction is supported by scientific literature and applauded CMS for demonstrating consistency on these questions and awareness of their impact across MDC 05. Other commenters stated they were disappointed that CMS did not propose to modify MS-DRGs 323, 324, and 325 to add procedure codes describing complex PCI procedures, including percutaneous coronary atherectomy procedures for FY 2025. A commenter stated that they offer a broad portfolio of products across the percutaneous coronary intervention space and believe they can provide additional input and data for consideration that would be helpful to CMS in evaluating potential modifications to the GROUPER logic to include orbital atherectomy procedures in the newly created MS-DRGs. Another commenter noted that the pipeline for additional technologies in the atherectomy family is expanding and recommended that CMS undertake an analysis of all ICD-10-PCS codes for atherectomy. A commenter questioned if Extirpation was the appropriate root operation to describe rotational and orbital atherectomy, as in their view, the procedures themselves are not removing calcified material. This commenter stated that in prior rulemaking CMS has stated procedures such as rotational and orbital atherectomy are reported with the root operation Extirpation because both techniques cut up the calcified material into small particles that are removed from the blood stream by the normal hemofiltration process and noted that in lithotripsy procedures, which are reported with the root operation Fragmentation, the normal hemofiltration process also removes the fragmented calcified material from the blood stream and suggested that CMS reconsider the root operation of atherectomy procedures as Fragmentation rather than Extirpation.

Response: We thank the commenters for sharing their feedback on these requests. As discussed in the proposed rule, we have found that with the implementation of ICD-10, some types of requested changes to the MS-DRG classifications require more extensive research to identify and analyze the relevant data for evaluating a potential change. The comments received

in response to our proposed rule discussion of the requests to modify the GROUPER logic of new MS-DRG 212, specifically, illustrate the complexity of the analysis and evaluation required to address these requests. Notably, many commenters believe that a modification to the logic of MS-DRG 212 may be warranted but differ greatly in the solution they believe would best address the concerns noted. We appreciate the public comments we received on these requests and will take these suggestions under consideration as we continue to monitor for impacts in MDC 05 and across the MS-DRGs to avoid unintended consequences or missed opportunities in most appropriately capturing the resource utilization and clinical coherence for these subsets of procedures. We note that we would address any proposed modifications to the existing logic in future rulemaking.

As discussed in the proposed rule, as we continue the analysis of the claims data with respect to MS-DRGs in MDC 05, we welcome public comments and feedback on other factors that should be considered in the potential restructuring of these MS-DRGs. Feedback and other suggestions may be directed to MEARIS™ at: <https://mearis.cms.gov/public/home>. Interested parties should submit any MS-DRG classification change requests, including any comments and suggestions for FY 2026 consideration by October 20, 2024 via MEARIS™ at: <https://mearis.cms.gov/public/home>.

As we did for the FY 2024 IPPS/LTCH PPS proposed rule, for the FY 2025 IPPS/LTCH PPS proposed rule we provided a test version of the ICD-10 MS-DRG GROUPER Software, Version 42, so that the public can better analyze and understand the impact of the proposals included in the proposed rule. We noted that this test software reflected the proposed GROUPER logic for FY 2025. Therefore, it included the new diagnosis and procedure codes that are effective for FY 2025 as reflected in Table 6A. – New Diagnosis Codes - FY 2025 and Table 6B. – New Procedure Codes - FY 2025 that were associated with the proposed rule, and does not include the diagnosis codes that are invalid beginning in FY 2025 as reflected in Table 6C. – Invalid Diagnosis Codes - FY 2025, and Table 6D. – Invalid Procedure Codes - FY 2025

associated with the proposed rule. Those tables were not published in the Addendum to the proposed rule, but are available on the CMS website at:

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service->

[Payment/AcuteInpatientPPS/index.html](https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html) as described in section VI. of the Addendum to the proposed rule. Because the diagnosis codes no longer valid for FY 2025 are not reflected in the test software, we made available a supplemental file in Table 6P.1a and 6P.1b that includes the mapped Version 42 FY 2025 ICD-10-CM and ICD-10-PCS codes and the deleted Version 41 FY 2024 ICD-10-CM codes and V41.1 ICD-10-PCS codes that should be used for testing purposes with users' available claims data. Therefore, users had access to the test software allowing them to build case examples that reflect the proposals that were included in the proposed rule. In addition, users were able to view the draft version of the ICD-10 MS-DRG Definitions Manual, Version 42.

Comment: A commenter expressed its appreciation that we provided a test version of the ICD-10 MS-DRG GROUPER Software, Version 42, however, the commenter stated that this version essentially only allows for a case-by-case analysis and a minimal batch analysis. The commenter stated that it would be more beneficial to have a Batch z/OS version of the test GROUPER so that it could be better utilized for broader and more meaningful analysis purposes. The commenter requested that availability of a Batch z/OS version of the test GROUPER be made publicly available for all future rulemaking.

Response: We appreciate the commenter's feedback and will take the suggestion into consideration.

We noted in the proposed rule that in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58764), as discussed in the CY 2024 Outpatient Prospective Payment System and Ambulatory Surgical Center (OPPS/ASC) proposed rule (CY 2024 OPPS/ASC proposed rule) (88 FR 49552, July 31, 2023), we stated that, consistent with the process that is used for updates to the "Integrated" Outpatient Code Editor (I/OCE) and other Medicare claims editing systems, we

proposed to address any future revisions to the IPPS Medicare Code Editor (MCE), including any additions or deletions of claims edits, as well as the addition or deletion of ICD-10 diagnosis and procedure codes to the applicable MCE edit code lists, outside of the annual IPPS rulemakings. As discussed in the CY 2024 OPSS/ASC proposed rule, we proposed to remove discussion of the IPPS MCE from the annual IPPS rulemakings, beginning with the FY 2025 rulemaking, and to generally address future changes or updates to the MCE through instruction to the Medicare administrative contractors (MACs). We encouraged readers to review the discussion in the CY 2024 OPSS/ASC proposed rule and submit comments in response to the proposal by the applicable deadline by following the instructions provided in that proposed rule.

As also discussed in the proposed rule, in the CY 2024 OPSS/ASC final rule (88 FR 82121 through 82124), after consideration of the public comments we received, we finalized the proposal to remove discussion of the MCE from the annual IPPS rulemakings, beginning with FY 2025 rulemaking, and to generally address future changes or updates to the MCE through instruction to the MACs. We also stated that, beginning with FY 2025, in association with the annual proposed rule, we are making available a draft version of the Definitions of Medicare Code Edits (MCE) Manual to provide the public with an opportunity to review any changes that will become effective October 1 for the upcoming fiscal year. In addition, as a result of new and modified code updates approved after the annual spring ICD-10 Coordination and Maintenance Committee meeting, any further changes to the MCE will be reflected in the finalized Definitions of Medicare Code Edits (MCE) Manual, made available in association with the annual final rule. As such, we made available the draft FY 2025 ICD-10 MCE Version 42 Manual file on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>.

We noted in the proposed rule that the MCE manual is comprised of two chapters: *Chapter 1: Edit code lists* provides a listing of each edit, an explanation of each edit, and as applicable, the diagnosis and/or procedure codes for each edit, and *Chapter 2: Code list changes*

summarizes the changes in the edit code lists (for example, additions and deletions) from the prior release of the MCE software. We also stated that the public may submit any questions, comments, concerns, or recommendations regarding the MCE to the CMS mailbox at MSDRGClassificationChange@cms.hhs.gov for our review and consideration.

Comment: Several commenters requested that CMS reconsider including updates to the MCE as part of the IPPS rulemaking process. A commenter stated that it recognized the importance of the MCE and expressed concern with the removal of MCE proposals from IPPS rulemaking. The commenter stated that identifying key considerations and mitigating unintended consequences are a key benefit of public review and consideration of stakeholder comments. The commenter stated that the proposed process is not transparent on key areas such as when the manual will be updated, effective dates, or the ability to provide feedback with timely responses. Other commenters stated that the MCE and related proposals include essential topics that warrant thorough review and consideration specific to inpatient hospital admissions and operational processes. The commenters asserted that these topics are vital to coding, clinical documentation, and revenue cycle professionals to ensure awareness and understanding ahead of implementation and historically allowed the opportunity for comment as applicable. According to the commenters, MCE change updates managed outside the IPPS rulemaking process create a strong potential for missed opportunities for pertinent public review and comment. The commenters stated these missed opportunities will create the potential for unintended consequences and administrative burdens for hospital teams. The commenters also stated that a historical review of IPPS comments in response to MCE proposals includes feedback on unacceptable principal diagnoses, age edits, and especially comments that affected the proposal and final implementation of CMS's unspecified code edit implemented in FY 2022.

The commenters stated that the draft version of the Definitions of Medicare Code Edits (MCE) Manual file made available in association with the proposed rule is a helpful reference, however revisions should be explicitly stated as proposed revisions or additions for

consideration. According to the commenters, as currently written, the changes are not listed as proposals within the manual and are implied as changes that have already been decided and will be effective with the upcoming fiscal year. Another commenter expressed appreciation that CMS stated it will make available a draft version of the Definitions of Medicare Code Edits (MCE) Manual file in association with the annual proposed rule to provide the public with an opportunity to review any changes that will become effective October 1 for the upcoming fiscal year. However, the commenter also stated that it is difficult to identify the changes in the draft version of the MCE Manual and recommended that CMS provide a list of the draft MCE changes each year (including any additions or deletions of diagnosis or procedure codes or MCE edits).

Response: We appreciate the commenters' feedback. As stated in the CY 2024 OPPTS/ASC final rule (88 FR 82121 through 82124), in the preamble of the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35949), and previously described in the preamble of this final rule, after consideration of the public comments we received, we finalized the proposal to remove discussion of the MCE from the annual IPPS rulemakings, beginning with FY 2025 rulemaking. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35949), we stated that beginning with FY 2025, in association with the annual proposed rule, we are making available a draft version of the Definitions of Medicare Code Edits (MCE) Manual to provide the public with an opportunity to review any changes that will become effective October 1 for the upcoming fiscal year.

We noted in the proposed rule, and as previously described in this final rule, that the MCE manual is comprised of two chapters: *Chapter 1: Edit code lists* provides a listing of each edit, an explanation of each edit, and as applicable, the diagnosis and/or procedure codes for each edit, and *Chapter 2: Code list changes* summarizes the changes in the edit code lists (for example, additions and deletions) from the prior release of the MCE software. We believe that *Chapter 2: Code list changes* in the MCE manual is clear as it lists the specific edit, followed by the list of codes that were added or deleted. The draft version of the Definitions of Medicare Code Edits (MCE) Manual will continue to be made publicly available in association with the

annual proposed rulemaking, and it is referred to as a “draft version”. However, the *Chapter 2: Code list changes* are not “draft” MCE changes. Rather, consistent with our established process to assign MS-DRGs to new diagnosis codes and new procedure codes, for which we examine the MS-DRG assignment for the predecessor code to determine the most appropriate MS-DRG assignment, we have historically used, and will continue to use, a similar process in the assignment of new diagnosis codes and new procedure codes to the edit codes lists under the MCE. Specifically, we review the predecessor code to determine if there are edits under the MCE for which the predecessor code is listed to determine which edit lists may be appropriate for the newly created codes.

As discussed in prior rulemaking (88 FR 58764), as a result of new and modified code updates approved after the annual spring ICD-10 Coordination and Maintenance Committee meeting, we routinely make changes to the MCE without discussion in IPPS rulemaking. In the past, in both the IPPS proposed and final rules, we have only provided the list of changes to the MCE that were brought to our attention after the prior year’s final rule. We historically have not listed all of the changes we have made to the MCE because of the new and modified codes approved after the annual spring ICD-10 Coordination and Maintenance Committee meeting. We stated that these changes are, and would still be, approved too late in the rulemaking schedule for inclusion in the proposed rule. Furthermore, although in the past our MCE policies have been described in our proposed and final rules, we have not provided the detail of each new or modified diagnosis and procedure code edit in the final rule.

Therefore, although we published, and will continue to publish, the edit code list changes in the “draft version” of the MCE manual, because discussion of the MCE has been removed from IPPS rulemakings, beginning with FY 2025 rulemaking as previously described, the edit code lists that appear in the “draft version” of the MCE manual in association with the proposed rule are considered final at the time of the development of the proposed rule. While the public may continue to submit any questions, comments, concerns, or recommendations regarding the

MCE to the CMS mailbox at MSDRGClassificationChange@cms.hhs.gov for our review and consideration, we will continue to make available on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software> the changes to the edit code lists for both the draft version (at the time of the development of the proposed rule) and finalized version of the Definitions of Medicare Code Edits (MCE) file, in association with the annual IPPS proposed and final rules.

Comment: Some commenters encouraged CMS to delay, revisit, and provide details of specific code changes and the deactivation of edits. The commenters also stated that the edits are an additional quality assurance mechanism to ensure appropriate ICD-10-CM/PCS assignment for accurate and timely claims submission. The commenters further stated that the edits help to prevent added administrative burden associated with unnecessary claims rework and resubmission.

Response: We thank the commenters for their feedback. We believe that the FY 2025 MCE updates reflect our established process as previously described in this final rule, as well as address concerns related to claims processing discussed in prior rulemaking (88 FR 58768). We will continue to monitor these updates and consider issuing additional provider guidance to ensure accurate claims submission and processing.

Comment: Similar to the discussion in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58789), a commenter requested that CMS implement an edit for claims that group to MS-DRG 014 (Allogeneic Bone Marrow Transplant), that would reject claims when an inpatient type of bill 11X claim is received without charges mapped to revenue code 0815, which is intended to capture the costs of donor search and cell acquisition activities for allogeneic hematopoietic stem cell transplants. The commenter stated that mandatory reporting of the revenue code on inpatient claims would have several benefits, including increasing the accuracy of claims reporting by transplant centers, ensuring the accuracy of CMS's budget neutrality calculations, and helping to ensure that CMS does not inappropriately generate outlier payment on MS-DRG 014 claims

(given that CMS removes costs associated with revenue code 0815 from its outlier calculation).

The commenter stated it would also mirror the edit established under the outpatient code editor.

Response: We appreciate the commenter's feedback. As stated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58789), we may consider provider education materials regarding the reporting of Allogeneic Stem Cell Acquisition/Donor Services in the future. We continue to believe that the suggested claims processing edit is not necessary at this time and expect providers to appropriately report charges associated with revenue code 0815.

Comment: A commenter stated it supported the removal of the vascular dementia codes from the Unacceptable Principal Diagnosis edit code list and that doing so will reduce administrative challenges with billing for services, improve the clinical accuracy of medical records and encourage appropriate care for this set of patients.

Response: We appreciate the commenter's support.

In summary, we thank the commenters for their views and feedback. Because we finalized the proposal to remove discussion of the MCE from the annual IPPS rulemakings beginning with FY 2025 rulemaking, the public may submit any future questions, comments, concerns, or recommendations regarding the MCE to the CMS mailbox at MSDRGClassificationChange@cms.hhs.gov for our review and consideration.

In association with the proposed rule, we made available the test version of the ICD-10 MS-DRG GROUPER Software, Version 42, the draft version of the ICD-10 MS-DRG Definitions Manual, Version 42, the draft version of the Definitions of Medicare Code Edits Manual, Version 42, and the supplemental mapping files in Table 6P.1a and 6P.1b of the FY 2024 and FY 2025 ICD-10-CM diagnosis and ICD-10-PCS procedure codes which are available at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software>.

Following are the changes that we proposed to the MS-DRGs for FY 2025. We invited public comments on each of the MS-DRG classification proposed changes, as well as our

proposals to maintain certain existing MS-DRG classifications discussed in the proposed rule. In some cases, we proposed changes to the MS-DRG classifications based on our analysis of claims data and clinical appropriateness. In other cases, we proposed to maintain the existing MS-DRG classifications based on our analysis of claims data and clinical appropriateness. As discussed in the FY 2025 IPPS/LTCH PPS proposed rule, our MS-DRG analysis was based on ICD-10 claims data from the September 2023 update of the FY 2023 MedPAR file, which contains hospital bills received from October 1, 2022, through September 30, 2023. In our discussion of the proposed MS-DRG reclassification changes, we referred to these claims data as the “September 2023 update of the FY 2023 MedPAR file.”

As explained in previous rulemaking (76 FR 51487), in deciding whether to propose to make further modifications to the MS-DRGs for particular circumstances brought to our attention, we consider whether the resource consumption and clinical characteristics of the patients with a given set of conditions are significantly different than the remaining patients represented in the MS-DRG. We evaluate patient care costs using average costs and lengths of stay and rely on clinical factors to determine whether patients are clinically distinct or similar to other patients represented in the MS-DRG. In evaluating resource costs, we consider both the absolute and percentage differences in average costs between the cases we select for review and the remainder of cases in the MS-DRG. We also consider variation in costs within these groups; that is, whether observed average differences are consistent across patients or attributable to cases that are extreme in terms of costs or length of stay, or both. Further, we consider the number of patients who will have a given set of characteristics and generally prefer not to create a new MS-DRG unless it would include a substantial number of cases.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58448), we finalized our proposal to expand our existing criteria to create a new complication or comorbidity (CC) or major complication or comorbidity (MCC) subgroup within a base MS-DRG. Specifically, we finalized the expansion of the criteria to include the NonCC subgroup for a three-way severity

level split. We stated we believed that applying these criteria to the NonCC subgroup would better reflect resource stratification as well as promote stability in the relative weights by avoiding low volume counts for the NonCC level MS-DRGs. We noted that in our analysis of MS-DRG classification requests for FY 2021 that were received by November 1, 2019, as well as any additional analyses that were conducted in connection with those requests, we applied these criteria to each of the MCC, CC, and NonCC subgroups. We also noted that the application of the NonCC subgroup criteria going forward may result in modifications to certain MS-DRGs that are currently split into three severity levels and result in MS-DRGs that are split into two severity levels. We stated that any proposed modifications to the MS-DRGs would be addressed in future rulemaking consistent with our annual process and reflected in Table 5 – Proposed List of Medicare Severity Diagnosis Related Groups (MS-DRGs), Relative Weighting Factors, and Geometric and Arithmetic Mean Length of Stay for the applicable fiscal year.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 44798), we finalized a delay in applying this technical criterion to existing MS-DRGs until FY 2023 or future rulemaking, in light of the public health emergency (PHE). Interested parties recommended that a complete analysis of the MS-DRG changes to be proposed for future rulemaking in connection with the expanded three-way severity split criteria be conducted and made available to enable the public an opportunity to review and consider the redistribution of cases, the impact to the relative weights, payment rates, and hospital case mix to allow meaningful comment prior to implementation.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 48803), we also finalized a delay in application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split in light of the ongoing PHE and until such time additional analyses can be performed to assess impacts, as discussed in response to public comments in the FY 2022 and FY 2023 IPPS/LTCH PPS final rules.

In association with our discussion of application of the NonCC subgroup criteria in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26673 through 26676), we provided an alternate test version of the ICD-10 MS-DRG GROUPER Software, Version 41.A, reflecting the proposed GROUPER logic for FY 2024 as modified by the application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split, available at

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software>. Therefore, users had access to the alternate test software

allowing them to build case examples that reflect the proposals included in the proposed rule with application of the NonCC subgroup criteria. We also provided additional files including an alternate Table 5—Alternate List of Medicare Severity Diagnosis Related Groups (MS-DRGs), Relative Weighting Factors, and Geometric and Arithmetic Mean Length of Stay, an alternate Length of Stay (LOS) Statistics file, an alternate Case Mix Index (CMI) file, and an alternate After Outliers Removed and Before Outliers Removed (AOR_BOR) file. The files are available in association with the FY 2024 IPPS/LTCH PPS proposed rule on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>.

We stated that the alternate test software and additional files were made available so that the public could better analyze and understand the impact on the proposals included in the proposed rule if the NonCC subgroup criteria were to be applied to existing MS-DRGs with a three-way severity level split. We refer readers to the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26673 through 26676) for further discussion of the alternate test software and additional files that were made available.

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58655 through 58661), we finalized to delay the application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split for FY 2024. We stated that we would continue to review and consider the feedback we had received in response to the additional information we made available in

association with the FY 2024 IPPS/LTCH PPS proposed rule for our development of the FY 2025 proposed rule.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35950), we noted that the IPPS Payment Impact File made available in connection with our annual IPPS rulemakings includes information used to categorize hospitals by various geographic and special payment consideration groups, including geographic location (urban or rural), teaching hospital status (that is, whether or not a hospital has GME residency programs and receives an IME adjustment), DSH hospital status (that is, whether or not a hospital receives Medicare DSH payments), special payment groups (that is, SCHs, MDHs, and RRCs) and other categories reflected in the impact analysis generally shown in Appendix A of the annual IPPS rulemakings. The IPPS Payment Impact File associated with the FY 2024 IPPS/LTCH PPS final rule can be found on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/fy-2024-ipp-pps-final-rule-home-page#Data>.

We proposed to continue to delay application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split for FY 2025, as we continue to consider the public comments received in response to the FY 2024 rulemaking. In addition, we encouraged interested parties to review the impacts and other information made available with the alternate test software (V41.A) and other additional files provided in connection with the FY 2024 IPPS/LTCH PPS proposed rule, as previously discussed, and stated that we continue to welcome feedback for consideration for future rulemaking.

Comment: Numerous commenters supported the proposal to continue to delay application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split for FY 2025.

Response: We thank the commenters for their support.

Comment: Several commenters expressed appreciation that CMS provided the meaningful data analysis and availability of the version 41.A alternate test GROUPER in

association with the FY 2024 proposed rule, however, the commenters stated that the ability to utilize an updated alternate test software and a current batch GROUPER along with additional streamlined data by hospital type is needed. According to the commenters, updated test software and an available batch GROUPER would allow hospitals to further analyze the operational and monetary impact of this type of proposed change more thoroughly and over a longer time span.

Response: We appreciate the commenters' feedback. As we noted in the proposed rule, the IPPS Payment Impact File made available in connection with our annual IPPS rulemakings includes information used to categorize hospitals by various geographic and special payment consideration groups and other categories reflected in the impact analysis generally shown in Appendix A of the annual IPPS rulemakings. We will consider the commenters' request to provide updated test software and a batch GROUPER for future rulemaking.

Comment: A commenter who agreed with the proposal to delay application of the NonCC subgroup criteria stated that CMS did not provide any new information from, or analysis of, the FY 2023 MedPAR file as it related to base, deleted, or new MS-DRGs related to the application of the NonCC subgroup criteria. The commenter stated that new data should have been included with the proposed rule to continue efforts to view the impact of the policy.

Response: We appreciate the commenter's support and feedback. In response to the commenter's request that we provide the potential impacts using the FY 2023 claims data, we are making it available in Table 6P.4 on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps> in association with this final rule.

We note that we did not propose to apply the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split for FY 2025. Moreover, as noted, we are continuing to consider comments received in response to FY 2024 rulemaking.

Comment: A commenter stated it utilized the files provided by CMS to analyze the impact of application of the NonCC subgroup criteria based on its own hospital volumes. The

commenter reported that while it found some positive impacts to the relative weight of the MS-DRGs impacted when applying the NonCC subgroup criteria, they continue to have concerns regarding the variations in claims data from year-to-year that may be used in the proposed MS-DRG restructuring. The commenter stated it agreed with comments in prior years from various professional organizations that have noted the variability in claims data and, thus, case mix variations from year-to-year.

Response: We appreciate the commenter's feedback.

Comment: A few commenters expressed concern that application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split will reduce the impact of CCs. The commenters noted from prior year's analyses findings that there are a number of MS-DRGs that would potentially be consolidated to reflect the two-way severity split for "with MCC" and "without MCC" and there were not any that reflected a "with CC/MCC" and "without CC/MCC" severity level split. The commenters stated that the impact of CCs would decrease as a result of the application of the expanded criteria, meaning that conditions designated as CC would increasingly need to be MCCs in order to impact case complexity and severity.

Response: We thank the commenters for their feedback. We disagree that application of the NonCC subgroup criteria specifically reduces the impact of CCs. Rather, we believe that application of the criteria combines the subset of cases that may or may not report a CC into one MS-DRG grouping that reflects the average costs and length of stay for that subset. Because the IPPS MS-DRGs are a system of averages, the cases reporting a CC continue to impact the average costs and average length of stay within the subgroup. We note that in the majority of the MS-DRGs where we previously assessed the impact of application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split and provided the potential MS-DRG changes, the volume of cases in the CC subgroup was significantly greater than those in the NonCC subgroup, thus contributing more to the overall average costs and average length of stay of the "potential" new MS-DRG structure. We also note that providers have the ability to

identify the subset of cases reporting a CC within the existing “with MCC” and “without MCC” MS-DRGs construct within their respective facilities.

After consideration of the public comments we received, and for the reasons discussed, we are finalizing our proposal to delay the application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split for FY 2025 as we continue to consider the public comments received in response to the FY 2024 rulemaking. We also continue to encourage interested parties to review the impacts and other information made available with the alternate test software (V41.A) and other additional files provided in connection with the FY 2024 IPPS/LTCH PPS proposed rule, as previously discussed. We continue to welcome feedback for consideration for future rulemaking that may be directed to MEARIS™ at <https://mearis.cms.gov/public/home>.

As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58661), we continue to apply the criteria to create subgroups, including application of the NonCC subgroup criteria, in our annual analysis of MS-DRG classification requests, consistent with our approach since FY 2021 when we finalized the expansion of the criteria to include the NonCC subgroup for a three-way severity level split. Accordingly, in our analysis of the MS-DRG classification requests for FY 2025 that we received by October 20, 2023, as well as any additional analyses that were conducted in connection with those requests, we applied these criteria to each of the MCC, CC, and NonCC subgroups, as described in the following table.

Criteria Number	Three-Way Split 123 (MCC vs CC vs NonCC)	Two-Way Split 1_23 MCC vs (CC+NonCC)	Two-Way Split 12_3 (MCC+CC) vs NonCC
1. At least 500 cases in the MCC/CC/NonCC group	500+ cases for MCC group; and 500+ cases for CC group; and 500+ cases for NonCC group	500+ cases for MCC group; and 500+ cases for (CC+NonCC) group	500+ cases for (MCC+CC) group; and 500+ cases for NonCC group
2. At least 5% of the patients are in the MCC/CC/NonCC group	5%+ cases for MCC group; and 5%+ cases for CC group; and 5%+ cases for NonCC group	5%+ cases for MCC group; and 5%+ cases for (CC+NonCC) group	5%+ cases for (MCC+CC) group; and 5%+ cases for NonCC group
3. There is at least a 20% difference in average cost between subgroups	20%+ difference in average cost between MCC group and CC group; and 20%+ difference in average cost between CC group and NonCC group	20%+ difference in average cost between MCC group and (CC+NonCC) group	20%+ difference in average cost between (MCC+ CC) group and NonCC group
4. There is at least a \$2,000 difference in average cost between subgroups	\$2,000+ difference in average cost between MCC group and CC group; and \$2,000+ difference in average cost between CC group and NonCC group	\$2,000+ difference in average cost between MCC group and (CC+ NonCC) group	\$2,000+ difference in average cost between (MCC+ CC) group and NonCC group
5. The R2 of the split groups is greater than or equal to 3	$R2 \geq 3.0$ for the three-way split within the base MS-DRG	$R2 \geq 3.0$ for the two-way 1_23 split within the base MS-DRG	$R2 \geq 3.0$ for the two-way 12_3 split within the base MS-DRG

In general, once the decision has been made to propose to make further modifications to the MS-DRGs as described previously, such as creating a new base MS-DRG, or in our evaluation of a specific MS-DRG classification request to split (or subdivide) an existing base MS-DRG into severity levels, all five criteria must be met for the base MS-DRG to be split (or subdivided) by a CC subgroup. We note that in our analysis of requests to create a new MS-DRG, we typically evaluate the most recent year of MedPAR claims data available. For example, we stated earlier that for the FY 2025 IPPS/LTCH PPS proposed rule, our MS-DRG analysis was based on ICD-10 claims data from the September 2023 update of the FY 2023 MedPAR file. However, in our evaluation of requests to split an existing base MS-DRG into severity levels, as noted in prior rulemaking (80 FR 49368), we typically analyze the most recent two years of data. This analysis includes two years of MedPAR claims data to compare the data results from one year to the next to avoid making determinations about whether additional severity levels are warranted based on an isolated year's data fluctuation and also, to validate that the established severity levels within a base MS-DRG are supported. The first step in our process of evaluating if the creation of a new CC subgroup within a base MS-DRG is warranted is to determine if all the criteria is satisfied for a three-way split. In applying the criteria for a

three-way split, a base MS-DRG is initially subdivided into the three subgroups: MCC, CC, and NonCC. Each subgroup is then analyzed in relation to the other two subgroups using the volume (Criteria 1 and 2), average cost (Criteria 3 and 4), and reduction in variance (Criteria 5). If the criteria fail, the next step is to determine if the criteria are satisfied for a two-way split. In applying the criteria for a two-way split, a base MS-DRG is initially subdivided into two subgroups: “with MCC” and “without MCC” (1_23) or “with CC/MCC” and “without CC/MCC” (12_3). Each subgroup is then analyzed in relation to the other using the volume (Criteria 1 and 2), average cost (Criteria 3 and 4), and reduction in variance (Criteria 5). If the criteria for both of the two-way splits fail, then a split (or CC subgroup) would generally not be warranted for that base MS-DRG. If the three-way split fails on any one of the five criteria and all five criteria for both two-way splits (1_23 and 12_3) are met, we would apply the two-way split with the highest R2 value. We note that if the request to split (or subdivide) an existing base MS-DRG into severity levels specifies the request is for either one of the two-way splits (1_23 or 12_3), in response to the specific request, we will evaluate the criteria for both of the two-way splits; however, we do not also evaluate the criteria for a three-way split.

Comment: A commenter recommended that CMS consider patient risk adjustment as a criterion for creating CC and MCC subgroups, including the impact of multiple comorbidities. According to the commenter, published literature suggests that as comorbidity status increases, patient risk of clinical events increase, as well as potential resource use. For example, the commenter stated that studies suggest that in patients with one presenting risk factor/comorbidity (either hypertension, congenital heart disease, previous stroke, or diabetes), compared to patients without these risks, that the risk of future stroke was 1.96 greater.⁴ According to the commenter, the authors also found patients with 2 or more of these risk factors to have an increased risk of future stroke at 2.87 greater the risk of patients without risk factors and stated that these results

⁴ Zhang Y, et al. Association of total pre-existing comorbidities with stroke risk: a large-scale community-based cohort study from China. BMC Public Health. 2021; 21(1):1910

suggest the cumulative effect of multiple CCs can dramatically impact a patient's risk and resource use in the absence of an MCC. The commenter suggested that CMS should consider the impact of multiple CCs (heart failure, AF, etc.) as a criterion when grouping an inpatient procedure to an MCC grouping in the absence of MCC.

Response: We appreciate the commenter's input and will take it under consideration as we continue to consider feedback associated with application of the NonCC subgroup criteria.

We are making the FY 2025 ICD-10 MS-DRG GROUPER and Medicare Code Editor (MCE) Software Version 42, the ICD-10 MS-DRG Definitions Manual files Version 42 and the Definitions of Medicare Code Edits Manual Version 42 available to the public on our CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>.

2. Pre-MDC MS-DRG 018 Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35951 through 35952), we discussed a request we received to revise the title of Pre-MDC MS-DRG 018 (Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies) in connection with an ICD-10-PCS procedure code request that was submitted via MEARIS™ by the December 1, 2023 deadline for consideration as an agenda topic to be discussed at the March 19-20, 2024 ICD-10 Coordination and Maintenance Committee meeting. The procedure code request involves the application of an autologous genetically engineered cell-based gene therapy, prademagene zamikeracel (PZ), that is indicated in the treatment of recessive dystrophic epidermolysis bullosa (RDEB), an extremely rare genetic disease of the skin that leads to large chronic wounds. The proposal was presented and discussed at the March 19–20, 2024, ICD-10 Coordination and Maintenance Committee meeting. We refer the reader to the CMS website at <https://www.cms.gov/medicare/coding-billing/icd-10-codes/icd-10-coordination-maintenance-committee-materials> for additional detailed information regarding the request, including a recording of the discussion and the related

meeting materials. Public comments in response to the code proposal were due by April 19, 2024. The requestor suggested that if finalized, a new procedure code to identify the application of PZ should be assigned to Pre-MDC MS-DRG 018 and that the title for Pre-MDC MS-DRG 018 be revised to reflect “Chimeric Antigen Receptor (CAR) T and Other Autologous Gene and Cell Therapies”.

Because the diagnosis and procedure code proposals that are presented at the March ICD-10-CM Coordination and Maintenance Committee meeting for an October 1 implementation (upcoming FY) are not finalized in time to include in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes in association with the proposed rule, as we have noted in prior rulemaking, we use our established process to examine the MS-DRG assignment for the predecessor codes to determine the most appropriate MS-DRG assignment. Specifically, we review the predecessor code and MS-DRG assignment most closely associated with the new procedure code, and in the absence of claims data, we consider other factors that may be relevant to the MS-DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We have noted in prior rulemaking that this process does not automatically result in the new procedure code being assigned to the same MS-DRG or to have the same designation (O.R. versus Non-O.R.) as the predecessor code. Under this established process, the MS-DRG assignment for the upcoming fiscal year for any new diagnosis or procedure codes finalized after the March meeting would be reflected in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes associated with the final rule for that fiscal year. Accordingly, we stated that the MS-DRG assignment for any new procedure codes describing PZ, if finalized following the March meeting, would be reflected in Table 6B.—New Procedure Codes associated with the final rule for FY 2025. As noted in prior rulemaking (87 FR 28135), the codes that are finalized after the March meeting are specifically identified with a footnote in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes that are made publicly available in association

with the final rule on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>. The public may provide feedback on these finalized assignments, which is then taken into consideration for the following fiscal year.

We note that the proposal to create new procedure codes that describe the application of PZ as discussed at the March 19-20, 2024, ICD-10 Coordination and Maintenance Committee meeting was approved and finalized as reflected in the FY 2025 ICD-10-PCS Code Update files that were made publicly available on the CMS website on June 5, 2024 at <https://www.cms.gov/medicare/coding-billing/icd-10-codes/2025-icd-10-pcs>.

We stated in the proposed rule that we did not agree with the request to revise the title for Pre-MDC MS-DRG 018 for FY 2025 as requested because the logic for Pre-MDC MS-DRG 018 is intended to include other immunotherapies and is not restricted to CAR T-cell and autologous gene and cell therapies. As discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44798 through 44806), we finalized our proposal to revise the title of Pre-MDC MS-DRG 018 to include “Other Immunotherapies” to better reflect the cases reporting the administration of non-CAR T-cell therapies and other immunotherapies that would also be assigned to this MS-DRG, in addition to CAR T-cell therapies. We noted that the term “Other Immunotherapies” is intended to encompass the group of therapies that are currently available and being utilized today (for which codes have been created for reporting in response to industry requests or are being considered for implementation), and to enable appropriate MS-DRG assignment for any future therapies that may also fit into this category and are not specifically identified as a CAR T-cell product, that may become available (for example receive marketing authorization or a newly established procedure code in the ICD-10-PCS classification).

In the proposed rule we also noted that, as discussed in prior rulemaking, this category of therapies continues to evolve, and we are in the process of carefully considering the feedback we have previously received about ways in which we can continue to appropriately reflect resource utilization while maintaining clinical coherence and stability in the relative weights under the

IPPS MS-DRGs. We stated we will continue to examine these complex issues in connection with future rulemaking and acknowledged that there may be distinctions to account for as we continue to gain more experience in the use of these therapies and have additional claims data to analyze.

Therefore, we did not propose to revise the title for Pre-MDC MS-DRG 018 to reflect “Chimeric Antigen Receptor (CAR) T and Other Autologous Gene and Cell Therapies” and proposed to maintain the existing title to Pre-MDC MS-DRG 018, “Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies” for FY 2025.

Comment: Commenters expressed support for the proposal to maintain the existing title to Pre-MDC MS-DRG 018, “Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies” for FY 2025.

Response: We thank the commenters for their support.

Comment: A commenter stated that application of PZ (prademagene zamikeracel) seems to differ significantly in terms of clinical coherence and resource utilization from other therapies currently mapped to MS-DRG 018, specifically in that it requires an operating room and subsequent post-surgical care. According to the commenter, although CMS did not specifically propose to map cases reporting the application of PZ to Pre-MDC MS-DRG 018 for FY 2025, PZ does not appear to be a match for the technologies currently included in Pre-MDC MS-DRG 018 since it is not an immunotherapy and would be the only surgical episode of care in the MS-DRG. The commenter requested that CMS not finalize the mapping for application of PZ to Pre-MDC MS-DRG 018 due to differences in resource use.

Another commenter stated that if CMS were to continue to assign new, higher volume, lower cost therapies to MS-DRG 018, it could potentially distort the relative weight of the MS-DRG, resulting in inadequate payment for CAR T-cell therapies. This commenter also recommended that CMS not map cases reporting application of PZ to Pre-MDC MS-DRG 018 due to clinical resource differences with other therapies currently mapped to Pre-MDC MS-DRG

018. The commenter further stated that given the important role CAR T-cell therapies play, and will continue to play for cancer patients, CMS should clarify its methodology for the inclusion of new procedure codes within Pre-MDC MS-DRG 018 and consider the resource costs and needs of potential new therapies to this MS-DRG so as not to limit access to current therapies. Other commenters recommended that CMS provide transparency in the assignment of therapies to Pre-MDC MS-DRG 018 to ensure accurate, predictable, and appropriate payment, including consideration of comparable resource use to existing therapies currently mapped to Pre-MDC MS-DRG 018.

Another commenter requested that CMS map the new procedure codes describing application of PZ to Pre-MDC MS-DRG 018, given the clinical characteristics and resource intensity of the gene and cellular therapy. According to the commenter, administration of both autologous CAR T-cell therapies and PZ is initiated through the collection of a sample of the patient's own cells. The commenter stated the cells are then modified as part of a complex and resource intensive process requiring the insertion of a new gene into the patient's own cells before administering them back to the patient. Specifically, the commenter stated that the keratinocyte cells (that is, the most prominent cells in the epidermis) of patients diagnosed with RDEB are collected via a "punch" biopsy procedure and transduced with a functional COL7A1 transgene using a retroviral vector, which is intended to result in adequate expression and secretion of the type VII collagen protein critical to anchoring the epidermis and facilitating wound healing. The commenter stated the transduced cells are then expanded, matured, and processed into sheets through an approximate 25-day process before they can be delivered to the hospital site and applied to the patient. The commenter stated that this process mirrors the CAR T-cell therapy development and administration process, where cells are harvested from the patient's blood, the patient's T-cells are isolated through a leukapheresis procedure, and the T-cells then are transduced with a CAR-encoding viral vector and expanded over an approximate month-long period before being returned to the treatment center for administration to the patient.

The commenter also stated that the application of PZ shares other similarities with the technologies currently assigned to Pre-MDC MS-DRG 018, including the need for an interdisciplinary team of health care personnel, and an extended length of stay following treatment. According to the commenter, from a resource perspective, like other therapies currently assigned to Pre-MDC MS-DRG 018, the main driver of resource utilization for an inpatient stay is the administration of the technology.

Response: We appreciate the commenters' feedback. In response to the commenters who requested that CMS not finalize the mapping for application of PZ to Pre-MDC MS-DRG 018 due to the belief that there are differences in resource use when compared to other therapies currently mapped to Pre-MDC MS-DRG 018, we note that the commenters did not indicate whether they believed the differences in resource use for application of PZ are higher or lower in comparison to the other therapies currently mapped to Pre-MDC MS-DRG 018, nor did the commenters offer any alternative MS-DRG suggestions for CMS's consideration. We acknowledge that application of PZ requires use of an operating room and the administration of other therapies currently assigned to Pre-MDC MS-DRG 018 do not. We also note that consistent with our established process for assigning new diagnosis or new procedure codes to MDCs, MS-DRGs, and the associated attributes (severity level and O.R. status), we examined the MDCs, MS-DRG assignment and O.R. status of the predecessor procedure codes to inform our assignments and designations. As discussed in prior rulemaking and previously in the preamble of this final rule, we review the predecessor code and MS-DRG assignment most closely associated with the new diagnosis or procedure code, and in the absence of claims data, we consider other factors that may be relevant to the MS-DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We have previously noted that this process does not automatically result in the new diagnosis or procedure code being assigned to the same MS-DRG or to have the same designation as the predecessor code. In our evaluation of MS-DRG

classification requests under the IPPS MS-DRGs, consideration is also given to the similarities and differences in resource utilization among patients in each MS-DRG and we strive to ensure that resource utilization is relatively consistent across patients in each MS-DRG. However, some variation in resource intensity will remain among the patients in each MS-DRG because the definition of the MS-DRG is not so specific that every patient is identical, rather the average pattern of resource intensity of a group of patients in an MS-DRG can be predicted.

We note that historically, in the development of the DRGs, the initial step in the determination of the DRG had been the assignment of the appropriate MDC based on the principal diagnosis, however, beginning with the eighth version of the GROUPER (CMS 8.0), the initial step in DRG assignment was based on the procedure being performed, thus the creation of the Pre-MDC DRGs, where the patient is assigned to these DRGs independent of the MDC of the principal diagnosis. Therefore, while the existing therapies (that is, CAR T-cell and non-CAR T-cell) currently mapped to Pre-MDC MS-DRG 018 may be indicated in the treatment of patients with cancer, the logic for case assignment to Pre-MDC MS-DRG 018 does not preclude the assignment of other therapies indicated in the treatment of patients that do not have a diagnosis of cancer. In our review of the MS-DRG assignment for application of PZ, we recognized that this technology is defined as an investigational genetically engineered autologous cell therapy. We also note that similar to the discussions in prior rulemaking with respect to the difficulty in predicting what the associated costs will be in the future for CAR T-cell and other immunotherapies that remain under development (87 FR 48806), it is also difficult to predict what the associated costs will be in the future for cell and gene therapies that remain under development or in clinical trials.

We further note that, in response to the President's Executive Order 14087, "Lowering Prescription Drug Costs for Americans", a Cell and Gene Therapy (CGT) Access Model was developed, which could help inform future inpatient payment policy for cell and gene therapies

more generally. For additional information on the CGT Access Model, we refer the reader to the CMS website at <https://www.cms.gov/priorities/innovation/innovation-models/cgt>.

Until such time additional data becomes available, we believe it is appropriate to map cases reporting the application of PZ to Pre-MDC MS-DRG 018 for FY 2025 based on the information currently available indicating similar utilization of resources for other cases currently mapped to MS-DRG 018 with regard to patients' severity of illness, treatment difficulty, and complexity of service.

In response to concerns that the assignment of new, higher volume, lower cost therapies to MS-DRG 018 could potentially distort the relative weight of the MS-DRG resulting in inadequate payment for CAR T-cell therapies, we note that in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48807), we addressed similar comments and also noted that we provided detailed summaries and responses to these same or similar comments in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44798 through 44806). We also refer the reader to the discussion in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36018 through 36020), and in section II.D.2.b. of this final rule, regarding the proposed and finalized relative weight methodology for cases mapping to Pre-MDC MS-DRG 018 effective October 1, 2024, for FY 2025.

After consideration of the public comments we received, we are finalizing our proposal to maintain the existing title to Pre-MDC MS-DRG 018, "Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies" for FY 2025. We are also finalizing the assignment of the eight procedure codes describing the use of PZ to Pre-MDC MS-DRG 018 as reflected in Table 6B. – New Procedure Codes, in association with this final rule and available on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>.

3. MDC 01 (Diseases and Disorders of the Nervous System):

a. Logic for MS-DRGs 023 through 027

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58661 through 58667), we discussed a request to reassign cases describing the insertion of a neurostimulator generator into the skull in combination with the insertion of a neurostimulator lead into the brain from MS-DRG 023 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator) to MS-DRG 021 (Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage with CC) or reassign all cases currently assigned to MS-DRG 023 that involve a craniectomy or a craniotomy with the insertion of device implant and create a new MS-DRG for these cases.

We stated the requestor acknowledged that the relatively low volume of cases that only involve the insertion of a neurostimulator generator into the skull in combination with the insertion of a neurostimulator lead into the brain in the claims data was likely not sufficient to warrant the creation of a new MS-DRG. The requestor further stated given the limited options within the existing MS-DRG structure that fit from both a cost and clinical cohesiveness perspective, they believed that MS DRG 021 was the most logical fit in terms of average costs and clinical coherence for reassignment even though, according to the requestor, the insertion of a neurostimulator generator into the skull in combination with the insertion of a neurostimulator lead into the brain is technically more complex and involves a higher level of training, extreme precision and sophisticated technology than performing a craniectomy for hemorrhage.

We noted that while our data findings demonstrated the average costs are higher for the cases with a principal diagnosis of epilepsy with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain when compared to all cases in MS-DRG 023, these cases represented a small percentage of the total number of cases reported in this MS-DRG. We stated that while we appreciated the requestor's concerns regarding the differential in average costs for cases describing the insertion of a neurostimulator generator into the skull in combination with the insertion of a neurostimulator lead into the brain when compared to all cases in their assigned MS-DRG, we believed additional time was needed to evaluate these cases

as part of our ongoing examination of the case logic to the MS-DRGs for craniotomy and endovascular procedures, which are MS-DRG 023, MS-DRG 024 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC), and MS-DRGs 025, 026, and 027 (Craniotomy and Endovascular Intracranial Procedures with MCC, with CC, and without CC/MCC, respectively).

As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48808 through 48820), in connection with our analysis of cases reporting laser interstitial thermal therapy (LITT) procedures performed on the brain or brain stem in MDC 01, we stated we have started to examine the logic for case assignment to MS-DRGs 023 through 027 to determine where further refinements could potentially be made to better account for differences in the technical complexity and resource utilization among the procedures that are currently assigned to those MS-DRGs. We stated that specifically, we were in the process of evaluating procedures that are performed using an open craniotomy (where it is necessary to surgically remove a portion of the skull) versus a percutaneous burr hole (where a hole approximately the size of a pencil is drilled) to obtain access to the brain in the performance of a procedure. We stated we were also reviewing the indications for these procedures, for example, malignant neoplasms versus epilepsy to consider if there may be merit in considering restructuring the current MS-DRGs to better recognize the clinical distinctions of these patient populations in the MS-DRGs.

As part of this evaluation, as discussed in the FY 2024 IPPS/LTCH PPS final rule, we have begun to analyze the ICD-10 coded claims data to determine if the patients' diagnoses, the objective of the procedure performed, the specific anatomical site where the procedure is performed or the surgical approach used (for example, open, percutaneous, percutaneous endoscopic, among others) demonstrates a greater severity of illness and/or increased treatment difficulty as we consider restructuring MS-DRGs 023 through 027, including how to better align the clinical indications with the performance of specific intracranial procedures. We referred the reader to Tables 6P.2b through 6P.2f associated with the FY 2024 IPPS/LTCH PPS proposed

rule (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>) for data analysis findings of cases assigned to MS-DRGs 023 through 027 from the September 2022 update of the FY 2022 MedPAR file as we continue to look for patterns of complexity and resource intensity.

In summary, we stated that while we agreed that neurostimulator cases can have average costs that are higher than the average costs of all cases in their respective MS-DRGs, in our analysis of this issue, it was difficult to detect patterns of complexity and resource intensity. Therefore, for the reasons discussed, we finalized our proposal to maintain the current assignment of cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain for FY 2024.

In the FY 2024 IPPS/LTCH PPS final rule, we stated we continue to believe that additional time is needed to evaluate these cases as part of our ongoing examination of the case logic for MS-DRGs 023 through 027. As part of our ongoing, comprehensive analysis of the MS-DRGs under ICD-10, we stated we would continue to explore mechanisms to ensure clinical coherence between these cases and the other cases with which they may potentially be grouped. We stated that the data analysis as displayed in Tables 6P.2b through 6P.2f associated with the FY 2024 IPPS/LTCH PPS proposed rule was displayed to provide the public an opportunity to review our examination of the procedures by their approach (open versus percutaneous), clinical indications, and procedures that involve the insertion or implantation of a device and to reflect on what factors should be considered in the potential restructuring of these MS-DRGs. We welcomed further feedback on how CMS should define technical complexity, what factors should be considered in the analysis, and whether there are other data not included in Tables 6P.2b through 6P.2f that CMS should analyze. We also stated we are interested in receiving feedback on where further refinements could potentially be made to better account for differences in the technical complexity and resource utilization among the procedures that are currently assigned to these MS-DRGs.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35952 through 35953), we discussed two comments we received by the October 20, 2023 deadline in response to this discussion in the FY 2024 IPPS/LTCH PPS final rule. A commenter recommended that CMS not use surgical approach (for example, open versus percutaneous) as a factor to reclassify MS-DRGs 023 through 027. The commenter stated whether the opening is created via a drill into the skull percutaneously or through a larger incision in the skull for a craniotomy, both approaches involve the risk of intracranial bleeding, infection, and brain swelling. The commenter further stated they do not support a consideration of the reassignment of the ICD-10-PCS procedure codes describing LITT, currently assigned to MS-DRGs 025 through 027, based on the diagnosis being treated. The commenter stated that the LITT procedure requires the same steps, time, and clinical resources when performed for brain cancer or epilepsy. In the commenter's view, differences in the disease causing the tumors or lesions do not affect the resources used for performing the procedure or the post-operative care for the patient. Lastly, the commenter stated they support the current structure of MS-DRGs 023 and 024 based on an acute complicated principal diagnosis, or chemotherapy implant, or epilepsy with neurostimulator. The commenter stated these diagnoses represent severe complex conditions that require immediate and urgent intervention.

Another commenter stated that the current logic for MS-DRGs 023 through 027 is sufficient and supports the clinical and resource similarities of the procedures reflected in these MS-DRGs. The commenter performed its own analysis and stated they found that realignment based on surgical approach or root operation could create significant new inequities. The commenter recommended that CMS maintain the current logic for MS-DRGs 025 through 027, as making changes could be disruptive to hospitals and create challenges for Medicare beneficiary access to life-saving technologies. The commenter stated they strongly believe that maintaining the current structure provides payment stability and integrity of these procedures over time.

In this final rule, we summarize the additional comments we received in response to this discussion in the FY 2025 IPPS/LTCH PPS proposed rule.

Comment: Commenters stated they support CMS' decision to continue to monitor the case logic for MS-DRGs 023 through 027 to determine if future changes are warranted. A commenter specifically stated in their review, they were unable to detect misalignment in patterns of complexity or resource intensity within MS-DRGs 023 through 027 and noted the procedures are well-established. Another commenter stated they appreciate CMS reviewing the craniotomy MS-DRGs and stated that CMS should ensure that MS-DRG assignments fully reflect all costs for very resource-intensive craniotomy procedures. This commenter also recommended that CMS expand its review of the craniotomy MS-DRGs to include MS-DRGs 020, 021, and 022 (Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage with MCC, with CC, and without CC/MCC, respectively) and stated that the payments for these MS-DRGs have been highly variable in recent years, notably being proposed to reduce by more than 7 percent for FY 2025, and may fail to adequately reflect the resources associated with care for patients with diagnoses such as aneurysms. The commenter encouraged CMS to examine these MS-DRGs with the goal of providing more stable payments for hospitals that furnish intensive craniotomy procedures and to mitigate the financial impact of large payment declines. Several other commenters expressed caution, however, and stated that CMS should allow providers more time to identify which diagnoses support this procedure code and as such do not agree with moving it to MS-DRG 021.

Response: We thank the commenters and appreciate the commenters' support and feedback. CMS will continue to monitor and analyze the claims data with respect to MS-DRGs 023 through 027 and we will take the recommendation to also review MS-DRGs 020, 021, and 022 into consideration as we further examine the logic for case assignment to the craniotomy MS-DRGs. We note that we did not propose or finalize a change to the GROUPER logic of MS-DRGs 020, 021, and 022 in FY 2024 IPPS/LTCH PPS rulemaking, nor did we propose a change

to the GROUPER logic of these MS-DRGs in the FY 2025 IPPS/LTCH PPS proposed rule, therefore, the difference in the relative weights reflected in Table 5 –List of Medicare Severity Diagnosis Related Groups (MS-DRGs), Relative Weighting Factors, and Geometric and Arithmetic Mean Length of Stay associated with FY 2025 proposed rule for MS-DRGs 020, 021, and 022 can be attributed to changes in the underlying data.

In response to the comments suggesting that CMS allow more time, it is unclear which diagnosis code and which procedure code the commenters were referring to as CMS did not propose to move any codes to MS-DRG 021 in the FY 2025 IPPS/LTCH proposed rule, and the commenters did not specifically identify any ICD-10 codes for CMS to consider.

CMS appreciates the comments submitted in response to the request for feedback in the FY 2024 IPPS/LTCH PPS final rule, as well as the comments submitted in response to the discussion in the FY 2025 IPPS/LTCH PPS proposed rule. As we continue analysis of the claims data with respect to MS-DRGs 023 through 027, we continue to seek public comments and feedback on other factors that should be considered in the potential restructuring of these MS-DRGs. As stated in prior rulemaking, we recognize the logic for MS-DRGs 023 through 027 has grown more complex over the years and believe there is opportunity for further refinement. We refer the reader to the ICD-10 MS-DRG Definitions Manual, Version 42 (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic for MS-DRGs 023 through 027 for FY 2025. Feedback and other suggestions may continue to be directed to MEARIS™, discussed in section II.C.1.b. of the preamble of this final rule at: <https://mearis.cms.gov/public/home>.

b. Intraoperative Radiation Therapy (IORT)

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35953 through 35956), we received a request to add ICD-10-PCS procedure codes D0Y0CZZ (Intraoperative radiation therapy (IORT) of brain) and D0Y1CZZ (Intraoperative radiation therapy (IORT) of

brain stem), to the Chemotherapy Implant logic list in MS-DRG 023 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator). According to the requestor, intraoperative radiation therapy (IORT) for the brain is always performed as part of the surgery to remove a brain tumor during the same operative episode. The requestor stated that once maximal safe tumor resection is achieved, the tumor cavity is examined for active egress of cerebrospinal fluid or bleeding. Next, intraoperative measurements are made using neuro-navigation or intraoperative imaging such as magnetic resonance imaging (MRI) or computed tomography (CT) to ensure safe distance to organs or tissues at risk, aid in appropriate dose calculation, and selection of proper applicator size. The applicator is then implanted into the tumor cavity and the radiation dose is delivered. The requestor stated that delivery time can be up to 40 minutes and upon completion of the treatment, the source is removed, and the cavity is re-inspected for active egress of cerebrospinal fluid and bleeding.

As discussed in the proposed rule, the requestor stated that currently the ICD-10-PCS procedure codes for excision of a brain tumor, 00B00ZZ (Excision of brain, open approach) and 00B70ZZ (Excision of cerebral hemisphere, open approach) map to both sets of craniotomy MS-DRGs. Specifically, MS-DRG 023 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator) and MS-DRG 024 (Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC), and MS-DRGs 025, 026, and 027 (Craniotomy and Endovascular Intracranial Procedures with MCC, with CC, and without CC/MCC, respectively). However, the requestor also stated that the procedure codes describing IORT (D0Y0CZZ or D0Y1CZZ) are not listed in the GROUPER logic and do not affect MS-DRG assignment. Therefore, cases reporting a procedure code describing excision of a brain tumor (00B00ZZ or 00B70ZZ) with IORT currently map to MS-DRGs 025, 026, and 027. The requestor suggested that cases reporting a procedure code describing excision of a brain tumor (00B00ZZ or

00B70ZZ) with IORT (D0Y0CZZ or D0Y1CZZ) should map to MS-DRG 023 because of the higher costs associated with the addition of IORT to the excision of brain tumor surgery.

According to the requestor, MS-DRG 023 includes complicated craniotomy cases involving the placement of radiological sources and chemotherapy implants. The requestor stated that because IORT involves a full course of radiation therapy delivered directly to the tumor bed via an applicator that is implanted into the tumor cavity during the same surgical session and is clinically similar to two other procedures listed in the Chemotherapy Implant logic list, it should also be included in the Chemotherapy Implant logic list. Specifically, the requestor stated procedure code 00H004Z (Insertion of radioactive element, cesium-131 collagen implant into brain, open approach) and procedure code 3E0Q305 (Introduction of other antineoplastic into cranial cavity and brain, percutaneous approach) also involve the delivery of either radiation or chemotherapy directly after tumor resection. According to the requestor, the resources involved in placing the delivery device are similar for all three procedures and the distinction is that the procedures described by codes 00H004Z and 3E0Q305 involve the insertion of devices that deliver radiation or chemotherapy over a period of time, whereas IORT delivers the entire dose of radiation during the operative session. As such, the requestor asserted that IORT is clinically aligned with the other procedures from a therapeutic and resource utilization perspective.

We noted in the proposed rule that the requestor performed its own analysis using the FY 2022 MedPAR file that was made available in association with the FY 2024 IPPS/LTCH PPS final rule and stated it found fewer than 11 cases reporting IORT in MS-DRGs 025, 026, and 027, with the majority of those cases mapping to MS-DRG 025. According to the requestor, the volume of claims reporting IORT is anticipated to increase as appropriate use of the technology is adopted.

We also noted in the proposed rule that the requestor is correct that currently, the logic for case assignment to MS-DRG 023 includes a Chemotherapy Implant logic list and the procedure codes that identify IORT (D0Y0CZZ and D0Y1CZZ) are not listed in the GROUPE

logic and do not affect MS-DRG assignment as the procedures are designated as non-O.R. procedures. The requestor is also correct that cases reporting a procedure code describing excision of a brain tumor (00B00ZZ or 00B70ZZ) with IORT currently map to MS-DRGs 025, 026, and 027. We refer the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1 (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic.

As discussed in the proposed rule, we analyzed claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRGs 023, 024, 025, 026, and 027 and for cases reporting excision of brain tumor and IORT. We identified claims reporting excision of brain tumor with procedure code 00B00ZZ or 00B70ZZ and identified claims reporting IORT with procedure code D0Y0CZZ or D0Y1CZZ. The findings from our analysis are shown in the following table. We note that there were no cases found to report IORT of brain (D0Y0CZZ) or brain stem (D0Y1CZZ) with excision of brain (00B00ZZ) or excision of cerebral hemisphere (00B70ZZ).

MS-DRG		Number of cases	Average Length of Stay	Average Costs
23	All cases	11,439	10.3	\$48,762
	Cases reporting excision of brain (00B00ZZ)	98	11.6	\$61,938
	Cases reporting excision of cerebral hemisphere (00B70ZZ)	242	10.7	\$58,498
	Cases reporting excision of brain (00B00ZZ) with IORT of brain (D0Y0CZZ)	0	0.0	\$0
	Cases reporting excision of brain (00B00ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain (D0Y0CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	All other cases	11,099	10.3	\$48,433
24	All cases	4,641	5.1	\$33,784
	Cases reporting excision of brain (00B00ZZ)	6	5.7	\$32,308
	Cases reporting excision of cerebral hemisphere (00B70ZZ)	7	9.3	\$34,707
	Cases reporting excision of brain (00B00ZZ) with IORT of brain (D0Y0CZZ)	0	0.0	\$0
	Cases reporting excision of brain (00B00ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain (D0Y0CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain stem (D0Y1CZZ)	0		\$0
	All other cases	4,628	5.1	\$33,785
25	All cases	21,118	8.8	\$37,822
	Cases reporting excision of brain (00B00ZZ)	1,676	8.8	\$38,410

	Cases reporting excision of cerebral hemisphere (00B70ZZ)	3,968	7.9	\$33,904
	Cases reporting excision of brain (00B00ZZ) with IORT of brain (D0Y0CZZ)	0	0.0	\$0
	Cases reporting excision of brain (00B00ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain (D0Y0CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	All other cases	15,474	9.0	\$38,763
26	All cases	5,882	4.5	\$27,231
	Cases reporting excision of brain (00B00ZZ)	188	4.8	\$26,093
	Cases reporting excision of cerebral hemisphere (00B70ZZ)	418	4.2	\$23,867
	Cases reporting excision of brain (00B00ZZ) with IORT of brain (D0Y0CZZ)	0	0	\$0
	Cases reporting excision of brain (00B00ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain (D0Y0CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	All other cases	5,276	4.5	\$27,538
27	All cases	7,232	2	\$22,136
	Cases reporting excision of brain (00B00ZZ)	161	2.9	\$20,695
	Cases reporting excision of cerebral hemisphere (00B70ZZ)	323	2.5	\$21,039
	Cases reporting excision of brain (00B00ZZ) with IORT of brain (D0Y0CZZ)	0	0	\$0
	Cases reporting excision of brain (00B00ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain (D0Y0CZZ)	0	0	\$0
	Cases reporting excision of cerebral hemisphere (00B70ZZ) with IORT of brain stem (D0Y1CZZ)	0	0	\$0
	All other cases	6,748	2.0	\$22,223

As the data show, there were no cases found to report the use of IORT in the performance of a brain tumor excision; therefore, we are unable to evaluate whether the use of IORT directly impacts resource utilization. For this reason, we proposed to maintain the current structure of MS-DRGs 023, 024, 025, 026, and 027 for FY 2025. We stated that we would continue to monitor the claims data in consideration of any future modifications to the MS-DRGs for which IORT may be reported.

Comment: Commenters supported the proposal to maintain the current structure of MS-DRGs 023, 024, 025, 026, and 027 for FY 2025.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to maintain the current structure of MS-DRGs 023, 024, 025, 026, and 027 for FY 2025.

4. MDC 05 (Diseases and Disorders of the Circulatory System)

a. Concomitant Left Atrial Appendage Closure and Cardiac Ablation

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35956 through 35959), we received a request to create a new MS-DRG to better accommodate the costs of concomitant left atrial appendage closure and cardiac ablation for atrial fibrillation in MDC 05 (Diseases and Disorders of the Circulatory System). Atrial fibrillation (AF) is an irregular and often rapid heart rate that occurs when the two upper chambers of the heart experience chaotic electrical signals. AF presents as either paroxysmal (lasting < 7 days), persistent (lasting > 7 day, but less than 1 year), or long standing persistent (chronic)(lasting > 1 year) based on time duration and can increase the risk for stroke, heart failure, and mortality. Management of AF has two primary goals: optimizing cardiac output through rhythm or rate control and decreasing the risk of cerebral and systemic thromboembolism. Among patients with AF, thrombus in the left atrial appendage (LAA) is a primary source for thromboembolism. Left Atrial Appendage Closure (LAAC) is a surgical or minimally invasive procedure to seal off the LAA to reduce the risk of embolic stroke.

According to the requestor, the manufacturer of the WATCHMAN™ Left Atrial Appendage Closure (LAAC) device, patients who are indicated for a LAAC device can also have symptomatic AF. For these patients, performing a cardiac ablation and LAAC procedure at the same time is ideal. Cardiac ablation is a procedure that works by burning or freezing tissue on the inside of the heart to disrupt faulty electrical signals causing the arrhythmia, which can help the heart maintain a normal heart rhythm. In the proposed rule, we noted the requestor highlighted a recent study (Piccini et al. Left atrial appendage occlusion with the WATCHMAN™ FLX and concomitant catheter ablation procedures. Heart Rhythm Society Meeting 2023, May 19, 2023; New Orleans, LA.). According to the requestor, the results of this study indicate that when LAAC is performed concomitantly with cardiac ablation, the outcomes are comparable to patients who have undergone these procedures separately.

As discussed in the proposed rule, the requestor identified the following potential procedure code combination that would comprise a concomitant left atrial appendage closure and cardiac ablation procedure: ICD-10-PCS procedure code 02L73DK (Occlusion of left atrial appendage with intraluminal device, percutaneous approach), that identifies the WATCHMAN™ device, in combination with 02583ZZ (Destruction of conduction mechanism, percutaneous approach). We noted in the proposed rule that the requestor performed its own analysis of this procedure code combination and stated that it found the average costs of cases reporting concomitant left atrial appendage closure and cardiac ablation procedures were consistently higher compared to the average costs of other cases within their respective MS-DRG, which it asserted could limit beneficiary access to these procedures. The requestor asserted that improved Medicare payment for providers who perform these procedures concomitantly would help Medicare patients to gain better access to these lifesaving and quality-improving services and decrease the risk of future readmissions and the need for future procedures.

We reviewed this request and in the proposed rule noted concerns regarding making proposed MS-DRG changes based on a specific, single technology (the WATCHMAN™ Left Atrial Appendage Closure (LAAC) device) identified by only one unique procedure code versus considering proposed changes based on a group of related procedure codes that can be reported to describe the same type or class of technology, which is more consistent with the intent of the MS-DRGs. Therefore, in reviewing this request, in the proposed rule we stated we identified eight additional ICD-10-PCS procedure codes that describe LAAC procedures and included these codes in our analysis. The nine codes we identified are listed in the following table.

ICD-10-PCS Code	Description
02L70CK	Occlusion of left atrial appendage with extraluminal device, open approach
02L70DK	Occlusion of left atrial appendage with intraluminal device, open approach
02L70ZK	Occlusion of left atrial appendage, open approach
02L73CK	Occlusion of left atrial appendage with extraluminal device, percutaneous approach
02L73DK	Occlusion of left atrial Appendage with intraluminal device, percutaneous approach
02L73ZK	Occlusion of left atrial appendage, percutaneous approach
02L74CK	Occlusion of left atrial appendage with extraluminal device, percutaneous endoscopic approach
02L74DK	Occlusion of left atrial appendage with intraluminal device, percutaneous endoscopic approach
02L74ZK	Occlusion of left atrial appendage, percutaneous endoscopic approach

Similarly, as noted previously, the requestor identified code 02583ZZ (Destruction of conduction mechanism, percutaneous approach) to describe cardiac ablation. In our review of the ICD-10-PCS classification, in the proposed rule we stated we identified 26 additional ICD-10-PCS codes that describe cardiac ablation that we also examined. The 27 codes we included in our analysis are listed in the following table.

ICD-10-PCS Code	Description
02540ZZ	Destruction of coronary vein, open approach
02543ZZ	Destruction of coronary vein, percutaneous approach
02544ZZ	Destruction of coronary vein, percutaneous endoscopic approach
02550ZZ	Destruction of atrial septum, open approach
02553ZZ	Destruction of atrial septum, percutaneous approach
02554ZZ	Destruction of atrial septum, percutaneous endoscopic approach
02560ZZ	Destruction of right atrium, open approach
02563ZZ	Destruction of right atrium, percutaneous approach
02564ZZ	Destruction of right atrium, percutaneous endoscopic approach
02570ZK	Destruction of left atrial appendage, open approach
02570ZZ	Destruction of left atrium, open approach
02573ZK	Destruction of left atrial appendage, percutaneous approach
02573ZZ	Destruction of left atrium, percutaneous approach
02574ZK	Destruction of left atrial appendage, percutaneous endoscopic approach
02574ZZ	Destruction of left atrium, percutaneous endoscopic approach
02580ZZ	Destruction of conduction mechanism, open approach
02583ZZ	Destruction of conduction mechanism, percutaneous approach
02584ZZ	Destruction of conduction mechanism, percutaneous endoscopic approach
02590ZZ	Destruction of chordae tendineae, open approach
02593ZZ	Destruction of chordae tendineae, percutaneous approach
02594ZZ	Destruction of chordae tendineae, percutaneous endoscopic approach
025S0ZZ	Destruction of right pulmonary vein, open approach
025S3ZZ	Destruction of right pulmonary vein, percutaneous approach
025S4ZZ	Destruction of right pulmonary vein, percutaneous endoscopic approach
025T0ZZ	Destruction of left pulmonary vein, open approach
025T3ZZ	Destruction of left pulmonary vein, percutaneous approach
025T4ZZ	Destruction of left pulmonary vein, percutaneous endoscopic approach

In the ICD-10 MS-DRGs Definitions Manual Version 41.1, for concomitant left atrial appendage closure and cardiac ablation procedures, the GROUPER logic assigns MS-DRGs 273 and 274 (Percutaneous and Other Intracardiac Procedures with and without MCC, respectively) depending on the presence of any additional MCC secondary diagnoses. We stated in the proposed rule that we examined claims data from the September 2023 update of the FY 2023 MedPAR file for all cases in MS-DRGs 273 and 274 and compared the results to cases reporting procedure codes describing concomitant left atrial appendage closure and cardiac ablation. Our findings are shown in the following table.

MS-DRGs 273 and 274: All Cases and Cases Reporting Concomitant Left Atrial Appendage Closure and Cardiac Ablation
--

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
273	All cases	7,250	5.4	\$35,197
	Cases with a procedure code LAAC and a procedure code for cardiac ablation	80	5.8	\$70,447
274	All Cases	47,801	1.4	\$29,209
	Cases with a procedure code LAAC and a procedure code for cardiac ablation	781	1.5	\$66,277

As shown in the table, in MS-DRG 273, we identified a total of 7,250 cases with an average length of stay of 5.4 days and average costs of \$35,197. Of those 7,250 cases, there were 80 cases reporting procedure codes describing concomitant left atrial appendage closure and cardiac ablation with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 273 (\$70,447 compared to \$35,197) and a slightly longer average length of stay (5.8 days compared to 5.4 days). In MS-DRG 274, we identified a total of 47,801 cases with an average length of stay of 1.4 days and average costs of \$29,209. Of those 47,801 cases, there were 781 cases reporting procedure codes describing concomitant left atrial appendage closure and cardiac ablation, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 274 (\$66,277 compared to \$29,209) and a slightly longer average length of stay (1.5 days compared to 1.4 days).

In the proposed rule we stated we reviewed these data and noted, clinically, the management of AF by performing concomitant left atrial appendage closure and cardiac ablation can improve symptoms, prevent stroke, and reduce the risk of bleeding compared with oral anticoagulants. We stated the data analysis clearly shows that cases reporting concomitant left atrial appendage closure and cardiac ablation procedures have higher average costs and slightly longer lengths of stay compared to all the cases in their assigned MS-DRG. For these reasons, we proposed to create a new MS-DRG for cases reporting a LAAC procedure and a cardiac ablation procedure.

As discussed in the proposed rule, to compare and analyze the impact of our suggested modifications, we ran a simulation using the claims data from the September 2023 update of the FY 2023 MedPAR file. The following table illustrates our findings for all 1,723 cases reporting

procedure codes describing concomitant left atrial appendage closure and cardiac ablation. We stated we believed the resulting proposed MS-DRG assignment is more clinically homogeneous, coherent and better reflects hospital resource use.

Proposed new MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX Concomitant Left Atrial Appendage Closure and Cardiac Ablation	1,723	3.1	\$54,629

We applied the criteria to create subgroups in a base MS-DRG as discussed in section II.C.1.b. of the FY 2025 IPPS/LTCH PPS proposed rule. As shown in the table that follows, a three-way split of the proposed new MS-DRGs failed the criterion that there be at least 500 cases for each subgroup due to low volume. Specifically, for the “with MCC” split, there were only 268 cases in the subgroup.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
With MCC	268	6.9	\$60,667
With CC	772	2.9	\$47,479
Without CC/MCC	683	1.7	\$60,340

We noted that we then applied the criteria for a two-way split for the “with CC/MCC” and “without CC/MCC” subgroups and found that the criterion that there be at least a 20% difference in average cost between subgroups could not be met. The following table illustrates our findings.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
With CC/MCC	1,040	3.9	\$50,877
Without CC/MCC	683	1.7	\$60,340

We also applied the criteria for a two-way split for the “with MCC” and “without MCC” subgroups and found that the criterion that there be at least 500 or more cases in each subgroup similarly could not be met. The criterion that there be at least a 20% difference in average costs between the subgroups also was not met. The following table illustrates our findings.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
With MCC	268	6.9	\$60,667
Without MCC	1,455	2.3	\$53,516

Therefore, for FY 2025, we did not propose to subdivide the proposed new MS-DRG for cases reporting procedure codes describing concomitant left atrial appendage closure and cardiac ablation into severity levels.

In summary, for FY 2025, taking into consideration that it clinically requires greater resources to perform concomitant left atrial appendage closure and cardiac ablation procedures, we proposed to create a new base MS-DRG for cases reporting a LAAC procedure and a cardiac ablation procedure in MDC 05. The proposed new MS-DRG is proposed new MS-DRG 317 (Concomitant Left Atrial Appendage Closure and Cardiac Ablation). We also proposed to include the nine ICD-10-PCS procedure codes that describe LAAC procedures and the 27 ICD-10-PCS procedure codes that describe cardiac ablation listed previously in the logic for assignment of cases reporting a LAAC procedure and a cardiac ablation procedure for the proposed new MS-DRG.

Comment: Many commenters expressed support for the proposal to create new base MS-DRG 317 for cases reporting a LAAC procedure and a cardiac ablation procedure in MDC 05. Commenters stated the creation of MS-DRG 317 is timely and will ensure more patients have access to needed care during a single hospital stay, reducing the need for additional admissions. Other commenters agreed that some patients with AF undergoing ablation are also candidates for LAAC procedures and stated combining the procedures is feasible, efficacious, and simple to employ. Several commenters stated that the proposal is a significant step forward to support better disease management for some of the most comorbid patients and likely will reduce downstream healthcare costs. A few commenters specifically stated they appreciate CMS' continued evaluation and acknowledgement of the increased resources required for patients requiring multiple procedures during a single inpatient hospitalization. While supporting the proposal to create MS-DRG 317, some commenters suggested that CMS devise a broader, more inclusive, supplemental payment mechanism to facilitate incremental payment when two major procedures are performed during the same hospital admission.

Response: We appreciate the commenters' support and the feedback regarding payment when two major procedures are performed during the same hospital admission.

Comment: Another commenter recommended that CMS delay creation of proposed new MS-DRG 317 for concomitant LAAC and cardiac ablation. While expressing support for proposals that will improve patient outcomes and increase efficiencies in the health care system, the commenter stated they believe it is premature for CMS to develop a new MS-DRG at this time. The commenter expressed concern that the evidence to support the safety, effectiveness, and workflow of these two procedures when performed concomitantly has not been well established and suggested that the results of two ongoing randomized control trials (RCTs) focusing on LAAC and ablation should be considered before CMS moves forward to develop a new MS-DRG.

Response: We thank the commenter for their feedback. In response to the suggestion that CMS delay implementation of proposed new MS-DRG 317 for concomitant LAAC and cardiac ablation, we reviewed the commenters' concern and do not agree that a delay is necessary or appropriate. As stated earlier, the data analysis clearly shows that cases reporting concomitant LAAC and cardiac ablation procedures have higher average costs and slightly longer lengths of stay compared to all the cases in their assigned MS-DRG. For these reasons, we proposed to create a new MS-DRG for cases reporting a LAAC procedure and a cardiac ablation procedure. We will continue to monitor the claims data and perform additional analysis if any evidence is presented to us regarding the clinical efficacy of concomitant left atrial appendage closure and cardiac ablation procedures. We would address any modifications to the logic in future rulemaking.

Comment: Other commenters noted a difference in case volume between the table CMS stated reflected the cases reporting procedure codes describing concomitant LAAC and cardiac ablation in MS-DRGs 273 and 274 and the table which CMS stated illustrated the findings for all cases reporting procedure codes describing concomitant LAAC and cardiac ablation found in the

claims data from the September 2023 update of the FY 2023 MedPAR file. Specifically, the commenters noted that 861 cases reporting procedure codes describing concomitant LAAC and cardiac ablation were found in MS-DRGs 273 and 274, while 1,723 cases reporting procedure codes describing concomitant LAAC and cardiac ablation were found in the simulation using the claims data from the September 2023 update of the FY 2023 MedPAR file. The commenters stated it is unclear from the tables and data associated with the proposed rule where the additional 862 cases are currently assigned. These commenters performed their own analysis of the supplemental After Outliers Removed (AOR)/Before Outliers Removed (BOR) file available in association with the FY 2025 IPPS/LTCH PPS proposed rule on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps> and recommended that CMS consider that cases reporting procedure codes describing concomitant LAAC and cardiac ablation group to other MS-DRGs, and should be incorporated into the analysis based on volume differences they noted in the AOR/BOR file.

Response: We thank the commenters for their feedback.

In response to suggestion that CMS provide insight regarding the difference in case volume between the table which we stated reflects our examination of the claims data from the September 2023 update of the FY 2023 MedPAR file for all cases in MS-DRGs 273 and 274, compared to the results for cases reporting procedure codes describing concomitant LAAC and cardiac ablation in those MS-DRGs, and the table which we stated illustrated our findings for all 1,723 cases reporting procedure codes describing concomitant LAAC and cardiac ablation, we note that as stated in the proposed rule, for concomitant LAAC and cardiac ablation procedures, the GROUPER logic assigns MS-DRGs 273 or 274 (Percutaneous and Other Intracardiac Procedures with or without MCC, respectively) depending on the presence of any additional MCC secondary diagnoses. Therefore, we focused our examination of claims data from the September 2023 update of the FY 2023 MedPAR file for all cases in MS-DRGs 273 and 274 and

compared the results to cases reporting procedure codes describing concomitant LAAC and cardiac ablation.

While not explicitly stated, assignment to MS-DRGs 273 or 274 is also dependent on the absence of other procedure codes that could affect MS-DRG assignment on the claim. If other procedure codes that could affect MS-DRG assignment are also reported on the claim along with procedure codes describing concomitant left atrial appendage closure and ablation, the MS-DRG assignment can vary depending on the procedure codes reported.

As discussed in section II.C.14. of the preamble of the proposed rule and this final rule, in our proposal to revise the surgical hierarchy for the MS-DRGs in MDC 05, we proposed to sequence proposed new MS-DRG 317 (Concomitant Left Atrial Appendage Closure and Cardiac Ablation) above MS-DRG 275 (Cardiac Defibrillator Implant with Cardiac Catheterization and MCC) and below MS-DRGs 231, 232, 233, 234, 235, and 236 (Coronary Bypass with or without PTCA, with or without Cardiac Catheterization or Open Ablation, with and without MCC, respectively). Under this proposal, if procedure codes describing concomitant LAAC and cardiac ablation are reported, the GROUPER logic would assign new MS-DRG 317 in the absence of other procedure codes that could affect MS-DRG assignment to an MS-DRG that would be sequenced higher in the surgical hierarchy than MS-DRG 317 in MDC 05. The table which we stated illustrated our findings for all 1,723 cases reporting procedure codes describing concomitant LAAC and cardiac ablation includes cases that are anticipated to potentially shift or be redistributed as a result of the proposal to 1) create a new base MS-DRG 317 and 2) the proposal to sequence the new MS-DRG above MS-DRG 275 and below MS-DRGs 231, 232, 233, 234, 235, and 236 in MDC 05.

To illustrate these shifts for this final rule, we again analyzed the September 2023 update of the FY 2023 MedPAR file for cases reporting procedure codes describing concomitant LAAC and cardiac ablation. We then examined the redistribution of cases that is anticipated to occur as a result of the proposal to create a new base MS-DRG 317 by processing the claims data from

the September 2023 update of the FY 2023 MedPAR file through the ICD-10 MS-DRG GROUPER Version 41 and then processing the same claims data through the ICD-10 MS-DRG GROUPER Version 42 for comparison. The number of cases from this comparison that result in different MS-DRG assignments is the number of the cases that are anticipated to potentially shift or be redistributed. Our findings are shown in the following table.

Version 41 MS-DRG	Description	Version 42 MS-DRG	Description	Counts
228	Other cardiothoracic procedures with MCC	317	Concomitant left atrial appendage closure and cardiac ablation	166
229	Other cardiothoracic procedures without MCC			627
242	Permanent cardiac pacemaker implant with MCC			9
243	Permanent cardiac pacemaker implant with CC			12
244	Permanent cardiac pacemaker implant without CC/MCC			7
245	AICD generator procedures			2
267	Endovascular cardiac valve replacement and supplement procedures without MCC			3
268	Aortic and heart assist procedures except pulsation balloon with MCC			3
269	Aortic and heart assist procedures except pulsation balloon without MCC			3
270	Other major cardiovascular procedures with MCC			5
271	Other major cardiovascular procedures with CC			10
272	Other major cardiovascular procedures without CC/MCC			7
273	Percutaneous and other intracardiac procedures with MCC			80
274	Percutaneous and other intracardiac procedures without MCC			780
275	Cardiac defibrillator implant with cardiac catheterization and MCC			2
276	Cardiac defibrillator implant with MCC			2
277	Cardiac defibrillator implant without MCC			3
319	Other endovascular cardiac valve procedures with MCC			1
320	Other endovascular cardiac valve procedures without MCC			1

As stated in the proposed rule and reflected in the previous table, we found 1,723 cases reporting procedure codes describing concomitant LAAC and cardiac ablation that are anticipated to potentially shift or be redistributed into MS-DRG 317. The largest number of cases moving into new MS-DRG 317 are moving out of MS-DRGs 274, 229, 228 and 273. In response to the suggestion that CMS incorporate other MS-DRGs into our analysis, we examined the claims data from the September 2023 update of the FY 2023 MedPAR file to identify the

average length of stay and average costs for all cases in MS-DRGs 228, 229, 242, 243, 244, 245, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 319, and 320. Our findings are shown in the following table.

MS-DRG	Description	Number of Cases	Average Length of Stay	Average Costs
228	Other cardiothoracic procedures with MCC	4,391	8.7	\$44,565
229	Other cardiothoracic procedures without MCC	5,712	3.3	\$28,987
242	Permanent cardiac pacemaker implant with MCC	14,716	6.5	\$29,485
243	Permanent cardiac pacemaker implant with CC	18,738	3.5	\$20,153
244	Permanent cardiac pacemaker implant without CC/MCC	9,137	2.5	\$16,294
245	AICD generator procedures	745	6.3	\$44,228
267	Endovascular cardiac valve replacement and supplement procedures without MCC	36,665	1.5	\$43,058
268	Aortic and heart assist procedures except pulsation balloon with MCC	2,598	9	\$59,383
269	Aortic and heart assist procedures except pulsation balloon without MCC	10,693	2	\$38,120
270	Other major cardiovascular procedures with MCC	15,594	9.4	\$44,343
271	Other major cardiovascular procedures with CC	11,559	5.2	\$30,837
272	Other major cardiovascular procedures without CC/MCC	3,706	2.3	\$22,884
273	Percutaneous and other intracardiac procedures with MCC	7,250	5.4	\$35,197
274	Percutaneous and other intracardiac procedures without MCC	47,801	1.4	\$29,209
275	Cardiac defibrillator implant with cardiac catheterization and MCC	3,358	10.3	\$63,181
276	Cardiac defibrillator implant with MCC	3,264	8.2	\$54,993
277	Cardiac defibrillator implant without MCC	3,840	4.2	\$42,111
319	Other endovascular cardiac valve procedures with MCC	1,033	10.1	\$38,581
320	Other endovascular cardiac valve procedures without MCC	385	3.2	\$20,914

In reviewing the data analysis performed, the 1,723 cases anticipated to potentially shift or be redistributed into MS-DRG 317 have higher average costs when compared to all the cases in MS-DRGs 228, 229, 273, and 274 (\$54,629 versus \$44,565, \$28,987, \$35,197, and \$29,209, respectively). The 1,723 cases anticipated to potentially shift or be redistributed into MS-DRG 317 have an average length of stay that is shorter than the average length of stay for all the cases in MS-DRGs 228, 229, and 273 (3.1 days versus 8.7 days, 3.3 days, and 5.4 days, respectively) and a longer average length of stay when compared to all the cases in MS-DRG 274 (3.1 days versus 1.4 days). We note that the 1,723 cases anticipated to potentially shift or be redistributed into MS-DRG 317 have lower average costs when compared to all the cases in MS-DRGs 275,

268, and 276 (\$54,629 versus \$63,181, \$59,383, and \$54,993, respectively), however only seven cases reported procedure codes describing concomitant left atrial appendage closure and cardiac ablation in these MS-DRGs. We also note that the 1,723 cases anticipated to potentially shift or be redistributed into MS-DRG 317 have a longer average length of stay when compared to all the cases in MS-DRGs 244, 272, 269, and 267 (3.1 days versus 2.5 days, 2.3 days, 2 days, and 1.5 days, respectively), however only 20 cases reported procedure codes describing concomitant left atrial appendage closure and cardiac ablation in these MS-DRGs. We reviewed these data and believed the proposal to create new base MS-DRG 317 for cases reporting procedure codes describing concomitant LAAC and cardiac ablation in MDC 05 and the proposed revision to the surgical hierarchy leads to a grouping that is more coherent and better reflects the clinical severity and resource use involved in these cases.

Comment: In reviewing the list of nine ICD-10-PCS procedure codes that describe LAAC procedures that were proposed to be included in the logic for assignment of cases reporting procedure codes describing concomitant LAAC and cardiac ablation for the proposed new MS-DRG, a commenter noted these nine codes are designated as non-O.R. procedures affecting the MS-DRG. The commenter also noted that codes 02570ZK (Destruction of left atrial appendage, open approach), 02573ZK (Destruction of left atrial appendage, percutaneous approach), and 02574ZK (Destruction of left atrial appendage, percutaneous endoscopic approach) included in the list of 27 ICD-10-PCS procedure codes that describe cardiac ablation proposed to be included in the logic for assignment to the proposed new MS-DRG, are also designated as non-O.R. procedures affecting the MS-DRG. The commenter stated that LAAC procedures and cardiac ablation procedures performed by an open or percutaneous endoscopic approach should be designated as operating room procedures to account for the resource utilization required to perform them as these procedures require the use of specialized equipment or devices.

Response: We thank the commenter for their feedback.

We agree that in the ICD-10 MS-DRGs Definitions Manual Version 41.1, the nine ICD-10-PCS procedure codes that describe LAAC procedures are recognized as non-O.R. procedures affecting the MS-DRGs to which they are assigned. We refer the reader to Section II.C.10 in the proposed rule and this final rule for the complete discussion of the designations each ICD-10-PCS code has under the IPPS MS-DRGs that determine whether and in what way the presence of that procedure code on a claim impacts the MS-DRG assignment. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 44898 through 44899) we reviewed these nine ICD-10-PCS procedure codes that describe LAAC procedures and stated we believe the current designation of LAAC procedures as non-O.R. procedures that affect the assignment for MS-DRGs 273 and 274 is clinically appropriate to account for the subset of patients undergoing left atrial appendage closure specifically. We further stated that we believed that circumstances in which a patient is admitted for a principal diagnosis outside of MDC 05 and a left atrial appendage closure is performed as the only surgical procedure in the same admission are infrequent, and if they do occur, the LAAC procedure would not be a significant contributing factor in the increased intensity of resources needed for facilities to manage these complex cases.

We continue to believe that circumstances in which a patient is admitted for a principal diagnosis outside of MDC 05 and LAAC is performed as the only surgical procedure in the same admission are infrequent, and that the current designation of LAAC procedures as non-O.R. procedures that affect the assignment for MS-DRGs 273 and 274, and now MS-DRG 317, is clinically appropriate to account for the subset of patients undergoing left atrial appendage closure specifically.

Similarly, we agree that in the ICD-10 MS-DRGs Definitions Manual Version 41.1, procedure codes 02570ZK, 02573ZK, and 02574ZK are recognized as non-O.R. procedures affecting the MS-DRGs as reflected in the following table, specifically.

ICD-10-PCS Code	Description	MDC	MS-DRG
02570ZK	Destruction of left atrial appendage, open approach	05	212
		05	233-234

		05	250-251
02573ZK	Destruction of left atrial appendage, percutaneous approach	05	273-274
02574ZK	Destruction of left atrial appendage, percutaneous endoscopic approach	05	273-274

We believe that circumstances in which a patient is admitted for a principal diagnosis outside of MDC 05 and a cardiac ablation is performed as the only surgical procedure in the same admission are infrequent, and that the current designation of 02570ZK, 02573ZK, and 02574ZK as non-O.R. procedures that affect the assignment for the MS-DRGs reflected in the previous table, and now MS-DRG 317, is clinically appropriate to account for the subset of patients undergoing cardiac ablation specifically.

Comment: A commenter suggested that ICD-10-PCS codes 02590ZZ (Destruction of chordae tendineae, open approach), 02593ZZ (Destruction of chordae tendineae, percutaneous approach), and 02594ZZ (Destruction of chordae tendineae, percutaneous endoscopic approach) describing ablation of the chordae tendineae be removed from the list of cardiac ablation procedures for MS-DRG 317 as the chordae tendineae would not be ablated in relation to cardiac ablation procedures, and instead they would be ablated in relation to cardiac valve repair or replacement procedures.

Response: We appreciate the feedback from the commenter.

As noted previously, atrial fibrillation (AF) is an irregular and often rapid heart rate that occurs when the two upper chambers of the heart experience chaotic electrical signals. Cardiac ablation is a procedure that is performed to correct a disturbance in the conduction system of the heart by damaging small areas of tissue using radiofrequency energy or freezing so that the damaged tissue can no longer generate or conduct electrical impulses. We agree that ablation of the chordae tendineae, which are the strong, fibrous connections between the valve leaflets and the papillary muscles, is not performed to stop abnormal electrical pathways as the cardiac conduction system does not pass through the chordae tendineae.

We examined claims data from the September 2023 update of the FY 2023 MedPAR file to evaluate the frequency with which ablation of the chordae tendineae is reported with left atrial

appendage closure, and found one case reporting procedure codes 02590ZZ (Destruction of chordae tendineae, open approach) and 02L70ZK (Occlusion of left atrial appendage, open approach) in MS-DRG 219 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC) with a length of stay of 7 days and costs of \$28,989.

We note that assignment of this one case to MS-DRG 219 indicates that other procedure code(s) assigned to the GROUPER logic of MS-DRG 219 were reported in addition to procedure codes 02590ZZ and 02L70ZK to drive assignment to this MS-DRG. We reviewed these data and because our analysis identified only one case reporting ablation of the chordae tendineae and left atrial appendage closure, and recognizing that ablation of the chordae tendineae is not performed to stop abnormal electrical pathways, we agree that procedure codes 02590ZZ, 02593ZZ, and 02594ZZ should be removed from the list of 27 ICD-10-PCS procedure codes that describe cardiac ablation listed previously in the proposed logic for assignment of cases reporting a LAAC procedure and a cardiac ablation procedure for the proposed new MS-DRG.

Comment: Many commenters noted that procedure code 02583ZF (Destruction of conduction mechanism using irreversible electroporation, percutaneous approach) to identify irreversible electroporation for cardiac ablation was finalized effective April 1, 2024 as reflected in the FY 2024 ICD-10-PCS Code Update files that were made publicly available on the CMS website at <https://www.cms.gov/Medicare/Coding/ICD10> on December 19, 2023. The new procedure code is also reflected in Table 6B. – New Procedure Codes, in association with the proposed rule and available on the CMS website at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS>, including the MS-DRG assignments for the new code for FY 2025.

These commenters noted that cardiac ablation procedures performed with the PulseSelect™ Pulsed Field Ablation (PFA) System for the treatment of paroxysmal (PAF) or persistent (PsAF) atrial fibrillation can also be performed concomitantly with left atrial appendage closure and recommended that procedure code 02583ZF also be assigned to new MS-

DRG 317 (Concomitant Left Atrial Appendage Closure and Cardiac Ablation) in MDC 05.

However, another commenter noted that there is limited data on combining the new pulse field ablation modality with LAAC and suggested that CMS continue to evaluate evidence on the safety and efficacy of using this new modality in concomitant procedures before assigning procedure code 02583ZF to new MS-DRG 317.

Response: We thank the commenters for their feedback.

We note that irreversible electroporation for cardiac ablation, also referred to as pulsed field ablation, delivers electrical pulses that result in destruction of selected cardiac tissue by irreversibly increasing the porosity of the cell membranes, inducing cell death, and can be used as a treatment for paroxysmal and persistent atrial fibrillation. As a procedure code that also describes the performance of cardiac ablation, we agree that procedure code 02583ZF should be added to the list of ICD-10-PCS procedure codes that describe cardiac ablation listed previously in the proposed logic for assignment of cases reporting a LAAC procedure and a cardiac ablation procedure for the proposed new MS-DRG. In response to the suggestion that CMS continue to evaluate evidence on the safety and efficacy of using this new modality in concomitant procedures before assigning procedure code 02583ZF to new MS-DRG 317, we note that procedure code 02583ZF describes a procedure that is clinically coherent with the other procedure codes proposed for assignment to MS-DRG 317, so it is reasonable that cases reporting procedure code 02583ZF and a procedure code describing LAAC group to the same MS-DRG.

Therefore, after consideration of the public comments we received, and for the reasons discussed, we are finalizing our proposal to create new MS-DRG 317 (Concomitant Left Atrial Appendage Closure and Cardiac Ablation) in MDC 05, with modification, effective October 1, 2024, for FY 2025. Specifically, we are modifying the proposed list of ICD-10-PCS procedure codes that describe cardiac ablation in the Version 42 GROUPER logic of new MS-DRG 317 by removing ICD-10-PCS codes 02590ZZ (Destruction of chordae tendineae, open approach),

02593ZZ (Destruction of chordae tendineae, percutaneous approach), and 02594ZZ (Destruction of chordae tendineae, percutaneous endoscopic approach) and adding ICD-10-PCS procedure code 02583ZF (Destruction of conduction mechanism using irreversible electroporation, percutaneous approach), as discussed previously.

The 25 ICD-10-PCS procedure codes that describe cardiac ablation that we are finalizing in the logic for assignment of cases reporting a LAAC procedure and a cardiac ablation procedure for FY 2025 are listed in the following table. This assignment is reflected in the final Version 42 GROUPER logic.

ICD-10-PCS Code	Description
02540ZZ	Destruction of coronary vein, open approach
02543ZZ	Destruction of coronary vein, percutaneous approach
02544ZZ	Destruction of coronary vein, percutaneous endoscopic approach
02550ZZ	Destruction of atrial septum, open approach
02553ZZ	Destruction of atrial septum, percutaneous approach
02554ZZ	Destruction of atrial septum, percutaneous endoscopic approach
02560ZZ	Destruction of right atrium, open approach
02563ZZ	Destruction of right atrium, percutaneous approach
02564ZZ	Destruction of right atrium, percutaneous endoscopic approach
02570ZK	Destruction of left atrial appendage, open approach
02570ZZ	Destruction of left atrium, open approach
02573ZK	Destruction of left atrial appendage, percutaneous approach
02573ZZ	Destruction of left atrium, percutaneous approach
02574ZK	Destruction of left atrial appendage, percutaneous endoscopic approach
02574ZZ	Destruction of left atrium, percutaneous endoscopic approach
02580ZZ	Destruction of conduction mechanism, open approach
02583ZZ	Destruction of conduction mechanism, percutaneous approach
02584ZZ	Destruction of conduction mechanism, percutaneous endoscopic approach
025S0ZZ	Destruction of right pulmonary vein, open approach
025S3ZZ	Destruction of right pulmonary vein, percutaneous approach
025S4ZZ	Destruction of right pulmonary vein, percutaneous endoscopic approach
025T0ZZ	Destruction of left pulmonary vein, open approach
025T3ZZ	Destruction of left pulmonary vein, percutaneous approach
025T4ZZ	Destruction of left pulmonary vein, percutaneous endoscopic approach
02583ZF	Destruction of conduction mechanism using irreversible electroporation, percutaneous approach

Table 6B.-New Procedure Codes, associated with this final rule reflects the modification to the MS-DRG assignments for procedure code 02583ZF for FY 2025. We refer the reader to section II.C.13. of the preamble of this final rule for further information regarding the table.

Lastly, we are finalizing the inclusion of the nine ICD-10-PCS procedure codes that describe LAAC procedures listed previously in the logic for assignment of cases reporting a LAAC procedure and a cardiac ablation procedure for new MS-DRG 317, without modification, for FY 2025. We refer the reader to section II.C.15. of the preamble of this final rule for the

discussion of the surgical hierarchy and the complete list of our proposed modifications to the surgical hierarchy as well as our finalization of those proposals.

b. Neuromodulation Device Implant for Heart Failure (Barostim™ Baroreflex Activation Therapy)

The BAROSTIM™ system is the first neuromodulation device system designed to trigger the body's main cardiovascular reflex to target symptoms of heart failure. The system consists of an implantable pulse generator (IPG) that is implanted subcutaneously in the upper chest below the clavicle, a stimulation lead that is sutured to either the right or left carotid sinus to activate the baroreceptors in the wall of the carotid artery, and a wireless programmer system that is used to non-invasively program and adjust BAROSTIM™ therapy via telemetry. The BAROSTIM™ system is indicated for the improvement of symptoms of heart failure in a subset of patients with symptomatic New York Heart Association (NYHA) Class III or Class II (who had a recent history of Class III) heart failure, with a low left ventricular ejection fraction, who also do not benefit from guideline directed pharmacologic therapy or qualify for Cardiac Resynchronization Therapy (CRT). The BAROSTIM™ system was approved for new technology add-on payments for FY 2021 (85 FR 58716 through 58717) and FY 2022 (86 FR 44974). The new technology add-on payment was subsequently discontinued effective FY 2023 (87 FR 48916).

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 48837 through 48843), we discussed a request we received to reassign the ICD-10-PCS procedure codes that describe the implantation of the BAROSTIM™ system from MS-DRGs 252, 253, and 254 (Other Vascular Procedures with MCC, with CC, and without MCC respectively) to MS-DRGs 222, 223, 224, 225, 226, and 227 (Cardiac Defibrillator Implant with and without Cardiac Catheterization with and without AMI/HF/Shock with and without MCC, respectively). The requestor stated that the subset of patients that have an indication for the implantation of a BAROSTIM™ system also have indications for the implantation of Implantable Cardioverter Defibrillators (ICD), Cardiac Resynchronization Therapy Defibrillators (CRT-D) and/or Cardiac Contractility Modulation

(CCM) devices, all of which also require the permanent implantation of a programmable, electrical pulse generator and at least one electrical lead. The requestor further stated that the average resource utilization required to implant the BAROSTIM™ system demonstrates a significant disparity compared to all procedures within MS-DRGs 252, 253, and 254.

In the FY 2023 IPPS/LTCH PPS final rule, we stated that the results of the claims analysis demonstrated we did not have sufficient claims data on which to base and evaluate any proposed changes to the current MS-DRG assignment. We also expressed concern in equating the implantation of a BAROSTIM™ system to the placement of ICD, CRT-D, and CCM devices as these devices all differ in terms of technical complexity and anatomical placement of the electrical lead(s). We noted there is no intravascular component or vascular puncture involved when implanting a BAROSTIM™ system. In contrast, the placement of ICD, CRT-D, and CCM devices generally involve a lead being affixed to the myocardium, being threaded through the coronary sinus or crossing a heart valve and are procedures that involve a greater level of complexity than affixing the stimulator lead to either the right or left carotid sinus when implanting a BAROSTIM™ system. We stated that we believed that as the number of cases reporting procedure codes describing the implantation of neuromodulation devices for heart failure increases, a better view of the associated costs and lengths of stay on average will be reflected in the data for purposes of assessing any reassignment of these cases. Therefore, after consideration of the public comments we received, and for the reasons stated earlier, we finalized our proposal to maintain the assignment of cases reporting procedure codes that describe the implantation of a neuromodulation device in MS-DRGs 252, 253, and 254 for FY 2023.

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58712 through 58720), we discussed a request we received to add ICD-10-CM diagnosis code R57.0 (Cardiogenic shock) to the list of “secondary diagnoses” that grouped to MS-DRGs 222 and 223 (Cardiac Defibrillator Implant with Cardiac Catheterization with Acute Myocardial Infarction (AMI), Heart Failure (HF), or Shock with and without MCC, respectively). During our review of the issue, we noted that the

results of our claims analysis showed that in procedures involving a cardiac defibrillator implant, the average costs and length of stay were generally similar without regard to the presence of diagnosis codes describing AMI, HF, or shock. We stated we believed that it may no longer be necessary to subdivide MS-DRGs 222, 223, 224, 225, 226, and 227 based on the diagnosis codes reported. After consideration of the public comments we received, and for the reasons stated in the rule, we finalized our proposal to delete MS-DRGs 222, 223, 224, 225, 226, and 227. We also finalized our proposal to create new MS-DRG 275 (Cardiac Defibrillator Implant with Cardiac Catheterization and MCC), new MS-DRG 276 (Cardiac Defibrillator Implant with MCC) and new MS-DRG 277 (Cardiac Defibrillator Implant without MCC) in MDC 05 for FY 2024.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35959 through 35962), we received a similar request to again review the MS-DRG assignment of the ICD-10-PCS procedure codes that describe the implantation of the BAROSTIM™ system. Specifically, the requestor recommended that CMS consider reassigning the ICD-10-PCS procedure codes that describe the implantation of the BAROSTIM™ system from MS-DRGs 252, 253, and 254 (Other Vascular Procedures with MCC, with CC, and without MCC respectively) to MS-DRGs 275 (Cardiac Defibrillator Implant with Cardiac Catheterization and MCC), MS-DRG 276, and 277 (Cardiac Defibrillator Implant with MCC and without MCC respectively); or to other more clinically coherent MS-DRGs for implantable device procedures indicated for Class III heart failure patients. The requestor stated in their analysis the number of claims reporting procedure codes that describe the implantation of the BAROSTIM™ system has been consistently growing over the past few years. The requestor acknowledged that the implantation of the BAROSTIM™ system is predominantly performed in the outpatient setting but noted that a significant number of severely sick patients with multiple comorbidities (such as chronic kidney disease, end stage renal disease (ESRD), chronic obstructive pulmonary disease (COPD), and AF) are treated in an inpatient setting. The requestor stated in their experience, hospitals that have performed

BAROSTIM™ procedures have stopped allowing patients to receive the device in the inpatient setting due to the high losses for each Medicare claim. The requestor asserted it is critically important to allow very sick and fragile patients access to the BAROSTIM™ procedure in an inpatient setting and stated these patients should not be denied access by hospitals due to the perceived gross underpayment of the current MS-DRG.

In the proposed rule we noted that the requestor stated the BAROSTIM™ procedure is not clinically coherent with other procedures assigned to MS-DRGs 252, 253, and 254 (Other Vascular Procedures) as the majority of the ICD-10-PCS codes assigned to MS-DRGs 252, 253, and 254 describe procedures to identify, diagnose, clear and restructure veins and arteries, excluding those that require implantable devices. Furthermore, the requestor stated the costs of the implantable medical devices used for the BAROSTIM™ system (that is, the electrical pulse generator and electrical lead) alone far exceed the average costs of other cases assigned to MS-DRGs 252, 253, and 254.

The following ICD-10-PCS procedure codes uniquely identify the implantation of the BAROSTIM™ system: 0JH60MZ (Insertion of stimulator generator into chest subcutaneous tissue and fascia, open approach) in combination with 03HK3MZ (Insertion of stimulator lead into right internal carotid artery, percutaneous approach) or 03HL3MZ (Insertion of stimulator lead into left internal carotid artery, percutaneous approach).

We stated in the proposed rule that to analyze this request, we first examined claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRGs 252, 253, and 254 to identify cases reporting procedure codes describing the implantation of the BAROSTIM™ system with or without a procedure code describing the performance of a cardiac catheterization as MS-DRG 275 is defined by the performance of cardiac catheterization and a secondary diagnosis of MCC. Our findings are shown in the following table.

MS-DRGs 252-254: All Cases and Cases Reporting Procedures Describing the Implantation of a BAROSTIM™ System				
MS-DRG		Number of Cases	Average Length of Stay	Average Costs
252	All cases	18,964	8	\$30,456
	Cases with diagnosis of heart failure with 0JH60MZ and 03HL3MZ or 03HK3MZ with cardiac catheterization	1	9	\$110,928
	Cases with diagnosis of heart failure with 0JH60MZ and 03HL3MZ or 03HK3MZ without cardiac catheterization	12	7.8	\$66,291
253	All cases	15,551	5.2	\$22,870
	Cases with diagnosis of heart failure with 0JH60MZ and 03HL3MZ or 03HK3MZ with cardiac catheterization	0	0	\$0
	Cases with diagnosis of heart failure with 0JH60MZ and 03HL3MZ or 03HK3MZ without cardiac catheterization	7	4	\$52,788
254	All cases	5,973	2.3	\$15,778
	Cases with diagnosis of heart failure with 0JH60MZ and 03HL3MZ or 03HK3MZ with cardiac catheterization	0	0	\$0
	Cases with diagnosis of heart failure with 0JH60MZ and 03HL3MZ or 03HK3MZ without cardiac catheterization	3	1.3	\$29,740

As shown in the table, in MS-DRG 252, we identified a total of 18,964 cases with an average length of stay of 8 days and average costs of \$30,456. Of those 18,964 cases, there was one case reporting procedure codes describing the implantation of the BAROSTIM™ system with a procedure code describing the performance of a cardiac catheterization with costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 252 (\$110,928 compared to \$30,456) and a longer length of stay (9 days compared to 8 days). There were 12 cases reporting procedure codes describing the implantation of the BAROSTIM™ system without a procedure code describing the performance of a cardiac catheterization, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 252 (\$66,291 compared to \$30,456) and a slighter shorter average length of stay (7.8 days compared to 8 days). In MS-DRG 253, we identified a total of 15,551 cases with an average length of stay of 5.2 days and average costs of \$22,870. Of those 15,551 cases, there were seven cases reporting procedure codes describing the implantation of the BAROSTIM™ system without a procedure code describing the performance of a cardiac catheterization, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 253 (\$52,788 compared to \$22,870) and a shorter average length of

stay (4 days compared to 5.2 days). We found zero cases in MS-DRG 253 reporting procedure codes describing the implantation of a BAROSTIM™ system with a procedure code describing the performance of a cardiac catheterization. In MS-DRG 254, we identified a total of 5,973 cases with an average length of stay of 2.3 days and average costs of \$15,778. Of those 5,973 cases, there were three cases reporting procedure codes describing the implantation of the BAROSTIM™ system without a procedure code describing the performance of a cardiac catheterization, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 254 (\$29,740 compared to \$15,778) and a shorter average length of stay (1.3 days compared to 2.3 days). We found zero cases in MS-DRG 254 reporting procedure codes describing the implantation of a BAROSTIM™ system with a procedure code describing the performance of a cardiac catheterization.

As stated in the proposed rule, we then examined claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRGs 275, 276, and 277. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
275	3,358	10.3	\$63,181
276	3,264	8.2	\$54,993
277	3,840	4.2	\$42,111

As the table shows, for MS-DRG 275, there were a total of 3,358 cases with an average length of stay of 10.3 days and average costs of \$63,181. For MS-DRG 276, there were a total of 3,264 cases with an average length of stay of 8.2 days and average costs of \$54,993. For MS-DRG 277, there were a total of 3,840 cases with an average length of stay of 4.2 days and average costs of \$42,111.

In exploring mechanisms to address this request, in the proposed rule we noted in total, there were only 23 cases reporting procedure codes describing the implantation of a BAROSTIM™ system in MS-DRGs 252, 253, and 254 (13, 7, and 3, respectively). We stated we reviewed these data, and stated while we recognize that the average costs of the 23 cases

reporting procedure codes describing the implantation of a BAROSTIM™ are greater when compared to the average costs of all cases in MS-DRGs 252, 253, and 254, the number of cases continued to be too small to warrant the creation of a new MS-DRG for these cases.

In the proposed rule we further noted, that of the 23 cases reporting procedure codes describing the implantation of a BAROSTIM™ system identified in MS-DRGs 252, 253, and 254, only one case reported the performance of cardiac catheterization. As discussed in the FY 2024 IPPS/LTCH PPS final rule, when reviewing the consumption of hospital resources for the cases reporting a cardiac defibrillator implant with cardiac catheterization during a hospital stay, the claims data clearly showed that the cases reporting secondary diagnoses designated as MCCs were more resource intensive as compared to other cases reporting cardiac defibrillator implant. Therefore, we finalized the creation of MS-DRG 275 for cases reporting a cardiac defibrillator implant with cardiac catheterization and a secondary diagnosis designated as an MCC. In the proposed rule we stated that of the 23 cases reporting procedure codes describing the implantation of a BAROSTIM™ system, there was only one case reporting a procedure code describing the performance of cardiac catheterization and a secondary diagnosis designated as an MCC, and we noted that there may have been other factors contributing to the higher costs of this one case. We stated that the results of the claims analysis demonstrated we did not have sufficient claims data on which to base and propose a change to the current MS-DRG assignment of cases reporting procedure codes describing the implantation of a BAROSTIM™ system from MS-DRGs 252, 253, and 254 to MS-DRG 275.

As stated in the proposed rule, further analysis of the claims data demonstrated that the 23 cases reporting procedure codes describing the implantation of a BAROSTIM™ system had an average length of stay of 5.8 days and average costs of \$59,355, as compared to the 3,264 cases in MS-DRG 276 that had an average length of stay of 8.2 days and average costs of \$54,993. We stated that while the cases reporting procedure codes describing the implantation of a BAROSTIM™ system had average costs that were \$4,362 higher than the average costs of all

cases in MS-DRG 276, as noted, there were only a total of 23 cases, and there may have been other factors contributing to the higher costs. In the proposed rule we noted, however, if we were to reassign all cases reporting procedure codes describing the implantation of a BAROSTIM™ system to MS-DRG 276, even if there is not a MCC present, the cases would receive higher payment and the reassignment could better account for the differences in resource utilization of these cases than in their respective MS-DRG.

In the proposed rule we stated we reviewed the clinical issues and the claims data, and while we continue to note that there is no intravascular component or vascular puncture involved when implanting a BAROSTIM™ system, and that the implantation of a BAROSTIM™ system is distinguishable from the placement of ICD, CRT-D, and CCM devices, as these devices all differ in terms of technical complexity and anatomical placement of the electrical lead(s), as discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48837 through 48843), we agreed that ICD, CRT-D, and CCM devices and the BAROSTIM™ system are clinically coherent in that they share an indication of heart failure, a major cause of morbidity and mortality in the United States, and that these cases demonstrate comparable resource utilization. Based on our review of the clinical issues and the claims data, and to better account for the resources required, we proposed to reassign the cases reporting procedure codes describing the implantation of a BAROSTIM™ system to MS-DRG 276, even if there is no MCC reported, to better reflect the clinical severity and resource use involved in these cases.

Therefore, for FY 2025, we proposed to reassign all cases with one of the following ICD-10-PCS code combinations capturing cases reporting procedure codes describing the implantation of a BAROSTIM™ system, to MS-DRG 276, even if there is no MCC reported:

- 0JH60MZ (Insertion of stimulator generator into chest subcutaneous tissue and fascia, open approach) in combination with 03HK3MZ (Insertion of stimulator lead into right internal carotid artery, percutaneous approach); and

- 0JH60MZ (Insertion of stimulator generator into chest subcutaneous tissue and fascia, open approach) in combination with 03HL3MZ (Insertion of stimulator lead into left internal carotid artery, percutaneous approach).

We also proposed to change the title of MS-DRG 276 from “Cardiac Defibrillator Implant with MCC” to “Cardiac Defibrillator Implant with MCC or Carotid Sinus Neurostimulator” to reflect the proposed modifications to MS-DRG assignments. We refer the reader to section II.C.15. of the preamble of this final rule for the discussion of the surgical hierarchy and the complete list of our proposed modifications to the surgical hierarchy as well as our finalization of those proposals.

Comment: Commenters expressed overwhelming support for the proposal to reassign cases reporting a procedure code combination describing the implantation of a BAROSTIM™ system to MS-DRG 276, even if there is no MCC reported. Commenters also expressed support for the proposal to change the title of MS-DRG 276 from “Cardiac Defibrillator Implant with MCC” to “Cardiac Defibrillator Implant with MCC or Carotid Sinus Neurostimulator” to reflect the proposed modifications to MS-DRG assignments. Many commenters stated this reassignment would ensure continued access of this very important therapy to eligible Medicare patients. A commenter specifically stated that assignment to MS-DRG 276 is appropriate on a clinical basis and would also better account for the differences in resource utilization of these cases as compared to their current assignments.

Response: We appreciate the commenters’ support.

After consideration of the public comments we received, we are finalizing our proposal to reassign cases reporting one of the previously listed ICD-10-PCS code combinations describing the implantation of a BAROSTIM™ system to MS-DRG 276, even if there is no MCC reported, without modification, effective October 1, 2024, for FY 2025. We are also finalizing the change to the title of MS-DRG 276 from “Cardiac Defibrillator Implant with MCC” to “Cardiac

Defibrillator Implant with MCC or Carotid Sinus Neurostimulator” to reflect the modifications to MS-DRG assignments.

c. Endovascular Cardiac Valve Procedures

The human heart contains four major valves—the aortic, mitral, pulmonary, and tricuspid valves. These valves function to keep blood flowing through the heart. When conditions such as stenosis or insufficiency/regurgitation occur in one or more of these valves, valvular heart disease may result. Intervention options, including surgical aortic valve replacement or transcatheter aortic valve replacement can be performed to treat diseased or damaged aortic heart valves. Surgical aortic valve replacement (SAVR) is a traditional, open-chest surgery where an incision is made to access the heart. The damaged valve is replaced, and the chest is surgically closed. Since SAVR is a major surgery that involves an incision, recovery time tends to be longer. Transcatheter aortic valve replacement (TAVR) is a minimally invasive procedure that involves a catheter being inserted into an artery, without an incision for most cases, and then guided to the heart. The catheter delivers the new valve without the need for the chest or heart to be surgically opened. Since TAVR is a non-surgical procedure, it is generally associated with a much shorter recovery time.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 49892 through 49893), we discussed a request we received to create a new MS-DRG that would only include the various types of cardiac valve replacements performed by an endovascular or transcatheter technique. We reviewed the claims data and stated the data analysis showed that cardiac valve replacements performed by an endovascular or transcatheter technique had a shorter average length of stay and higher average costs in comparison to all of the cases in their assigned MS-DRGs, which were MS-DRGs 216, 217, 218, 219, 220, and 221 (Cardiac Valve & Other Major Cardiothoracic Procedure with and without Cardiac Catheterization, with MCC, with CC, and without CC/MCC, respectively). In the FY 2015 IPPS/LTCH PPS final rule we stated that patients receiving endovascular cardiac valve replacements were significantly different from those patients who

undergo an open chest cardiac valve replacement and noted that patients receiving endovascular cardiac valve replacements are not eligible for open chest cardiac valve procedures because of a variety of health constraints, which we stated highlights the fact that peri-operative complications and post-operative morbidity have significantly different profiles for open chest procedures compared with endovascular interventions. We further noted that separately grouping these endovascular valve replacement procedures provides greater clinical cohesion for this subset of high-risk patients. Therefore, we finalized our proposal to create MS-DRGs 266 and 267 (Endovascular Cardiac Valve Replacement, with MCC and without MCC, respectively) for FY 2015.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42080 through 42089), we discussed a request we received to modify the MS-DRG assignment for transcatheter mitral valve repair (TMVR) with implant procedures. We reviewed the claims data and stated based on our data analysis, transcatheter cardiac valve repair procedures and transcatheter (endovascular) cardiac valve replacement procedures are more clinically coherent in that they describe endovascular cardiac valve interventions with implants and were similar in terms of average length of stay and average costs to cases in MS-DRGs 266 and 267 when compared to other procedures in their current MS-DRG assignment. For the reasons described in the rule and after consideration of the public comments we received, we finalized our proposal to modify the structure of MS-DRGs 266 and 267 by reassigning the procedure codes that describe transcatheter cardiac valve repair (supplement) procedures, to revise the title of MS-DRG 266 from “Endovascular Cardiac Valve Replacement with MCC” to “Endovascular Cardiac Valve Replacement and Supplement Procedures with MCC” and to revise the title of MS-DRG 267 from “Endovascular Cardiac Valve Replacement without MCC” to “Endovascular Cardiac Valve Replacement and Supplement Procedures without MCC”, to reflect the finalized restructuring.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35962 through 35966), we received a request to delete MS-DRGs 266 and 267 and to move the cases reporting

transcatheter aortic valve replacement or repair (supplement) procedures currently assigned to those MS-DRGs into MS-DRGs 216, 217, 218, 219, 220, and 221. The requestor asserted that under the current IPPS payment methodology, TAVR procedures are not profitable to hospitals and when patients are clinically eligible for both a TAVR and SAVR procedures, factors beyond clinical appropriateness can drive treatment decisions. According to the requestor (the manufacturer of the SAPIEN™ family of transcatheter heart valves) sharing a single set of MS-DRGs would eliminate the current disincentives hospitals face and create financial neutrality between the two lifesaving treatment options. The requestor stated the current disincentives are increasingly problematic because they contribute to treatment disparities among certain racial, socioeconomic, and geographic groups.

As discussed in the proposed rule, the requestor noted that currently surgical cardiac valve replacement and supplement procedures, such as SAVR, are assigned to MS-DRGs 216, 217, 218, 219, 220, and 221, and endovascular cardiac valve replacement and supplement procedures, such as TAVR, are assigned to MS-DRGs 266 and 267. The requestor stated that both sets of MS-DRGs address valve disease and include valve repair or replacement procedures for any of the four heart valves. According to the requestor, while the sets of MS-DRGs involve clinically similar cases their payment rates differ which may be unintentionally influencing clinical decision-making by incentivizing hospitals to choose more invasive SAVR procedures over less-invasive TAVR procedures.

As mentioned earlier, the requestor recommended that CMS delete MS-DRGs 266 and 267 and move the cases reporting transcatheter aortic valve replacement or repair (supplement) procedures currently assigned to those MS-DRGs into MS-DRGs 216, 217, 218, 219, 220, and 221. We stated in the proposed rule that the requestor performed its own analysis and stated that the models of this suggested solution indicated the change would result in moderate differences in per case payments by case type and would not increase overall Medicare spending. The requestor noted that while their requested solution would potentially decrease payment to cases

currently assigned to MS-DRGs 216, 217, 218, 219, 220, and 221, while at the same time increasing the payment to cases reporting endovascular cardiac valve replacement and supplement procedures, the results of their claim analysis demonstrated that the net difference in total payments across all cases would increase by approximately \$6.5 million. The requestor stated that they anticipate that their proposed solution could increase Medicare patients' access to innovative endovascular cardiac valve procedures by establishing payment neutrality between SAVR and TAVR procedures.

As discussed in the proposed rule, we reviewed this request and noted the requestor was correct that in Version 41.1 cases reporting procedure codes that describe endovascular cardiac valve replacement and supplement procedures, including TAVR, group to MS-DRGs 266 and 267. We stated that the requestor was also correct that cases reporting procedure codes that describe surgical cardiac valve replacement and supplement procedures, including SAVR, group to MS-DRGs 216, 217, 218, 219, 220, and 221. We refer the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1 (available on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic for MS-DRGs 216, 217, 218, 219, 220, 221, 266, and 267.

As discussed in the proposed rule, to begin our analysis, we identified the ICD-10-PCS procedure codes that describe endovascular (transcatheter) cardiac valve replacement and supplement procedures and the ICD-10-PCS procedure codes that describe surgical cardiac valve replacement and supplement procedures. We also identified the ICD-10-PCS codes that describe cardiac catheterization, as MS-DRGs 216, 217, and 218 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively) are defined by the performance of cardiac catheterization. We refer the reader to Table 6P.2a, Table 6P.2b, and Table 6P.2c, respectively, associated with the proposed rule and this final rule (available at: <https://www.cms.gov/medicare/payment/prospective->

[payment-systems/acute-inpatient-pps](#)) for the lists of the ICD-10-PCS procedure codes that we identified that describe endovascular cardiac valve replacement and supplement procedures, surgical cardiac valve replacement and supplement procedures, and cardiac catheterization procedures.

As discussed in the proposed rule, we then examined the claims data from the September 2023 update of the FY 2023 MedPAR file for all cases in MS-DRGs 216, 217, 218, 219, 220, and 221 and compared the results to cases reporting surgical cardiac valve replacement and supplement procedures in MS-DRG 216, 217, 218, 219, 220, and 221. The following table shows our findings:

MS-DRGs 216-221: All Cases and Cases Reporting Surgical Cardiac Valve Replacement and Supplement Procedures				
	MS-DRG	Number of Cases	Average Length of Stay	Average Costs
216	All cases	5,033	13.9	\$84,176
	Surgical cardiac valve replacement and supplement procedures	2,973	16.8	\$87,497
217	All cases	1,635	7.2	\$58,381
	Surgical cardiac valve replacement and supplement procedures	867	9.5	\$56,829
218	All cases	275	3.4	\$54,624
	Surgical cardiac valve replacement and supplement procedures	60	6.7	\$45,096
219	All cases	12,458	10.5	\$67,228
	Surgical cardiac valve replacement and supplement procedures	9,780	10.3	\$64,954
220	All cases	9,829	6.3	\$47,242
	Surgical cardiac valve replacement and supplement procedures	7,841	6.4	\$46,245
221	All cases	1,242	3.8	\$41,539
	Surgical cardiac valve replacement and supplement procedures	627	4.9	\$39,081

As shown in the table, in MS-DRG 216, we identified a total of 5,033 cases with an average length of stay of 13.9 days and average costs of \$84,176. Of those 5,033 cases, there were 2,973 cases reporting surgical cardiac valve replacement and supplement procedures, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 216 (\$87,497 compared to \$84,176) and a longer average length of stay (16.8 days compared to 13.9 days). In MS-DRG 217, we identified a total of 1,635 cases with an average length of stay of 7.2 days and average costs of \$58,381. Of those 1,635 cases, there were 867 cases reporting surgical cardiac valve replacement and supplement procedures, with average costs lower than the average

costs in the FY 2023 MedPAR file for MS-DRG 217 (\$56,829 compared to \$58,381) and a longer average length of stay (9.5 days compared to 7.2 days). In MS-DRG 218, we identified a total of 275 cases with an average length of stay of 3.4 days and average costs of \$54,624. Of those 275 cases, there were 60 cases reporting surgical cardiac valve replacement and supplement procedures, with average costs lower than the average costs in the FY 2023 MedPAR file for MS-DRG 218 (\$45,096 compared to \$54,624) and a longer average length of stay (6.7 days compared to 3.4 days). In MS-DRG 219, we identified a total of 12,458 cases with an average length of stay of 10.5 days and average costs of \$67,228. Of those 12,458 cases, there were 9,780 cases reporting surgical cardiac valve replacement and supplement procedures, with average costs lower than the average costs in the FY 2023 MedPAR file for MS-DRG 219 (\$64,954 compared to \$67,228), and a slightly shorter average length of stay (10.3 days compared to 10.5 days). In MS-DRG 220, we identified a total of 9,829 cases with an average length of stay of 6.3 days and average costs of \$47,242. Of those 9,829 cases, there were 7,841 cases reporting surgical cardiac valve replacement and supplement procedures, with average costs lower than the average costs in the FY 2023 MedPAR file for MS-DRG 220 (\$46,245 compared to \$47,242) and a slightly longer average length of stay (6.4 days compared to 6.3 days). In MS-DRG 221, we identified a total of 1,242 cases with an average length of stay of 3.8 days and average costs of \$41,539. Of those 1,242 cases, there were 627 cases reporting surgical cardiac valve replacement and supplement procedures, with average costs lower than the average costs in the FY 2023 MedPAR file for MS-DRG 221 (\$39,081 compared to \$41,539) and a longer average length of stay (4.9 days compared to 3.8 days).

Next, as discussed in the proposed rule, we examined claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRGs 266 and 267. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
266	19,936	4.7	\$54,188
267	36,665	1.5	\$43,058

As noted in the proposed rule, because there is a two-way split within MS-DRGs 266 and 267 and there is a three-way split within MS-DRGs 216, 217, and 218, and MS-DRGs 219, 220, and 221 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively), we also analyzed the cases reporting a code describing an endovascular cardiac valve replacement and supplement procedure with a procedure code describing the performance of a cardiac catheterization for the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC). We also analyzed the cases reporting a code describing an endovascular cardiac valve replacement and supplement procedure without a procedure code describing the performance of a cardiac catheterization for the presence or absence of a secondary diagnosis designated as a CC or an MCC.

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
266	Endovascular cardiac valve replacement and supplement procedures with cardiac catheterization with MCC	5,443	7.9	\$63,128
	Endovascular cardiac valve replacement and supplement procedures without cardiac catheterization with MCC	14,493	3.5	\$50,831
267	Endovascular cardiac valve replacement and supplement procedures with cardiac catheterization with CC	4,761	2	\$42,163
	Endovascular cardiac valve replacement and supplement procedures without cardiac catheterization with CC	22,996	1.5	\$43,637
	Endovascular cardiac valve replacement and supplement procedures with cardiac catheterization without CC/MCC	1,386	1.3	\$39,709
	Endovascular cardiac valve replacement and supplement procedures without cardiac catheterization without CC/MCC	7,522	1.2	\$42,472

As shown in the table, the data analysis performed indicates that the 5,443 cases in MS-DRG 266 reporting endovascular cardiac valve replacement and supplement procedures with a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as an MCC have an average length of stay that is shorter than the average length of stay (7.9 days versus 16.8 days) and lower average costs (\$63,128 versus \$87,497) when compared to the cases in MS-DRG 216 reporting surgical cardiac valve

replacement and supplement procedures with a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as an MCC. The 4,761 cases in MS-DRG 267 reporting endovascular cardiac valve replacement and supplement procedures with a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as a CC have an average length of stay that is shorter than the average length of stay (2 days versus 9.5 days) and lower average costs (\$42,163 versus \$56,829) when compared to the cases in MS-DRG 217 reporting surgical cardiac valve replacement and supplement procedures with a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as an CC. The 1,386 cases in MS-DRG 267 reporting endovascular cardiac valve replacement and supplement procedures with a procedure code describing the performance of a cardiac catheterization, and without a secondary diagnosis code designated as a CC or MCC have an average length of stay that is shorter than the average length of stay (1.3 days versus 6.7 days) and lower average costs (\$39,709 versus \$45,096) when compared to the cases in MS-DRG 218 reporting surgical cardiac valve replacement and supplement procedures with a procedure code describing the performance of a cardiac catheterization, without a secondary diagnosis code designated as a CC or MCC.

The 14,493 cases in MS-DRG 266 reporting endovascular cardiac valve replacement and supplement procedures without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as an MCC have an average length of stay that is shorter than the average length of stay (3.5 days versus 10.3 days) and lower average costs (\$50,831 versus \$64,954) when compared to the cases in MS-DRG 219 reporting surgical cardiac valve replacement and supplement procedures without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as an MCC. The 22,996 cases in MS-DRG 267 reporting endovascular cardiac valve replacement and supplement procedures without a procedure code describing the performance of

a cardiac catheterization, and with a secondary diagnosis code designated as a CC have an average length of stay that is shorter than the average length of stay (1.5 days versus 6.4 days) and lower average costs (\$43,637 versus \$46,245) when compared to the cases in MS-DRG 220 reporting surgical cardiac valve replacement and supplement procedures without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as an CC. The 7,522 cases in MS-DRG 267 reporting endovascular cardiac valve replacement and supplement procedures without a procedure code describing the performance of a cardiac catheterization, and without a secondary diagnosis code designated as a CC or MCC have an average length of stay that is shorter than the average length of stay (1.2 days versus 4.9 days) and higher average costs (\$42,472 versus \$39,081) when compared to the cases in MS-DRG 221 reporting surgical cardiac valve replacement and supplement procedures without a procedure code describing the performance of a cardiac catheterization, without a secondary diagnosis code designated as a CC or MCC.

We stated in the proposed rule that this data analysis shows the cases in MS-DRG 266 and 267 reporting endovascular cardiac valve replacement and supplement procedures with a procedure code describing the performance of a cardiac catheterization when distributed based on the presence or absence of a secondary diagnosis designated as a CC or a MCC have average costs lower than the average costs of cases reporting surgical cardiac valve replacement and supplement procedures with a procedure code describing the performance of a cardiac catheterization in the FY 2023 MedPAR file for MS-DRGs 216, 217, and 218 respectively, and the average lengths of stay are shorter. Similarly, the cases in MS-DRG 266 and 267 reporting endovascular cardiac valve replacement and supplement procedures without a procedure code describing the performance of a cardiac catheterization when distributed based on the presence or absence of a secondary diagnosis designated as a CC or a MCC generally have average costs lower than the average costs of cases reporting surgical cardiac valve replacement and supplement procedures without a procedure code describing the performance of a cardiac

catheterization in the FY 2023 MedPAR file for MS-DRGs 219, 220, and 221 respectively, and the average lengths of stay are shorter.

We stated in the proposed rule that for patients with an indication for cardiac valve replacement, clinical and anatomic factors must be considered when decision-making between procedures such as TAVR and SAVR. We noted that SAVR is not a treatment option for patients with extreme surgical risk (that is, high probability of death or serious irreversible complication), severe atheromatous plaques of the ascending aorta such that aortic cross-clamping is not feasible, or with other conditions that would make operation through sternotomy or thoracotomy prohibitively hazardous. We stated that we agreed that the endovascular or transcatheter technique presents a viable option for high-risk patients who are not candidates for the traditional open surgical approach, however we also noted that TAVR is not indicated for every patient. TAVR is contraindicated in patients who cannot tolerate an anticoagulation/antiplatelet regimen, or who have active bacterial endocarditis or other active infections, or who have significant annuloplasty ring dehiscence.

In the proposed rule, we stated we had concern with the assertion that clinicians perform more invasive surgical procedures, such as SAVR procedures, only to increase payment to their facility where minimally invasive TAVR procedures are also viable option. The choice of SAVR versus TAVR should not be based on potential facility payment. Instead, the decision on the procedural approach to be utilized should be based upon an individualized risk-benefit assessment that includes reviewing factors such as the patient's age, surgical risk, frailty, valve morphology, and presence of concomitant valve disease or coronary artery disease. As we have stated in prior rulemaking (83 FR 41201), it is not appropriate for facilities to deny treatment to beneficiaries needing a specific type of therapy or treatment that involves increased costs. Conversely, it is not appropriate for facilities to recommend a specific type of therapy or treatment strictly because it may involve higher payment to the facility.

Also, we stated we had concern with the requestor's assertion that sharing a single set of MS-DRGs could eliminate any perceived disincentives hospitals may face and create financial neutrality between the two lifesaving treatment options. In the proposed rule, we noted that the data analysis shows that cases reporting surgical cardiac valve replacement and supplement procedures have higher costs and longer lengths of stay. We stated that if clinical decision-making is being driven by financial motivations, as suggested by the requestor, in circumstances where the decision on which approach is best (for example, TAVR or SAVR) is left to the providers' discretion, it is unclear how reducing payment for surgical cardiac valve replacement and supplement procedures would eliminate possible disincentives, or not have the opposite effect, and instead incentivize endovascular cardiac valve replacement and supplement procedures.

As discussed in the proposed rule, the MS-DRGs are a classification system intended to group together diagnoses and procedures with similar clinical characteristics and utilization of resources and are not intended to be utilized as a tool to incentivize the performance of certain procedures. When performed, surgical cardiac valve replacement and supplement procedures are clinically different from endovascular cardiac valve replacement and supplement procedures in terms of technical complexity and hospital resource use. In the FY 2015 IPPS/LTCH PPS final rule, we stated that separately grouping endovascular valve replacement procedures provides greater clinical cohesion for this subset of high-risk patients. In the FY 2025 IPPS/LTCH PPS proposed rule, we stated our claims analysis demonstrates that this continues to be substantiated by the difference in average costs and average lengths of stay demonstrated by the two cohorts. We stated we continue to believe that endovascular cardiac valve replacement and supplement procedures are clinically coherent in their currently assigned MS-DRGs. Therefore, we proposed to maintain the structure of MS-DRGs 266 and 267 for FY 2025.

Comment: Many commenters expressed support for the proposal to maintain the structure of MS-DRGs 266 and 267 for FY 2025. A commenter stated it is unclear why the requestor

would imply that there is any type of bias in patient selection of surgical cardiac valve replacement and repair procedures over endovascular cardiac valve replacement and supplement procedures, and stated in their experience, the decision to perform endovascular or surgical cardiac valve replacement and supplement procedures is typically made by the heart team based on the patient's individualized risk-benefit and associated factors such as the patient's age, surgical risk, frailty, valve morphology, and presence of concomitant valve disease or coronary artery disease. A commenter specifically stated while they firmly believe that procedures such as TAVR should be paid at a rate that makes them efficacious for hospitals to perform, given the analysis provided by CMS, the requested MS-DRG modification may not be the best path to this end. Another commenter stated they agreed with CMS that although both types of cardiac valve interventions treat the same type of disease, the work and resource utilization associated with the procedures is significantly different and noted that surgical cardiac replacement or repair procedures typically require more resources such as increased operating room time, additional supportive staff for the procedure and longer lengths of stay. Another commenter stated in addition to the important points that CMS made in the proposed rule regarding the lack of cost coherence between TAVR and SAVR procedures, in their own analysis, the impact of moving TAVR cases into MS-DRGs 216, 217, 218, 219, 220, and 221 (Cardiac Valve & Other Major Cardiothoracic Procedure with and without Cardiac Catheterization, with MCC, with CC, and without CC/MCC, respectively) would cause a 12 percent decrease in average costs and a 9 percent decrease in relative weight in MS-DRGs 216, 217, 218, 219, 220, and 221.

Response: We appreciate the commenters' support and feedback.

Comment: A commenter (the requestor) disagreed with the proposal to maintain the structure of MS-DRGs 266 and 267 and stated appropriate payment under the IPPS is critical to improving access to TAVR procedures for all eligible patients and ensuring timely access to valve replacement therapies. This commenter stated they continue to maintain that incentives for valve replacement procedures strongly favor SAVR over TAVR due to the payment differential

between the two procedures. While acknowledging that SAVR cases have increased clinical labor and indirect costs, the commenter again asserted that merging the procedures into a single set of MS-DRGs would establish better financial neutrality between the procedure options by creating more similarity between TAVR and SAVR contribution margins as hospitals measure per-case profitability. Lastly, the commenter noted in their own analysis, payment rates for MS-DRGs 266 and 267 have declined approximately 6 percent from 2022 to 2025, while the payments rates for MS-DRGs 216, 217, 218, 219, 220, and 221 have increased by 8 percent in the same time frame and stated that the years of declining TAVR payment rates while SAVR payment rates increased do influence hospital decisions about whether to expand their structural heart programs to include TAVR procedures, particularly in hospitals located in geographic areas with low wage indexes.

Response: We appreciate the commenter's feedback. With respect to changes in payment rates in the referenced MS-DRGs, each year we calculate the relative weights by dividing the average cost for cases within each MS-DRG by the average cost for cases across all MS-DRGs. We believe any weight changes observed by the commenter over time to be appropriately driven by the underlying data in the years since CMS began using the ICD-10 data in calculating the relative weights. We also note that over the past five years, there have been changes to the hierarchy and structure of certain MS-DRGs in MDC 05. It is to be expected that when MS-DRGs are restructured, such as when procedure codes are reassigned or the hierarchy within an MDC is revised, resulting in a different case-mix within the MS-DRGs, the relative weights of the MS-DRGs will change as a result. Therefore, the data appear to reflect that the differences in the relative weights reflected in Table 5–List of Medicare Severity Diagnosis Related Groups (MS-DRGs), Relative Weighting Factors, and Geometric and Arithmetic Mean Length of Stay associated with the final rule for each applicable fiscal year can be attributed to the fact that the finalization of these proposals resulted in a different case-mix within the MS-DRGs, which is

then being reflected in the relative weights. We refer readers to section II.D.2. of the preamble of this final rule for a discussion of the relative weight calculations.

As stated in prior rulemaking (88 FR 58730), the MS-DRGs were developed as a patient classification scheme consisting of patients who are similar clinically and with regard to their consumption of hospital resources. While all patients are unique, groups of patients have diagnostic and therapeutic attributes in common that determine their level of resource intensity. Similar resource intensity means that the resources used are relatively consistent across the patients in each MS-DRG. When performed, surgical cardiac valve replacement and supplement procedures are clinically different from endovascular cardiac valve replacement and supplement procedures in terms of technical complexity and hospital resource use. We continue to believe that endovascular cardiac valve replacement and supplement procedures are clinically coherent in their currently assigned MS-DRGs.

As stated earlier, the MS-DRGs are not intended to be utilized as a tool to incentivize the performance of certain procedures. As we have stated in prior rulemaking, we rely on providers to assess the needs of their patients and provide the most appropriate treatment. It is not appropriate for facilities to deny treatment to beneficiaries needing a specific type of therapy or treatment that potentially involves increased costs (86 FR 44847). It would also not be appropriate to consider modifications to the MS-DRG assignment of cases reporting the performance of a specific procedure solely as an incentive for providers to perform one procedure over another.

Therefore, after consideration of the public comments we received, and for the reasons stated earlier, we are finalizing our proposal to maintain the structure of MS-DRGs 266 and 267, without modification, for FY 2025.

d. MS-DRG Logic for MS-DRG 215

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35966 through 35968), we discussed a request we received to review the GROUPER logic for MS-DRG 215 (Other Heart

Assist System Implant) in MDC 05 (Diseases and Disorders of the Circulatory System). The requestor stated that when the procedure code describing the revision of malfunctioning devices within the heart via an open approach is assigned, the encounter groups to MS-DRG 215. The requestor stated that, in their observation, ICD-10-PCS code 02WA0JZ (Revision of synthetic substitute in heart, open approach) can only be assigned if a more specific anatomical site is not documented in the operative note. The requestor further stated they interpreted this to mean that an ICD-10-PCS procedure code describing the open revision of a synthetic substitute in the heart can only apply to the ventricular wall or left atrial appendage and excludes the atrial or ventricular septum or any valve to qualify for MS-DRG 215 and recommended that CMS consider the expansion of the open revision of heart structures to include the atrial or ventricular septum and heart valves.

In the proposed rule we stated that to begin our analysis, we reviewed the GROUPER logic. We stated that the requestor is correct that ICD-10-PCS procedure code 02WA0JZ is currently one of the listed procedure codes in the GROUPER logic for MS-DRG 215. While the requestor stated that when procedures codes describing the revisions of malfunctioning devices within the heart via an open approach are assigned, the encounter groups to MS-DRG 215, we stated we wished to clarify that the revision codes listed in the GROUPER logic for MS-DRG 215 specifically describe procedures to correct, to the extent possible, a portion of a malfunctioning heart assist device or the position of a displaced heart assist device. Further, we stated it was unclear what was meant by the requestor's statement that ICD-10-PCS code 02WA0JZ can only be assigned if more specific anatomical site is not documented in the operative note, as ICD-10-PCS code 02WA0JZ is used to describe the open revision of artificial heart systems. We noted that total artificial hearts are pulsating bi-ventricular devices that are implanted into the chest to replace a patient's left and right ventricles and can provide a bridge to heart transplantation for patients who have no other reasonable medical or surgical treatment options. We refer the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1 (available

on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic for MS-DRG 215. We encouraged the requestor and any providers that have cases involving heart assist devices for which they need ICD-10 coding assistance and clarification on the usage of the codes, to submit their questions to the American Hospital Association's Central Office on ICD-10 at <https://www.codingclinicadvisor.com/>.

As previously noted, as discussed in the proposed rule, the requestor recommended that we consider expansion of the open revision of heart structures to include the atrial or ventricular septum and heart valves. The requestor did not provide a specific list of procedure codes involving the open revision of heart structures. While not explicitly stated, we stated we understood this request to be for our consideration of the reassignment of the procedure codes describing the open revision of devices in the heart valves, atrial septum, or ventricular septum to MS-DRG 215, therefore, we stated we reviewed the ICD-10-PCS classification and identified the following 18 procedure codes. These 18 codes are all assigned to MS-DRGs 228 and 229 (Other Cardiothoracic Procedures with and without MCC, respectively) in MDC 05 in Version 41.1.

ICD-10-PCS Code	Description
02W50JZ	Revision of synthetic substitute in atrial septum, open approach
02WF07Z	Revision of autologous tissue substitute in aortic valve, open approach
02WF08Z	Revision of zooplastic tissue in aortic valve, open approach
02WF0JZ	Revision of synthetic substitute in aortic valve, open approach
02WF0KZ	Revision of nonautologous tissue substitute in aortic valve, open approach
02WG07Z	Revision of autologous tissue substitute in mitral valve, open approach
02WG08Z	Revision of zooplastic tissue in mitral valve, open approach
02WG0JZ	Revision of synthetic substitute in mitral valve, open approach
02WG0KZ	Revision of nonautologous tissue substitute in mitral valve, open approach
02WH07Z	Revision of autologous tissue substitute in pulmonary valve, open approach
02WH08Z	Revision of zooplastic tissue in pulmonary valve, open approach
02WH0JZ	Revision of synthetic substitute in pulmonary valve, open approach
02WH0KZ	Revision of nonautologous tissue substitute in pulmonary valve, open approach
02WJ07Z	Revision of autologous tissue substitute in tricuspid valve, open approach
02WJ08Z	Revision of zooplastic tissue in tricuspid valve, open approach
02WJ0JZ	Revision of synthetic substitute in tricuspid valve, open approach
02WJ0KZ	Revision of nonautologous tissue substitute in tricuspid valve, open approach
02WM0JZ	Revision of synthetic substitute in ventricular septum, open approach

Next, in the proposed rule we stated we examined claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRG 228 and 229 to identify cases reporting one of

the 18 codes listed previously that describe the open revision of devices in the heart valves, atrial septum, or ventricular septum. Our findings are shown in the following table:

MS-DRGs 228 – 229: All Cases and Cases Reporting Open Revision of Devices in the Heart Valves, Atrial Septum, or Ventricular Septum				
	MS-DRG	Number of Cases	Average Length of Stay	Average Costs
228	All cases	4,391	8.7	\$44,565
	Cases with a procedure code describing the open revision of devices in the heart valves, atrial septum, or ventricular septum	12	15.7	\$51,549
229	All Cases	5,712	3.3	\$28,987
	Cases with a procedure code describing the open revision of devices in the heart valves, atrial septum, or ventricular septum	1	1	\$11,322

As shown in the table, in MS-DRG 228, we identified a total of 4,391 cases with an average length of stay of 8.7 days and average costs of \$44,565. Of those 4,391 cases, there were 12 cases reporting a procedure code describing the open revision of devices in the heart valves, atrial septum, or ventricular septum, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 228 (\$51,549 compared to \$44,565) and a longer average length of stay (15.7 days compared to 8.7 days). In MS-DRG 229, we identified a total of 5,712 cases with an average length of stay of 3.3 days and average costs of \$28,987. Of those 5,712 cases, there was one case reporting a procedure code describing the open revision of devices in the heart valves, atrial septum, or ventricular septum with costs lower than the average costs in the FY 2023 MedPAR file for MS-DRG 229 (\$11,322 compared to \$28,987) and a shorter length of stay (1 day compared to 3.3 days).

We stated we then examined claims data from the September 2023 update of the FY 2023 MedPAR for MS-DRG 215. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
215	3,668	9.2	\$91,021

In the proposed rule we stated our analysis indicates that the cases assigned to MS-DRG 215 have much higher average costs than the cases reporting a procedure code describing the open revision of devices in the heart valves, atrial septum, or ventricular septum currently assigned to MS-DRGs 228 and 229. Instead, the average costs and average length of stay for

case reporting a procedure code describing the open revision of devices in the heart valves, atrial septum, or ventricular septum appear to be generally more aligned with the average costs and average length of stay for all cases in MS-DRGs 228 and 229, where they are currently assigned.

In addition, based on our review of the clinical considerations, we stated we did not believe the procedure codes describing the open revision of devices in the heart valves, atrial septum, or ventricular septum are clinically coherent with the procedure codes currently assigned to MS-DRG 215. We noted that heart assist devices, such as ventricular assist devices and artificial heart systems, provide circulatory support by taking over most of the workload of the left ventricle. Blood enters the pump through an inflow conduit connected to the left ventricle and is ejected through an outflow conduit into the body's arterial system. Heart assist devices can provide temporary left, right, or biventricular support for patients whose hearts have failed and can also be used as a bridge for patients who are awaiting a heart transplant. In the proposed rule we stated that devices placed in the heart valves, atrial septum, or ventricular septum do not serve the same purpose as heart assist devices and we stated we did not believe the procedure codes describing the revision of these devices should be assigned to MS-DRG 215. Further, we stated that the various indications for devices placed in the heart valves, atrial septum or ventricular septum are not aligned with the indications for heart assist devices. We stated we believe that patients with indications for heart assist devices tend to be more severely ill and these inpatient admissions are associated with greater resource utilization. Therefore, for the reasons stated previously, we proposed to maintain the GROUPER logic for MS-DRG 215 for FY 2025.

Comment: Many commenters agreed with CMS' proposal to maintain the GROUPER logic for MS-DRG 215 for FY 2025. A commenter stated that they agreed with CMS that, in general, most patients with indications for heart assist devices tend to be more severely ill and will require greater resource utilization than patients that are admitted for open revision of devices related to heart valves, atrial septum, or ventricular septum.

Response: We appreciate the commenters' support.

Therefore, after consideration of the public comments we received, we are finalizing our proposal to maintain the GROUPER logic for MS-DRG 215 for FY 2025, without modification.

5. MDC 06 (Diseases and Disorders of the Digestive System): Excision of Intestinal Body Parts

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35968 through 35969), we identified a replication issue from the ICD-9 based MS-DRGs to the ICD-10 based MS-DRGs regarding the assignment of eight ICD-10-PCS codes that describe the excision of intestinal body parts by open, percutaneous, or percutaneous endoscopic approach. Under the Version 32 ICD-9 based MS-DRGs, ICD-9-CM procedure code 45.33 (Local excision of lesion or tissue of small intestine, except duodenum) was designated as an O.R. procedure and was assigned to MDC 06 (Diseases and Disorders of the Digestive System) in MS-DRGs 347, 348, and 349 (Anal and Stomal Procedures with MCC, with CC, and without CC/MCC, respectively).

In the proposed rule, we noted that there are eight ICD-10-PCS code translations that provide more detailed and specific information for ICD-9-CM code 45.33 that also currently group to MS-DRGs 347, 348, and 349 in the ICD-10 MS-DRGs Version 41.1. These eight procedure codes are shown in the following table:

ICD-10-PCS Code	Description
0DB83ZZ	Excision of small intestine, percutaneous approach
0DBA3ZZ	Excision of jejunum, percutaneous approach
0DBA4ZZ	Excision of jejunum, percutaneous endoscopic approach
0DBB3ZZ	Excision of ileum, percutaneous approach
0DBB4ZZ	Excision of ileum, percutaneous endoscopic approach
0DBC0ZZ	Excision of ileocecal valve, open approach
0DBC3ZZ	Excision of ileocecal valve, percutaneous approach
0DBC4ZZ	Excision of ileocecal valve, percutaneous endoscopic approach

In the proposed rule we stated we noted during our review of this issue that under ICD-9-CM, procedure code 45.33 did not differentiate the specific type of approach used to perform the procedure. This is in contrast to the eight comparable ICD-10-PCS code translations listed in the previous table that do differentiate among various approaches (open, percutaneous, and percutaneous endoscopic). We also noted that there are four additional ICD-10-PCS code translations that provide more detailed and specific information for ICD-9-CM code 45.33,

however these four codes currently group to MS-DRGs 329, 330, and 331 (Major Small and Large Bowel Procedures with MCC, with CC, and without CC/MCC, respectively), and not MS-DRGs 347, 348, and 349, in the ICD-10 MS-DRGs Version 41.1. These four procedure codes are shown in the following table:

ICD-10-PCS Code	Description
0DB80ZZ	Excision of small intestine, open approach
0DB84ZZ	Excision of small intestine, percutaneous endoscopic approach
0DBA0ZZ	Excision of jejunum, open approach
0DBB0ZZ	Excision of ileum, open approach

We refer the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1 (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic for MS-DRGs 329, 330, 331, 347, 348, and 349.

Next, as discussed in the proposed rule we examined claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRG 347, 348, and 349 to identify cases reporting one of the eight codes listed previously that describe excision of intestinal body parts by an open, percutaneous, or percutaneous endoscopic approach. Our findings are shown in the following table:

MS-DRGs 347 – 349: All Cases and Cases Reporting One of Eight Procedure Codes Describing Excision of an Intestinal Body Part by Open, Percutaneous, or Percutaneous Endoscopic Approach				
	MS-DRG	Number of Cases	Average Length of Stay	Average Costs
347	All cases	752	7.6	\$21,462
	Cases with 0DB83ZZ, 0DBA3ZZ, 0DBA4ZZ, 0DBB3ZZ, 0DBB4ZZ, 0DBC0ZZ, 0DBC3ZZ, or 0DBC4ZZ	66	8.5	\$27,081
348	All cases	1,580	4.2	\$12,020
	Cases with 0DB83ZZ, 0DBA3ZZ, 0DBA4ZZ, 0DBB3ZZ, 0DBB4ZZ, 0DBC0ZZ, 0DBC3ZZ, or 0DBC4ZZ	192	4.9	\$17,063
349	All Cases	644	2.2	\$9,095
	Cases with 0DB83ZZ, 0DBA3ZZ, 0DBA4ZZ, 0DBB3ZZ, 0DBB4ZZ, 0DBC0ZZ, 0DBC3ZZ, or 0DBC4ZZ	117	3	\$14,612

As shown in the table, in MS-DRG 347, we identified a total of 752 cases with an average length of stay of 7.6 days and average costs of \$21,462. Of those 752 cases, there were 66 cases reporting one of eight procedure codes describing the excision of intestinal body parts

by an open, percutaneous, or percutaneous endoscopic approach, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 347 (\$27,081 compared to \$21,462) and a longer average length of stay (8.5 days compared to 7.6 days). In MS-DRG 348, we identified a total of 1,580 cases with an average length of stay of 4.2 days and average costs of \$12,020. Of those 1,580 cases, there were 192 cases reporting one of eight procedure codes describing the excision of intestinal body parts by an open, percutaneous, or percutaneous endoscopic approach, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 348 (\$17,063 compared to \$12,020) and a longer average length of stay (4.9 days compared to 4.2 days). In MS-DRG 349, we identified a total of 644 cases with an average length of stay of 2.2 days and average costs of \$9,095. Of those 644 cases, there were 117 cases reporting one of eight procedure codes describing the excision of intestinal body parts by an open, percutaneous, or percutaneous endoscopic approach, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 349 (\$14,612 compared to \$9,095), and a longer average length of stay (3 days compared to 2.2 days).

We stated we then examined claims data from the September 2023 update of the FY 2023 MedPAR for MS-DRGs 329, 330, and 331. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
329	28,706	12.5	\$38,468
330	37,642	6.3	\$20,852
331	18,004	3.3	\$14,796

While the average costs for all cases in MS-DRGs 329, 330, and 331 are higher than the average costs of the cases reporting one of eight procedure codes describing the excision of intestinal body parts by an open, percutaneous, or percutaneous endoscopic approach, we stated the data suggest that overall, cases reporting one of eight procedure codes describing the excision of intestinal body parts by an open, percutaneous, or percutaneous endoscopic approach may be more appropriately aligned with the average costs of the cases in MS-DRGs 329, 330, and 331 in comparison to MS-DRGs 347, 348, and 349, even though the average lengths of stay are shorter.

In the proposed rule we stated we reviewed this grouping issue, and our analysis indicates that the eight procedure codes describing the excision of intestinal body parts by an open, percutaneous, or percutaneous endoscopic approach were initially assigned to the list of procedures in the GROUPER logic for MS-DRGs 347, 348, and 349 as a result of replication in the transition from ICD-9 to ICD-10 based MS-DRGs. We also noted that procedure codes 0DB83ZZ, 0DBA3ZZ, 0DBA4ZZ, 0DBB3ZZ, 0DBB4ZZ, 0DBC0ZZ, 0DBC3ZZ, and 0DBC4ZZ do not describe procedures on a stoma, which is an artificial opening on the abdomen that can be connected to either the digestive or urinary system to allow waste to be diverted out of the body, or the anus. We stated we supported the reassignment of codes 0DB83ZZ, 0DBA3ZZ, 0DBA4ZZ, 0DBB3ZZ, 0DBB4ZZ, 0DBC0ZZ, 0DBC3ZZ, and 0DBC4ZZ for clinical coherence and that we believe these eight procedure codes should be appropriately grouped along with the four other procedure codes that describe excision of intestinal body parts by an open, or percutaneous endoscopic approach currently assigned to MS-DRGs 329, 330, and 331.

Accordingly, because the procedures described by the eight procedure codes that describe excision of intestinal body parts by an open, percutaneous, or percutaneous endoscopic approach are not clinically consistent with procedures on the anus or stoma, and it is clinically appropriate to reassign these procedures to be consistent with the four other procedure codes that describe excision of intestinal body parts by an open, or percutaneous endoscopic approach in MS-DRGs 329, 330, and 331, we proposed the reassignment of procedure codes 0DB83ZZ, 0DBA3ZZ, 0DBA4ZZ, 0DBB3ZZ, 0DBB4ZZ, 0DBC0ZZ, 0DBC3ZZ, and 0DBC4ZZ from MS-DRGs 347, 348, and 349 (Anal and Stomal Procedures with MCC, with CC, and without CC/MCC, respectively) to MS-DRGs 329, 330, and 331 (Major Small and Large Bowel Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 06, effective FY 2025.

Comment: Commenters supported the proposal to reassign the eight procedure codes that describe the excision of intestinal body parts by an open, percutaneous, or percutaneous

endoscopic approach from MS-DRGs 347, 348, and 349 to MS-DRGs 329, 330, and 331. A commenter thanked CMS for this review and stated that they agreed that the proposed reassignment would correct an error that was made during the transition from the ICD-9 based MS-DRGs to the ICD-10 based MS-DRGs. Other commenters stated that these procedure codes do not belong in the MS-DRGs they are currently assigned to, and that reassignment will appropriately group these procedures based on the body part involved.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to reassign procedure codes 0DB83ZZ, 0DBA3ZZ, 0DBA4ZZ, 0DBB3ZZ, 0DBB4ZZ, 0DBC0ZZ, 0DBC3ZZ, and 0DBC4ZZ from MS-DRGs 347, 348, and 349 (Anal and Stomal Procedures with MCC, with CC, and without CC/MCC, respectively) to MS-DRGs 329, 330, and 331 (Major Small and Large Bowel Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 06, without modification, effective October 1, 2024, for FY 2025.

6. MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)

a. MS-DRG Logic for MS-DRGs 456, 457, and 458

In the proposed rule we discussed an inconsistency in the GROUPER logic for MS-DRGs 456, 457, and 458 (Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions with MCC, with CC, and without CC/MCC, respectively) related to ICD-10-CM diagnosis codes describing deforming dorsopathies. The logic for case assignment to MS-DRGs 456, 457, and 458 as displayed in the ICD-10 MS-DRG Definitions Manual Version 41.1 (which is available on the CMS website at:

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software>) is comprised of four logic lists. The first logic list is entitled “Spinal Fusion Except Cervical” and is defined by a list of procedure codes designated as O.R. procedures that describe spinal fusion procedures of the thoracic, thoracolumbar, lumbar, lumbosacral, sacrococcygeal, coccygeal, and sacroiliac joint. The second logic list is entitled

“Spinal Curvature/Malignancy/Infection” and is defined by a list of diagnosis codes describing spinal curvature, spinal malignancy, and spinal infection that are used to define the logic for case assignment when any one of the listed diagnosis codes is reported as the principal diagnosis.

The third logic list is entitled “OR Secondary Diagnosis” and is defined by a list of diagnosis codes describing curvature of the spine that are used to define the logic for case assignment when any one of the listed codes is reported as a secondary diagnosis. The fourth logic list is entitled “Extensive Fusions” and is defined by a list of procedure codes designated as O.R. procedures that describe extensive spinal fusion procedures. We refer the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1, (available on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic for MS-DRGs 456, 457, and 458.

In the second logic list entitled “Spinal Curvature/Malignancy/Infection” there are a subset of six diagnosis codes describing other specified deforming dorsopathies as shown in the following table.

ICD-10-CM Code	Description
M43.8X4	Other specified deforming dorsopathies, thoracic region
M43.8X5	Other specified deforming dorsopathies, thoracolumbar region
M43.8X6	Other specified deforming dorsopathies, lumbar region
M43.8X7	Other specified deforming dorsopathies, lumbosacral region
M43.8X8	Other specified deforming dorsopathies, sacral and sacrococcygeal region
M43.8X9	Other specified deforming dorsopathies, site unspecified

In the third logic list entitled “OR Secondary Diagnosis” there are currently 14 diagnosis codes listed, one of which is diagnosis code M43.8X9 (Other specified deforming dorsopathies, site unspecified) as shown in the following table.

OR Secondary Diagnosis Codes	
ICD-10-CM Code	Description
M40.10	Other secondary kyphosis, site unspecified
M40.14	Other secondary kyphosis, thoracic region
M40.15	Other secondary kyphosis, thoracolumbar region
M41.40	Neuromuscular scoliosis, site unspecified
M41.44	Neuromuscular scoliosis, thoracic region
M41.45	Neuromuscular scoliosis, thoracolumbar region
M41.46	Neuromuscular scoliosis, lumbar region

M41.47	Neuromuscular scoliosis, lumbosacral region
M41.50	Other secondary scoliosis, site unspecified
M41.54	Other secondary scoliosis, thoracic region
M41.55	Other secondary scoliosis, thoracolumbar region
M41.56	Other secondary scoliosis, lumbar region
M41.57	Other secondary scoliosis, lumbosacral region
M43.8X9	Other specified deforming dorsopathies, site unspecified

In the proposed rule we stated that we recognized that the five diagnosis codes describing deforming dorsopathies of specific anatomic sites that are listed in the second logic list entitled “Spinal Curvature/Malignancy/Infection” are not listed in the third logic list entitled “OR Secondary Diagnosis”, rather, only diagnosis code M43.8X9 (Other specified deforming dorsopathies, site unspecified) appears in both logic lists. Therefore, we considered if it was clinically appropriate to add the five diagnosis codes describing deforming dorsopathies of specific anatomic sites that are listed in the second logic list entitled “Spinal Curvature/Malignancy/Infection” to the third logic list entitled “OR Secondary Diagnosis”.

A deforming dorsopathy is characterized by abnormal bending or flexion in the vertebral column. All spinal deformities involve problems with curve or rotation of the spine, regardless of site specificity. In the proposed rule we stated our belief that the five diagnosis codes describing deforming dorsopathies of specific anatomic sites are clinically aligned with the diagnosis codes currently included in the “OR Secondary Diagnosis” logic list. Therefore, for clinical consistency we proposed to add diagnosis codes M43.8X4, M43.8X5, M43.8X6, M43.8X7, and M43.8X8 to the “OR Secondary Diagnosis” logic list for MS-DRGs 456, 457, and 458, effective October 1, 2024, for FY 2025.

Comment: Commenters supported the proposal to add diagnosis codes M43.8X4, M43.8X5, M43.8X6, M43.8X7, and M43.8X8 to the “OR Secondary Diagnosis” logic list for MS-DRGs 456, 457, and 458.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to add diagnosis codes M43.8X4, M43.8X5, M43.8X6, M43.8X7, and M43.8X8 to the “OR

Secondary Diagnosis” logic list for MS-DRGs 456, 457, and 458 effective October 1, 2024, for FY 2025.

b. Interbody Spinal Fusion Procedures

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35971 through 35985), we discussed a request we received to reassign cases reporting spinal fusion procedures using an aprevo™ customized interbody fusion device from the lower severity MS-DRG 455 (Combined Anterior and Posterior Spinal Fusion without CC/MCC) to the higher severity MS-DRG 453 (Combined Anterior and Posterior Spinal Fusion with MCC), from the lower severity MS-DRG 458 (Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions without CC/MCC) to the higher severity level MS-DRG 456 (Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions with MCC) when a diagnosis of malalignment is reported, and from MS-DRGs 459 and 460 (Spinal Fusion Except Cervical with MCC and without MCC, respectively) to MS-DRG 456. We referred the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1 (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic.

In the proposed rule we noted that this topic has been discussed previously in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26726 through 26729) and final rule (88 FR 58731 through 58735, as corrected in the FY 2024 final rule correction notice at 88 FR 77211). We also noted that the aprevo™ Intervertebral Body Fusion Device technology was approved for new technology add-on payments for FY 2022 (86 FR 45127 through 45133). We further noted that, as discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49468 through 49469), CMS finalized the continuation of the new technology add-on payments for this technology for FY 2023. In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58802), we finalized the continuation of new technology add-on payments for the transforaminal lumbar interbody fusion (TLIF) indication for aprevo™ for FY 2024, and the discontinuation of the new technology add-

on payments for the anterior lumbar interbody fusion (ALIF) and lateral lumbar interbody fusion (LLIF) indications for FY 2024. We referred the reader to section II.E. for discussion of the FY 2025 status of technologies receiving new technology add-on payments for FY 2024, including the status for the aprevo™ technology.

Additionally, in the proposed rule we noted that in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26726 through 26729) and final rule (88 FR 58731 through 58735), effective October 1, 2021 (FY 2022), we implemented 12 new ICD-10-PCS procedure codes to identify and describe spinal fusion procedures using the aprevo™ customized interbody fusion device. We noted that the manufacturer expressed concerns that there may be unintentional miscoded claims from providers with whom they do not have an explicit relationship and that following the submission of the request for the FY 2024 MS-DRG classification change for cases reporting the performance of a spinal fusion procedure utilizing an aprevo™ customized interbody spinal fusion device, it submitted a code proposal requesting a revision to the title of the procedure codes that were finalized effective FY 2022. We also noted that, as discussed in the FY 2024 IPPS/LTCH PPS final rule, a proposal to revise the code title for the procedure codes that identify and describe spinal fusion procedures using the aprevo™ customized interbody fusion device was presented and discussed as an Addenda item at the March 7–8, 2023 ICD-10 Coordination and Maintenance Committee meeting and subsequently finalized.

As discussed in the proposed rule, the code title changes for the 12 ICD-10-PCS procedure codes to identify and describe spinal fusion procedures using the aprevo™ customized interbody fusion device were reflected in the FY 2024 ICD-10-PCS Code Update files available via the CMS website at: <https://www.cms.gov/medicare/coding-billing/icd-10-codes/2024-icd-10-pcs>, as well as in Table 6F.—Revised Procedure Code Titles— FY 2024 associated with the FY 2024 IPPS/LTCH PPS final rule and available via the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>. We noted that only the code titles were revised and the code numbers themselves did not change.

Accordingly, effective with discharges on and after October 1, 2023 (FY 2024), the 12 ICD-10-PCS procedure codes to identify and describe spinal fusion procedures using the aprevo™ customized interbody fusion device with their revised code titles are as follows:

ICD-10-PCS Code	Description
XRGA0R7	Fusion of thoracolumbar vertebral joint using custom-made anatomically designed interbody fusion device, open approach, new technology group 7
XRGA3R7	Fusion of thoracolumbar vertebral joint using custom-made anatomically designed interbody fusion device, percutaneous approach, new technology group 7
XRGA4R7	Fusion of thoracolumbar vertebral joint using custom-made anatomically designed interbody fusion device, percutaneous endoscopic approach, new technology group 7
XRGB0R7	Fusion of lumbar vertebral joint using custom-made anatomically designed interbody fusion device, open approach, new technology group 7
XRGB3R7	Fusion of lumbar vertebral joint using custom-made anatomically designed interbody fusion device, percutaneous approach, new technology group 7
XRGB4R7	Fusion of lumbar vertebral joint using custom-made anatomically designed interbody fusion device, percutaneous endoscopic approach, new technology group 7
XRGC0R7	Fusion of 2 or more lumbar vertebral joints using custom-made anatomically designed interbody fusion device, open approach, new technology group 7
XRGC3R7	Fusion of 2 or more lumbar vertebral joints using custom-made anatomically designed interbody fusion device, percutaneous approach, new technology group 7
XRGC4R7	Fusion of 2 or more lumbar vertebral joints using custom-made anatomically designed interbody fusion device, percutaneous endoscopic approach, new technology group 7
XRGD0R7	Fusion of lumbosacral joint using custom-made anatomically designed interbody fusion device, open approach, new technology group 7
XRGD3R7	Fusion of lumbosacral joint using custom-made anatomically designed interbody fusion device, percutaneous approach, new technology group 7
XRGD4R7	Fusion of lumbosacral joint using custom-made anatomically designed interbody fusion device, percutaneous endoscopic approach, new technology group 7

As stated in the proposed rule, as part of our analysis of the manufacturer's request to reassign cases involving the aprevo™ device as discussed in the FY 2024 proposed and final rules, we presented findings from our analysis of claims data from the September 2022 update of the FY 2022 MedPAR file for MS-DRGs 453, 454, 455, 456, 457, 458, 459, and 460 and cases reporting any one of the 12 original procedure codes describing utilization of an aprevo™ customized interbody spinal fusion device. We stated that while we agreed that the findings

from our analysis appeared to indicate that cases reporting the performance of a procedure using an aprevo™ customized interbody spinal fusion device reflected a higher consumption of resources, due to the concerns expressed with respect to suspected inaccuracies of the coding and therefore, reliability of the claims data, we would continue to monitor the claims data for resolution of the potential coding issues identified by the requestor (the manufacturer). We also stated that we continued to believe additional review of claims data was warranted and would be informative as we continued to consider cases involving this technology for future rulemaking. Specifically, we stated we believed it would be premature to propose any MS-DRG modifications for spinal fusion procedures using an aprevo™ customized interbody spinal fusion device for FY 2024 and finalized our proposal to maintain the structure of MS-DRGs 453, 454, 455, 456, 457, 458, 459, and 460, without modification, for FY 2024 (88 FR 58734 through 58735). As discussed further in the FY 2024 final rule correction, in response to the manufacturer's comment expressing concern about the reliability of the Medicare claims data in the MedPAR file used for purposes of CMS's claims data analysis, as compared to the manufacturer's analysis of its own customer claims data, we stated that in order for us to consider using non-MedPAR data, the non-MedPAR data must be independently validated, meaning when an entity submits non-MedPAR data, we must be able to independently review the medical records and verify that a particular procedure was performed for each of the cases that purportedly involved the procedure. We noted that, in this particular circumstance, where external data for cases reporting the use of an aprevo™ spinal fusion device was provided, we did not have access to the medical records to conduct an independent review; therefore, we were not able to validate or confirm the non-MedPAR data submitted by the commenter for consideration in FY 2024. However, we also noted that our work in this area was ongoing, and we would continue to examine the data and consider these issues as we develop potential future rulemaking proposals. We referred readers to the FY 2024 IPPS/LTCH PPS correction notice (88 FR 77211) for further discussion.

In the proposed rule, we noted that the manufacturer provided us with a list of the providers with which it indicated it has an explicit relationship, to assist in our ongoing review of its request for reassignment of cases reporting spinal fusion procedures using an aprevo™ interbody fusion device from the lower severity spinal fusion MS-DRGs to the higher severity level spinal fusion MS-DRGs.

As stated in the proposed rule, to continue our analysis of cases reporting spinal fusion procedures using an aprevo™ customized interbody fusion device, we first analyzed claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRGs 453, 454, 455, 456, 457, 458, 459, and 460, and cases reporting any one of the previously listed procedure codes describing the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device.⁵ Our findings are shown in the following tables.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 453 All cases	4,066	9.5	\$80,420
MS-DRG 453 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	26	9.8	\$99,162
MS-DRG 454 All cases	20,425	4.3	\$54,983
MS-DRG 454 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	129	4.9	\$71,527
MS-DRG 455 All cases	17,000	2.6	\$41,015
MS-DRG 455 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	87	2.6	\$54,922
MS-DRG 456 All cases	1,475	12.6	\$76,060
MS-DRG 456 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	2	8.5	\$69,009
MS-DRG 457 All cases	3,730	6.1	\$52,179
MS-DRG 457 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	11	5	\$47,221
MS-DRG 458 All cases	1,260	3.1	\$39,260
MS-DRG 458 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	6	3	\$53,140
MS-DRG 459 All cases	3,152	9.6	\$53,192

⁵ As noted earlier in the discussion, the code titles were updated but the code numbers themselves did not change.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 459 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	1	22	\$288,499
MS-DRG 460 All cases	28,698	3.4	\$32,586
MS-DRG 460 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	64	2.4	\$53,513

Summary Data for MS-DRGs 453, 454 and 455			
MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRGs 453, 454, and 455 All cases	41,491	4.1	\$51,753
MS-DRGs 453, 454, and 455 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	242	4.6	\$68,526

Summary Data for MS-DRGs 456, 457 and 458			
MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRGs 456, 457, and 458 All cases	6,465	7.0	\$55,110
MS-DRGs 456, 457, and 458 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	19	4.7	\$51,384

Summary Data for MS-DRGs 459 and 460			
MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRGs 459 and 460 All cases	31,850	4.0	\$34,625
MS-DRGs 459 and 460 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	65	2.7	\$57,128

We identified the majority of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRGs 453, 454, and 455 with a total of 242 cases (26+129+87=242) with an average length of stay of 4.6 days and average costs of \$68,526. The 26 cases found in MS-DRG 453 appear to have a comparable average length of stay (9.8 days versus 9.5 days) and higher average costs (\$99,162 versus \$80,420) compared to all the cases in MS-DRG 453, with a difference in average costs of \$18,742 for the cases reporting the performance of a spinal fusion procedure

using an aprevo™ custom-made anatomically designed interbody fusion device. The 129 cases found in MS-DRG 454 appear to have a comparable average length of stay (4.9 days versus 4.3 days) and higher average costs (\$71,527 versus \$54,983) compared to all the cases in MS-DRG 454, with a difference in average costs of \$16,544 for the cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device. The 87 cases found in MS-DRG 455 have an identical average length of stay of 2.6 days in comparison to all the cases in MS-DRG 455, however, the difference in average costs is \$13,907 ($\$54,922 - \$41,015 = \$13,907$) for the cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device.

For MS-DRGs 456, 457, and 458, we found a total of 19 cases ($2 + 11 + 6 = 19$) reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device with an average length of stay of 4.7 days and average costs of \$51,384. The 2 cases found in MS-DRG 456 have a shorter average length of stay (8.5 days versus 12.6 days) and lower average costs (\$69,009 versus \$76,060) compared to all the cases in MS-DRG 456. The 11 cases found in MS-DRG 457 also have a shorter average length of stay (5.0 days versus 6.1 days) and lower average costs (\$47,221 versus \$52,179). For MS-DRG 458, we found 6 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device with a comparable average length of stay (3.0 days versus 3.1 days) and higher average costs (\$53,140 versus \$39,260) compared to the average costs of all the cases in MS-DRG 458, with a difference in average costs of \$13,880 ($\$53,140 - \$39,260 = \$13,880$) for the cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device.

For MS-DRGs 459 and 460, we found a total of 65 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device with an average length of stay of 2.7 days and average costs of \$57,128. The single case found in MS-DRG 459 had a longer length of stay (22 days versus 9.6 days) and higher costs

(\$288,499 versus \$53,192) compared to the average costs of all the cases in MS-DRG 459. For MS-DRG 460, the 64 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device had a shorter average length of stay (2.4 days versus 3.4 days) and higher average cost (\$53,513 versus \$32,586), compared to all the cases in MS-DRG 460, with a difference in average costs of \$20,927 ($\$53,513 - \$32,586 = \$20,927$) for the cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device.

As discussed in the FY 2024 final rule, the manufacturer expressed concern that there may be unintentional miscoded claims from providers with whom they do not have an explicit relationship and, as previously discussed, subsequently provided the list of providers with which it indicated it has an explicit relationship to assist in our ongoing review. We noted in the proposed rule that in connection with the list of providers submitted, the manufacturer also resubmitted claims data from the Standard Analytical File (SAF) that included FY 2022 claims and the first two quarters (discharges beginning October 1, 2022 through March 31, 2023) of FY 2023 from these providers. We stated that the list of providers the manufacturer submitted to us was considered applicable for the dates of service in connection with the resubmitted claims data. The manufacturer stated that the list of providers with which it has an explicit relationship is subject to change on a weekly basis as additional providers begin to use the technology. The manufacturer also clarified that the external customer data it had previously referenced in connection with the FY 2024 rulemaking that was received directly from the providers with which it has an explicit relationship is Medicare data. As stated in the proposed rule, we reviewed the September update of the FY 2022 MedPAR file and compared it against the claims data file with the list of providers submitted by the manufacturer for FY 2022. We noted that with this updated analysis of the September update of the FY 2022 MedPAR claims data, we were able to confirm that the majority of the cases for the providers with which the manufacturer indicated it has an explicit relationship matched the claims data in our FY 2022 MedPAR file.

However, we also stated that we identified 3 claims that appeared in the manufacturer’s file that were not found in our FY 2022 MedPAR file and could not be validated. Next, we reviewed the September update of the FY 2023 MedPAR file and compared it against the claims data file with the list of providers submitted by the manufacturer for the first two quarters of FY 2023. We stated we were able to confirm that the majority of the cases for the providers with which the manufacturer indicated it has an explicit relationship matched the claims data in our FY 2023 MedPAR file. However, we also stated that we identified 2 claims that appeared in the manufacturer’s file that were not found in our FY 2023 MedPAR file and could not be validated.

As discussed in the proposed rule, in our analysis of the cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRGs 453, 454, 455, 456, 457, 458, 459, and 460 from the September update of the FY 2023 MedPAR file, we also reviewed the findings for cases identified based on the list of providers with which the manufacturer indicated it has an explicit relationship and cases based on other providers, (that is, those providers not included on the manufacturer’s list), and compared those to the findings from all the cases we identified in the September update of the FY 2023 MedPAR file reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRGs 453, 454, 455, 456, 457, 458, 459, and 460. The findings from our analysis are shown in the following table. We noted that there were no cases found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device based on the list of providers submitted by the manufacturer in MS-DRG 456.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 453 All cases	4,066	9.5	\$80,420
MS-DRG 453 Cases reporting a custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file	26	9.8	\$99,162

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 453 Cases reporting a custom-made anatomically designed interbody fusion device based on the manufacturer provider list	10	10.5	\$118,863
MS-DRG 453 Cases reporting a custom-made anatomically designed interbody fusion device based on other providers	16	9.4	\$86,849
MS-DRG 454 All cases	20,425	4.3	\$54,983
MS-DRG 454 Cases reporting a custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file	129	4.9	\$71,527
MS-DRG 454 Cases reporting a custom-made anatomically designed interbody fusion device based on the manufacturer provider list	48	6.3	\$81,680
MS-DRG 454 Cases reporting a custom-made anatomically designed interbody fusion device based on other providers	81	4.1	\$65,510
MS-DRG 455 All cases	17,000	2.6	\$41,015
MS-DRG 455 Cases reporting a custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file	87	2.6	\$54,922
MS-DRG 455 Cases reporting a custom-made anatomically designed interbody fusion device based on the manufacturer provider list	14	2.5	\$61,637
MS-DRG 455 Cases reporting a custom-made anatomically designed interbody fusion device based on other providers	73	2.6	\$53,634
MS-DRG 456 All cases	1,475	12.6	\$76,060
MS-DRG 456 Cases reporting a custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file	2	8.5	\$69,009
MS-DRG 457 All cases	3,730	6.1	\$52,179
MS-DRG 457 Cases reporting a custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file	11	5	\$47,221
MS-DRG 457 Cases reporting a custom-made anatomically designed interbody fusion device based on the manufacturer provider list	2	4.5	\$53,113
MS-DRG 457 Cases reporting a custom-made anatomically designed interbody fusion device based on other providers	9	5.1	\$45,912
MS-DRG 458 All cases	1,260	3.1	\$39,260
MS-DRG 458 Cases reporting a custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file	6	3	\$53,140
MS-DRG 458 Cases reporting a custom-made anatomically designed interbody fusion device based on the manufacturer provider list	3	3.33	\$52,760

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 458 Cases reporting a custom-made anatomically designed interbody fusion device based on other providers	3	2.7	\$53,520
MS-DRG 459 All cases	3,152	9.6	\$53,192
MS-DRG 459 Cases reporting a custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file	1	22	\$288,499
MS-DRG 459 Cases reporting a custom-made anatomically designed interbody fusion device based on the manufacturer provider list	1	22	\$288,499
MS-DRG 460 All cases	28,698	3.4	\$32,586
MS-DRG 460 Cases reporting a custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file	64	2.4	\$53,513
MS-DRG 460 Cases reporting a custom-made anatomically designed interbody fusion device based on the manufacturer provider list	13	2.6	\$62,829
MS-DRG 460 Cases reporting a custom-made anatomically designed interbody fusion device based on other providers	51	2.3	\$51,138

For MS-DRG 453, the data show that of the 26 cases found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file, 10 cases were reported based on the manufacturer’s provider list, and 16 cases were reported based on other providers. The average length of stay is longer (10.5 days versus 9.4 days), and the average costs are higher (\$118,863 versus \$86,849) for the 10 cases reported based on the manufacturer’s provider list compared to the 16 cases that were reported based on other providers. For MS-DRG 454, the data show that of the 129 cases found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file, 48 cases were reported based on the manufacturer’s provider list, and 81 cases were reported based on other providers. The average length of stay is longer (6.3 days versus 4.1 days), and the average costs are higher (\$81,680 versus \$65,510) for the 48 cases reported based on the manufacturer’s provider list compared to the 81 cases that were reported based on other providers. For MS-

DRG 455, the data show that of the 87 cases found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file, 14 cases were reported based on the manufacturer's provider list, and 73 cases were reported based on other providers. The average length of stay is shorter (2.5 days versus 2.6 days), and the average costs are higher (\$61,637 versus \$53,634) for the 14 cases reported based on the manufacturer's provider list compared to the 73 cases that were reported based on other providers.

For MS-DRG 456, the data show that of the 2 cases found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file, there were no cases reported based on the manufacturer's provider list and the 2 cases reported were based on other providers. For MS-DRG 457, the data show that of the 11 cases found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file, 2 cases were reported based on the manufacturer's provider list, and 9 cases were reported based on other providers. The average length of stay is shorter (4.5 days versus 5.1 days), and the average costs are higher (\$53,113 versus \$45,912) for the 2 cases reported based on the manufacturer's provider list compared to the 9 cases that were reported based on other providers. For MS-DRG 458, the data show that of the 6 cases found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file, 3 cases were reported based on the manufacturer's provider list, and 3 cases were reported based on other providers. The average length of stay is longer (3.3 days versus 2.7 days), and the average costs are lower (\$52,760 versus \$53,520) for the 3 cases reported based on the manufacturer's provider list compared to the 3 cases that were reported for other providers.

For MS-DRG 459, the data show that the single case found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion

device from the FY 2023 MedPAR file was based on the manufacturer's provider list. There were no cases reported based on other providers. For MS-DRG 460, the data show that of the 64 cases found to report the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from the FY 2023 MedPAR file, 13 cases were reported based on the manufacturer's provider list, and 51 cases were reported based on other providers. The average length of stay is comparable (2.6 days versus 2.3 days), and the average costs are higher (\$62,829 versus \$51,138) for the 13 cases reported based on the manufacturer's provider list compared to the 51 cases that were reported from other providers.

As discussed in the proposed rule, we considered these data findings with regard to the concerns expressed by the manufacturer that there may be unintentional miscoded claims reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from providers with whom the manufacturer does not have an explicit relationship. Based on our review and analysis of the claims data, we stated that we are unable to confirm that the claims from these providers with whom the manufacturer indicated that it does not have an explicit relationship are miscoded.

In the proposed rule we noted that, while a newly established ICD-10 code may be associated with an application for new technology add-on payment, such codes are not generally established to be product specific. We stated that, if, after consulting the official coding guidelines, a provider determines that an ICD-10 code associated with a new technology add-on payment describes the technology that they are billing, the hospital may report the code and be eligible to receive the associated add-on payment. We noted that providers are responsible for ensuring that they are billing correctly for the services they render. In addition, as we noted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38012), coding advice is issued independently from payment policy. We also noted that, historically, we have not provided coding advice in rulemaking with respect to policy (82 FR 38045). We stated that as one of the Cooperating Parties for ICD-10, we collaborate with the American Hospital Association (AHA) through the

Coding Clinic for ICD-10-CM and ICD-10-PCS to promote proper coding. We recommended that an entity seeking coding guidance submit any questions pertaining to correct coding to the AHA.

Accordingly, after review of the list of providers and associated claims data submitted by the manufacturer, and our analysis of the MedPAR data, we stated we believed these MedPAR data are appropriate for our FY 2025 analysis. Therefore, in assessing the request for reassignment of cases reporting the performance of a spinal fusion procedure using an *aprevo*TM custom-made anatomically designed interbody fusion device from the lower severity MS-DRG 455 to the higher severity MS-DRG 453, from the lower severity MS-DRG 458 to the higher severity level MS-DRG 456 when a diagnosis of malalignment is reported, and cases from MS-DRGs 459 and 460 to MS-DRG 456 for FY 2025, we considered all the claims data reporting the performance of a spinal fusion procedure, including those spinal fusion procedures using an *aprevo*TM custom-made anatomically designed interbody fusion device as identified in the September update of the FY 2023 MedPAR file for these MS-DRGs. Consequently, our analysis also included claims based on the list of providers submitted by the manufacturer as well as other providers.

We stated in the proposed rule that, based on the findings from our analysis and clinical review, we do not believe the requested reassignments are supported. Specifically, we stated it would not be appropriate to propose to reassign the 87 cases reporting the performance of a spinal fusion procedure using an *aprevo*TM custom-made anatomically designed interbody fusion device from the lower severity level MS-DRG 455 (without CC/MCC) with an average length of stay of 2.6 days and average costs of \$54,922 to the higher severity level MS-DRG 453 (with MCC) with an average length of stay of 9.5 days and average costs of \$80,420. We noted that if we were to propose to reassign the 87 cases from the lower severity MS-DRG 455 to the higher severity MS-DRG 453, the MS-DRGs would no longer be clinically coherent with regard to severity of illness of the patients, and the cases would reflect a difference in resource utilization,

as demonstrated by the difference in average costs of approximately \$25,498 ($\$80,420 - \$54,922 = \$25,498$), as well as a difference in average length of stay (2.6 days versus 9.5 days) compared to all the cases in MS-DRG 453. Similarly, we stated it would not be appropriate to propose to reassign the 6 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from the lower severity level MS-DRG 458 (without CC/MCC) with an average length of stay of 3.0 days and average costs of \$53,140 to the higher severity level MS-DRG 456 (with MCC) with an average length of stay of 12.6 days and average costs of \$76,060. We stated that if we were to propose to reassign the 6 cases from the lower severity MS-DRG 458 to the higher severity MS-DRG 456, the MS-DRGs would no longer be clinically coherent with regard to severity of illness of the patients and the cases would reflect a difference in resource utilization, as demonstrated by the difference in average costs of approximately \$22,920 ($\$76,060 - \$53,140 = \$22,920$) as well as a difference in average length of stay (3.0 days versus 12.6 days) compared to all the cases in MS-DRG 456. Finally, we stated it would not be appropriate nor consistent with the definition of the MS-DRGs to propose to reassign the 65 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device from MS-DRGs 459 and 460 with an average length of stay of 2.7 days and average costs of \$57,128 to MS-DRG 456. In addition to the cases reflecting a difference in resource utilization as demonstrated by the difference in average costs of approximately \$18,932 ($\$76,060 - \$57,128 = \$18,932$) as well as having a shorter average length of stay (2.7 days versus 12.6 days), we noted that the logic for case assignment to MS-DRGs 456, 457, and 458 is specifically defined by principal diagnosis logic. As such, cases grouping to this set of MS-DRGs require a principal diagnosis of spinal curvature, malignancy, or infection, or an extensive fusion procedure. We stated that it would not be clinically appropriate to propose to reassign cases from MS-DRGs 459 and 460 that do not have a principal diagnosis of spinal curvature, malignancy, or infection, or an extensive fusion procedure, and are not consistent with the logic for case assignment to MS-DRG 456.

As discussed in the proposed rule, in light of the higher average costs of the cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRGs 453, 454, 455, 458, and 460, we further reviewed the claims data for cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in these MS-DRGs and identified a wide range in the average length of stay and average costs. For example, in MS-DRG 453, the average length of stay for the 26 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device ranged from 3.0 days to 27 days and the average costs ranged from \$28,054 to \$177,919. In MS-DRG 454, the average length of stay for the 129 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device ranged from 1.0 day to 16 days and the average costs ranged from \$10,242 to \$316,780. In MS-DRG 455, the average length of stay for the 87 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device ranged from 1.0 day to 9.0 days and the average costs ranged from \$7,961 to \$216,200. In MS-DRG 456, the length of stay for the 2 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device were 8.0 days and 9.0 days, respectively, with costs of \$107,457 and \$30,560, respectively. In MS-DRG 457, the average length of stay for the 11 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device ranged from 1.0 day to 17 days and the average costs ranged from \$25,955 to \$89,176. In MS-DRG 458, the average length of stay for the 6 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device ranged from 1.0 day to 5.0 days and the average costs ranged from \$33,165 to \$78,720. In MS-DRG 459, the length of stay for the single case reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device was

22 days with a cost of \$288,499, indicating it is an outlier. In MS-DRG 460, the average length of stay for the 64 cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device ranged from 1.0 day to 8.0 days and the average costs ranged from \$8,981 to \$325,104.

As discussed in the proposed rule, in our analysis of the claims data for MS-DRGs 453, 454, and 455, we also identified a number of cases for which additional spinal fusion procedures were performed, beyond the logic for case assignment to the respective MS-DRG. For example, the logic for case assignment to MS-DRGs 453, 454, and 455 requires at least one anterior column fusion and one posterior column fusion (that is, combined anterior and posterior fusion). We noted that the aprevo™ custom-made anatomically designed interbody fusion device is used in the performance of an anterior column fusion. We stated that findings from our analysis of MS-DRG 453 show that of the 26 cases reporting a combined anterior and posterior fusion (including an aprevo™ custom-made anatomically designed interbody fusion device), 24 cases also reported another spinal fusion procedure. We categorized these cases as “multiple level fusions” where another procedure code describing a spinal fusion procedure was reported in addition to the combined anterior and posterior fusion procedure codes. We stated that findings from our analysis of MS-DRG 454 show that of the 129 cases reporting a combined anterior and posterior fusion (including an aprevo™ custom-made anatomically designed interbody fusion device), 100 cases also reported another spinal fusion procedure. Lastly, we stated that findings from our analysis of MS-DRG 455 show that of the 87 cases reporting a combined anterior and posterior fusion (including an aprevo™ custom-made anatomically designed interbody fusion device), 51 cases also reported another spinal fusion procedure.

We noted in the proposed rule that while the findings from our analysis indicate a wide range in the average length of stay and average costs for cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device, we believed the increase in resource utilization for certain cases may be partially

attributable to the performance of multiple level fusion procedures and, specifically for MS-DRGs 453 and 454, the reporting of secondary diagnosis MCC and CC conditions. We noted that our analysis of the data for MS-DRGs 453 and 454 show that the cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device also reported multiple MCC and CC conditions, which we believe may be an additional contributing factor to the increase in resource utilization for these cases, combined with the reported performance of multiple level fusions.

As discussed in the proposed rule, in our analysis of the data for MS-DRGs 453, 454, and 455 and cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device, we also identified other procedures that were reported, some of which are designated as operating room (O.R.) procedures, that we believed may be another contributing factor to the increase in resource utilization and complexity for these cases. (We noted that because a discectomy is frequently performed in connection with a spinal fusion procedure, we did not consider these procedures as contributing factors to consumption of resources in these spinal fusion cases). We provided a list of the top 5 MCC and CC conditions, as well as the top 5 O.R. procedures (excluding discectomy) reported in MS-DRGs 453, 454, and 455 that we believed may be contributing factors to the increase in resource utilization and complexity for these cases as shown in the tables that follow. We noted that the logic for case assignment to MS-DRG 453 includes the reporting of at least one secondary diagnosis MCC condition (“with MCC”) and cases that group to this MS-DRG may also report secondary diagnosis CC conditions. We provided the frequency data for both the top 5 secondary diagnosis MCC conditions and the top 5 secondary diagnosis CC conditions, in addition to the top 5 O.R. procedures (excluding discectomy) that were reported for spinal fusion cases with an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRG 453. We noted that because the logic for case assignment to MS-DRG 454 includes the reporting of at least one secondary diagnosis CC condition (“with CC”) we provided the top 5

secondary diagnosis CC conditions and the top 5 O.R. procedures (excluding discectomy) that were reported for spinal fusion cases with an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRG 454. We noted that the logic for case assignment to MS-DRG 455 is “without CC/MCC” and does not include any secondary diagnosis MCC or CC conditions, therefore, we only provided a table with the top 5 O.R. procedures (excluding discectomy) reported for that MS-DRG in addition to a spinal fusion procedure.

MS-DRG 453 Top 5 Secondary Diagnosis MCC Conditions Reported		
ICD-10-CM Code	Description	Frequency
J95.2	Acute pulmonary insufficiency following nonthoracic surgery	5
G92.8	Other toxic encephalopathy	5
R57.1	Hypovolemic shock	4
J18.9	Pneumonia, unspecified organism	4
J81.0	Acute pulmonary edema	2

MS-DRG 453 Top 5 Secondary Diagnosis CC Conditions Reported		
ICD-10-CM Code	Description	Frequency
D6.2	Acute posthemorrhagic anemia	17
E87.4	Mixed disorder of acid-base balance	4
N17.9	Acute kidney failure, unspecified	3
E87.1	Hypo-osmolality and hyponatremia	3
K56.7	Ileus, unspecified	3

MS-DRG 453 Top 5 Operating Room Procedures Reported		
ICD-10-PCS Code	Description	Frequency
01NB0ZZ	Release lumbar nerve, open approach	2,011
00NY0ZZ	Release lumbar spinal cord, open approach	754
01NR0ZZ	Release sacral nerve, open approach	538
0QP004Z	Removal of internal fixation from lumbar vertebra, open approach	379
00NW0ZZ	Release cervical spinal cord, open approach	380

MS-DRG 454 Top 5 Secondary Diagnosis CC Conditions Reported		
ICD-10-CM Code	Description	Frequency
D6.2	Acute posthemorrhagic anemia	66
E87.1	Hypo-osmolality and hyponatremia	19
K56.7	Ileus, unspecified	13
M96.0	Pseudarthrosis after fusion or arthrodesis	10
J98.11	Atelectasis	10

MS-DRG 454 Top 5 Operating Room Procedures Reported		
ICD-10-PCS Code	Description	Frequency
00NY0ZZ	Release lumbar spinal cord, open approach	4,109
01NB0ZZ	Release lumbar nerve, open approach	12,389
0SP004Z	Removal of internal fixation device from lumbar vertebral joint, open approach	1,381
0QP004Z	Removal of internal fixation device from lumbar vertebra, open approach	2,398
01NR0ZZ	Release sacral nerve, open approach	3,098

MS-DRG 455 Top 5 Operating Room Procedures Reported		
ICD-10-PCS Code	Description	Frequency
0QP004Z	Removal of internal fixation device from lumbar vertebra, open approach	1,184

0SP004Z	Removal of internal fixation device from lumbar vertebral joint, open approach	756
01NR0ZZ	Release sacral nerve, open approach	2,143
00NY0ZZ	Release lumbar spinal cord, open approach	3,192
01NB0ZZ	Release lumbar nerve, open approach	10,405

As previously summarized, our analysis of the claims data for cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device demonstrated a low volume of cases and higher average costs in comparison to all the cases in their respective MS-DRGs (that is, in MS-DRGs 453, 454, 455, 458, 459, and 460). Therefore, as stated in the proposed rule, we expanded our analysis to include all spinal fusion cases in MS-DRGs 453, 454, 455, 456, 457, 458, 459, and 460 to identify and further examine the cases reporting multiple level fusions versus single level fusions, multiple MCCs or CCs, and other O.R. procedures as we believed that clinically, all of these factors may contribute to increases in resource utilization, severity of illness and technical complexity.

As stated in the proposed rule, we began our expanded analysis with MS-DRGs 453, 454, and 455. Based on the findings for a subset of the cases (that is, the subset of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device) in these MS-DRGs as previously discussed, and our review of the logic for case assignment to these MS-DRGs, we developed three categories of spinal fusion procedures to further examine. The first category was for the single level combined anterior and posterior fusions except cervical, the second category was for the multiple level combined anterior and posterior fusions except cervical and the third category was for the combined anterior and posterior cervical spinal fusions. We refer the reader to Table 6P.2d for the list of procedure codes we identified to categorize the single level combined anterior and posterior fusions except cervical, Table 6P.2e for the list of procedure codes we identified to categorize the multiple level combined anterior and posterior fusions except cervical, and Table 6P.2f for the list of procedure codes we identified to categorize the combined anterior and posterior

cervical spinal fusions in association with the proposed rule and available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>.

Findings from our analysis are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 453 All cases	4,066	9.5	\$80,420
MS-DRG 453 Cases with single level combined anterior and posterior fusion except cervical	791	6.4	\$47,031
MS-DRG 453 Cases with multiple level combined anterior and posterior fusion except cervical	2,664	9.6	\$91,358
MS-DRG 453 Cases with combined anterior and posterior cervical fusion	587	12.5	\$75,077
MS-DRG 454 All cases	20,425	4.3	\$54,983
MS-DRG 454 Cases with single level combined anterior and posterior fusion except cervical	6,481	3.4	\$38,107
MS-DRG 454 Cases with multiple level combined anterior and posterior fusion except cervical	12,498	4.8	\$64,065
MS-DRG 454 Cases with combined anterior and posterior cervical fusion	1,391	5.1	\$52,274
MS-DRG 455 All cases	17,000	2.6	\$41,015
MS-DRG 455 Cases with single level combined anterior and posterior fusion except cervical	8,787	2.3	\$33,010
MS-DRG 455 Cases with multiple level combined anterior and posterior fusion except cervical	7,855	3.0	\$50,097
MS-DRG 455 Cases with combined anterior and posterior cervical fusion	345	2.9	\$37,515

The data show that across MS-DRGs 453, 454, and 455, cases reporting multiple level combined anterior and posterior fusion procedures have a comparable average length of stay (9.6 days versus 9.5 days, 4.8 days versus 4.3 days, and 3.0 days versus 2.6 days, respectively) and higher average costs (\$91,358 versus \$80,420, \$64,065 versus \$54,983, and \$50,097 versus \$41,015) compared to all the cases in MS-DRGs 453, 454, and 455, respectively. The data also show that across MS-DRGs 453, 454, and 455, cases reporting multiple level combined anterior and posterior fusion procedures have a longer average length of stay (9.6 days versus 6.4 days, 4.8 days versus 3.4 days, and 3.0 days versus 2.3 days, respectively) and higher average costs (\$91,358 versus \$47,031, \$64,065 versus \$38,107, and \$50,097 versus \$33,010, respectively) compared to cases reporting a single level combined anterior and posterior fusion. For cases reporting a combined anterior and posterior cervical fusion across MS-DRGs 453 and 454, the

data show a longer average length of stay (12.5 days versus 9.5 days, and 5.1 days versus 4.3 days, respectively) compared to all the cases in MS-DRGs 453 and 454 and a comparable average length of stay (2.9 days versus 2.6 days) for cases reporting a combined anterior and posterior cervical fusion in MS-DRG 455. The data also show that across MS-DRGs 453, 454, and 455, cases reporting a combined anterior and posterior cervical fusion have higher average costs (\$75,077 versus \$47,031, \$52,274 versus \$38,107, and \$37,515 versus \$33,010, respectively) compared to the single level combined anterior and posterior fusion cases.

The data also reflect that in applying the logic that was developed for the three categories of spinal fusion in MS-DRGs 453, 454, and 455 (single level combined anterior and posterior fusion except cervical, multiple level combined anterior and posterior fusion except cervical, and combined anterior and posterior cervical fusion), there is a small redistribution of cases from the current MS-DRGs 453, 454, and 455 to other spinal fusion MS-DRGs because the logic for case assignment to MS-DRGs 453, 454, and 455 is currently satisfied with any one procedure code from the anterior spinal fusion logic list and any one procedure code from the posterior spinal fusion logic list, however, the logic lists that were developed for our analysis using the three categories of spinal fusion are comprised of specific procedure code combinations to satisfy the criteria for case assignment to any one of the three categories developed. For example, based on our analysis of MS-DRG 453 using the September update of the FY 2023 MedPAR file, the total number of cases found in MS-DRG 453 is 4,066 and with application of the logic for each of the three categories, the total number of cases in MS-DRG 453 is 4,042 ($791 + 2,664 + 587 = 4,042$), a difference of 24 cases. Using the September update of the FY 2023 MedPAR file, the total number of cases found in MS-DRG 454 is 20,425 and with application of the logic for each of the three categories, the total number of cases in MS-DRG 454 is 20,370 ($6,481 + 12,498 + 1,391 = 20,370$), a difference of 55 cases. Lastly, using the September update of the FY 2023 MedPAR file, the total number of cases found in MS-DRG 455 is 17,000 and with application of the logic for each of the three categories, the total number of cases in MS-DRG

455 is 16,987 (9,763 +6,879+345=16,987), a difference of 13 cases. Overall, a total of 92 cases are redistributed from MS-DRGs 453, 454, and 455 to other spinal fusion MS-DRGs.

We stated in the proposed rule that the findings from our analysis of MS-DRGs 453, 454, and 455 are consistent with the expectation that clinically, the greater the number of spinal fusion procedures performed during a single procedure (for example, intervertebral levels fused), the greater the consumption of resources expended. We also stated we believed the use of interbody fusion cages, other types of spinal instrumentation, operating room time, comorbidities, pharmaceuticals, and length of stay may all be contributing factors to resource utilization for spinal fusion procedures. In addition, it is expected that as a result of potential changes to the logic for case assignment to a MS-DRG, there will be a redistribution of cases among the MS-DRGs.

We stated in the proposed rule that, based on our review and analysis of the spinal fusion cases in MS-DRGs 453, 454, and 455, we believe new MS-DRGs are warranted to differentiate between multiple level combined anterior and posterior spinal fusions except cervical, single level combined anterior and posterior spinal fusions except cervical, and combined anterior and posterior cervical spinal fusions, to more appropriately reflect utilization of resources for these procedures, including those performed with an aprevo™ custom-made anatomically designed interbody fusion device. We noted that the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device as identified by any one of the 12 previously listed procedure codes would not be reported for a cervical spinal fusion procedure as reflected in Table 6P.2f associated with the proposed rule and this final rule and available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>.

To compare and analyze the impact of our suggested modifications, we noted that we ran simulations using claims data from the September 2023 update of the FY 2023 MedPAR file.

The following table illustrates our findings for all 23,017 cases reporting procedure codes describing multiple level combined anterior and posterior spinal fusions.

Proposed new MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX	23,017	4.7	\$62,457

We stated we applied the criteria to create subgroups in a base MS-DRG as discussed in section II.C.1.b. of the preamble of the proposed rule and this final rule. We noted that, as shown in the table that follows, a three-way split of the proposed new base MS-DRG was met. The following table illustrates our findings.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	2,664	9.6	\$91,358
With CC	12,498	4.8	\$64,065
Without CC/MCC	7,855	3.0	\$50,097

For the proposed new MS-DRGs , there is (1) at least 500 or more cases in the MCC group, the CC subgroup, and in the without CC/MCC subgroup; (2) at least 5 percent of the cases are in the MCC subgroup, the CC subgroup, and in the without CC/MCC subgroup; (3) at least a 20 percent difference in average costs between the MCC subgroup and the CC subgroup and between the CC group and NonCC subgroup; (4) at least a \$2,000 difference in average costs between the MCC subgroup and the with CC subgroup and between the CC subgroup and NonCC subgroup; and (5) at least a 3-percent reduction in cost variance, indicating that the proposed severity level splits increase the explanatory power of the base MS-DRG in capturing differences in expected cost between the proposed MS-DRG severity level splits by at least 3 percent and thus improve the overall accuracy of the IPPS payment system.

As a result, for FY 2025, we proposed to create new MS-DRG 426 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with MCC), new MS-DRG 427 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with CC), and new MS-DRG 428 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except

Cervical without CC/MCC). The following table reflects a simulation of the proposed new MS-DRGs.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG 426	2,664	9.6	\$91,358
Proposed new MS-DRG 427	12,498	4.8	\$64,065
Proposed new MS-DRG 428	7,855	3.0	\$50,097

The next step in our analysis of the impact of our suggested modifications to MS-DRGs 453, 454, and 455 was to review the cases reporting single combined anterior and posterior cervical fusions. The following table illustrates our findings for all 16,059 cases reporting procedure codes describing single level combined anterior and posterior spinal fusions.

Proposed new MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX	16,059	2.9	\$35,758

We stated we applied the criteria to create subgroups in a base MS-DRG as discussed in section II.C.1.b. of the preamble of the proposed rule and this final rule. We noted that, as shown in the table that follows, a three-way split of this proposed new base MS-DRG failed to meet the criterion that at least 5% or more of the cases are in the MCC subgroup. It also failed to meet the criterion that there be at least a 20% difference in average costs between the CC and NonCC (without CC/MCC) subgroup. The following table illustrates our findings.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	791	6.4	\$47,031
With CC	6,481	3.4	\$38,107
Without CC/MCC	8,787	2.3	\$33,010

As discussed in section II.C.1.b. of the preamble of the proposed rule and this final rule, if the criteria for a three-way split fail, the next step is to determine if the criteria are satisfied for a two-way split. We therefore applied the criteria for a two-way split for the “with MCC and without MCC” subgroups. We noted that, as shown in the table that follows, a two-way split of

this base MS-DRG failed to meet the criterion that there be at least 5% or more of the cases in the with MCC subgroup.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	791	6.4	\$47,031
Without MCC	15,268	2.8	\$35,174

We then applied the criteria for a two-way split for the “with CC/MCC and without CC/MCC” subgroups. As shown in the table that follows, a two-way split of this base MS-DRG failed to meet the criterion that there be at least a 20% difference in average costs between the “with CC/MCC and without CC/MCC” subgroup.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With CC/MCC	7,272	3.7	\$39,078
Without CC/MCC	8,787	2.3	\$33,010

We noted that because the criteria for both of the two-way splits failed a split (or CC subgroup) is not warranted for the proposed new base MS-DRG. As a result, for FY 2025, we proposed to create new base MS-DRG 402 (Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical). The following table reflects a simulation of the proposed new base MS-DRG.

Proposed New MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed MS-DRG 402	16,059	2.9	\$35,758

For the final step in our analysis of the impact of our suggested modifications to MS-DRGs 453, 454, and 455 we reviewed the cases reporting combined anterior and posterior cervical fusions. The following table illustrates our findings for all 2,323 cases reporting procedure codes describing combined anterior and posterior cervical spinal fusions.

Proposed new MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX	2,323	6.6	\$55,844

We stated we applied the criteria to create subgroups in a base MS–DRG as discussed in section II.C.1.b. of the preamble of the proposed rule and this final rule. We noted that, as shown in the table that follows, a three-way split of this proposed new base MS-DRG failed to meet the criterion that there be at least 500 cases in the NonCC subgroup.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	587	12.5	\$75,077
With CC	1,391	5.1	\$52,274
Without CC/MCC	345	2.9	\$37,515

As discussed in section II.C.1.b. of the preamble of the proposed rule and this final rule, if the criteria for a three-way split fail, the next step is to determine if the criteria are satisfied for a two-way split. We therefore applied the criteria for a two-way split for the “with MCC and without MCC” subgroups. We note that, as shown in the table that follows, a two-way split of this proposed new base MS-DRG was met. For the proposed MS-DRGs, there is at least (1) 500 or more cases in the MCC group and in the without MCC subgroup; (2) 5 percent or more of the cases in the MCC group and in the without MCC subgroup; (3) a 20 percent difference in average costs between the MCC group and the without MCC group; (4) a \$2,000 difference in average costs between the MCC group and the without MCC group; and (5) a 3-percent reduction in cost variance, indicating that the proposed severity level splits increase the explanatory power of the base MS-DRG in capturing differences in expected cost between the proposed MS-DRG severity level splits by at least 3 percent and thus improve the overall accuracy of the IPPS payment system. The following table illustrates our findings for the suggested MS-DRGs with a two-way severity level split.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	587	12.5	\$75,077
Without MCC	1,736	4.6	\$49,341

Accordingly, because the criteria for the two-way split were met, we stated we believed a split (or CC subgroup) is warranted for the proposed new base MS-DRG. As a result, for FY 2025, we proposed to create new MS-DRG 429 (Combined Anterior and Posterior Cervical Spinal Fusion with MCC) and new MS-DRG 430 (Combined Anterior and Posterior Cervical Spinal Fusion without MCC). The following table reflects a simulation of the proposed new MS-DRGs.

Proposed New MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG 429	587	12.5	\$75,077
Proposed new MS-DRG 430	1,736	4.7	\$49,341

We then analyzed the cases reporting spinal fusion procedures in MS-DRGs 456, 457, and 458. As previously described, the logic for case assignment to MS-DRGs 456, 457, and 458 is defined by principal diagnosis logic and extensive fusion procedures. Cases reporting a principal diagnosis of spinal curvature, malignancy, or infection or an extensive fusion procedure will group to these MS-DRGs. We referred the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1 available on the CMS web site at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software> for complete documentation of the GROUPER logic for MS-DRGs 456, 457, and 458.

As also previously described, in our initial analysis of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device, the 13 cases we found in MS-DRGs 456 and 457 (2+11=13, respectively) appeared to be grouping appropriately, however, the average costs for the 6 cases found in MS-DRG 458 showed a difference of approximately \$13,880. Because of the low volume of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in the “without CC/MCC” MS-DRG 458, and the low volume of cases reporting the performance of a spinal fusion procedure using an aprevo™

custom-made anatomically designed interbody fusion device in MS-DRGs 456, 457, and 458 overall (2+11+6=19), for this expanded review of the claims data, we shared the results of our analysis in association with cases reporting extensive fusion procedures in MS-DRGs 456, 457, and 458. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 456 All cases	1,475	12.6	\$76,060
MS-DRG 456 Cases reporting an extensive fusion	332	11.5	\$89,773
MS-DRG 457 All cases	3,730	6.1	\$52,179
MS-DRG 457 Cases reporting an extensive fusion	171	6.6	\$75,588
MS-DRG 458 All cases	1,260	3.1	\$39,260
MS-DRG 458 Cases reporting an extensive fusion	146	3.8	\$48,035

The data show that the 332 cases reporting an extensive fusion procedure in MS-DRG 456 have a shorter average length of stay (11.5 days versus 12.6 days) and higher average costs (\$89,773 versus \$76,060) compared to all the cases in MS-DRG 456. For MS-DRG 457, the data show that the 171 cases reporting an extensive fusion have a comparable average length of stay (6.6 days versus 6.1 days) and higher average costs (\$75,588 versus \$52,179) compared to all the cases in MS-DRG 457. Lastly, for MS-DRG 458, the data show that the 146 cases reporting an extensive fusion procedure have a comparable average length of stay (3.8 days versus 3.1 days) and higher average costs (\$48,035 versus \$39,260) compared to all the cases in MS-DRG 458.

In the proposed rule we stated we believe that over time, the volume of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRGs 456, 457, and 458 may increase and we could consider further in the context of the cases reporting an extensive fusion procedure. However, due to the logic for case assignment to these MS-DRGs also being defined by diagnosis code logic, additional analysis would be needed prior to considering any modification to the current structure of these MS-DRGs. We stated that as we continue to evaluate how we may refine these spinal fusion MS-DRGs, we are also seeking public comments and feedback on other factors that

should be considered in the potential restructuring of MS-DRGs 456, 457, and 458. Thus, for FY 2025, we proposed to maintain the current structure of MS-DRGs 456, 457, and 458, without modification. Feedback and other suggestions for future rulemaking may be submitted by October 20, 2024 and directed to MEARIS™ at <https://mearis.cms.gov/public/home>.

Next, we performed an expanded analysis for spinal fusion cases reported in MS-DRGs 459 and 460. We noted that cases grouping to MS-DRG 459 have at least one secondary diagnosis MCC condition reported (“with MCC”) and because MS-DRG 460 is “without MCC”, cases grouping to this MS-DRG may include the reporting of at least one secondary diagnosis CC condition (in addition to cases that may not report a CC (for example, NonCC)). Based on the findings for a subset of the cases (that is, the subset of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device) in these MS-DRGs as previously discussed, and our review of the logic for case assignment to these MS-DRGs, we developed two categories of spinal fusion procedures to further examine. The first category was for the single level spinal fusions except cervical, and the second category was for the multiple level spinal fusions except cervical. We refer the reader to Table 6P.2g for the list of procedure codes we identified to categorize the single level spinal fusions except cervical and Table 6P.2h for the list of procedure codes we identified to categorize the multiple level spinal fusions except cervical in association with the proposed rule and available on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>. Findings from our analysis are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 459 All cases	3,152	9.6	\$53,192
MS-DRG 459 Cases reporting single level spinal fusion except cervical	1,098	8.9	\$46,031
MS-DRG 459 Cases reporting multiple level spinal fusion except cervical	2,069	10.1	\$57,209
MS-DRG 460 All cases	28,698	3.4	\$32,586
MS-DRG 460 Cases reporting single level spinal fusion except cervical	14,058	3.0	\$28,110

MS-DRG 460 Cases reporting multiple level spinal fusion except cervical	14,677	3.9	\$36,932
---	--------	-----	----------

The data show that the 2,069 cases reporting a multiple level spinal fusion except cervical in MS-DRG 459 have a longer average length of stay (10.1 days versus 9.6 days) and higher average costs (\$57,209 versus \$53,192) when compared to all the cases in MS-DRG 459. The data also show that the 2,069 cases reporting a multiple level spinal fusion except cervical in MS-DRG 459 have a longer average length of stay (10.1 days versus 8.9 days) and higher average costs (\$57,209 versus \$46,031) when compared to the 1,098 cases reporting a single level spinal fusion except cervical in MS-DRG 459. For MS-DRG 460, the data show that the 14,677 cases reporting a multiple level spinal fusion except cervical have a comparable average length of stay (3.9 days versus 3.4 days) and higher average costs (\$36,932 versus \$32,586) when compared to all the cases in MS-DRG 460. The data also show that the 14,677 cases reporting a multiple level spinal fusion except cervical have a comparable average length of stay (3.9 days versus 3.0 days) and higher average costs (\$36,932 versus \$28,110) when compared to the 14,058 cases reporting a single level spinal fusion except cervical in MS-DRG 460.

In the proposed rule we stated that based on our review and analysis of the spinal fusion cases in MS-DRGs 459 and 460, we believe new MS-DRGs are warranted to differentiate between multiple level spinal fusions except cervical and single level spinal fusions except cervical to more appropriately reflect utilization of resources for these procedures, including those performed with an aprevo™ custom-made anatomically designed interbody fusion device.

To compare and analyze the impact of our suggested modifications, we ran simulations using claims data from the September 2023 update of the FY 2023 MedPAR file. The following table illustrates our findings for all 16,746 cases reporting procedure codes describing multiple level spinal fusions except cervical.

Proposed new MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX	16,746	4.6	\$39,438

We stated we applied the criteria to create subgroups in a base MS–DRG as discussed in section II.C.1.b. of the preamble of the proposed rule and this final rule. We noted that, as shown in the table that follows, a three-way split of this proposed new base MS-DRG failed to meet the criterion that there be at least a 20% difference in average costs between the CC and NonCC (without CC/MCC) subgroup. The following table illustrates our findings.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	2,069	10.1	\$57,209
With CC	8,695	4.6	\$38,574
Without CC/MCC	5,982	2.8	\$34,546

As discussed in section II.C.1.b. of the preamble of the proposed rule and this final rule, if the criteria for a three-way split fail, the next step is to determine if the criteria are satisfied for a two-way split. We therefore applied the criteria for a two-way split for the “with MCC and without MCC” subgroups. We noted that, as shown in the table that follows, a two-way split of this proposed new base MS-DRG was met. For the proposed MS-DRGs, there is at least (1) 500 or more cases in the MCC group and in the without MCC subgroup; (2) 5 percent or more of the cases in the MCC group and in the without MCC subgroup; (3) a 20 percent difference in average costs between the MCC group and the without MCC subgroup; (4) a \$2,000 difference in average costs between the MCC group and the without MCC subgroup; and (5) a 3-percent reduction in cost variance, indicating that the proposed severity level splits increase the explanatory power of the base MS-DRG in capturing differences in expected cost between the proposed MS-DRG severity level splits by at least 3 percent and thus improve the overall accuracy of the IPPS payment system. The following table illustrates our findings for the suggested MS-DRGs with a two-way severity level split.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	2,069	10.1	\$57,209
Without MCC	14,677	3.9	\$36,932

As a result, for FY 2025, we proposed to create new MS-DRGs 447 (Multiple Level Spinal Fusion Except Cervical with MCC) and new MS-DRG 448 (Multiple Level Spinal Fusion Except Cervical without MCC). We also proposed to revise the title for existing MS-DRGs 459 and 460 to “Single Level Spinal Fusion Except Cervical with MCC and without MCC”, respectively. In the proposed rule we stated that this proposal would better differentiate the resource utilization, severity of illness and technical complexity between single level and multiple level spinal fusions that do not include cervical spinal fusions in the logic for case assignment. The following table reflects a simulation of the proposed new MS-DRGs.

Proposed New MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG 447	2,069	10.1	\$57,209
Proposed new MS-DRG 448	14,677	3.9	\$36,932

In conclusion, we proposed to delete MS-DRGs 453, 454, and 455 and proposed to create 8 new MS-DRGs. We proposed to create new MS-DRG 426 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with MCC), MS-DRG 427 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with CC), MS-DRG 428 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical without CC/MCC), MS-DRG 402 (Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical), MS-DRG 429 (Combined Anterior and Posterior Cervical Spinal Fusion with MCC), MS-DRG 430 (Combined Anterior and Posterior Cervical Spinal Fusion without MCC), MS-DRG 447 (Multiple Level Spinal Fusion Except Cervical with MCC) and MS-DRG 448 (Multiple Level Spinal Fusion Except Cervical without MCC) for FY 2025. We proposed the logic for case assignment to these proposed new MS-DRGs as displayed in Table 6P.2d, Table 6P.2e, Table 6P.2f, Table 6P.2g, and Table 6P.2h in association with the proposed rule and available via the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>. We also proposed to revise the title for MS-DRGs 459 and 460 to “Single Level Spinal Fusion Except Cervical with MCC and without MCC”, respectively.

Lastly, as discussed in section II.C.14 of the preamble of the proposed rule, we proposed conforming changes to the surgical hierarchy for MDC 08.

Comment: Commenters supported the proposed restructuring for the spinal fusion MS-DRGs for FY 2025. A commenter stated that the existing MS-DRGs have not kept pace with the rapid advancements in spine fusion technology and techniques, leading to significant financial strain on hospitals. According to the commenter, the cost differences associated with performing a one-level lumbar fusion compared to a multi-level fusion are substantial, not only in terms of the surgical time and complexity but also in postoperative care and rehabilitation. The commenter stated that the proposal represents a much-needed advancement in the payment structure for hospitals supporting these complex surgeries and acknowledges the varied complexity and resources required for these distinct types of surgeries. The commenter also stated that the proposal ensures a comprehensive approach that addresses the full spectrum of spinal fusion procedures. In addition, the commenter stated that this refined categorization will enable hospitals to receive more appropriate payment, reflecting the specific nature of each procedure and the level of care provided to patients with diverse spinal conditions. The commenter also stated that by aligning MS-DRGs more closely with the actual costs incurred, the new structure will allow hospitals to allocate resources more effectively and continue investing in high-quality patient care. Lastly, the commenter stated that the proposed changes recognize the variations in patient populations, including the different needs and recovery trajectories of those undergoing non-cervical versus cervical spine fusion surgeries.

Another commenter stated that currently, MS-DRGs 453 through 455 do not adequately differentiate between the complexity and relative resource use associated with multiple level procedures. The commenter stated that this adjustment will lead to more accurate payment, resource allocation, and further aligns with the clinical accuracy and medical advancements of these procedures.

A commenter stated it supported the proposed changes as it would create further specificity in coding. Another commenter also expressed appreciation for CMS's efforts to update the spinal fusion MS-DRGs to better reflect current clinical practice delineating single versus multiple level procedures with the detailed analysis that outlined the proposed changes. This commenter stated they plan to monitor the impact of the proposed revisions, if finalized, for both its customers and patients.

Response: We thank the commenters for their support.

Comment: A commenter stated it reviewed the proposed spinal fusion MS-DRG changes and while it found that most of the redistribution appears appropriate, they have concerns about the proposed MS-DRG 402 (Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical) because the ability to capture the impact of a CC or MCC is not reflected. The commenter performed its own analysis and stated that the single level combined anterior and posterior fusion cases have longer lengths of stay and higher average costs when a CC or MCC is present. According to the commenter, its analysis showed that the proposed MS-DRG 402 does not adequately reflect the resource consumption for patients with significant comorbid conditions. The commenter recommended that MS-DRG 402 not be finalized as a single MS-DRG and instead suggested it be established as a three-way split MS-DRG (with MCC, with CC and without CC/MCC, respectively).

Response: We appreciate the commenter's analysis. As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35981), we applied the criteria to create subgroups for the proposed new base MS-DRG. The criteria for a three-way split and both two-way splits failed, therefore, only a proposed new base MS-DRG was supported.

Comment: Several commenters stated they supported CMS's review of the spinal fusion MS-DRGs to consider potential logic revisions. The commenters expressed appreciation and support for the distinction that new, revised and expanded spinal fusion MS-DRGs can provide

for data analysis, notably in instances where multiple and single-level anatomically different spinal level location procedures are performed during the same operative episode. However, the commenters stated that it is essential to address and consider the logic for all the spinal fusion MS-DRGs to maintain the stability of reporting and to ensure capture of the technical complexity and medical severity indications for these procedures. The commenters requested that CMS consider delaying the proposal and provide additional insight and rationale as to why MS-DRGs 456, 457, and 458 (Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions with MCC, with CC, and without CC/MCC, respectively) and MS-DRGs 471, 472, and 473 (Cervical Spinal Fusion with MCC, with CC, and without CC/MCC, respectively), were not incorporated into the analysis for FY 2025.

Response: We appreciate the commenters' support. We note that in the preamble of the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35971 through 35985) and in this final rule, as part of our ongoing analysis of the manufacturer's request to reassign cases involving the aprevo™ device, we presented findings from our analysis of claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRGs 456, 457, and 458, and cases reporting any one of the procedure codes describing the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device. We stated that based on our findings, the 13 cases we found in MS-DRGs 456 and 457 (2+11=13, respectively) appeared to be grouping appropriately, however, the average costs for the 6 cases found in MS-DRG 458 showed a difference of approximately \$13,880. We also stated that, because of the low volume of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in the "without CC/MCC" MS-DRG 458, and the low volume of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRGs 456, 457, and 458 overall (2+11+6=19), for the expanded review of the claims data, we were sharing the results of our analysis in association with cases reporting extensive fusion procedures in MS-DRGs 456,

457, and 458. We further stated that we believed over time, that the volume of cases reporting the performance of a spinal fusion procedure using an aprevo™ custom-made anatomically designed interbody fusion device in MS-DRGs 456, 457, and 458 may increase and we could consider further in the context of the cases reporting an extensive fusion procedure. However, we also noted that due to the logic for case assignment to these MS-DRGs being defined by diagnosis code logic, additional analysis would be needed prior to considering any modification to the current structure of these MS-DRGs. We stated that as we continue to evaluate how we may refine these spinal fusion MS-DRGs, we are also seeking public comments and feedback on other factors that should be considered in the potential restructuring of MS-DRGs 456, 457, and 458. Thus, for FY 2025, we proposed to maintain the current structure of MS-DRGs 456, 457, and 458, without modification. We noted that feedback and other suggestions for future rulemaking may be submitted by October 20, 2024 and directed to MEARIS™ at <https://mearis.cms.gov/public/home>.

With respect to the commenters' concerns that we excluded analysis of MS-DRGs 471, 472, and 473 for FY 2025, we note that the MS-DRG request under consideration for ongoing review was related to assignment of cases reporting procedures involving use of the aprevo™ custom-made anatomically designed interbody spinal fusion device technology that is used in the performance of a spinal fusion procedure and specifically indicated for treatment of the anterior column of the thoracolumbar, lumbar, or lumbosacral vertebra. The procedure codes describing a custom-made anatomically designed interbody fusion device are not listed in the logic for case assignment to MS-DRGs 471, 472, and 473 because the logic for those MS-DRGs is specifically indicated for the cervical vertebrae. While not specifically discussed in the proposed rule, the manufacturer of the aprevo™ custom-made interbody spinal fusion device technology received a second Breakthrough Device designation for its technology in September 2023 that is indicated specifically for the treatment of patients with cervical spine disease. We anticipate, similar to the approach utilized for the treatment of patients with lumbar spine disease, that it is possible the

manufacturer may request a unique procedure code(s) to describe the use of the technology for the cervical spine with the potential of applying for a new technology add-on payment and subsequent MS-DRG classification changes. For these reasons, we believe additional time is necessary as we consider how we may refine the cervical spinal fusion MS-DRGs. We are also seeking feedback on factors that should be considered in the potential restructuring of MS-DRGs 471, 472, and 473 for future rulemaking. For example, are there other patient-specific spinal fusion technologies currently in development or in use and indicated for cervical spine disease that should also be evaluated and considered. Feedback and other suggestions for future rulemaking may be submitted by October 20, 2024 and directed to MEARIS™ at <https://mearis.cms.gov/public/home>.

Comment: A few commenters who appreciated CMS's attempts to recognize the differences in complexity between single level and multiple level spinal fusion procedures stated their belief that additional time is needed for hospitals to assess the impact of the proposed changes. According to the commenters, the proposed changes may have a negative impact on community hospitals, which they stated tend to treat less-complex cases.

A couple commenters stated that CMS has previously given two years notice to hospitals about potential changes and provided the example of CMS's request for public comments and feedback on potential restructuring for MS-DRGs 023 through 027, as discussed in FY 2024 and FY 2025 rulemaking. Another commenter stated that the proposed restructuring of the spinal fusion MS-DRGs is a major revision, and without any warning to hospitals. However, this commenter also stated that regardless of the outcome for the proposed reorganization of the spinal fusion MS-DRGs, CMS should address the resource utilization disparity related to the use of the aprevo™ custom-made anatomically designed spine fusion devices. According to the commenter, failure to implement this issue for FY2025 will create a financial disincentive for hospitals to utilize this innovative technology, thus eliminating access for patients. The commenter recommended CMS reassign cases reporting a custom-made anatomically designed

interbody fusion device to MS-DRGs that address the higher resource utilization and to ensure continued access to the technology. This same commenter also stated its belief that the proposal should undergo a comprehensive review by a spine group to identify and mitigate any unintended consequences.

Response: We appreciate the commenters' feedback. As discussed in prior rulemaking (86 FR 44878), the MS-DRG system is a system of averages and it is expected that within the diagnostic related groups, some cases may demonstrate higher than average costs, while other cases may demonstrate lower than average costs. It is generally expected that as a result of the annual MS-DRG reclassifications that are finalized, the experience of different categories of hospitals may differ based on the population of patients they treat and the services offered by the facility.

With respect to the commenter's concern that hospitals had no warning regarding the proposed restructuring for a subset of the spinal fusion MS-DRGs, we note that in addition to proposing these changes in the FY 2025 IPPS/LTCH PPS proposed rule, we discussed this topic in the FY 2024 IPPS/LTCH PPS rulemaking, including noting that our work in this area was ongoing, and that we would continue to examine the data and consider these issues as we develop potential future rulemaking proposals. Providers have had the opportunity to consider how spinal fusion cases (including cases reporting the use of a custom-made anatomically designed interbody fusion device) are reported in the claims data for their respective facilities and grouped under the IPPS MS-DRGs, as well as to submit requested changes to the classifications for these MS-DRGs for CMS's consideration. We further note that, as stated in the preamble of the annual IPPS rulemakings, section 1886(d)(4)(C) of the Act requires that the Secretary adjust the DRG classifications and relative weights at least annually to account for changes in resource consumption. These adjustments are made to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources. We include these changes as part of our annual IPPS rulemaking, which provides the public,

including any particular interested parties, the opportunity to review and comment on these proposals.

Comment: A few commenters who expressed appreciation for CMS's efforts to update the spinal fusion MS-DRGs to better reflect current clinical practice and facility costs more accurately stated they need more information about the potential impact of the proposed designations and the opportunity to study the proposed changes further. These commenters recommended that CMS not conduct this restructuring while also considering the spinal fusion episode accountability model under the Transforming Episode Accountability Model (TEAM).

Response: We appreciate the commenters' feedback. We refer the reader to section X.A.3.b. of the preamble of this final rule for further discussion of how the proposed restructuring of the spinal fusion MS-DRGs may be considered in connection with the spinal fusion episode category under TEAM.

Comment: A few commenters who expressed support for potential changes to the logic for case assignment to the spinal fusion MS-DRGs stated they reviewed data provided by CMS with the AOR/BOR (After Outliers Removed/Before Outliers Removed) version 41 and version 42 files, and Table 5 - Proposed List of Medicare Severity Diagnosis Related Groups (MS-DRGs), Relative Weighting Factors, and Geometric and Arithmetic Mean Length of Stay that was made available in association with the proposed rule. The commenters stated it was unclear if the current proposed spinal fusion MS-DRGs better reflect resource consumption based on its findings of a minimal change in the case mix index between version 41 (4.6504) and version 42 (4.6454). The commenters suggested further analysis of all the spinal fusion MS-DRGs should be considered.

A commenter stated that the version 42 AOR table showed more spinal fusion cases in comparison to the total spinal fusion cases included in the rule discussion. The commenter questioned if there was duplication of the same patients being counted based on the logic lists for

the proposal and stated it was not clear how duplications may have been handled in the data if there was both a multiple level fusion and single level fusion reported on the same case.

Response: It is not entirely clear how the commenters performed the case-mix index calculations, however, based on the data table provided by the commenters, we believe the commenters used the case counts from the AOR file and relative weights to calculate a case-weighted average relative weight for the spinal fusion MS-DRGs and are referring to that as a case-mix index. We note that under the proposed restructuring, the same population of cases among the spinal fusion MS-DRGs is being redistributed, therefore, we would not expect a significant shift in the case-mix index.

With respect to the differences in case counts between the version 42 AOR table in comparison to the number of cases included in the rule discussion for the proposed spinal fusion MS-DRGs, we note that, as stated in the proposed rule, our MS-DRG analysis was based on ICD-10 claims data from the September 2023 update of the FY 2023 MedPAR file, which contains hospital bills received from October 1, 2022, through September 30, 2023. In comparison, as also stated in the proposed rule, the FY 2023 MedPAR file used in developing the proposed MS-DRG relative weights for FY 2025 included discharges occurring on October 1, 2022, through September 30, 2023, based on bills received by CMS through December 31, 2023. *Comment:* A commenter noted that the titles of the ICD-10-PCS procedure codes that were created to report spinal fusion procedures using the aprevo™ customized interbody fusion device were revised, effective October 1, 2023, as a result of the manufacturer's concerns that some claims may have been unintentionally miscoded. The commenter stated that per the materials from the March 2023 ICD-10 Coordination and Maintenance Committee meeting, the manufacturer requested the title revision to help minimize misinterpretation of the term "customizable." The commenter remarked that CMS was unable to confirm that claims reporting any one of the codes created that describe use of the aprevo™ device had in fact been miscoded, and as discussed in the proposed rule, while a newly established ICD-10 code may be

associated with an application for a new technology add-on payment, such codes are not generally established to be product specific. The commenter added that CMS further stated that if, after consulting the official coding guidelines, a provider determines that an ICD-10 code associated with a new technology add-on payment describes the technology that they are billing, the hospital may report the code and be eligible to receive the associated add-on payment. The commenter stated that some ICD-10-PCS codes are intended to be product specific, as the code title(s) often represent a manufacturer's specific technology, particularly in the New Technology section. The commenter added that the Coding Clinic for ICD-10-CM/PCS Editorial Advisory Board has determined that some ICD-10-PCS codes are only intended for a specific product and should not be used for other devices or substances.

The commenter stated that in the case of the aprevo™ device, it is not clear why the titles of the associated procedure codes were revised to more clearly describe this specific device and address the manufacturer's concerns regarding miscoding, if it was appropriate to assign the codes for spinal fusion procedures using devices other than the aprevo™ device. The commenter further stated that absence of clarity regarding device specific codes may have an unintended effect on the use of new technology due to concerns regarding lack of payment, which they stated may have a negative impact on clinical outcomes.

Response: We appreciate the commenter's feedback. With respect to the commenter's remarks about revisions made to the code title for the procedure codes describing spinal fusion procedures with an aprevo™ interbody fusion device, we note that we addressed this issue when we were made aware of it and believe the code title is now appropriate. It was brought to our attention that the term "customizable" as reflected in the original code title was leading to confusion with devices that utilize expandable cages and are "customized" to fit during the procedure. In response to the manufacturer's concerns regarding potential miscoded claims and its request to revise the original code descriptor to help minimize misinterpretation of the term "customizable" by providers' coding personnel, we presented and received public support to

finalize the proposed revision to the code titles. The intent was not to specifically limit the reporting of the code, since, as stated in the proposed rule, while a newly established ICD-10 code may be associated with an application for a new technology add-on payment, such codes are not generally established to be product specific.

We note that historically, our approach to proposing and finalizing new procedure codes through the ICD-10 Coordination and Maintenance Committee meeting process was largely built on the fact that the procedure classification system was designed to report the procedure performed, not the device or other specific technology used. However, we also note that with the implementation of the new technology add-on payment policy, aspects of that approach to creating new procedure codes have become more complex. While we have strived to maintain consistency with that historical approach, we also recognize the responsibility to balance and support the requirements of the new technology add-on payment policy, which have continued to evolve since its inception.

The commenter is correct that certain ICD-10-PCS codes located in the New Technology section of the ICD-10-PCS procedure classification, also known as “Section X”, are product specific. For example, a procedure code request for the administration of a therapeutic agent, regardless of it being related to a new technology add-on payment application, is often presented as a proposal through the ICD-10 Coordination and Maintenance Committee meeting process, and subsequently finalized (following review and consideration of the public comments) with the generic name of the agent in the code description (title). Oftentimes, there is a clinical need and several benefits to capture a certain level of specificity for purposes of data collection, such as tracking a particular patient population, or assessing clinical outcomes. We note that following the finalization of a new procedure code that is classified within the new technology section (Section X) of ICD-10-PCS, we discuss the disposition of that code after a 3-year period during a future ICD-10 Coordination and Maintenance Committee meeting, which also generally aligns with the expiration of a product’s eligibility for an add-on payment under the new technology

add-on payment policy. We also take this opportunity to point out that a procedure, service, or technology is not required to submit a new technology add-on payment application for consideration of a Section X code. As discussed in prior rulemaking (80 FR 49434 through 49435), when the ICD-10-PCS New Technology section was under development, we established that the purpose of the New Technology section is to also provide a mechanism to capture services that would not normally be coded and reported in the inpatient setting.

We appreciate the commenter's feedback on this topic and will continue to consider how to better address coding proposals in connection with new technologies for future discussion at the ICD-10 Coordination and Maintenance Committee meeting.

Comment: A commenter (the manufacturer of the aprevo™ custom-made anatomically designed interbody fusion device) stated that while CMS partially addressed the request to assign spinal fusion procedures reporting the use of a custom-made anatomically designed interbody fusion device to appropriate MS-DRGs that more closely align with the increase in resource utilization, the analysis under the proposed restructuring did not specifically reflect data related to the resource utilization for custom-made anatomically designed devices under the single level versus multiple level MS-DRG construct.

The commenter provided a comprehensive list detailing the sequence of events related to prior rulemaking discussions involving custom-made anatomically designed interbody fusion devices including its approved eligibility for new technology add-on payments, revisions to the procedure code title to change the description from “customizable” to “custom-made anatomically designed” interbody fusion device, and prior data analysis findings. The commenter also provided extensive clinical background on custom-made anatomically designed interbody fusion devices and reiterated the designation as an FDA Breakthrough technology. Additionally, the commenter stated that published clinical data has shown that custom-made

anatomically designed interbody fusion devices improve care by delivering more precise patient specific alignment^{6,7}, which they stated has been proven to reduce the risk of revision surgery.

In response to publication of the FY 2025 IPPS/LTCH PPS proposed rule, the commenter stated its belief that 1.) CMS contradicted its position on the original description of the procedure codes by making the statement in the FY 2025 IPPS/LTCH PPS proposed rule that a newly established ICD-10 code may be associated with an application for new technology add-on payment and such codes are not generally established to be product specific and 2.) CMS acknowledged that the description used in the original ICD-10 code inadvertently described several types of technologies, and this likely contributed to the miscoded claims. According to the commenter, because CMS decided to consider resource utilization disparities for *all* cases reporting the use of a custom-made anatomically designed interbody spinal fusion device in its analysis for FY 2025 (that is, they stated CMS did not limit its analysis to cases associated only with the list of providers provided by the manufacturer), the commenter's original requested reassignments are no longer supported by data and therefore, the commenter stated revised reassignments are appropriate to request.

The commenter stated that CMS sought to find an alternative explanation for the resource incoherence demonstrated across the cases reporting any one of the 12 procedure codes describing a spinal fusion procedure with a custom-made anatomically designed interbody spinal fusion device and that the expanded analysis was unrelated to the original request because it did not provide data related to the use of custom-made anatomically designed devices under the proposed single level versus multiple level MS-DRG construct. The commenter further stated that the absence of this specific data (single level versus multiple level) in the proposed rule

⁶ Smith, et al. Global Spine J. 2023 Nov 21.

⁷ Sadrameli S, et al. ISASS 2024.

necessitated the submission of a revised request under the proposed new structure and the findings from its analysis for CMS's review and consideration.

The commenter provided prior examples of MS-DRG classification requests comparing length of stay differences and low claims volume to demonstrate instances for which CMS reassigned cases from a lower severity level MS-DRG to a higher severity level MS-DRG, including the proposal regarding the Neuromodulation Device Implant for Heart Failure (Barostim™ Baroreflex Activation Therapy), as discussed in the preamble of the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35959 through 35962) and in section II.C.4.b. of the preamble of this final rule.

The commenter also remarked on CMS's discussion of the data analysis presented in the proposed rule regarding the wide range in average costs for claims reporting the use of a custom-made anatomically designed interbody fusion device. The commenter stated it engaged a contractor to assess the distribution of costs and length of stay for all spinal fusion cases and cases reporting the use of a custom-made anatomically designed interbody fusion device using FY 2023 Q1-Q4 inpatient standard analytical file (SAF) data. According to the commenter, the findings from its analysis demonstrate that cases reporting the use of a custom-made anatomically designed interbody fusion device consistently show higher average costs in comparison to the average costs of all spinal fusion cases in their respective MS-DRG, which they stated are an indication that the higher costs are not an artifact of a few cases.

The commenter conducted additional analyses using the FY 2023 MedPAR data with the logic lists from the tables provided in association with the proposed rule and stated that its findings demonstrate disparities in resource utilization for cases reporting use of a custom-made anatomically designed interbody fusion device among the proposed multiple level and single level spinal fusion MS-DRGs. Specifically, the commenter stated cases reporting the use of a

custom-made anatomically designed interbody fusion device under the proposed MS-DRG structure should be reassigned as shown in the table that follows.

Cases in Proposed MS-DRG	Requested MS-DRG Reassignment
402 - Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical	428 - Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical without CC/MCC
428 - Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical without CC/MCC	427 - Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with CC
427 - Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with CC	426 - Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with MCC
460 - Single Level Spinal fusion except cervical without MCC	447 - Multiple Level Spinal Fusion Except Cervical with MCC
448 - Multiple Level Spinal Fusion Except Cervical without MCC	447 - Multiple Level Spinal Fusion Except Cervical with MCC

According to the commenter, findings from its analysis under the proposed MS-DRG structure support the reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from the lower severity proposed MS-DRGs to the higher severity level proposed MS-DRGs because the resource utilization of cases reporting the use of a custom-made anatomically designed interbody fusion device align more closely with the resource utilization of cases in the requested MS-DRG. The commenter stated that the requested reassignments are consistent with other MS-DRG classifications CMS has previously finalized and therefore, the precedent exists.

The commenter also provided an alternative recommendation for CMS’s consideration based on the current, existing spinal fusion MS-DRGs, with minor modifications from its initial FY 2024 request for the reassignment of cases reporting a custom-made anatomically designed interbody fusion device. Specifically, the commenter provided its analysis under the existing MS-DRGs and indicated that cases reporting the use of a custom-made anatomically designed interbody fusion device under the existing MS-DRG structure should be considered for reassignment as shown in the table that follows, if the proposed structure is not finalized.

Cases in Existing MS-DRG	Requested MS-DRG Reassignment
454 - Combined Anterior and Posterior Spinal Fusion with CC	453 - Combined Anterior and Posterior Spinal Fusion with MCC
455 - Combined Anterior and Posterior Spinal Fusion without CC/MCC	454 - Combined Anterior and Posterior Spinal Fusion with CC
458 - Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions without CC/MCC	457 - Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions with CC
460 - Spinal Fusion Except Cervical without MCC	459 - Spinal Fusion Except Cervical with MCC

Based on the findings from its analyses under the proposed and current MS-DRG structure for spinal fusions, the commenter asserted that reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device is supported by compelling data that demonstrates a resource utilization disparity for cases reporting the technology. The commenter stated that without appropriate payment, Medicare beneficiaries will lose access to the technology, and stated they deserve continued access to the technology because it improves patient care. The commenter urged CMS to finalize the reassignment of these cases for FY 2025.

Some commenters stated that the new technology add-on payment for custom-made anatomically designed interbody spinal fusion devices is ending on September 30, 2024, and if CMS decides to move forward with the proposed MS-DRG changes without the reassignment of the procedure codes describing the custom-made anatomically designed technology to more appropriate MS-DRGs, it would create a financial disincentive for hospitals and eliminate access to the breakthrough technology for patients. The commenters reiterated prior concerns raised in public comments by spine surgeons that were discussed in the FY 2024 rulemaking and stated that without adequate payment, hospitals will not authorize use of the technology.

A few commenters suggested that if CMS is going to finalize the proposed restructuring, consideration be given to deleting MS-DRGs 459 and 460 and creating new MS-DRGs for single

level spinal fusion except cervical with MCC and without MCC because they stated the proposed revisions would significantly change the types of cases classified to these MS-DRGs.

Response: We appreciate the commenters' feedback. In response to the commenter's statement that CMS contradicted its position on the original description of the procedure codes, we note that the manufacturer contacted CMS about its concerns. CMS' actions were to provide clarity to all parties in light of concerns that the manufacturer raised. As a general matter, CMS aims to provide clarity when possible, and we recognized there could be impacts to coding, data collection, and payment, and therefore we took the opportunity to revise the code title in this case. Specifically, as stated above, in response to the manufacturer's concerns regarding potential miscoded claims and its request to revise the original code descriptor to help minimize misinterpretation of the term "customizable" by providers' coding personnel, we presented and received public support to finalize the proposed revision to the code titles. We wish to clarify that CMS did not specifically acknowledge that the description used in the original ICD-10 code inadvertently described several types of technologies, and that this likely contributed to the miscoded claims. As discussed in the proposed rule and previously in this final rule, we provided clarification that finalization of the revised code title was not intended to specifically limit the reporting of the code, since a newly established ICD-10 code that may be associated with an application for a new technology add-on payment is generally not established to be product specific.

We disagree with the commenter's assertion that CMS contradicted its prior position on length of stay differences with respect to clinical coherence. We note that in the examples provided by the commenter of MS-DRG classification requests comparing length of stay differences and low claims volume to demonstrate instances for which CMS reassigned cases from a lower severity level MS-DRG to a higher severity level MS-DRG, the topics were discussed and considered in more than one rulemaking cycle prior to finalizing the reassignment of cases from the lower severity level to the higher severity level and length of stay was still a

factor under consideration. We also note that because of the lag in claims data used in our analysis of MS-DRG classification requests, depending on the specific procedures and technology under consideration, it is not uncommon to delay a decision and continue to monitor the data until additional analysis can be performed.

In this case, CMS performed additional analyses to examine if other factors could be identified as contributing to the increased resource utilization for cases reporting any one of the 12 procedure codes describing a spinal fusion procedure with a custom-made anatomically designed interbody spinal fusion device. We disagree that the expanded analysis was unrelated to the original request because it did not specifically provide data related to the use of custom-made anatomically designed devices under the proposed single level versus multiple level MS-DRG construct, however, we appreciate the commenter’s submission of suggested alternative reassignments under the proposed new structure and optional consideration under the existing structure.

In response to the commenter’s request to reassign cases reporting the use of a custom-made anatomically designed interbody fusion device under the proposed restructuring for the spinal fusion MS-DRGs, we analyzed claims data from the September update of the FY 2023 MedPAR file for proposed MS-DRGs 402, 426, 427, 428, 447, 448, 459 and 460 and cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 402 All cases	16,059	2.9	\$35,758
MS-DRG 402 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	66	2.7	\$46,410
MS-DRG 426 All cases	2,664	9.6	\$91,358
MS-DRG 426 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	24	10.2	\$103,956
MS-DRG 427 All cases	12,498	4.8	\$64,065
MS-DRG 427 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	101	5.3	\$76,827

MS-DRG 428 All cases	7,855	3	\$50,097
MS-DRG 428 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	51	3.1	\$64,036
MS-DRG 447 All cases	2,069	10.1	\$57,209
MS-DRG 447 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	1	22.0	\$288,499
MS-DRG 448 All cases	14,677	3.9	\$36,932
MS-DRG 448 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	26	2.9	\$62,831
MS-DRG 459 All cases	3,152	9.6	\$53,192
MS-DRG 459 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	0	0	\$0
MS-DRG 460 All cases	28,698	3.4	\$32,586
MS-DRG 460 Cases reporting spinal fusion using a custom-made anatomically designed interbody fusion device	38	2.1	\$47,138

The findings show that the 307 cases reporting a spinal fusion procedure using a custom-made anatomically designed interbody fusion device in MS-DRGs 402, 426, 427, 428, 447, 448, 459 and 460 have higher average costs in comparison to the average costs of all the cases in their respective proposed MS-DRG. We note, as shown in the table, that there were zero cases found to report the use of a custom-made anatomically designed interbody fusion device in proposed revised MS-DRG 459. For proposed MS-DRGs 402 and 428, the findings show that the cases reporting the use of a custom-made anatomically designed interbody fusion device have a comparable average length of stay compared to all the cases in their respective proposed MS-DRG. The findings also show that for proposed MS-DRGs 426 and 427, the cases reporting the use of a custom-made anatomically designed interbody fusion device have a longer average length of stay compared to all the cases in their respective proposed MS-DRG. For proposed MS-DRG 447, we note that the single case reporting the use of a custom-made anatomically designed interbody fusion device is an outlier. For proposed MS-DRG 448 and proposed revised MS-DRG 460, cases reporting the use of a custom-made anatomically designed interbody fusion device have a shorter average length of stay compared to all the cases in their respective proposed MS-DRG.

We reviewed the requested reassignment for the 66 cases from proposed MS-DRG 402 to proposed MS-DRG 428 and note that the logic for case assignment to proposed MS-DRG 428 is comprised of cases reporting a multiple level combined anterior and posterior fusion (except cervical) without a CC/MCC and the logic for case assignment for proposed MS-DRG 402 is comprised of cases reporting a single level combined anterior and posterior fusion (except cervical) that may also have an MCC or CC reported since it is a proposed base MS-DRG that is not subdivided by severity. The proposed logic for case assignment to each of these proposed MS-DRGs includes the procedure codes describing the use of a custom-made anatomically designed interbody fusion device in the definition of the respective proposed MS-DRG. Therefore, the reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed MS-DRG 402 to proposed MS-DRG 428 would not be feasible and would not be consistent with the logic of the proposed MS-DRGs which is intended to differentiate a single level combined anterior and posterior fusion from a multiple level combined anterior and posterior spinal fusion.

Next, we reviewed the requested reassignment for the 51 cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed MS-DRG 428 (without CC/MCC) to proposed MS-DRG 427 (with CC) and for the 101 cases from proposed MS-DRG 427 (with CC) to proposed MS-DRG 426 (with MCC). We note that because the proposed MS-DRGs are subdivided with a three-way split, it is not feasible to reassign cases reporting the use of a custom-made anatomically designed interbody fusion device as requested at this time. Generally, with a three-way split, the requested reassignment of cases can only be considered for movement from one severity level to the next highest severity level. For example, consideration could be given to reassign cases from the “without CC/MCC” severity level to the “with CC” severity level or from the “with CC” level to the “with MCC” severity level. Because the proposed logic lists for case assignment to each of these proposed MS-DRGs includes the procedure codes describing the use of a custom-made anatomically designed interbody fusion

device in the definition of the respective proposed MS-DRG, the GROUPER software is not able to exclude cases reporting a custom-made anatomically designed interbody fusion device from grouping to proposed MS-DRG 426 (“with MCC”) that would otherwise group to proposed MS-DRG 428 (“without CC/MCC”).

We then reviewed the requested reassignment for the 38 cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed revised MS-DRG 460 to proposed MS-DRG 447. We note that the logic for case assignment to proposed MS-DRG 447 is comprised of cases reporting a multiple level spinal fusion (except cervical) and the logic for case assignment for proposed revised MS-DRG 460 is comprised of cases reporting a single level spinal fusion (except cervical). The proposed logic for case assignment to each of these proposed MS-DRGs includes the procedure codes describing the use of a custom-made anatomically designed interbody fusion device in the definition of the respective proposed MS-DRG. Therefore, the reassignment of the 38 cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed revised MS-DRG 460 to proposed MS-DRG 447 would not be feasible and would not be consistent with the logic of the proposed MS-DRGs which is intended to differentiate a single level spinal fusion from a multiple level spinal fusion.

Lastly, we reviewed the requested reassignment for the 26 cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed MS-DRG 448 to proposed MS-DRG 447. Based on the logic lists for case assignment and because these MS-DRGs are subdivided by a two-way split that both describe multiple level spinal fusion (except cervical), we determined it would be feasible to reassign cases from the “without MCC” severity level (MS-DRG 448) to the “with MCC” severity level (MS-DRG 447).

As previously described, when MS-DRGs are subdivided with a three-way split, the requested reassignment of cases can only be considered from one severity level to the next

highest severity level. In our review of the data for proposed MS-DRGs 426, 427, and 428, we considered the average costs of the 24 cases found in proposed MS-DRG 426 reporting the use of a custom-made anatomically designed interbody fusion device compared to the average cost of all the cases in proposed MS-DRG 426 (\$103,956 versus \$91,358) and the average costs of the 101 cases found in proposed MS-DRG 427 reporting the use of a custom-made anatomically designed interbody fusion device compared to the average cost of all the cases in proposed MS-DRG 427 (\$76,827 versus \$64,065). Although the average length of stay for cases reporting a custom-made anatomically designed interbody fusion device in proposed MS-DRG 427 is shorter in comparison to the average length of stay of all the cases in proposed MS-DRG 426, we believe the reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed MS-DRG 427 (with CC) to proposed MS-DRG 426 (with MCC) is supported and better reflects the resource utilization and complexity of cases using the custom-made anatomically designed interbody fusion device technology in a multiple level combined anterior and posterior spinal fusion. We recognize that the 51 cases found in proposed MS-DRG 428 reporting the use of a custom-made anatomically designed interbody fusion device have higher average costs compared to the average cost of all the cases in MS-DRG 428 (\$64,038 versus \$50,097), however, as previously described, we are unable to accommodate two severity level reassignment requests for an MS-DRG subdivided by a three-way split at this time.

We noted earlier in this section of the preamble of this final rule, in our review of the requested reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed MS-DRG 448 to proposed MS-DRG 447 that the request was feasible based on the logic of the proposed MS-DRGs that are subdivided with a two-way split. In our review of the data for proposed MS-DRGs 447 and 448, we considered the average costs of the 26 cases found in proposed MS-DRG 448 reporting the use of a custom-made anatomically designed interbody fusion device compared to the average cost of all the cases in proposed MS-DRG 448 (\$62,831 versus \$36,932). We also considered the one case found in

proposed MS-DRG 447 reporting the use of a custom-made anatomically designed interbody fusion device to be an outlier with costs of \$288,499 compared to the average costs of all the cases in proposed MS-DRG 447 (\$57,209). We believe the reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed MS-DRG 448 (without MCC) to proposed MS-DRG 447 (with MCC) is supported and better reflects the resource utilization and complexity of cases using the custom-made anatomically designed interbody fusion device technology in a multiple level anterior and posterior spinal fusion.

As previously discussed, we determined that the requested reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed revised MS-DRG 460 to proposed MS-DRG 447 would not be feasible based on the logic for case assignment. However, based on the data findings, we believe it is appropriate to consider the reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed revised MS-DRG 460 to proposed revised MS-DRG 459. In our review of the data for proposed revised MS-DRGs 459 and 460, we considered the average costs of the 38 cases found in proposed revised MS-DRG 460 reporting the use of a custom-made anatomically designed interbody fusion device compared to the average cost of all the cases in proposed revised MS-DRG 460 (\$47,138 versus \$32,586). While there were no cases found to report the use of a custom-made anatomically designed interbody fusion device in proposed revised MS-DRG 459, we considered the average costs of all the cases in proposed revised MS-DRG 459 (\$53,192). While the average length of stay of the cases reporting a custom-made anatomically designed interbody fusion device are shorter (2.1 days versus 9.6 days), we believe the reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed revised MS-DRG 460 (without MCC) to proposed revised MS-DRG 459 (with MCC) is supported and better reflects the resource utilization of cases using the custom-made anatomically designed interbody fusion device technology in a single level spinal fusion. As also previously discussed, a few commenters

suggested that if the proposed restructuring was to be finalized, consideration be given to deleting proposed revised MS-DRGs 459 and 460 and creating new MS-DRGs for single level spinal fusion except cervical with MCC and without MCC, respectively, because the proposed revisions would significantly change the types of cases classified to these MS-DRGs. We agree with the commenters that the proposed revisions to the MS-DRG logic change the types of cases that would be classified to proposed revised MS-DRGs 459 and 460. Specifically, because the logic for case assignment to existing MS-DRGs 459 and 460 was proposed to be restructured to better differentiate between single level spinal fusions (except cervical) and multiple level spinal fusions (except cervical), it would not be appropriate to retain the existing MS-DRG numbers 459 and 460 with revised titles. We proposed to create new MS-DRGs 447 and 448 to reflect multiple level spinal fusion procedures (except cervical) therefore, maintaining the existing MS-DRG numbers of 459 and 460 for the single level spinal fusions (except cervical) logic only could potentially result in confusion about the logic for case assignment. If users were to reference MS-DRG numbers 459 and 460 only, in the absence of the full MS-DRG titles, others may not be aware that the logic for case assignment to these MS-DRGs had changed effective FY 2025. As such, we agree that existing MS-DRG numbers 459 and 460 should be deleted.

We recognize that with the requested reassignments the average length of stay for cases reporting a custom-made anatomically designed interbody fusion device varies from the average length of stay for all the cases in the requested MS-DRGs, and we continue to believe that length of stay is a factor in assessing clinical coherence, however, we also consider the use of a specific technology in the performance of a procedure as a measure of complexity in connection with resource consumption, particularly when that technology is indicated for a specific population. In the case of custom-made anatomically designed interbody fusion devices, the technology is indicated for patients who have complicated spinal anatomy necessitating individualized treatment plans to precisely address spinal alignment needs and reduce the risk of revision surgery.

After consideration of the public comments we received, we are finalizing our proposal to delete MS-DRGs 453, 454, and 455 and to create new MS-DRGs 426, 427, and 428, with modification, for FY 2025. Specifically, we are finalizing our proposal with modification to assign cases reporting the use of a custom-made anatomically designed interbody fusion device with a CC to new MS-DRG 426. Conforming changes to the GROUPER logic are also shown in Table 6P.2e associated with this final rule and available on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps> and also as reflected in the final version of ICD-10 MS-DRG Definitions Manual, version 42, available in association with this final rule and available via the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>. Accordingly, the finalized MS-DRG titles are MS-DRG 426 “Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with MCC or Custom-Made Anatomically Designed Interbody Fusion Device”, MS-DRG 427 “Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with CC” and MS-DRG 428 “Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical without CC/MCC” effective October 1, 2024, for FY 2025.

We are also finalizing our proposal to create new MS-DRGs 447 and 448, with modification, for FY 2025. Specifically, we are finalizing our proposal with modification to assign cases reporting the use of a custom-made anatomically designed interbody fusion device without an MCC to MS-DRG 447. Conforming changes to the GROUPER logic are shown in Table 6P.2h associated with this final rule and available on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps> and also reflected in the final version of ICD-10 MS-DRG Definitions Manual, version 42, available in association with this final rule and available via the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>. Accordingly, the finalized MS-DRG titles are MS-DRG 447

“Multiple Level Anterior and Posterior Spinal Fusion Except Cervical with MCC or Custom-Made Anatomically Designed Interbody Fusion Device” and MS-DRG 448 “Multiple Level Anterior and Posterior Spinal Fusion Except Cervical without MCC” effective October 1, 2024, for FY 2025.

As previously discussed, we stated we believe the reassignment of cases reporting the use of a custom-made anatomically designed interbody fusion device from proposed revised MS-DRG 460 (without MCC) to proposed revised MS-DRG 459 (with MCC) is supported and agree with the commenters that the proposed revisions to the MS-DRG logic change the types of cases that would be classified to MS-DRGs 459 and 460. As previously noted, the logic for case assignment to existing MS-DRGs 459 and 460 was proposed to be restructured to better differentiate between single level and multiple level spinal fusions, therefore it would not be appropriate to retain the existing MS-DRG numbers 459 and 460 with revised titles because the cases that group to these MS-DRGs would change. Therefore, for FY 2025, we are deleting MS-DRGs 459 and 460, and finalizing the creation of MS-DRGs 450 and 451. The logic for case assignment to MS-DRGs 450 and 451 is comprised of the logic lists that were initially proposed for revised MS-DRGs 459 and 460, with modification. We are also finalizing the assignment of cases reporting the use of a custom-made anatomically designed interbody fusion device without an MCC to MS-DRG 450. Conforming changes to the GROUPER logic are shown in Table 6P.2g associated with this final rule and available on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps> and also reflected in the final version of ICD-10 MS-DRG Definitions Manual, version 42, available in association with this final rule and available via the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>. Accordingly, the finalized MS-DRG titles are MS-DRG 450 “Single Level Spinal Fusion Except Cervical with MCC or Custom-Made Anatomically

Designed Interbody Fusion Device” and MS-DRG 451 “Single Level Spinal Fusion Except Cervical without MCC” effective October 1, 2024, for FY 2025.

We are also finalizing our proposal to create new MS-DRG 402, and new MS-DRGs 429 and 430, without modification, for FY 2025. Accordingly, we are finalizing the proposed GROUPER logic for these MS-DRGs as shown in Table 6P.2d and 6P.2f, respectively, associated with this final rule and available on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps> and as also reflected in the final version of ICD-10 MS-DRG Definitions Manual, version 42, available in association with this final rule and available via the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>. The finalized MS-DRG titles are MS-DRG 402 “Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical”, MS-DRG 429 “Combined Anterior and Posterior Cervical Spinal Fusion with MCC” and MS-DRG 430 “Combined Anterior and Posterior Cervical Spinal Fusion without MCC” effective October 1, 2024, for FY 2025. We will continue to monitor the data for these finalized MS-DRGs and consider if any future modifications may be warranted.

7. MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders): Resection of Right Large Intestine

In the proposed rule, we noted that we identified an inconsistency in the MDC and MS-DRG assignment of procedure codes describing resection of the right large intestine and resection of the left large intestine with an open and percutaneous endoscopic approach. ICD-10-PCS procedure codes 0DTG0ZZ (Resection of left large intestine, open approach) and 0DTG4ZZ (Resection of left large intestine, percutaneous endoscopic approach) are currently assigned to MDC 10 in MS-DRGs 628, 629, and 630 (Other Endocrine, Nutritional and Metabolic O.R. Procedures with MCC, with CC, and without CC/MCC, respectively). However, the procedure codes that describe resection of the right large intestine with an open or

percutaneous endoscopic approach, 0DTF0ZZ (Resection of right large intestine, open approach) and 0DTF4ZZ (Resection of right large intestine, percutaneous endoscopic approach) are not assigned to MDC 10 in MS-DRGs 628, 629, and 630. To ensure clinical alignment and consistency, as well as appropriate MS-DRG assignment, we proposed to add procedure codes 0DTF0ZZ and 0DTF4ZZ to MDC 10 in MS-DRGs 628, 629, and 630 effective October 1, 2024, for FY 2025.

Comment: Commenters supported our proposal to add procedure codes 0DTF0ZZ and 0DTF4ZZ to MDC 10 in MS-DRGs 628, 629, and 630. A commenter also suggested that CMS consider providing an index of ICD-10-PCS codes that are assigned to each MDC in the ICD-10 MS-DRG Definitions Manual in a “reverse look up” format that could be utilized to identify other potential omissions or inaccuracies such as the issues discussed in the proposed rule. The commenter urged CMS to make this information publicly available in a user-friendly format to enable interested parties to review the MDC and MS-DRG assignments more easily for ICD-10-PCS procedure codes.

Response: We thank the commenters for their support. With respect to the commenter’s suggestion that CMS develop a “reverse look up” index of the ICD-10-PCS procedure codes to enable members of the public to more easily review the MDC and MS-DRG assignments of the procedure codes, we appreciate the feedback and will take the suggestion under advisement.

After consideration of the public comments we received, we are finalizing our proposal to add procedure codes 0DTF0ZZ and 0DTF4ZZ to MDC 10 in MS-DRGs 628, 629, and 630 effective October 1, 2024, for FY 2025.

8. MDC 15 (Newborns and Other neonates with Conditions Originating in Perinatal Period):
MS-DRG 795 Normal Newborn

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35985 through 35991), we received a request to review the GROUPER logic that would determine the assignment of cases to MS-DRG 794 (Neonate with Other Significant Problems). The requestor

stated that it appears that MS-DRG 794 is the default MS-DRG in MDC 15 (Newborns and Other Neonates with Conditions Originating in Perinatal Period), as the GROUPER logic for MS-DRG 794 displayed in the ICD-10 MS-DRG Version 41.1 Definitions Manual is defined by a “principal or secondary diagnosis of newborn or neonate, with other significant problems, not assigned to DRG 789 through 793 or 795”. The requestor expressed concern that defaulting to MS-DRG 794, instead of MS-DRG 795 (Normal Newborn), for assignment of cases in MDC 15 could contribute to overpayments in healthcare by not aligning the payment amount to the appropriate level of care in newborn cases. The requestor recommended that CMS update the GROUPER logic that would determine the assignment of cases to MS-DRGs in MDC 15 to direct all cases that do not have the diagnoses and procedures as specified in the Definitions Manual to instead be grouped to MS-DRG 795.

Specifically, as discussed in the proposed rule, the requestor expressed concern that a newborn encounter coded with a principal diagnosis code from ICD-10-CM category Z38 (Liveborn infants according to place of birth and type of delivery), followed by code P05.19 (Newborn small for gestational age, other), P59.9 (Neonatal jaundice, unspecified), Q38.1 (Ankyloglossia), Q82.5 (Congenital non-neoplastic nevus), or Z23 (Encounter for immunization) is assigned to MS-DRG 794. The requestor stated that they performed a detailed claim level study, and in their clinical assessment, newborn encounters coded with a principal diagnosis code from ICD-10-CM category Z38, followed by diagnosis code P05.19, P59.9, Q38.1, Q82.5, or Z23 in fact clinically describe normal newborn encounters and the case assignment should instead be to MS-DRG 795.

We stated in the proposed rule that our analysis of this grouping issue confirmed that when a principal diagnosis code from MDC 15, such as a diagnosis code from category Z38 (Liveborn infants according to place of birth and type of delivery), is reported followed by ICD-10-CM code P05.19 (Newborn small for gestational age, other), Q38.1 (Ankyloglossia) or Q82.5 (Congenital non-neoplastic nevus), the case is assigned to MS-DRG 794.

However, as we examined the GROUPER logic that would determine an assignment of cases to MS-DRG 795, we noted in the proposed rule that the “only secondary diagnosis” list under MS-DRG 795 already includes ICD-10-CM codes P59.9 (Neonatal jaundice, unspecified) and Z23 (Encounter for immunization). Therefore, when a principal diagnosis code from MDC 15, such as a diagnosis code from category Z38 (Liveborn infants according to place of birth and type of delivery) is reported, followed by ICD-10-CM code P59.9 or Z23, the case is currently assigned to MS-DRG 795, not MS-DRG 794, as suggested by the requestor. We refer the reader to the ICD-10 MS-DRG Version 41.1 Definitions Manual (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic for MS-DRGs 794 and 795.

Next, we stated in the proposed rule that we reviewed the claims data from the September 2023 update of the FY 2023 MedPAR file; however, we found zero cases across MS-DRGs 794 and 795. We then examined the clinical factors. The description for ICD-10-CM diagnosis code P05.19 is “Newborn small for gestational age, other” and the inclusion term in the ICD-10-CM Tabular List of Diseases for this diagnosis code is “Newborn small for gestational age, 2500 grams and over.” We noted in the proposed rule that “small-for-gestational age” is diagnosed by assessing the gestational age and the weight of the baby after birth. There is no specific treatment for small-for-gestational-age newborns. Most newborns who are moderately small for gestational age are healthy babies who just happen to be on the smaller side. Unless the newborn is born with an infection or has a genetic disorder, most small-for-gestational-age newborns have no symptoms and catch up in their growth during the first year of life and have a normal adult height. Next, ICD-10-CM diagnosis code Q38.1 describes ankyloglossia, also known as tongue-tie, which is a condition that impairs tongue movement due to a restrictive lingual frenulum. We noted that in infants, tongue-tie is treated by making a small cut to the lingual frenulum to allow the tongue to move more freely. This procedure, called a frenotomy, can be done in a healthcare

provider's office without anesthesia. Newborns generally recover within about a minute of the procedure, and pain relief is usually not indicated. Lastly, ICD-10-CM diagnosis code Q82.5 describes a congenital non-neoplastic nevus. A congenital nevus is a type of pigmented birthmark that appears at birth or during a baby's first year. Most congenital nevi do not cause health problems and may only require future monitoring.

In reviewing these three ICD-10-CM codes and the conditions they describe; we stated in the proposed rule that we believe these diagnoses generally do not prolong the inpatient admission of the newborn and newborns with these diagnoses generally receive standard follow-up care after birth. We stated clinically, we agreed with the requestor that newborn encounters coded with a principal diagnosis code from ICD-10-CM category Z38 (Liveborn infants according to place of birth and type of delivery), followed by code P05.19 (Newborn small for gestational age, other), Q38.1 (Ankyloglossia), or Q82.5 (Congenital non-neoplastic nevus) should not map to MS-DRG 794 (Neonate with Other Significant Problems) and should instead be assigned to MS-DRG 795 (Normal Newborn). Therefore, for the reasons discussed, we proposed to reassign diagnosis code P05.19 from the "principal or secondary diagnosis" list under MS-DRG 794 to the "principal diagnosis" list under MS-DRG 795 (Normal Newborn). We also proposed to add diagnosis codes Q38.1 and Q82.5 to the "only secondary diagnosis" list under MS-DRG 795 (Normal Newborn). Under this proposal, cases with a principal diagnosis described by an ICD-10-CM code from category Z38 (Liveborn infants according to place of birth and type of delivery), followed by codes P05.19, Q38.1, or Q82.5 will be assigned to MS-DRG 795.

In response to the recommendation that CMS update the GROUPER logic that would determine an assignment of cases to MS-DRGs in MDC 15, in the proposed rule we stated we agreed with the requestor that the GROUPER logic for MS-DRG 794 is defined by a "principal or secondary diagnosis of newborn or neonate, with other significant problems, not assigned to DRG 789 through 793 or 795". We acknowledged that MS-DRG 794 utilizes "fall-through"

logic, meaning if a diagnosis code is not assigned to any of the other MS-DRGs, then assignment “falls-through” to MS-DRG 794. As discussed in the proposed rule, we have started to examine the GROUPER logic that would determine the assignment of cases to the MS-DRGs in MDC 15, including MS-DRGs 794 and 795, to determine where further refinements could potentially be made to better account for differences in clinical complexity and resource utilization. However, as we have noted in prior rulemaking (72 FR 47152), we cannot adopt the same approach to refine the newborn MS-DRGs because of the extremely low volume of Medicare patients there are in these MS-DRGs. Additional time is needed to fully and accurately evaluate cases currently grouping to the MS-DRGs in MDC 15 to consider if restructuring the current MS-DRGs would better recognize the clinical distinctions of these patient populations. Any proposed modifications to these MS-DRGs will be addressed in future rulemaking consistent with our annual process.

Comment: Many commenters expressed support for the proposal to reassign diagnosis code P05.19 from the “principal or secondary diagnosis” list under MS-DRG 794 to the “principal diagnosis” list under MS-DRG 795 (Normal Newborn) and the proposal to add diagnosis codes Q38.1 and Q82.5 to the “only secondary diagnosis” list under MS-DRG 795 (Normal Newborn) for FY 2025. Several commenters stated these updates are needed, are very timely, and will better align cases to the appropriate level of care. Other commenters stated they were committed to helping update the GROUPER logic for MS-DRG 794 and expressed their willingness to work with CMS. A commenter specifically stated they applaud CMS’ initiation of an examination of the GROUPER logic that would determine the assignment of cases to the MS-DRGs in MDC 15 to determine where further refinements could potentially be made to better account for differences in clinical complexity and resource utilization.

While indicating their support for the proposal, some commenters provided the following list of diagnoses which they stated also clinically describe normal newborn encounters when reported and therefore case assignment should also be to MS-DRG 795 instead of MS-DRG 794.

ICD-10-CM Diagnosis Code	Description
P08.1	Other heavy for gestational age newborn
P08.21	Post-term newborn
P09.6	Abnormal findings on neonatal screening for neonatal hearing loss
Q55.63	Congenital torsion of penis
Q55.69	Other congenital malformation of penis
Q82.8	Other specified congenital malformations of skin
Z05.1	Observation and evaluation of newborn for suspected infectious condition ruled out
Z05.42	Observation and evaluation of newborn for suspected metabolic condition ruled out
Z28.82	Immunization not carried out because of caregiver refusal
Z71.85	Encounter for immunization safety counseling

Response: We thank the commenters for their support for the proposal as well as for broader efforts to evaluate the assignment of cases to the MS-DRGs in MDC 15. In response to the list of diagnoses which commenters stated also clinically describe normal newborn encounters when reported and therefore assignment should be to MS-DRG 795, we note that the “principal diagnosis” list under MS-DRG 795 already includes ICD-10-CM codes P08.1 (Other heavy for gestational age newborn) and P08.21 (Post-term newborn). Additionally, the “only secondary diagnosis” list under MS-DRG 795 already includes ICD-10-CM codes Q82.8 (Other specified congenital malformations of skin), Z05.1 (Observation and evaluation of newborn for suspected infectious condition ruled out), Z05.42 (Observation and evaluation of newborn for suspected metabolic condition ruled out), and Z28.82 (Immunization not carried out because of caregiver refusal). Therefore, when principal diagnosis code P08.1 or P08.21 is reported, the case is currently assigned to MS-DRG 795, not MS-DRG 794. Similarly, when a principal diagnosis code from MDC 15, such as a diagnosis code from category Z38 (Liveborn infants according to place of birth and type of delivery) is reported, followed by ICD-10-CM code Q82.8, Z05.1, Z05.42, or Z28.82, the case is currently assigned to MS-DRG 795, not MS-DRG 794, as suggested by the commenters. We refer the reader to the ICD-10 MS-DRG Version 42 Definitions Manual (available on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms->

[drg-classifications-and-software](#)) for complete documentation of the GROUPER logic for MS-DRGs 794 and 795.

We will review the remaining diagnoses suggested by the commenters as we examine the GROUPER logic that would determine the assignment of cases to the MS-DRGs in MDC 15, including MS-DRGs 794 and 795. We note that we would address any proposed modifications to the existing logic in future rulemaking.

Comment: Other commenters disagreed with the proposal. A commenter noted that patients with ankyloglossia can struggle to breastfeed, are at risk of an early transition to formula, can be small for gestational age, and are at risk for malnutrition. Another commenter noted that contrary to statements in the proposed rule, frenotomy or frenectomy procedures are not as simple as once originally thought and can involve rare complications such as bleeding, airway obstruction, damage to surrounding structures, scarring, and oral aversion secondary to damage to the tongue, nerves, or salivary glands and further noted that when undergoing frenotomy without analgesia, researchers found that 18% of infants cried during and 60% cried after the procedure. This commenter stated that their analysis of claims from their facility indicated that of the approximately 1000 cases reporting a secondary diagnosis of ankyloglossia, frenectomy was performed in approximately 60 cases due to issues with breast feeding and 15% of those cases had a length of stay greater than or equal to 4 days.

A commenter disagreed with the proposal to remove ICD-10-CM diagnosis code P05.19 (newborn small for gestation age, other) from the logic for MS-DRG 794 and stated that newborns that are small for gestational age must undergo hypoglycemia screening, which includes the monitoring of glucose levels at 1, 2, 3, 12, and 24 hours of life and are at increased risk for complications such as neonatal asphyxia, hypothermia, hypoglycemia, hypocalcemia, polycythemia, sepsis, and death. This commenter stated review of the neonatal admissions at their facility supports that these neonates often require longer lengths of stay and utilize increased resources as 5% of approximately 800 cases reporting a secondary diagnosis of P05.19

had a length of stay greater or equal to 4 days. This commenter stated that should diagnosis codes P05.19 and Q38.1 be removed from the logic of MS-DRG 794, a new MS-DRG should be created to capture newborns with minor problems.

Response: We appreciate the commenters' feedback. We considered concerns expressed by the commenters and continue to believe that diagnoses P05.19 and Q38.1 generally do not prolong the inpatient admission of the newborn and newborns with these diagnoses generally receive standard follow-up care after birth. As discussed in the proposed rule, the description for ICD-10-CM diagnosis code P05.19 is "Newborn small for gestational age, other" and the inclusion term in the ICD-10-CM Tabular List of Diseases for this diagnosis code is "Newborn small for gestational age, 2500 grams and over." We continue to believe that most newborns who are moderately small for gestational age are healthy babies who just happen to be on the smaller side. We further note that under the proposal to reassign diagnosis code P05.19 from the "principal or secondary diagnosis" list under MS-DRG 794 to the "principal diagnosis" list under MS-DRG 795, cases reporting other codes from ICD-10-CM subcategory P05.1- (Newborns small for gestation age) describing newborns small for gestation age, 1999 grams or less, will continue to be assigned to MS-DRG 793 (Full Term Neonate with Major Problems). While we agree that newborns can require serial glucose monitoring after birth, blood glucose can be checked with just a few drops of blood, usually taken from the heel of the newborn and does not involve an invasive procedure.

Similarly, in infants with ankyloglossia indicated for frenotomy, the frenotomy is generally a quick, non-invasive procedure that can be done in a healthcare provider's office without anesthesia. Should the uncommon postprocedural complications noted by the commenter arise when frenotomy is performed in the inpatient setting, those complications should be reported to fully reflect the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the complication. We also note, as discussed in prior rulemaking (86 FR 44878), the MS-DRG system is a system of averages and it

is expected that within the diagnostic related groups, some cases may demonstrate higher than average costs, while other cases may demonstrate lower than average costs. We also provide outlier payments to mitigate extreme loss on individual cases.

We will review the suggestion to create an MS-DRG for newborns with minor problems as we examine the GROUPER logic that would determine the assignment of cases to the MS-DRGs in MDC 15 and would address any proposed modifications to the existing logic in future rulemaking.

Therefore, after consideration of the public comments we received, and for the reasons discussed, we are finalizing our proposal to reassign diagnosis code P05.19 from the “principal or secondary diagnosis” list under MS-DRG 794 to the “principal diagnosis” list under MS-DRG 795 (Normal Newborn), without modification, effective October 1, 2024, for FY 2025. We are also finalizing our proposal to add diagnosis codes Q38.1 and Q82.5 to the “only secondary diagnosis” list under MS-DRG 795 (Normal Newborn), without modification, effective October 1, 2024, for FY 2025. Under these finalizations, cases with a principal diagnosis described by an ICD-10-CM code from category Z38 (Liveborn infants according to place of birth and type of delivery), followed by codes P05.19, Q38.1, or Q82.5 will be assigned to MS-DRG 795.

As noted earlier and discussed in the proposed rule, we have started our examination of the GROUPER logic that would determine an assignment of cases to MS-DRGs in MDC 15. During this review, we stated in the proposed rule we noted the logic for MS-DRG 795 (Normal Newborn) includes five diagnosis codes from ICD-10-CM category Q81 (Epidermolysis bullosa). We refer the reader to the ICD-10 MS-DRG Version 41.1 Definitions Manual (available via on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic for MS-DRG 795. The five diagnosis codes and their current MDC and MS-DRG assignments are listed in the following table.

ICD-10-CM Code	Description	MDC	MS-DRG
Q81.0	Epidermolysis bullosa simplex	09	

Q81.1	Epidermolysis bullosa letalis	15	606 and 607 (Minor Skin Disorders with MCC and without MCC, respectively) 795 (Normal Newborn)
Q81.2	Epidermolysis bullosa dystrophica		
Q81.8	Other epidermolysis bullosa		
Q81.9	Epidermolysis bullosa, unspecified		

In the proposed rule we stated we reviewed this grouping issue and noted that epidermolysis bullosa (EB) is a group of genetic (inherited) disorders that causes skin to be fragile, blister, and tear easily in response to minimal friction or trauma. In some cases, blisters form inside the body in places such as the mouth, esophagus, other internal organs, or eyes. When the blisters heal, they can cause painful scarring. In severe cases, the blisters and scars can harm internal organs and tissue enough to be fatal. Patients diagnosed with severe cases of EB have a life expectancy that ranges from infancy to 30 years of age.

We noted in the proposed rule that EB has four primary types: simplex, junctional, dystrophic, and Kindler syndrome, and within each type there are various subtypes, ranging from mild to severe. A skin biopsy can confirm a diagnosis of EB and identify which layers of the skin are affected and determine the type of epidermolysis bullosa. Genetic testing may also be ordered to diagnose the specific type and subtype of the disease. In caring for patients with EB, adaptations may be necessary in the form of handling, feeding, dressing, managing pain, and treating wounds caused by the blisters and tears. If there is a known diagnosis of EB, but the neonate has no physical signs at birth, there will still need to be specialty consultation in the inpatient setting or referral for outpatient follow-up. We stated we believe the five diagnosis codes from ICD-10-CM category Q81 (Epidermolysis bullosa) describe conditions that require advanced care and resources similar to other conditions already assigned to the logic of MS-DRG 794 and MS-DRGs 595 and 596 (Major Skin Disorders with MCC and without MCC, respectively), even in cases where the type of EB is unspecified.

Therefore, for clinical consistency, we proposed to reassign ICD-10-CM diagnosis codes Q81.0, Q81.1, Q81.2, Q81.8, and Q81.9 from MS-DRGs 606 and 607 in MDC 09 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast) and MS-DRG 795 (Normal Newborn) in

MDC 15 to MS-DRGs 595 and 596 in MDC 09 and MS-DRG 794 in MDC 15, effective October 1, 2024, for FY 2025.

Comment: Commenters expressed support for the proposal to reassign ICD-10-CM diagnosis codes Q81.0, Q81.1, Q81.2, Q81.8, and Q81.9 from MS-DRGs 606 and 607 in MDC 09 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast) and MS-DRG 795 (Normal Newborn) in MDC 15 to MS-DRGs 595 and 596 in MDC 09 and MS-DRG 794 in MDC 15 for FY 2025.

Response: We appreciate the commenters support.

After consideration of the public comments we received, we are finalizing our proposal to reassign ICD-10-CM diagnosis codes Q81.0, Q81.1, Q81.2, Q81.8, and Q81.9 from MS-DRGs 606 and 607 in MDC 09 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast) and MS-DRG 795 (Normal Newborn) in MDC 15 to MS-DRGs 595 and 596 (Major Skin Disorders with MCC and without MCC, respectively) in MDC 09 and MS-DRG 794 (Neonate with Other Significant Problems) in MDC 15, without modification, effective October 1, 2024, for FY 2025.

9. MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms):
Acute Leukemia

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35986 through 35991), we identified a replication issue from the ICD-9 based MS-DRGs to the ICD-10 based MS-DRGs regarding the assignment of six ICD-10-CM diagnosis codes that describe a type of acute leukemia. We noted that under the Version 32 ICD-9-CM based MS-DRGs, the ICD-9-CM diagnosis codes as shown in the following table were assigned to surgical MS-DRGs 820, 821, and 822 (Lymphoma and Leukemia with Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively), surgical MS-DRGs 823, 824, and 825 (Lymphoma and Non-Acute Leukemia with Other Procedures with MCC, with CC, and without CC/MCC, respectively), and medical MS-DRGs 840, 841, and 842 (Lymphoma and Non-Acute Leukemia

with MCC, with CC, and without CC/MCC, respectively) in MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms). The six ICD-10-PCS code translations also shown in the following table, that provide more detailed and specific information for the ICD-9-CM codes reflected, also currently group to MS-DRGs 820, 821, 822, 823, 824, 825, 840, 841 and 842 in the ICD-10 MS-DRGs Version 41.1. We refer the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1 (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for complete documentation of the GROUPER logic for MS-DRGs 820, 821, 822, 823, 824, 825, 840, 841, and 842.

ICD-9-CM Diagnosis Code	Description	ICD-10-CM Diagnosis Code	Description
207.20	Megakaryocytic leukemia, without mention of having achieved remission	C94.20	Acute megakaryoblastic leukemia not having achieved remission
207.21	Megakaryocytic leukemia, in remission	C94.21	Acute megakaryoblastic leukemia, in remission
207.22	Megakaryocytic leukemia, in relapse	C94.22	Acute megakaryoblastic leukemia, in relapse
238.79	Other lymphatic and hematopoietic tissues	C94.40	Acute panmyelosis with myelofibrosis not having achieved remission
238.79	Other lymphatic and hematopoietic tissues	C94.41	Acute panmyelosis with myelofibrosis, in remission
238.79	Other lymphatic and hematopoietic tissues	C94.42	Acute panmyelosis with myelofibrosis, in relapse

In the proposed rule we stated that during our review of this issue, we noted that under ICD-9-CM, the diagnosis codes as reflected in the table did not describe the acuity of the diagnosis (for example, acute versus chronic). This is in contrast to their six comparable ICD-10-CM code translations listed in the previous table that provide more detailed and specific information for the ICD-9-CM diagnosis codes and do specify the acuity of the diagnoses.

We noted in the proposed rule that ICD-10-CM codes C94.20, C94.21, and C94.22 describe acute megakaryoblastic leukemia (AMKL), a rare subtype of acute myeloid leukemia (AML) that affects megakaryocytes, platelet-producing cells that reside in the bone marrow. Similarly, ICD-10-CM codes C94.40, C94.41, and C94.42 describe acute panmyelosis with myelofibrosis (APMF), a rare form of acute myeloid leukemia characterized by acute

panmyeloid proliferation with increased blasts and accompanying fibrosis of the bone marrow that does not meet the criteria for AML with myelodysplasia related changes. As previously mentioned, these six diagnosis codes are assigned to MS-DRGs 820, 821, 822, 823, 824, 825, 840, 841, and 842. In the proposed rule, we noted that GROUPER logic lists for MS-DRGs 820, 821, and 822 includes diagnosis codes describing lymphoma and both acute and non-acute leukemias, however the logic lists for MS-DRGs 823, 824, 825, 840, 841, and 842 contain diagnosis codes describing lymphoma and non-acute leukemias. We stated that in our analysis of this grouping issue, we also noted that cases reporting a chemotherapy principal diagnosis with a secondary diagnosis describing acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis are assigned to MS-DRGs 846, 847, and 848 (Chemotherapy without Acute Leukemia as Secondary Diagnosis, with MCC, with CC, and without CC/MCC, respectively) in Version 41.1.

Next, in the proposed rule we stated we examined claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRG 823, 824, 825, 840, 841, and 842 to identify cases reporting one of the six diagnosis codes listed previously that describe acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis. We also examined MS-DRGs 846, 847, and 848 (Chemotherapy without Acute Leukemia as Secondary Diagnosis, with MCC, with CC, and without CC/MCC, respectively). Our findings are shown in the following tables:

MS-DRGs 823, 824, and 825: All Cases and Cases Reporting Diagnosis Codes Describing Acute Megakaryoblastic Leukemia or Acute Panmyelosis with Myelofibrosis				
MS-DRG		Number of Cases	Average Length of Stay	Average Costs
823	All cases	2,235	14	\$40,587
	Cases with C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	2	31.5	\$49,600
824	All cases	1,764	6.8	\$19,262
	Cases with C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	0	0	\$0
825	All Cases	427	2.9	\$10,959
	Cases with C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	1	6	\$17,293

As shown in the table, in MS-DRG 823, we identified a total of 2,235 cases with an average length of stay of 14 days and average costs of \$40,587. Of those 2,235 cases, there were two cases reporting a diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis, with average costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 823 (\$49,600 compared to \$40,587) and a longer average length of stay (31.5 days compared to 14 days). We found zero cases in MS-DRG 824 reporting a diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis. In MS-DRG 825, we identified a total of 427 cases with an average length of stay of 2.9 days and average costs of \$10,959. Of those 427 cases, there was one case reporting a diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis, with costs higher than the average costs in the FY 2023 MedPAR file for MS-DRG 825 (\$17,293 compared to \$10,959) and a longer length of stay (6 days compared to 2.9 days).

MS-DRGs 840, 841, and 842: All Cases and Cases Reporting Diagnosis Codes Describing Acute Megakaryoblastic Leukemia or Acute Panmyelosis with Myelofibrosis				
MS-DRG		Number of Cases	Average Length of Stay	Average Costs
840	All cases	7,747	9.6	\$26,215
	Cases with C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	12	8.7	\$21,357
841	All cases	5,019	5.3	\$13,502
	Cases with C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	6	2.8	\$6,976
842	All Cases	726	3.4	\$9,272
	Cases with C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	0	0	\$0

As shown in the table, in MS-DRG 840, we identified a total of 7,747 cases with an average length of stay of 9.6 days and average costs of \$26,215. Of those 7,747 cases, there were 12 cases reporting a diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis, with average costs lower than the average costs in the FY 2023 MedPAR file for MS-DRG 840 (\$21,357 compared to \$26,215) and a shorter average length of stay (8.7 days compared to 9.6 days). In MS-DRG 841, we identified a total of 5,019 cases with an average length of stay of 5.3 days and average costs of \$13,502. Of those 5,019

cases, there were six cases reporting a diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis, with average costs lower than the average costs in the FY 2023 MedPAR file for MS-DRG 841 (\$6,976 compared to \$13,502) and a shorter average length of stay (2.8 days compared to 5.3 days). We found zero cases in MS-DRG 842 reporting a diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis.

MS-DRGs 846, 847, and 848: All Cases and Cases with a Chemotherapy Principal Diagnosis Code and a Secondary Diagnosis Code Describing Acute Megakaryoblastic Leukemia or Acute Panmyelosis with Myelofibrosis				
MS-DRG		Number of Cases	Average Length of Stay	Average Costs
846	All cases	2,936	8	\$22,705
	Cases with a chemotherapy principal diagnosis code with a secondary diagnosis code of C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	0	0	\$0
847	All cases	7,329	4.4	\$11,250
	Cases with a chemotherapy principal diagnosis code with a secondary diagnosis code of C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	2	5	\$7,569
848	All Cases	113	3.1	\$7,347
	Cases with a chemotherapy principal diagnosis code with a secondary diagnosis code of C94.20, C94.21, C94.22, C94.40, C94.41, or C94.42	0	0	\$0

As shown in the table, in MS-DRG 847, we identified a total of 7,329 cases with an average length of stay of 4.4 days and average costs of \$11,250. Of those 7,329 cases, there were two cases reporting a chemotherapy principal diagnosis code with a secondary diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis, with average costs lower than the average costs in the FY 2023 MedPAR file for MS-DRG 840 (\$7,569 compared to \$11,250) and a longer average length of stay (5 days compared to 4.4 days). We found zero cases in MS-DRGs 846 and 848 reporting a diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis.

As discussed in the proposed rule, next, we examined the MS-DRGs within MDC 17. Given that the six diagnoses codes describe subtypes of acute myeloid leukemia, we stated that we determined that the cases reporting a principal diagnosis of acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis would more suitably group to medical MS-DRGs 834, 835, and 836 (Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without

CC/MCC, respectively). Similarly, we stated cases reporting a chemotherapy principal diagnosis with a secondary diagnosis describing acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis would more suitably group to medical MS-DRGs 837, 838, and 839 (Chemotherapy with Acute Leukemia as Secondary Diagnosis, or with High Dose Chemotherapy Agent with MCC, with CC or High Dose Chemotherapy Agent, and without CC/MCC, respectively).

We stated we then examined claims data from the September 2023 update of the FY 2023 MedPAR for MS-DRGs 834, 835, 836, 837, 838, and 839. Our findings are shown in the following table.

MS-DRG	Description	Number of Cases	Average Length of Stay	Average Costs
834	Acute Leukemia without Major O.R. Procedures with MCC	4,094	16.3	\$49,986
835	Acute Leukemia without Major O.R. Procedures with CC	1,682	7.2	\$19,023
836	Acute Leukemia without Major O.R. Procedures without CC/MCC	230	4	\$11,225
837	Chemotherapy with Acute Leukemia as Secondary Diagnosis or with High Dose Chemotherapy Agent with MCC	1,567	15.3	\$43,195
838	Chemotherapy with Acute Leukemia as Secondary Diagnosis with CC or High Dose Chemotherapy Agent	1,131	6.7	\$18,162
839	Chemotherapy with Acute Leukemia as Secondary Diagnosis without CC/MCC	502	4.4	\$12,417

While the average costs for all cases in MS-DRGs 834, 835, 836, 837, 838, and 839 are higher than the average costs of the small number of cases reporting a diagnosis code that describes acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis, or reporting a chemotherapy principal diagnosis with a secondary diagnosis describing acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis, and the average lengths of stay are longer, we noted that diagnosis codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 describe types of acute leukemia. In the proposed rule we stated that for clinical coherence, we believe these six diagnosis codes would be more appropriately grouped along with other ICD-10-CM diagnosis codes that describe types of acute leukemia.

We reviewed this grouping issue, and stated our analysis indicates that the six diagnosis codes describing the acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis

were initially assigned to the list of diagnoses in the GROUPER logic for MS-DRGs 823, 824, 825, 840, 841, and 842 as a result of replication in the transition from ICD-9 to ICD-10 based MS-DRGs. We also noted that diagnosis codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 do not describe non-acute leukemia diagnoses.

Accordingly, because the six diagnosis codes that describe acute megakaryoblastic leukemia or acute panmyelosis with myelofibrosis are not clinically consistent with non-acute leukemia diagnoses, and it is clinically appropriate to reassign these diagnosis codes to be consistent with the other diagnosis codes that describe acute leukemias in MS-DRGs 834, 835, 836, 837, 838, and 839, we proposed the reassignment of diagnosis codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 from MS-DRGs 823, 824, and 825 (Lymphoma and Non-Acute Leukemia with Other Procedures with MCC, with CC, and without CC/MCC, respectively), and MS-DRGs 840, 841, and 842 (Lymphoma and Non-Acute Leukemia with MCC, with CC, and without CC/MCC, respectively) to MS-DRGs 834, 835, and 836 (Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) and MS-DRGs 837, 838, and 839 (Chemotherapy with Acute Leukemia as Secondary Diagnosis, or with High Dose Chemotherapy Agent with MCC, with CC or High Dose Chemotherapy Agent, and without CC/MCC, respectively) in MDC 17, effective FY 2025. Under this proposal, diagnosis codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 will continue to be assigned to surgical MS-DRGs 820, 821, and 822 (Lymphoma and Leukemia with Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively).

Comment: Commenters supported our proposal to reassign diagnosis codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 from MS-DRGs 823, 824, and 825 and MS-DRGs 840, 841, and 842 to MS-DRGs 834, 835, and 836 and MS-DRGs 837, 838, and 839 in MDC 17.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to reassign diagnosis codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 from MS-DRGs

823, 824, and 825 (Lymphoma and Non-Acute Leukemia with Other Procedures with MCC, with CC, and without CC/MCC, respectively), and MS-DRGs 840, 841, and 842 (Lymphoma and Non-Acute Leukemia with MCC, with CC, and without CC/MCC, respectively) to MS-DRGs 834, 835, and 836 (Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) and MS-DRGs 837, 838, and 839 (Chemotherapy with Acute Leukemia as Secondary Diagnosis, or with High Dose Chemotherapy Agent with MCC, with CC or High Dose Chemotherapy Agent, and without CC/MCC, respectively) in MDC 17, without modification, effective October 1, 2024, for FY 2025. Under this finalization, diagnosis codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 will continue to be assigned to surgical MS-DRGs 820, 821, and 822 (Lymphoma and Leukemia with Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively).

As discussed in the proposed rule, in our review of the MS-DRGs in MDC 17 for further refinement, we next examined the procedures currently assigned to MS-DRGs 820, 821, and 822 (Lymphoma and Leukemia with Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) and MS-DRGs 826, 827, and 828 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively). We noted that the logic for case assignment to MS-DRGs 820, 821, 822, 826, 827, and 828 is comprised of a logic list entitled “Operating Room Procedures” which is defined by a list of 4,320 ICD-10-PCS procedure codes, including 90 ICD-10-PCS codes describing bypass procedures from the cerebral ventricle to various body parts. We refer the reader to the ICD-10 MS-DRG Definitions Manual Version 41.1 (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>) for complete documentation of the GROUPER logic for MS-DRGs 820, 821, 822, 826, 827, and 828.

In the proposed rule we stated in our review of the procedures currently assigned to MS-DRGs 820, 821, 822, 826, 827, and 828, we noted 12 ICD-10-PCS procedure codes that describe

bypass procedures from the cerebral ventricle to the subgaleal space or cerebral cisterns, such as subgaleal or cisternal shunt placement, that are not included in the logic for MS-DRGs 820, 821, 822, 826, 827, and 828. The 12 procedure codes are listed in the following table.

ICD-10-PCS Code	Description
001607A	Bypass cerebral ventricle to subgaleal space with autologous tissue substitute, open approach
00160JA	Bypass cerebral ventricle to subgaleal space with synthetic substitute, open approach
00160KA	Bypass cerebral ventricle to subgaleal space with nonautologous tissue substitute, open approach
00160ZB	Bypass cerebral ventricle to cerebral cisterns, open approach
001637A	Bypass cerebral ventricle to subgaleal space with autologous tissue substitute, percutaneous approach
00163JA	Bypass cerebral ventricle to subgaleal space with synthetic substitute, percutaneous approach
00163KA	Bypass cerebral ventricle to subgaleal space with nonautologous tissue substitute, percutaneous approach
00163ZB	Bypass cerebral ventricle to cerebral cisterns, percutaneous approach
001647A	Bypass cerebral ventricle to subgaleal space with autologous tissue substitute, percutaneous endoscopic approach
00164JA	Bypass cerebral ventricle to subgaleal space with synthetic substitute, percutaneous endoscopic approach
00164KA	Bypass cerebral ventricle to subgaleal space with nonautologous tissue substitute, percutaneous endoscopic approach
00164ZB	Bypass cerebral ventricle to cerebral cisterns, percutaneous endoscopic approach

We noted in the proposed rule that a subgaleal shunt consists of a shunt tube with one end in the lateral ventricles while the other end is inserted into the subgaleal space of the scalp, while a ventriculo-cisternal shunt diverts the cerebrospinal fluid flow from one of the lateral ventricles, via a ventricular catheter, to the cisterna magna of the posterior fossa. Both procedures allow for the drainage of excess cerebrospinal fluid. Indications for ventriculosubgaleal or ventriculo-cisternal shunting include acute head trauma, subdural hematoma, hydrocephalus, and leptomenigeal disease (LMD) in malignancies such as breast cancer, lung cancer, melanoma, acute lymphocytic leukemia (ALL) and non-hodgkin's lymphoma (NHL).

Recognizing that acute lymphocytic leukemia (ALL) and non-hodgkin's lymphoma (NHL) are indications for ventriculosubgaleal or ventriculo-cisternal shunting, in the proposed rule we stated we supported adding the 12 ICD-10-PCS codes identified in the table to MS-DRGs 820, 821, 822, 826, 827, and 828 in MDC 17 for consistency to align with the procedure codes listed in the definition of MS-DRGs 820, 821, 822, 826, 827, and 828 and also to permit proper case assignment when a principal diagnosis from MDC 17 is reported with one of the procedure codes in the table that describes bypass procedures from the cerebral ventricle to the subgaleal space or cerebral cisterns. Therefore, we proposed to add the 12 procedure codes that

describe bypass procedures from the cerebral ventricle to the subgaleal space or cerebral cisterns listed previously to MS-DRGs 820, 821, 822, 826, 827, and 828 in MDC 17 for FY 2025.

Comment: Commenters agreed with the proposal to add the 12 procedure codes that describe bypass procedures from the cerebral ventricle to the subgaleal space or cerebral cisterns to MS-DRGs 820, 821, 822, 826, 827, and 828 in MDC 17.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to add the 12 procedure codes that describe bypass procedures from the cerebral ventricle to the subgaleal space or cerebral cisterns listed previously to MS-DRGs 820, 821, 822, 826, 827, and 828 in MDC 17, without modification, effective October 1, 2024, for FY 2025.

Lastly, as discussed in the proposed rule, in our analysis of the MS-DRGs in MDC 17 for further refinement, we noted that the logic for case assignment to medical MS-DRGs 834, 835, and 836 (Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) as displayed in the ICD-10 MS-DRG Version 41.1 Definitions Manual (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>) is comprised of a logic list entitled “Principal Diagnosis” and is defined by a list of 27 ICD-10-CM diagnosis codes describing various types of acute leukemias. We noted that when any one of the 27 listed diagnosis codes from the “Principal Diagnosis” logic list is reported as a principal diagnosis, without a procedure code designated as an O.R. procedure or without a procedure code designated as a non-O.R. procedure that affects the MS-DRG, the case results in assignment to MS-DRG 834, 835, or 836 depending on the presence of any additional MCC or CC secondary diagnoses. We noted however, that while not displayed in the ICD-10 MS-DRG Version 41.1 Definitions Manual, when any one of the 27 listed diagnosis codes from the “Principal Diagnosis” logic list is reported as a principal diagnosis, along with a procedure code designated as an O.R. procedure that is not listed in the logic list of MS-DRGs 820, 821, and 822 (Lymphoma and Leukemia with Major O.R.

Procedures with MCC, with CC, and without CC/MCC, respectively), the case also results in assignment to medical MS-DRG 834, 835, or 836 depending on the presence of any additional MCC or CC secondary diagnoses.

As medical MS-DRG 834, 835, and 836 contains GROUPER logic that includes ICD-10-PCS procedure codes designated as O.R. procedures, in the proposed rule we stated we examined claims data from the September 2023 update of the FY 2023 MedPAR file for MS-DRG 834, 835, and 836 to identify cases reporting an O.R. procedure. Our findings are shown in the following table:

MS-DRGs 834, 835, and 836: All Cases and Cases Reporting an O.R. Procedure				
MS-DRG		Number of Cases	Average Length of Stay	Average Costs
834	All cases	4,094	16.3	\$49,986
	Cases reporting an O.R. procedure	277	28.2	\$92,246
835	All cases	1,682	7.2	\$19,023
	Cases reporting an O.R. procedure	79	10.4	\$30,771
836	All Cases	230	4	\$11,225
	Cases reporting an O.R. procedure	7	5.9	\$17,950

As shown by the table, in MS-DRG 834, we identified a total of 4,094 cases, with an average length of stay of 16.3 days and average costs of \$49,986. Of those 4,094 cases, there were 277 cases reporting an O.R. procedure, with higher average costs as compared to all cases in MS-DRG 834 (\$92,246 compared to \$49,986), and a longer average length of stay (28.2 days compared to 16.3 days). In MS-DRG 835, we identified a total of 1,682 cases with an average length of stay of 7.2 days and average costs of \$19,023. Of those 1,682 cases, there were 79 cases reporting an O.R. procedure, with higher average costs as compared to all cases in MS-DRG 835 (\$30,771 compared to \$19,023), and a longer average length of stay (10.4 days compared to 7.2 days). In MS-DRG 836, we identified a total of 230 cases with an average length of stay of 4 days and average costs of \$11,225. Of those 230 cases, there were 7 cases reporting an O.R. procedure, with higher average costs as compared to all cases in MS-DRG 836 (\$17,950 compared to \$11,225), and a longer average length of stay (5.9 days compared to 4

days). We stated that the data analysis shows that the average costs of cases reporting an O.R. procedure are higher than for all cases in their respective MS-DRG.

We stated in the proposed rule that the data analysis clearly shows that cases reporting a principal diagnosis code describing a type of acute leukemia with an ICD-10-PCS procedure code designated as O.R. procedure that is not listed in the logic list of MS-DRGs 820, 821, and 822 have higher average costs and longer lengths of stay compared to all the cases in their assigned MS-DRG. For these reasons, we proposed to create a new surgical MS-DRG for cases reporting a principal diagnosis code describing a type of acute leukemia with an O.R. procedure.

To compare and analyze the impact of our suggested modifications, as discussed in the proposed rule, we ran a simulation using the claims data from the September 2023 update of the FY 2023 MedPAR file. The following table illustrates our findings for all 367 cases reporting a principal diagnosis code describing a type of acute leukemia with an ICD-10-PCS procedure code designated as O.R. procedure that is not listed in the logic list of MS-DRGs 820, 821, and 822. We stated we believe the resulting proposed MS-DRG assignment, reflecting these modifications, is more clinically homogeneous, coherent, and better reflects hospital resource use.

Proposed new MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX Acute Leukemia with Other Procedures	367	23.9	\$76,996

In the proposed rule, we stated we applied the criteria to create subgroups in a base MS-DRG as discussed in section II.C.1.b. of this FY 2025 IPPS/LTCH PPS proposed rule. As shown in the table, we identified a total of 367 cases using the claims data from the September 2023 update of the FY 2023 MedPAR file, so the criterion that there are at least 500 or more cases in each subgroup could not be met. Therefore, for FY 2025, we did not propose to subdivide the proposed new MS DRG for acute leukemia with other procedures into severity levels.

In summary, for FY 2025, we proposed to create a new base surgical MS-DRG for cases reporting a principal diagnosis describing a type of acute leukemia with an ICD-10-PCS procedure code designated as an O.R. procedure that is not listed in the logic list of MS-DRGs 820, 821, and 822 in MDC 17. The proposed new MS-DRG is proposed new MS-DRG 850 (Acute Leukemia with Other Procedures). We proposed to add the 27 ICD-10-CM diagnosis codes describing various types of acute leukemias currently listed in the logic list entitled “Principal Diagnosis” in MS-DRGs 834, 835, and 836 as well as ICD-10-CM codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 discussed earlier in this section to the proposed new MS-DRG 850. We also proposed to add the procedure codes from current MS-DRGs 823, 824, and 825 (Lymphoma and Non-Acute Leukemia with Other Procedures with MCC, with CC, and without CC/MCC, respectively) to the proposed new MS-DRG 850. In the proposed rule, we noted that in the current logic list of MS-DRGs 823, 824, and 825 there are 189 procedure codes describing stereotactic radiosurgery of various body parts that are designated as non-O.R. procedures affecting the MS-DRG, therefore, as part of the logic for new MS-DRG 850, we also proposed to designate these 189 codes as non-O.R. procedures affecting the MS-DRG.

In addition, we proposed to revise the titles for MS-DRGs 834, 835, and 836 by deleting the reference to “Major O.R. Procedures” in the title. Specifically, we proposed to revise the titles of medical MS-DRGs 834, 835, and 836 from “Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without CC/MCC”, respectively to “Acute Leukemia with MCC, with CC, and without CC/MCC”, respectively to better reflect the GROUPER logic that will no longer include ICD-10-PCS procedure codes designated as O.R. procedures. We refer the reader to section II.C.15. of the preamble of this final rule for the discussion of the surgical hierarchy and the complete list of our proposed modifications to the surgical hierarchy as well as our finalization of those proposals.

Comment: Commenters supported the proposal to create new surgical MS-DRG 850 for cases reporting a principal diagnosis code describing a type of acute leukemia with an O.R.

procedure in MDC 17. Commenters also supported the proposal to revise the titles of medical MS-DRGs 834, 835, and 836 from “Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without CC/MCC”, respectively to “Acute Leukemia with MCC, with CC, and without CC/MCC”. Several commenters stated they appreciate CMS’ continued analysis and refinement in this MDC and the recognition of the increased resource intensity involved in acute leukemia cases with certain operating room procedures. Another commenter stated they appreciate the agency’s detailed explanation and stated they support the changes as proposed.

Response: We thank the commenters for their support.

Comment: While supporting the creation of a new MS-DRG for cases reporting a principal diagnosis describing a type of acute leukemia with an ICD-10-PCS procedure code designated as O.R. procedure that is not listed in the logic list of MS-DRGs 820, 821, and 822 in MDC 17, a few commenters suggested that CMS reconsider the criteria for determining subgroups with small population MS-DRGs such as proposed new MS-DRG 850. According to these commenters, while the data clearly shows differences in the average costs and average lengths of stay in cases reporting secondary diagnoses designated as MCCs, CCs, and NonCCs, the criterion that there are at least 500 or more cases in each subgroup could not be met as only 367 cases were identified, therefore, CMS did not propose to subdivide the proposed new MS DRG for acute leukemia with other procedures into severity levels.

Response: We thank the commenters for their support and feedback. With regard to the suggestion that CMS reconsider the criteria for determining subgroups with small population MS-DRGs, we note in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58448), we finalized our proposal to expand our existing criteria to create a new complication or comorbidity (CC) or major complication or comorbidity (MCC) subgroup within a base MS-DRG. Specifically, we finalized the expansion of the criteria to include the NonCC subgroup for a three-way severity level split. We stated we believed that applying these criteria to the NonCC subgroup would

better reflect resource stratification as well as promote stability in the relative weights by avoiding low volume counts for the NonCC level MS-DRGs.

As further discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58659 through 58660), the minimum case volume requirements were established to avoid overly fragmenting the MS-DRG classification system. We stated that with smaller volumes, the MS-DRGs will be subject to stochastic (unpredictable) effects. We continue to believe that stability of MS-DRG payment is an important objective and therefore, that a volume criterion is a needed adjunct to cost differentiation. We established a 500-case minimum to support this stability. Additionally, we note that in examining the claims data from the September 2023 update of the FY 2023 MedPAR file to identify cases reporting an O.R. procedure and a principal diagnosis code describing various types of acute leukemias, there were only 7 cases reporting an O.R. procedure with a principal diagnosis code describing various types of acute leukemias, without reporting a secondary diagnosis designated as a CC or an MCC. As stated in the proposed rule (89 FR 36021), we set a threshold of 10 cases as the minimum number of cases required to compute a reasonable weight for an MS-DRG. Fewer than 10 cases does not provide sufficient data to set accurate and stable cost relative weights.

We also note, as discussed in prior rulemaking (86 FR 44878), the MS-DRG system is a system of averages and it is expected that within the diagnostic related groups, some cases may demonstrate higher than average costs, while other cases may demonstrate lower than average costs. We also provide outlier payments to mitigate extreme loss on individual cases.

We refer the reader to section II.C.1.b. of the preamble of this final rule for related discussion regarding our finalization of the expansion of the criteria to include the NonCC subgroup in the FY 2021 final rule and our finalization of the proposal to continue to delay application of the NonCC subgroup criteria to existing MS-DRGs with a three-way severity level split for FY 2025.

After consideration of the public comments we received, and for the reasons discussed, we are finalizing our proposal to create new base surgical MS-DRG 850 (Acute Leukemia with Other Procedures) for cases reporting a principal diagnosis describing a type of acute leukemia with an ICD-10-PCS procedure code designated as an O.R. procedure that is not listed in the logic list of MS-DRGs 820, 821, and 822 in MDC 17, without modification, effective October 1, 2024, for FY 2025. Accordingly for FY 2025, we are finalizing our proposal to add the 27 ICD-10-CM diagnosis codes describing various types of acute leukemias currently listed in the logic list entitled “Principal Diagnosis” in MS-DRGs 834, 835, and 836 as well as ICD-10-CM codes C94.20, C94.21, C94.22, C94.40, C94.41, and C94.42 discussed earlier in this section to new MS-DRG 850. We are finalizing our proposal to add the procedure codes from current MS-DRGs 823, 824, and 825 (Lymphoma and Non-Acute Leukemia with Other Procedures with MCC, with CC, and without CC/MCC, respectively) to new MS-DRG 850. In addition, we are also finalizing our proposal to designate the 189 codes describing stereotactic radiosurgery of various body parts as non-O.R. procedures affecting the MS-DRG as part of the logic for new MS-DRG 850 for FY 2025.

Lastly, we are finalizing our proposal to revise the titles for medical MS-DRGs 834, 835, and 836 from “Acute Leukemia without Major O.R. Procedures with MCC, with CC, and without CC/MCC”, respectively to “Acute Leukemia with MCC, with CC, and without CC/MCC”, respectively for FY 2025.

10. Review of Procedure Codes in MS-DRGs 981 Through 983 and 987 Through 989

We annually conduct a review of procedures producing assignment to MS-DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or MS-DRGs 987 through 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) on the basis of volume, by procedure, to see if it would be appropriate to move cases reporting these procedure codes out of these MS-DRGs into one of the surgical MS-DRGs

for the MDC into which the principal diagnosis falls. The data are arrayed in two ways for comparison purposes. We look at a frequency count of each major operative procedure code. We also compare procedures across MDCs by volume of procedure codes within each MDC. We use this information to determine which procedure codes and diagnosis codes to examine.

We identify those procedures occurring in conjunction with certain principal diagnoses with sufficient frequency to justify adding them to one of the surgical MS-DRGs for the MDC in which the diagnosis falls. We also consider whether it would be more appropriate to move the principal diagnosis codes into the MDC to which the procedure is currently assigned.

Based on the results of our review of the claims data from the September 2023 update of the FY 2023 MedPAR file of cases found to group to MS-DRGs 981 through 983 or MS-DRGs 987 through 989, in the proposed rule (89 FR 35991) we stated we did not identify any cases for reassignment and did not propose to move any cases from MS-DRGs 981 through 983 or MS-DRGs 987 through 989 into a surgical MS-DRGs for the MDC into which the principal diagnosis or procedure is assigned.

In addition to the internal review of procedures producing assignment to MS-DRGs 981 through 983 or MS-DRGs 987 through 989, we also consider requests that we receive to examine cases found to group to MS-DRGs 981 through 983 or MS-DRGs 987 through 989 to determine if it would be appropriate to add procedure codes to one of the surgical MS-DRGs for the MDC into which the principal diagnosis falls or to move the principal diagnosis to the surgical MS-DRGs to which the procedure codes are assigned. As discussed in the proposed rule, we did not receive any requests suggesting reassignment.

We also review the list of ICD-10-PCS procedures that, when in combination with their principal diagnosis code, result in assignment to MS-DRGs 981 through 983, or 987 through 989, to ascertain whether any of those procedures should be reassigned from one of those two groups of MS-DRGs to the other group of MS-DRGs based on average costs and the length of stay. We look at the data for trends such as shifts in treatment practice or reporting practice that

would make the resulting MS-DRG assignment illogical. If we find these shifts, we would propose to move cases to keep the MS-DRGs clinically similar or to provide payment for the cases in a similar manner. Generally, we move only those procedures for which we have an adequate number of discharges to analyze the data.

Additionally, we also consider requests that we receive to examine cases found to group to MS-DRGs 981 through 983 or MS-DRGs 987 through 989 to determine if it would be appropriate for the cases to be reassigned from one of the MS-DRG groups to the other. Based on the results of our review of the claims data from the September 2023 update of the FY 2023 MedPAR file, in the proposed rule we stated we did not identify any cases for reassignment. We also did not receive any requests suggesting reassignment. Therefore, for FY 2025 we did not propose to move any cases reporting procedure codes from MS-DRGs 981 through 983 to MS-DRGs 987 through 989 or vice versa.

Comment: Commenters expressed support for CMS' proposal to not move any cases from MS-DRGs 981 through 983 or MS-DRGs 987 through 989 into a surgical MS-DRGs for the MDC into which the principal diagnosis or procedure is assigned. Commenters also expressed support for CMS' proposal to not move any cases reporting procedure codes from MS-DRGs 981 through 983 to MS-DRGs 987 through 989 or vice versa.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to not move any cases from MS-DRGs 981 through 983 or MS-DRGs 987 through 989 into a surgical MS-DRGs for the MDC into which the principal diagnosis or procedure is assigned. We are also finalizing, without modification, our proposal to not move any cases reporting procedure codes from MS-DRGs 981 through 983 to MS-DRGs 987 through 989 or vice versa.

11. Operating Room (O.R.) and Non-O.R. Procedures

a. Background

Under the IPPS MS-DRGs (and former CMS MS-DRGs), we have a list of procedure codes that are considered operating room (O.R.) procedures. Historically, we developed this list using physician panels that classified each procedure code based on the procedure and its effect on consumption of hospital resources. For example, generally the presence of a surgical procedure which required the use of the operating room would be expected to have a significant effect on the type of hospital resources (for example, operating room, recovery room, and anesthesia) used by a patient, and therefore, these patients were considered surgical. Because the claims data generally available do not precisely indicate whether a patient was taken to the operating room, surgical patients were identified based on the procedures that were performed.

Generally, if the procedure was not expected to require the use of the operating room, the patient would be considered medical (non-O.R.).

Currently, each ICD-10-PCS procedure code has designations that determine whether and in what way the presence of that procedure on a claim impacts the MS-DRG assignment. First, each ICD-10-PCS procedure code is either designated as an O.R. procedure for purposes of MS-DRG assignment (“O.R. procedures”) or is not designated as an O.R. procedure for purposes of MS-DRG assignment (“non-O.R. procedures”). Second, for each procedure that is designated as an O.R. procedure, that O.R. procedure is further classified as either extensive or non-extensive. Third, for each procedure that is designated as a non-O.R. procedure, that non-O.R. procedure is further classified as either affecting the MS-DRG assignment or not affecting the MS-DRG assignment. We refer to these designations that do affect MS-DRG assignment as “non O.R. affecting the MS-DRG.” For new procedure codes that have been finalized through the ICD-10 Coordination and Maintenance Committee meeting process and are proposed to be classified as O.R. procedures or non-O.R. procedures affecting the MS-DRG, we recommend the MS-DRG assignment which is then made available in association with the proposed rule (Table 6B. – New Procedure Codes) and subject to public comment. These proposed assignments are generally based on the assignment of predecessor codes or the assignment of similar codes. For example,

we generally examine the MS-DRG assignment for similar procedures, such as the other approaches for that procedure, to determine the most appropriate MS-DRG assignment for procedures proposed to be newly designated as O.R. procedures. As discussed in section II.C.13 of the preamble of this final rule, we are making Table 6B. – New Procedure Codes – FY 2025 available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps.html>. We also refer readers to the ICD-10 MS-DRG Version 41.1 Definitions Manual at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software.html> for detailed information regarding the designation of procedures as O.R. or non-O.R. (affecting the MS- DRG) in Appendix E--Operating Room Procedures and Procedure Code/MS-DRG Index.

In the FY 2020 IPPS/LTCH PPS proposed rule, we stated that, given the long period of time that has elapsed since the original O.R. (extensive and non-extensive) and non-O.R. designations were established, the incremental changes that have occurred to these O.R. and non-O.R. procedure code lists, and changes in the way inpatient care is delivered, we plan to conduct a comprehensive, systematic review of the ICD-10-PCS procedure codes. This will be a multiyear project during which we will also review the process for determining when a procedure is considered an operating room procedure. For example, we may restructure the current O.R. and non-O.R. designations for procedures by leveraging the detail that is now available in the ICD-10 claims data. We refer readers to the discussion regarding the designation of procedure codes in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38066) where we stated that the determination of when a procedure code should be designated as an O.R. procedure has become a much more complex task. This is, in part, due to the number of various approaches available in the ICD-10-PCS classification, as well as changes in medical practice. While we have typically evaluated procedures on the basis of whether or not they would be performed in an operating room, we believe that there may be other factors to consider with regard to resource utilization, particularly with the implementation of ICD-10.

We discussed in the FY 2020 IPPS/LTCH PPS proposed rule that as a result of this planned review and potential restructuring, procedures that are currently designated as O.R. procedures may no longer warrant that designation, and conversely, procedures that are currently designated as non-O.R. procedures may warrant an O.R. type of designation. We intend to consider the resources used and how a procedure should affect the MS-DRG assignment. We may also consider the effect of specific surgical approaches to evaluate whether to subdivide specific MS-DRGs based on a specific surgical approach. We stated we plan to utilize our available MedPAR claims data as a basis for this review and the input of our clinical advisors. As part of this comprehensive review of the procedure codes, we also intend to evaluate the MS-DRG assignment of the procedures and the current surgical hierarchy because both of these factor into the process of refining the ICD-10 MS-DRGs to better recognize complexity of service and resource utilization.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58540 through 58541), we provided a summary of the comments we had received in response to our request for feedback on what factors or criteria to consider in determining whether a procedure is designated as an O.R. procedure in the ICD-10-PCS classification system for future consideration. We also stated that in consideration of the PHE, we believed it may be appropriate to allow additional time for the claims data to stabilize prior to selecting the timeframe to analyze for this review.

We stated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58749) that we continue to believe additional time is necessary as we continue to develop our process and methodology. Therefore, we stated we will provide more detail on this analysis and the methodology for conducting this review in future rulemaking. In response to this discussion in the FY 2024 IPPS/LTCH PPS final rule, we received a comment by the October 20, 2023 deadline. As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35992), the commenter acknowledged that there is no easy rule that would allow CMS to designate certain surgeries as "non-O.R." procedures. The commenter stated that they believed that open procedures should

always be designated O.R. procedures and approaches other than open should not be a sole factor in designating a procedure as non-O.R. as some minimally invasive procedures using a percutaneous endoscopic approach require more training, specialized equipment, time, and resources than traditional open procedures. In addition, the commenter stated that whether a procedure is frequently or generally performed in the outpatient setting should not be used for determination of O.R. vs non-O.R. designation and noted that a surgery that can be performed in the outpatient setting for a clinically stable patient may not be able to be safely performed on a patient who is clinically unstable. The commenter also asserted that for procedures that can be performed in various locations within the hospital, that is, bedside vs operating room, there should be a mechanism to differentiate the setting of the procedure to determine the MS-DRG assignment, as in the commenter's assessment, the ICD-10 classification does not provide a way to indicate the severity of certain conditions, or the complexity of procedures performed.

As discussed in the proposed rule, CMS appreciates the commenter's feedback and recommendations as to factors to consider in evaluating O.R. designations. We stated we agree with the commenter and believe that there may be other factors to consider with regard to resource utilization. As discussed in the FY 2024 IPPS/LTCH PPS final rule, we have signaled in prior rulemaking that the designation of an O.R. procedure encompasses more than the physical location of the hospital room in which the procedure may be performed; in other words, the performance of a procedure in an operating room is not the sole determining factor we will consider as we examine the designation of a procedure in the ICD-10-PCS classification system. We are exploring alternatives on how we may restructure the current O.R. and non-O.R. designations for procedures by leveraging the detail that is available in the ICD-10 claims data.

Comment: Many commenters supported CMS' plan to continue to conduct the comprehensive, systematic review of the ICD-10-PCS codes and to evaluate their current O.R. and non-O.R. designations. These commenters expressed that they were supportive of CMS' decision to continue to develop our process and methodology. Other commenters stated they

agreed that the revolution in medical procedures in recent years may render the performance of a procedure in an O.R. a less critical distinction in driving payment policy. A commenter stated that because of technological advances, sophisticated, resource-intensive procedures are no longer confined to the O.R. setting and noted that in their observation, bi-plane radiology interventional suites and cardiac catheterization labs used for procedures such as mechanical thrombectomy or endovascular coiling for aneurysms can utilize more advanced equipment and supplies than a basic operating room with minimal installed equipment. Several commenters recommended that CMS provide detailed impact files prior to the adoption of changes to the designation of procedure codes in the ICD-10-PCS classification and stated that they look forward to commenting on CMS' data analysis and methodology in the future.

As part of the broader and continuing conversation about the designations of procedures in the ICD-10-PCS classification system, a few commenters recommended that CMS work closely with physician specialty societies and industry stakeholders to identify the most important drivers of complexity and resource use in the hospital setting. A commenter specifically recommended that CMS consider a technical expert panel (TEP) made up of industry stakeholders and experts to review methodologies for determining the designation of procedure codes in the ICD-10-PCS classification system. Another commenter encouraged CMS to consider factors such as:

- whether the procedure involves either the intentional non-transient alteration of structures of the body, or cutting into the body, or both;
- the surgical approach (e.g., open, percutaneous endoscopic or percutaneous approach);
- the requirement of either a surgeon or non-surgeon provider to be present during procedure;
- the complexity of procedures performed in an operating room, or a hybrid operating room, versus procedures performed in an electrophysiology laboratory;

- resource utilization requirements during the performance of the procedure in terms of the need for anesthesia and monitoring, etc.; and
- inpatient versus outpatient status.

Response: We thank the commenters for their support. We also thank commenters for sharing their views and their willingness to provide feedback and recommendations as to what factors to consider in evaluating O.R. versus non-O.R. designations. We agree with commenters and believe that there may be other factors to consider with regard to resource utilization, particularly with the implementation of ICD-10. While CMS has already convened an internal workgroup comprised of clinicians, consultants, coding specialists and other policy analysts, as well as provided opportunity to provide feedback as to what factors to consider in evaluating O.R. versus non-O.R. designations, we look forward to further input and feedback from interested parties. As discussed in the proposed rule, we are considering the feedback received to date on what factors and/or criteria to consider in determining whether a procedure is designated as an O.R. procedure in the ICD-10-PCS classification system as we continue to develop our process and methodology and will provide more detail on this analysis and the methodology for conducting this comprehensive review in future rulemaking. We encourage the public to continue to submit comments on any other factors to consider in our refinement efforts to recognize and differentiate consumption of resources for the ICD-10 MS-DRGs for consideration.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule, we did not receive any requests regarding changing the designation of specific ICD-10-PCS procedure codes from non-O.R. to O.R. procedures, or to change the designation from O.R. procedures to non-O.R. procedures by the October 20, 2023 deadline. In this section of this final rule, as we did in the proposed rule, we discuss the proposals we made based on our internal review and analysis and we discuss the process that was utilized for evaluating each procedure code. For each procedure, we considered--

- Whether the procedure would typically require the resources of an operating room;
- Whether it is an extensive or a non-extensive procedure; and
- To which MS-DRGs the procedure should be assigned.

We note that many MS-DRGs require the presence of any O.R. procedure. As a result, cases with a principal diagnosis associated with a particular MS-DRG would, by default, be grouped to that MS-DRG. Therefore, we do not list these MS-DRGs in our discussion in this section of this final rule. Instead, we only discuss MS-DRGs that require explicitly adding the relevant procedure codes to the GROUPER logic in order for those procedure codes to affect the MS-DRG assignment as intended.

For procedures that would not typically require the resources of an operating room, we determined if the procedure should affect the MS-DRG assignment. In cases where we proposed to change the designation of procedure codes from non-O.R. procedures to O.R. procedures, we also proposed one or more MS-DRGs with which these procedures are clinically aligned and to which the procedure code would be assigned.

In addition, cases that contain O.R. procedures will map to MS-DRGs 981, 982, or 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or MS-DRGs 987, 988, or 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) when they do not contain a principal diagnosis that corresponds to one of the MDCs to which that procedure is assigned. These procedures need not be assigned to MS-DRGs 981 through 989 in order for this to occur. Therefore, we did not specifically address that aspect in summarizing the proposals we made based on our internal review and analysis in the proposed rule and in this section of this final rule.

b. Non-O.R. Procedures to O.R. Procedures

(1) Laparoscopic Biopsy of Intestinal Body Parts

As discussed in the proposed rule (89 FR 35993), during our review, we noted inconsistencies in how procedures involving laparoscopic excisions of intestinal body parts are designated. Procedure codes describing the laparoscopic excision of intestinal body parts differ by qualifier. ICD-10-PCS procedure codes describing excisions of intestinal body parts with the diagnostic qualifier “X”, are used to report these procedures when performed for diagnostic purposes. We identified the following five related codes:

ICD-10-PCS Code	Description
0DBF4ZX	Excision of right large intestine, percutaneous endoscopic approach, diagnostic
0DBG4ZX	Excision of left large intestine, percutaneous endoscopic approach, diagnostic
0DBL4ZX	Excision of transverse colon, percutaneous endoscopic approach, diagnostic
0DBM4ZX	Excision of descending colon, percutaneous endoscopic approach, diagnostic
0DBN4ZX	Excision of sigmoid colon, percutaneous endoscopic approach, diagnostic

In the proposed rule, we noted the ICD-10-PCS procedure codes describing the laparoscopic excision of intestinal body parts for diagnostic purposes listed previously have been assigned different attributes in terms of designation as an O.R. or non-O.R. procedure when compared to similar procedures describing the laparoscopic excisions of intestinal body parts for nondiagnostic purposes. We noted in the ICD-10 MS-DRGs Version 41, these ICD-10-PCS codes are currently recognized as non-O.R. procedures for purposes of MS-DRG assignment, while similar excision of intestinal body part procedure codes with the same approach but different qualifiers are recognized as O.R. procedures.

As discussed in the proposed rule, upon further review and consideration, we stated we believe that procedure codes 0DBF4ZX, 0DBG4ZX, 0DBL4ZX, 0DBM4ZX and 0DBN4ZX describing a laparoscopic excision of an intestinal body parts for diagnostic purposes warrant designation as an O.R. procedures consistent with other laparoscopic excision procedures performed on the same intestinal body parts for nondiagnostic purposes. We stated we also believe it is clinically appropriate for these procedures to group to the same MS-DRGs as the procedures describing excision procedures performed on the intestinal body parts for nondiagnostic purposes. Therefore, we proposed to add procedure codes 0DBF4ZX, 0DBG4ZX, 0DBL4ZX, 0DBM4ZX and 0DBN4ZX to the FY 2025 ICD-10 MS-DRG Version 42 Definitions

Manual in Appendix E--Operating Room Procedures and Procedure Code/MS-DRG Index as O.R. procedures assigned to MS-DRG 264 (Other Circulatory System O.R. Procedures) in MDC 05 (Diseases and Disorders of the Circulatory System); MS-DRGs 329, 330, and 331 (Major Small and Large Bowel Procedures, with MCC, with CC, and without CC/MCC, respectively) in MDC 06 (Diseases and Disorders of the Digestive System); MS-DRGs 820, 821, and 822 (Lymphoma and Leukemia with Major O.R. Procedures with MCC, CC, without CC/MCC, respectively) and MS-DRGS 826, 827, and 828 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms); MS-DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively) in MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs); and MS-DRGs 957, 958, and 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC, and without CC/MCC, respectively) in MDC 24 (Multiple Significant Trauma).

Comment: Commenters supported the proposal to reclassify ICD-10-PCS procedure codes 0DBF4ZX (Excision of right large intestine, percutaneous endoscopic approach, diagnostic), 0DBG4ZX (Excision of left large intestine, percutaneous endoscopic approach, diagnostic), 0DBL4ZX (Excision of transverse colon, percutaneous endoscopic approach, diagnostic), 0DBM4ZX (Excision of descending colon, percutaneous endoscopic approach, diagnostic), and 0DBN4ZX (Excision of sigmoid colon, percutaneous endoscopic approach, diagnostic) as O.R. procedures for the purposes of MS-DRG assignment for FY 2025. A commenter stated they believed that laparoscopic procedures—whether diagnostic or nondiagnostic—will always be performed in an O.R. The commenter further urged CMS to publish O.R. versus non-O.R. designation data on its website for all ICD-10-PCS codes, not just new codes, so that specialty societies can more easily review and identify possible errors.

Response: We appreciate the commenters’ support and thank the commenter for their feedback. We also appreciate the commenter’s suggestion, however, as stated in the earlier in this section, and as we have signaled in prior rulemaking, the designation of an O.R. procedure encompasses more than the physical location of the hospital room in which the procedure may be performed. In other words, the performance of a procedure in an operating room is not the sole determining factor we consider as we examine the designation of a procedure in the ICD-10-PCS classification system. Additionally, we refer the commenter, and interested specialty societies, to Appendix E of the ICD-10 MS-DRG Version 42 Definitions Manual (which is available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software>) for a list of all the ICD-10-PCS procedure codes that affect MS-DRG assignment (that is, procedure codes designated as O.R. procedures or as non-O.R. procedures affecting the MS-DRG), the MDCs and MS-DRGs to which they are assigned, and a description of the surgical categories.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of procedure codes 0DBF4ZX, 0DBG4ZX, 0DBL4ZX, 0DBM4ZX and 0DBN4ZX from non-O.R. procedures to O.R. procedures, without modification, effective October 1, 2024.

(2) Laparoscopic Biopsy of Gallbladder and Pancreas

As discussed in the proposed rule (89 FR 35994), during our review, we noted inconsistencies in how procedures involving laparoscopic excisions of gallbladder or pancreas are designated. Procedure codes describing the laparoscopic excision of the gallbladder or pancreas differ by qualifier. The ICD-10-PCS procedure code describing an excision of the gallbladder and the procedure code describing an excision of the pancreas with the diagnostic qualifier “X”, are used to report these procedures when performed for diagnostic purposes. We stated we identified the following two related codes:

ICD-10-PCS Code	Description
0FB44ZX	Excision of gallbladder, percutaneous endoscopic approach, diagnostic

In the proposed rule, we noted the ICD-10-PCS procedure codes describing the laparoscopic excision of the gallbladder or the pancreas for diagnostic purposes listed previously have been assigned different attributes in terms of designation as an O.R. or a non-O.R. procedure when compared to similar procedures describing the laparoscopic excisions of the gallbladder or the pancreas for nondiagnostic purposes. In the ICD-10 MS-DRGs Version 41, these ICD-10-PCS codes are currently recognized as non-O.R. procedures for purposes of MS-DRG assignment, while similar excision of the gallbladder or the pancreas procedure codes with the same approach but different qualifiers are recognized as O.R. procedures.

As discussed in the proposed rule, upon further review and consideration, we stated we believe that procedure code 0FB44ZX describing a laparoscopic excision of the gallbladder for diagnostic purposes and procedure code 0FBG4ZX describing a laparoscopic excision of the pancreas for diagnostic purposes both warrant designation as an O.R. procedure consistent with other laparoscopic excision procedures performed on the same body parts for nondiagnostic purposes. We stated we also believe it is clinically appropriate for these procedures to group to the same MS-DRGs as the procedures describing excision procedures performed on the gallbladder or pancreas for nondiagnostic purposes. Therefore, we proposed to add procedure code 0FB44ZX to the FY 2025 ICD-10 MS-DRG Version 42 Definitions Manual in Appendix E--Operating Room Procedures and Procedure Code/MS-DRG Index as an O.R. procedure assigned to MS-DRGs 411, 412, and 413 (Cholecystectomy with C.D.E., with MCC, with CC, and without CC/MCC, respectively) and MS-DRGs 417, 418, and 419 (Laparoscopic Cholecystectomy without C.D.E., with MCC, with CC, and without CC/MCC, respectively) in MDC 07 (Diseases and Disorders of the Hepatobiliary System and Pancreas); MS-DRGs 820, 821, and 822 (Lymphoma and Leukemia with Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) and MS-DRGs 826, 827, and 828 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with MCC, with CC, and

without CC/MCC, respectively) in MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms); MS-DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively) in MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs); and MS-DRGs 957, 958, and 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC, and without CC/MCC, respectively) in MDC 24 (Multiple Significant Trauma).

We also proposed to add procedure code 0FBG4ZX to the FY 2025 ICD-10 MS-DRG Version 42 Definitions Manual in Appendix E--Operating Room Procedures and Procedure Code/MS-DRG Index as an O.R. procedure assigned to MS-DRGs 405, 406, and 407 (Pancreas, Liver and Shunt Procedures, with MCC, with CC, and without CC/MCC, respectively) in MDC 06 (Diseases and Disorders of the Digestive System); MS-DRGs 628, 629 and 630 (Other Endocrine, Nutritional and Metabolic O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders); MS-DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively) in MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs); and MS-DRGs 957, 958, and 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC, and without CC/MCC, respectively) in MDC 24 (Multiple Significant Trauma).

Comment: Commenters supported the proposal to reclassify ICD-10-PCS procedure codes 0FB44ZX (Excision of gallbladder, percutaneous endoscopic approach, diagnostic) and 0FBG4ZX (Excision of pancreas, percutaneous endoscopic approach, diagnostic) as O.R. procedures for the purposes of MS-DRG assignment for FY 2025.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of procedure codes 0FB44ZX and 0FBG4ZX from non-O.R. procedures to O.R. procedures, without modification, effective October 1, 2024.

12. Changes to the MS-DRG Diagnosis Codes for FY 2025

a. Background of the CC List and the CC Exclusions List

Under the IPPS MS-DRG classification system, we have developed a standard list of diagnoses that are considered CCs. Historically, we developed this list using physician panels that classified each diagnosis code based on whether the diagnosis, when present as a secondary condition, would be considered a substantial complication or comorbidity. A substantial complication or comorbidity was defined as a condition that, because of its presence with a specific principal diagnosis, would cause an increase in the length-of-stay by at least 1 day in at least 75 percent of the patients. However, depending on the principal diagnosis of the patient, some diagnoses on the basic list of complications and comorbidities may be excluded if they are closely related to the principal diagnosis. In FY 2008, we evaluated each diagnosis code to determine its impact on resource use and to determine the most appropriate CC subclassification (NonCC, CC, or MCC) assignment. We refer readers to sections II.D.2. and 3. of the preamble of the FY 2008 IPPS final rule with comment period for a discussion of the refinement of CCs in relation to the MS DRGs we adopted for FY 2008 (72 FR 47152 through 47171).

b. Overview of Comprehensive CC/MCC Analysis

In the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159), we described our process for establishing three different levels of CC severity into which we would subdivide the diagnosis codes. The categorization of diagnoses as a MCC, a CC, or a NonCC was accomplished using an iterative approach in which each diagnosis was evaluated to determine the extent to which its presence as a secondary diagnosis resulted in increased hospital resource use. We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) for a complete discussion of our approach. Since the comprehensive analysis was completed for FY 2008, we have evaluated diagnosis codes individually when assigning severity levels to new codes and when receiving requests to change the severity level of specific diagnosis codes.

We noted in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235 through 19246) that with the transition to ICD-10-CM and the significant changes that have occurred to diagnosis codes since the FY 2008 review, we believed it was necessary to conduct a comprehensive analysis once again. Based on this analysis, we proposed changes to the severity level designations for 1,492 ICD-10-CM diagnosis codes and invited public comments on those proposals. As summarized in the FY 2020 IPPS/LTCH PPS final rule, many commenters expressed concern with the proposed severity level designation changes overall and recommended that CMS conduct further analysis prior to finalizing any proposals. After careful consideration of the public comments we received, as discussed further in the FY 2020 IPPS/LTCH PPS final rule, we generally did not finalize our proposed changes to the severity designations for the ICD-10-CM diagnosis codes, other than the changes to the severity level designations for the diagnosis codes in category Z16 (Resistance to antimicrobial drugs) from a NonCC to a CC. We stated that postponing adoption of the proposed comprehensive changes in the severity level designations would allow further opportunity to provide additional background to the public on the methodology utilized and clinical rationale applied across diagnostic categories to assist the public in its review. We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42150 through 42152) for a complete discussion of our response to public comments regarding the proposed severity level designation changes for FY 2020.

As discussed in the FY 2021 IPPS/LTCH PPS proposed rule (85 FR 32550), to provide the public with more information on the CC/MCC comprehensive analysis discussed in the FY 2020 IPPS/LTCH PPS proposed and final rules, CMS hosted a listening session on October 8, 2019. The listening session included a review of this methodology utilized to mathematically measure the impact on resource use. We refer readers to <https://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums/Downloads/10082019ListingSessionTrascriptandQandAandAudioFile.zip> for the transcript and audio file of the listening session. We also refer readers to <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient->

[pps/ms-drg-classifications-and-software](#) for the supplementary file containing the mathematical data generated using claims from the FY 2018 MedPAR file describing the impact on resource use of specific ICD-10-CM diagnosis codes when reported as a secondary diagnosis that was made available for the listening session.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58550 through 58554), we discussed our plan to continue a comprehensive CC/MCC analysis, using a combination of mathematical analysis of claims data as discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235) and the application of nine guiding principles and plan to present the findings and proposals in future rulemaking. The nine guiding principles are as follows:

- Represents end of life/near death or has reached an advanced stage associated with systemic physiologic decompensation and debility.
- Denotes organ system instability or failure.
- Involves a chronic illness with susceptibility to exacerbations or abrupt decline.
- Serves as a marker for advanced disease states across multiple different comorbid conditions.
- Reflects systemic impact.
- Post-operative/post-procedure condition/complication impacting recovery.
- Typically requires higher level of care (that is, intensive monitoring, greater number of caregivers, additional testing, intensive care unit care, extended length of stay).
- Impedes patient cooperation or management of care or both.
- Recent (last 10 years) change in best practice, or in practice guidelines and review of the extent to which these changes have led to concomitant changes in expected resource use.

We refer readers to the FY 2021 IPPS/LTCH PPS final rule for a complete summation of the comments we received for each of the nine guiding principles and our responses to those

comments. In the proposed rule we noted that since the FY 2021 IPPS/LTCH PPS final rule we have continued to solicit feedback regarding the nine guiding principles, as well as other possible ways we can incorporate meaningful indicators of clinical severity. We have encouraged the public to provide a detailed explanation of how applying a suggested concept or principle would ensure that the severity designation appropriately reflects resource use for any diagnosis code when providing feedback or comments. In the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26748 through 26750) we illustrated how the nine guiding principles might be applied in evaluating changes to the severity designations of diagnosis codes in our discussion of our proposed changes to the severity level designation for certain diagnosis codes that describe homelessness. In the proposed rule, we stated that we have not received any additional feedback or comments on the nine guiding principles since the FY 2021 IPPS/LTCH PPS final rule; therefore, in the FY 2025 IPPS/LTCH PPS proposed rule we proposed to finalize the nine guiding principles as listed previously. We stated that under this proposal, our evaluations to determine the extent to which the presence of a diagnosis code as a secondary diagnosis results in increased hospital resource use will include a combination of mathematical analysis of claims data as discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235) and the application of the nine guiding principles.

Comment: Many commenters supported our proposal to finalize the nine guiding principles. Commenters stated they continued to support CMS' consideration of the nine guiding principles in conjunction with its mathematical analysis of the data in evaluating whether changes to the severity level designations of diagnoses are needed and to ensure the severity designations appropriately reflect resource use based on review of the claims data, as well as consideration of relevant clinical factors (for example, the clinical nature of each of the secondary diagnoses and the severity level of clinically similar diagnoses).

Response: We thank the commenters for their support.

Comments: Other commenters expressed concerns with the guiding principles. These commenters stated that the nine guiding principles appeared to be open to interpretation or differences in clinical opinion and noted a lack of detailed definitions and criteria for applying the guiding principles. Other commenters stated that it was not clear how CMS will apply the guiding principles in conjunction with the mathematical analyses of claims data to make decisions about severity levels. These commenters stated in their observation, CMS had not stated how it will handle conditions that might not fit any guiding principles, such as obstetrical diagnoses, congenital conditions, or potentially social determinants of health, but reflect mathematical data for the impact on resource use that could suggest a need for a change to the severity designation of the code. Several commenters stated they were unclear as to the impact finalizing the guiding principles would have on diagnosis codes that are currently designated as MCCs or CCs when reported as secondary diagnoses. These commenters stated that more information is needed to better understand CMS' process for decision making on the designation of diagnosis severity levels.

Response: We thank the commenters for sharing their concerns.

We note the focus of our analysis is on the appropriate severity level designation of individual ICD-10-CM codes as secondary diagnosis codes and how they relate to inpatient prospective payment and the resource utilization required while the patient is in the hospital. We wish to clarify for commenters that the application of the nine guiding principles is not a departure from our historic approach of considering both mathematical analysis and clinical factors as described in the FY 2008 IPPS/LTCH PPS final rule. In the FY 2008 IPPS/LTCH PPS final rule (72 FR 47153 through 47154), we stated the need for a revised CC list prompted a reexamination of the secondary diagnoses that qualify as a CC and stated our intent was to better distinguish cases that are likely to result in increased hospital resource use based on secondary diagnoses. We stated that using a combination of mathematical data and the judgment of our medical advisors, we included the condition on the CC list if it could demonstrate that its

presence would lead to substantially increased hospital resource use. We stated diagnoses may require increased hospital resource use because of a need for such services as:

- Intensive monitoring (for example, an intensive care unit (ICU) stay).
- Expensive and technically complex services (for example, heart transplant).
- Extensive care requiring a greater number of caregivers (for example, nursing care for a patient with quadriplegia).

In reviewing the diagnosis codes that describe chronic diseases, we stated in the FY 2008 IPPS/LTCH PPS final rule that we made exceptions for diagnosis codes that indicate a chronic disease in which the underlying illness has reached an advanced stage or is associated with systemic physiologic decompensation and debility. We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47153 through 47154) for a complete discussion of our approach.

The nine guiding principles were developed to build on the process we described in the FY 2008 IPPS/LTCH PPS final rule and are not intended to turn the analysis into a quantitative exercise, requiring that every diagnosis code satisfy each principle. Instead, as stated in prior rulemaking, the nine guiding principles are intended to provide a framework for assessing relevant clinical factors to help denote if, and to what degree, additional resources are required above and beyond those that are already being utilized to address the principal diagnosis or other secondary diagnoses that might also be present on the claim. In response to the commenter's concerns regarding a lack of detailed definition of each principle, we refer commenters to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58550 through 58554), for a complete discussion of our response to similar public comments regarding each of the nine guiding principles.

Comment: Some commenters stated that the guiding principles appeared to be more applicable to MCC conditions, were too strict, and could potentially eliminate CC conditions. A commenter stated that the application of the guiding principles would represent a substantial revision to the definition of a CC, noting MS-DRG Definition Manual Version 41.1 provides the following definition: “A substantial complication or comorbidity was defined as a condition that

because of its presence with a specific principal diagnosis would cause an increase in length of stay by at least one day in at least 75 percent of the patients.”

Response: We appreciate the commenters’ feedback.

We do not believe the nine guiding principles would be mostly applicable, or only applicable, to MCC conditions. In applying the nine guiding principles in our review of the appropriate severity level designation, the intention is not to require that a diagnosis code satisfy each principle, or a specific number of principles in assessing whether to designate a secondary diagnosis code as a NonCC versus a CC versus an MCC. Rather, the severity level determinations would be based on the consideration of the clinical factors captured by these principles as well as the empirical analysis of the additional resources associated with the secondary diagnosis.

We wish to clarify that the definition of a “substantial complication or comorbidity” from the MS-DRG Definition Manual that the commenter referenced, is the definition of a CC that was used in Version 8 of the DRGs. In FY 2008, for Version 25 of the MS-DRGs, the diagnoses comprising the CC list were completely redefined and instead each CC was categorized as a major CC or a CC (that is, non-major CC) based on relative resource use. As stated previously, we refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) for a complete discussion of our approach.

We note that in addition to the FY 2021 IPPS/LTCH PPS rule, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44915 through 44926), the FY 2023 IPPS/LTCH PPS final rule (87 FR 48865 through 48872), the FY 2024 IPPS/LTCH PPS final rule (88 FR 58753 through 58759), and in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35997 through 36001), we have illustrated how the guiding principles might be applied in evaluating changes to the severity designations of diagnosis codes. We have also continued to solicit feedback regarding the guiding principles, as well as other possible ways we can incorporate meaningful indicators of clinical severity. We note the commenters did not provide alternative principles for

consideration, nor was feedback provided as to other possible ways we can incorporate meaningful indicators of clinical severity.

As discussed in prior rulemaking, our intended approach is for CMS to first use these guiding principles in making an initial clinical assessment of the appropriate severity level designation for each ICD-10-CM code as a secondary diagnosis. CMS will then use a mathematical analysis of claims data as discussed in the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) to determine if the presence of the ICD-10-CM code as a secondary diagnosis appears to, or does not appear to, increase hospital resource consumption. There may be instances in which we would decide that the clinical analysis weighs in favor of proposing to maintain or proposing to change the severity designation of an ICD-10-CM code after application of the nine guiding principles. Any proposed modifications to the severity level designation of ICD-10-CM codes would be addressed in future rulemaking consistent with our annual process.

Therefore, after consideration of the public comments received, and for the reasons discussed, we are finalizing the nine guiding principles as listed previously in this FY 2025 IPPS/LTCH PPS final rule. Accordingly, our evaluations to determine the extent to which the presence of a diagnosis code as a secondary diagnosis results in increased hospital resource use will include a combination of mathematical analysis of claims data as discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235) and the application of the nine guiding principles. We thank commenters for sharing their views and their willingness to support CMS in our efforts to continue a comprehensive CC/MCC analysis.

In the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25175 through 25180), as another interval step in our comprehensive review of the severity designations of ICD-10-CM diagnosis codes, we requested public comments on a potential change to the severity level designations for “unspecified” ICD-10-CM diagnosis codes that we were considering adopting for FY 2022. Specifically, we noted we were considering changing the severity level designation of “unspecified” diagnosis codes to a NonCC where there are other codes available in that code

subcategory that further specify the anatomic site. As summarized in the FY 2022 IPPS/LTCH PPS final rule, many commenters expressed concern with the potential severity level designation changes overall and recommended that CMS delay any possible change to the designation of these codes to give hospitals and their physicians time to prepare. After careful consideration of the public comments we received, we maintained the severity level designation of the “unspecified” diagnosis codes currently designated as a CC or MCC where there are other codes available in that code subcategory that further specify the anatomic site for FY 2022. We refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 44916 through 44926) for a complete discussion of our response to public comments regarding the potential severity level designation changes. Instead, for FY 2022, we finalized a new Medicare Code Editor (MCE) code edit for “unspecified” codes, effective with discharges on and after April 1, 2022. We stated we believe finalizing this new edit would provide additional time for providers to be educated while not affecting the payment the provider is eligible to receive. We refer the reader to section II.D.14.e. of the FY 2022 IPPS/LTCH PPS final rule (86 FR 44940 through 44943) for the complete discussion.

As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48866), we stated that as the new unspecified edit became effective beginning with discharges on and after April 1, 2022, we believed it was appropriate to not propose to change the designation of any ICD-10-CM diagnosis codes, including the unspecified codes that are subject to the “Unspecified Code” edit, as we continue our comprehensive CC/MCC analysis to allow interested parties the time needed to become acclimated to the new edit.

Comment: A commenter stated that they were pleased that CMS continues to maintain the severity level designation of the “unspecified” diagnosis codes, currently designated as a CC or MCC where there are other codes available in that code subcategory that further specify the anatomic site, that are subject to the “Unspecified Code” edit. The commenter further stated that they agreed that maintaining this status quo will allow time for providers

to be educated and adjust to the edit. Another commenter suggested that CMS provide data from the Medicare Code Editor (MCE) that identifies each provider reporting “unspecified” diagnosis codes with designations as a CC or MCC when there are other codes available in that code subcategory that further specify the anatomic site, which can be used to inform providers on the number of “unspecified” diagnosis codes being reported at their facility compared to their peers.

Response: CMS appreciates the commenters’ feedback and recommendations. We will give careful consideration to what additional information may be helpful in assisting to educate providers on the documentation required to report to the highest level of specificity as it relates to the laterality of the conditions treated in the inpatient setting as we continue to formulate future next steps in our comprehensive review of the severity designations of ICD-10-CM diagnosis codes.

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28177 through 28181), we also requested public comments on how the reporting of diagnosis codes in categories Z55-Z65 might improve our ability to recognize severity of illness, complexity of illness, and/or utilization of resources under the MS-DRGs. Consistent with the Administration’s goal of advancing health equity for all, including members of historically underserved and under-resourced communities, as described in the President’s January 20, 2021 Executive Order 13985 on “Advancing Racial Equity and Support for Underserved Communities Through the Federal Government,”⁸ we stated we were also interested in receiving feedback on how we might otherwise foster the documentation and reporting of the diagnosis codes describing social and economic circumstances to more accurately reflect each health care encounter and improve the reliability and validity of the coded data including in support of efforts to advance health equity.

⁸Available at: <https://www.federalregister.gov/documents/2021/01/25/2021-01753/advancing-racial-equity-and-support-for-underserved-communities-through-the-federal-government>.

We noted that social determinants of health (SDOH) are the conditions in the environments where people are born, live, learn, work, play, worship, and age that affect a wide range of health, functioning, and quality-of-life outcomes and risks.⁹ The subset of Z codes that describe the social determinants of health are found in categories Z55-Z65 (Persons with potential health hazards related to socioeconomic and psychosocial circumstances). These codes describe a range of issues related – but not limited – to education and literacy, employment, housing, ability to obtain adequate amounts of food or safe drinking water, and occupational exposure to toxic agents, dust, or radiation.

We received numerous public comments that expressed a variety of views on our comment solicitation, including many comments that were supportive, and others that offered specific suggestions for our consideration in future rulemaking. Many commenters applauded CMS' efforts to encourage documentation and reporting of SDOH diagnosis codes given the impact that social risks can have on health outcomes. These commenters stated that it is critical that physicians, other health care professionals, and facilities recognize the impact SDOH have on the health of their patients. Many commenters also stated that the most immediate and important action CMS could take to increase the use of SDOH Z codes is to finalize the evidence-based “Screening for Social Drivers of Health” and “Screen Positive Rate for Social Drivers of Health” measures proposed to be adopted in the Hospital Inpatient Quality Reporting (IQR) Program. In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49202 through 49220), CMS finalized the “Screening for Social Drivers of Health” and “Screen Positive Rate for Social Drivers of Health” measures in the Hospital Inpatient Quality Reporting (IQR) Program. We refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 48867 through 48872) for the complete discussion of the public comments received regarding the request for information on SDOH diagnosis codes.

⁹Available at: <https://health.gov/healthypeople/priority-areas/social-determinants-health>.

As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58755 through 58759), based on our analysis of the impact on resource use for the ICD-10-CM Z codes that describe homelessness and after consideration of public comments, we finalized changes to the severity levels for diagnosis codes Z59.00 (Homelessness, unspecified), Z59.01 (Sheltered homelessness), and Z59.02 (Unsheltered homelessness), from NonCC to CC. We stated our expectation that finalizing the changes would encourage the increased documentation and reporting of the diagnosis codes describing social and economic circumstances and serve as an example for providers that, when they document and report SDOH codes, CMS can further examine the claims data and consider future changes to the designation of these codes when reported as a secondary diagnosis. We further stated CMS would continue to monitor and evaluate the reporting of the diagnosis codes describing social and economic circumstances.

We refer the reader to the following section of this final rule for discussion of our proposed changes to the severity level designation for the diagnosis codes that describe inadequate housing and housing instability for FY 2025, as well as our finalization of that proposal.

We have updated the Impact on Resource Use Files on the CMS website so that the public can review the mathematical data for the impact on resource use generated using claims from the FY 2019 through the FY 2023 MedPAR files. These files are posted on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>. As discussed in prior rulemaking, we also continue to be interested in receiving feedback on how we might further foster the documentation and reporting of the most specific diagnosis codes supported by the available medical record documentation and clinical knowledge of the patient's health condition to more accurately reflect each health care encounter and improve the reliability and validity of the coded data.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35997), for new diagnosis codes approved for FY 2025, consistent with our annual process for designating a severity level (MCC, CC, or NonCC) for new diagnosis codes, we first review the predecessor code designation, followed by review and consideration of other factors that may be relevant to the severity level designation, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis or treatment of the condition. We note that this process does not automatically result in the new diagnosis code having the same designation as the predecessor code. We refer the reader to section II.C.13 of this final rule for the discussion of the finalized changes to the ICD-10-CM and ICD-10-PCS coding systems for FY 2025.

c. Changes to Severity Levels

1. SDOH - Inadequate Housing/Housing Instability

As discussed earlier in this section and in the proposed rule (89 FR 35997 through 35999), in continuation of our examination of the SDOH Z codes, we reviewed the mathematical data on the impact on resource use for the subset of ICD-10-CM Z codes that describe the social determinants of health found in categories Z55-Z65 (Persons with potential health hazards related to socioeconomic and psychosocial circumstances).

As discussed in the proposed rule, the ICD-10-CM SDOH Z codes that describe inadequate housing and housing instability are currently designated as NonCCs when reported as secondary diagnoses. The following table reflects the impact on resource use data generated using claims from the September 2023 update of the FY 2023 MedPAR file. We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) for a complete discussion of our historical approach to mathematically evaluate the extent to which the presence of an ICD-10-CM code as a secondary diagnosis resulted in increased hospital resource use, and a more detailed explanation of the columns in the table.

ICD-10-CM Code ^a	Description ^b	Total Count ^c	Cnt1 ^d	C1 ^e	Cnt2 ^f	C2 ^g	Cnt3 ^h	C3 ⁱ
Z59.10	Inadequate housing, unspecified	227	21	2.63	85	1.38	121	2.81
Z59.11	Inadequate housing environmental temperature	74	4	0.51	33	1.02	37	2.64
Z59.12	Inadequate housing utilities	162	12	0.99	80	1.65	70	2.39
Z59.19	Other inadequate housing	987	93	1.85	431	2.82	463	3.07
Z59.811	Housing instability, housed, with risk of homelessness	165	21	1.97	79	2.51	65	3.18
Z59.812	Housing instability, housed, homelessness in past 12 months	141	15	0.76	65	1.77	61	2.33
Z59.819	Housing instability, housed unspecified	1,237	96	0.92	619	2.25	522	2.88

^a This column is the secondary diagnosis code (SDX).

^b This column is the title of the SDX.

^c The total count of discharge claims with the SDX.

^d Count of discharge claims with the SDX but with no other SDX or with all other SDX a NonCC.

^e "C1" impact on resource use of the SDX for discharge claims in "Cnt1".

^f Count of discharge claims with the SDX and with at least one other SDX that is a CC but none that is an MCC.

^g "C2" impact on resource use of the SDX for discharge claims in "Cnt2".

^h Count of discharge claims with the SDX and with at least one other SDX that is a MCC.

ⁱ "C3" impact on resource use of the SDX for discharge claims in "Cnt3".

The table shows that the C1 value is 2.63 for ICD-10-CM diagnosis code Z59.10 and 1.85 for ICD-10-CM diagnosis code Z59.19. A value close to 2.0 in column C1 suggests that the secondary diagnosis is more aligned with a CC than a NonCC. Because the C1 values in the table are generally close to 2, the data suggest that when these two SDOH Z codes are reported as a secondary diagnosis, the resources involved in caring for a patient experiencing inadequate housing support increasing the severity level from a NonCC to a CC. In contrast, the C1 value for ICD-10-CM diagnosis code Z59.11 is 0.51 and is 0.99 for ICD-10-CM diagnosis code Z59.12. A C1 value generally closer to 1 suggests the resources involved in caring for patients experiencing inadequate housing in terms of environmental temperature and utilities are more aligned with a NonCC severity level than a CC or an MCC severity level.

As discussed in the proposed rule, the underlying cause of the inconsistency between the C1 values for inadequate housing, unspecified and other inadequate housing and the two more specific codes that describe the necessities unavailable in the housing environment is unclear. We noted that diagnosis codes Z59.10 (Inadequate housing, unspecified), Z59.11 (Inadequate housing environmental temperature), Z59.12 (Inadequate housing utilities), and Z59.19 (Other

inadequate housing) became effective on April 1, 2023 (FY 2023). In reviewing the historical C1 values for code Z59.1 (Inadequate housing), the predecessor code before the code was expanded to further describe inadequate housing and the basic necessities unavailable in the housing environment, we noted the mathematical data for the impact on resource use generated using claims from the FY 2019, FY 2020, FY 2021, and FY 2022 MedPAR files reflects C1 values for code Z59.1 of 2.09, 1.73, 2.04, and 2.69, respectively. We refer the reader to the Impact on Resource Use Files generated using claims from the FY 2019 through the FY 2022 MedPAR files posted on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>. We stated we believe the lower C1 values for ICD-10-CM codes Z59.11 (Inadequate housing environmental temperature) and Z59.12 (Inadequate housing utilities) reflected in the mathematical data for the impact on resource use generated using claims from the FY 2023 MedPAR file may be attributed to lack of use or knowledge about the newly expanded codes, such that the data may not yet reflect the full impact on resource use for patients experiencing these circumstances.

Similarly, the table shows that the C1 value is 1.97 for ICD-10-CM diagnosis code Z59.811. A value close to 2.0 in column C1 suggests that the secondary diagnosis is more aligned with a CC than a NonCC. Because the C1 value in the table is generally close to 2, the data suggest that when this SDOH Z code is reported as a secondary diagnosis, the resources involved in caring for a patient experiencing an imminent risk of homelessness support increasing the severity level from a NonCC to a CC. In contrast, the C1 value for ICD-10-CM diagnosis code Z59.812 (Housing instability, housed, homelessness in past 12 months) and (Housing instability, housed unspecified) is 0.76 and is 0.92 for ICD-10-CM diagnosis code Z59.819. A C1 value generally closer to 1 suggests the resources involved in caring for patients experiencing housing instability, with history of homelessness in the past 12 months or housing instability, unspecified are more aligned with a NonCC severity level than a CC or an MCC

severity level. We stated in the proposed rule that the underlying cause of the inconsistency between the C1 values for codes describing housing instability is unclear.

In the proposed rule, we noted that diagnosis codes Z59.811, Z59.812, and Z59.819 became effective on October 1, 2021 (FY 2022). In reviewing the historical C1 values for code Z59.8 (Other problems related to housing and economic circumstances), the predecessor code before the code was expanded to further describe the problems related to housing and economic circumstances, we noted the mathematical data for the impact on resource use generated using claims from the FY 2019 and FY 2020 MedPAR files reflects C1 values for code Z59.8 of 1.92 and 1.63, respectively. There were no data reflected for this code in the Impact on Resource Use File generated using claims from the FY 2021 MedPAR files. The mathematical data for the impact on resource use generated using claims from the FY 2022 MedPAR file reflects C1 values for codes Z59.811, Z59.812, and Z59.819 of 2.44, 3.12, and 2.09, respectively. We stated we were uncertain if the fluctuations in the C1 values from year to year, or FY 2021, in particular, may reflect fluctuations that may be a result of the COVID-19 public health emergency or even reduced hospitalizations of certain conditions. We stated we were also uncertain if the fluctuations may be attributed to lack of use or knowledge about the expanded codes, such that the data on the reporting of codes Z59.812 and Z59.819 may not yet reflect the full impact on resource use for patients experiencing these circumstances.

As discussed in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58550 through 58554), and earlier in this section, following the listening session on October 8, 2019, we reconvened an internal workgroup comprised of clinicians, consultants, coding specialists and other policy analysts to identify guiding principles to apply in evaluating whether changes to the severity level designations of diagnoses are needed and to ensure the severity designations appropriately reflect resource use based on review of the claims data, as well as consideration of relevant clinical factors (for example, the clinical nature of each of the secondary diagnoses and the

severity level of clinically similar diagnoses) and improve the overall accuracy of the IPPS payments.

In considering the nine guiding principles identified by the workgroup, as summarized previously, in the proposed rule we noted that, similar to homelessness, inadequate housing and housing instability are circumstances that can impede patient cooperation or management of care, or both. In addition, patients experiencing inadequate housing and housing instability can require a higher level of care by needing an extended length of stay.

Inadequate housing is defined as an occupied housing unit that has moderate or severe physical problems (for example, deficiencies in plumbing, heating, electricity, hallways, and upkeep).^{10,11} Features of substandard housing have long been identified as contributing to the spread of infectious diseases. Patients living in inadequate housing may be exposed to health and safety risks, such as vermin, mold, water leaks, and inadequate heating or cooling systems.^{12,13} An increasing body of evidence has associated poor housing conditions with morbidity from infectious diseases, chronic illnesses, exposure to toxins, injuries, poor nutrition, and mental disorders.¹⁴

As discussed in the proposed rule, housing instability encompasses a number of challenges, such as having trouble paying rent, overcrowding, moving frequently, or spending the bulk of household income on housing.¹⁵ These experiences may negatively affect physical health and make it harder to access health care. Studies have found moderate evidence to suggest that housing instability is associated with higher prevalence of overweight/obesity, hypertension,

diabetes, and cardiovascular disease, worse hypertension and diabetes control, and higher acute health care utilization among those with diabetes and cardiovascular disease.¹⁶

In reviewing the mathematical data for the impact on resource use generated using claims from the FY 2023 MedPAR file for the seven ICD-10-CM codes describing inadequate housing and housing instability comprehensively and reviewing the potential impact these circumstances could have on patients' clinical course, we noted in the proposed rule that whether the patient is experiencing inadequate housing or housing instability, the patient may have limited or no access to prescription medicines or over-the-counter medicines, including adequate locations to store medications away from the heat or cold, and have difficulties adhering to medication regimens. Experiencing inadequate housing or housing instability may negatively affect a patient's physical health and make it harder to access timely health care.¹² Delays in medical care may increase morbidity and mortality risk among those with underlying, preventable, and treatable medical conditions.¹⁷ In addition, we noted that findings also suggest that patients experiencing inadequate housing or housing instability are associated with higher rates of inpatient admissions for mental, behavioral, and neurodevelopmental disorders, longer hospital stays, and substantial health care costs.¹⁸

Therefore, after considering the impact on resource use data generated using claims from the September 2023 update of the FY 2023 MedPAR file for the seven ICD-10-CM diagnosis codes that describe inadequate housing and housing instability and consideration of the nine guiding principles, we proposed to change the severity level designation for diagnosis codes Z59.10 (Inadequate housing, unspecified), Z59.11 (Inadequate housing environmental temperature), Z59.12 (Inadequate housing utilities), Z59.19 (Other inadequate housing), Z59.811

(Housing instability, housed, with risk of homelessness), Z59.812 (Housing instability, housed, homelessness in past 12 months) and Z59.819 (Housing instability, housed unspecified) from NonCC to CC for FY 2025.

Comment: Commenters expressed overwhelming support for our proposal to change the severity level designation for diagnosis codes Z59.10 (Inadequate housing, unspecified), Z59.11 (Inadequate housing environmental temperature), Z59.12 (Inadequate housing utilities), Z59.19 (Other inadequate housing), Z59.811 (Housing instability, housed, with risk of homelessness), Z59.812 (Housing instability, housed, homelessness in past 12 months) and Z59.819 (Housing instability, housed unspecified) from NonCC to CC for FY 2025. These commenters stated this proposal acknowledges the significant impact these circumstances can have on patient outcomes and the increased resource allocation required to effectively manage the care of these patients in terms of increased severity of illness, readmissions resulting from lack of follow-up and continued medical treatment and delayed discharges. A commenter stated that changing the severity level of the seven ICD-10-CM diagnosis codes that describe inadequate housing and housing instability is not only appropriate, it is crucial in order to help address the complex needs of these patients. Commenters stated that this change is a critical step toward increasing health care access for underserved and under-resourced communities and in recognizing and addressing broader factors that impact patient health. A commenter specifically stated this proposal is another notable effort on CMS' part to recognize the interconnectedness of health and social needs. Another commenter stated this change will encourage providers to ask more detailed questions of patients to better understand their housing status, improving overall data quality.

Response: We thank the commenters for their support.

Comment: While commending CMS' efforts, many commenters noted an operational concern in that currently only 25 diagnoses are captured on the institutional electronic claim form and 19 diagnoses are captured on the paper bill. Many commenters stated this issue is becoming increasingly critical as Medicare and other payers move to implement new quality

measures that emphasize the screening and identification of patient-level, health-related social needs, which will dictate the need for reporting additional codes. Commenters stated that documenting and reporting the social and economic circumstances patients may be experiencing can require a substantial number of SDOH Z codes, which could lead to the crowding out of other diagnosis codes that also need to be captured on the institutional claim form for both payment and quality measures. Commenters suggested that a factor that may be negatively impacting more comprehensive reporting of the diagnosis codes describing social and economic circumstances is the limit on the number of diagnoses that may be reported on an inpatient claim. A commenter stated they performed their own analysis of the FY 2021 MedPAR file and found that 17 percent of inpatient claims reached the maximum limit of 25 diagnoses that can be reported on the claim. Another commenter stated at their facility approximately one-third of cases have 26 codes or more, with some cases reporting as many as 45 codes. A few commenters suggested that CMS evaluate the potential to expand the number of diagnosis codes that can be submitted, or alternatively, design a separate way to report the Z codes on the claim form, separate and distinct from the fields for the diagnosis codes.

Response: We thank the commenters for their continued feedback on this issue. We note that any proposed changes to the institutional claim form would need to be submitted to the National Uniform Billing Committee (NUBC) for consideration as the NUBC develops and maintains the Uniform Billing (UB) 04 data set and form, not CMS. The NUBC is a Data Content Committee named in the Health Insurance Portability and Accountability Act of 1996 (HIPAA) and is composed of a diverse group of interested parties representing providers, health plans, designated standards maintenance organizations, public health organizations, and vendors.

Comment: Another commenter expressed concern that CMS continues to delay the comprehensive analysis of the severity designation of all the diagnosis codes in the ICD-10-CM classification in favor of reviewing the subset of ICD-10-CM Z codes that describe the social determinants of health. The commenter stated in their view, ensuring MS-DRG payment is

congruent with what it costs to care for patients should be CMS' primary objective. Many other commenters encouraged CMS to examine other SDOH Z codes that describe circumstances such as lack of adequate food and drinking water, extreme poverty, lack of transportation, and problems related to employment, physical environment, social environment, upbringing, primary support group, literacy, economic circumstances, and psychosocial circumstances to determine the hospital resource utilization related to addressing these factors and to analyze whether these SDOH Z codes should be considered for severity designation changes in future rulemaking as well. A commenter noted that these social needs create substantial barriers to healthcare and good health, both before and after receiving care.

Specifically, many commenters stated that research has found a strong association between food insecurity and chronic conditions and encouraged CMS to examine the severity designation of ICD-10-CM SDOH Z code Z59.41 (Food insecurity). These commenters stated that food insecurity can be an indicator of food deprivation, malnutrition, or lack of access to healthy foods and diet, which could have differing impacts on a patient and could be associated with higher healthcare utilization and costs. A commenter stated that in their observation, many hospitals have built robust programs to address the food needs of inpatients and stated that several hospitals have even begun to provide patients with fresh fruit, vegetables, and other essential groceries to take home upon discharge without payment.

Response: We appreciate the feedback.

We note that as described in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58761), CMS has undertaken interval steps towards a comprehensive CC/MCC analysis. We stated in the FY 2024 IPPS/LTCH PPS final rule, considering the potential impact of implementing a significant number of severity designation changes, and in light of the public health emergency (PHE) that was occurring concurrently from 2020 until 2023, we believe these interval steps were appropriate as we plan to continue a comprehensive CC/MCC analysis, using a combination of mathematical analysis of claims data and the application of nine guiding

principles. We refer the reader to the discussion earlier in this section where we discuss the finalization of the nine guiding principles for FY 2025.

In response to comments that CMS examine the severity designation of ICD-10-CM code Z59.41 (Food insecurity), we note that ICD-10-CM code Z59.41 is currently designated as a NonCC when reported as a secondary diagnosis. The following table reflects the impact on resource use data generated using claims from the September 2023 update of the FY 2023 MedPAR file for code Z59.41. We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) for a complete discussion of our historical approach to mathematically evaluate the extent to which the presence of an ICD-10-CM code as a secondary diagnosis resulted in increased hospital resource use, and a more detailed explanation of the columns in the table.

ICD-10-CM Code ^a	Description ^b	Total Count ^c	Cnt1 ^d	C1 ^e	Cnt2 ^f	C2 ^g	Cnt3 ^h	C3 ⁱ
Z59.41	Food insecurity	6,634	548	0.9273	3,043	2.0218	3,043	2.6077

^a This column is the secondary diagnosis code (SDX).

^b This column is the title of the SDX.

^c The total count of discharge claims with the SDX.

^d Count of discharge claims with the SDX but with no other SDX or with all other SDX a NonCC.

^e “C1” impact on resource use of the SDX for discharge claims in “Cnt1”.

^f Count of discharge claims with the SDX and with at least one other SDX that is a CC but none that is an MCC.

^g “C2” impact on resource use of the SDX for discharge claims in “Cnt2”.

^h Count of discharge claims with the SDX and with at least one other SDX that is a MCC.

ⁱ “C3” impact on resource use of the SDX for discharge claims in “Cnt3”.

The table shows that the C1 value is 0.9273 for ICD-10-CM diagnosis code is Z59.41. A C1 value generally closer to 1 suggests the resources involved in caring for patients experiencing food insecurity are more aligned with a NonCC severity level, as the code is currently designated, rather than a CC or an MCC severity level. This contrasts with the conclusions documented in research that has shown that food insecurity empirically can be associated with higher healthcare use and costs, even when accounting for other socioeconomic factors.¹⁹ We note that the table also shows that code Z59.41 was only reported in a total of 6,634 claims in the September 2023 update of the FY 2023 MedPAR file.

¹⁹ Berkowitz SA, Seligman HK, Meigs JB, Basu S. Food insecurity, healthcare utilization, and high cost: a longitudinal cohort study. *Am J Manag Care*. 2018 Sep;24(9):399-404. PMID: 30222918; PMCID: PMC6426124.

The impact on resource use data generated using claims from the September 2023 update of the FY 2023 MedPAR file for code Z59.41 again illustrates that if SDOH Z codes are not consistently reported in inpatient claims data, our methodology utilized to mathematically measure the impact on resource use, as described previously, may not adequately reflect what additional resources were expended by hospitals to address these circumstances. If SDOH Z codes are consistently reported in inpatient claims, the impact on resource use data may more adequately reflect what additional resources were expended to address these SDOH circumstances in terms of requiring clinical evaluation, extended length of hospital stay, increased nursing care or monitoring or both, and comprehensive discharge planning and we can re-examine these severity designations in future rulemaking.

In Table 6P.3b associated with this final rule, we have made available the data generated using claims from the September 2023 update of the FY 2023 MedPAR file describing the impact on resource use when reported as a secondary diagnosis for the ICD-10-CM codes describing various diagnoses and circumstances that commenters to the FY 2025 IPPS/LTCH proposed rule suggested CMS review to determine if changes to the severity level designations are warranted in future rulemaking. These data are consistent with data historically used to mathematically measure impact on resource use for secondary diagnoses, and the data which we will use in combination with application of the nine guiding principles as we continue the comprehensive CC/MCC analysis. We will examine these suggestions and determine if there are other diagnoses codes, including diagnosis codes that describe SDOH, that should also be considered further and will provide more detail in future rulemaking.

Comment: Some commenters stated there continue to be many challenges for clinicians in documenting SDOH, such as the lack of knowledge surrounding these codes. Many commenters stated there was a lack of standard, nationally accepted definitions of the SDOH Z codes and that ambiguity between Z codes can lead to confusion among clinical staff. A commenter stated that CMS should engage with key stakeholders, including patients and diverse

communities to establish a transparent process and timeline for updating Z code terms and definitions.

Other commenters stated that healthcare providers may gravitate towards certain codes, while other, possibly more specific codes, may exist in the classification that could accurately describe similar situations. These commenters stated that this can lead to inconsistent code usage and can limit the ability to see any correlations between these particular conditions and the resulting patient complexity and additional cost of care. A commenter noted that the difference between the seven different codes describing inadequate housing and housing instability requires a nuanced understanding and stated that appropriately documenting the Z codes for inadequate housing and housing instability will require training of staff to understand the differences. Another commenter suggested that CMS focus on addressing infrastructural, technological, and knowledge gaps to facilitate use of Z codes and stated if CMS does not address these gaps, inequities between well-funded hospitals that can afford to train staff to document and report Z codes as compared to other struggling hospitals who lack the means or know-how will be exacerbated.

A commenter expressed concern and stated that documentation of an SDOH circumstance does not always clearly demonstrate whether or how the SDOH impacts the patient's health. This commenter stated that while SDOH Z codes help with mapping the social factors afflicting a patient, that map does not (and cannot) fully describe the patient's life which can present a challenge for the provider when determining what factors to document, and for the coder, when deciding how to report that documentation using the appropriate SDOH Z code(s).

Many other commenters also expressed concern and stated that while they support the use of Z codes to help identify the complexity of issues impacting patients, information about an individual's social risk and needs has been shown to be sensitive. Commenters stated that expressing certain circumstances, such as housing instability or inadequacy, can be uncomfortable for patients, which could result in underreporting. These commenters also stated

they believed the descriptions of ICD-10-CM SDOH Z codes can be stigmatizing, and therefore the descriptions should be changed to be more patient friendly to protect the patient-provider relationship since patients can access their code assignments in after-visit summaries.

Response: We appreciate the feedback. As discussed in section II.C.15 of the preamble of this final rule, the CDC/NCHS has lead responsibility for the diagnosis code classification. In response to the suggestion that transparent process and timeline be established for updating Z code terms and definitions, we note there is an established process as the ICD-10 Coordination and Maintenance Committee addresses updates to the ICD-10-CM and ICD-10-PCS coding systems, as also discussed in section II.C.15 of the preamble of this final rule. The ICD-10 Coordination and Maintenance Committee holds its meetings each spring and fall to update the codes and the applicable payment and reporting systems by October 1 or April 1 of each year. Proposals for updates to the diagnosis codes, including diagnosis codes describing social determinants of health should be directed to nchsicd10CM@cdc.gov for consideration at a future ICD-10 Coordination and Maintenance Committee meeting.

We also note that the ICD-10-CM Official Guidelines for Coding and Reporting have been regularly revised to provide additional guidance as it relates to diagnosis codes describing social determinants of health. We encourage the commenters to review the Official ICD-10-CM Coding Guidelines, which can be found on the CDC website at:

<https://www.cdc.gov/nchs/icd/icd-10-cm/files.html>. The American Hospital Association (AHA)'s *Coding Clinic for ICD-10-CM/PCS* publication has provided further clarification on the appropriate documentation and use of Z codes to enable hospitals to incorporate them into their processes. The AHA also offers a range of tools and resources for hospitals, health systems and clinicians to address the social needs of their patients. We believe these updates and resources will help alleviate the concerns expressed by these commenters. As one of the four Cooperating Parties for ICD-10, we will continue to collaborate with the AHA to provide guidance for coding problems or risk factors related to SDOH through the AHA's *Coding Clinic for ICD-10-CM/PCS*

publication and to review the ICD-10-CM Coding Guidelines to determine where further clarifications may be made.

Comment: Some commenters recommended that CMS consider payment incentives for documenting and reporting of SDOH Z codes. Several commenters encouraged CMS to explore additional incentives for Z code utilization that do not rely on a code-by-code approach. While applauding CMS proposing to change the severity designation of the seven ICD-10-CM diagnosis codes that describe inadequate housing and housing instability, a commenter stated they also believe it is imperative that CMS continue to take steps towards more fundamental payment and delivery reforms, such as by directly addressing the social drivers of health under alternative payment models (APM) or the Hospital Value-based Purchasing (HVBP) Health Equity Adjustment (HEA), to hold providers accountable for high value, whole person care.

A few commenters stated that simply changing the severity designation of SDOH Z codes to CCs and marginally increasing payment will be inadequate to meaningfully drive CMS' stated equity mission. These commenters stated CMS' reporting and payment rules should better reflect and compensate hospitals for the multiple health-related social needs that patients experience to truly improve health outcomes and mitigate the current health disparities that exist. A commenter suggested that CMS consider an alternative policy that would provide increased payment for a CC designation only in certain MS-DRGs when certain Z codes are reported. Another commenter stated that they believed that the creation of a new Hierarchical Condition Category (HCC) for SDOH Z codes is needed to foster necessary support for delivering consistent levels of care and could help mitigate the challenges that social risk factors pose to creating effective treatment plans for patients. Some commenters suggested that CMS incentivize the use of patient self-report screening tools that are integrated within electronic health records to support the use of Z codes.

Other commenters noted that currently, if another secondary diagnosis designated as a CC or MCC is documented and reported, there will be no additional payment if the clinician

reports a diagnosis code describing inadequate housing and housing instability, potentially minimalizing the practical impact of changing the severity level designation of these codes. These commenters recommended CMS provide increased flexibility in payment to account for multiple CCs or MCCs that may be reported for a given patient who may be experiencing numerous health and social concerns at the same time, stating that it is almost impossible to isolate and address only one need and expect an improved health outcome in their view.

Response: We thank commenters for sharing their views and recommendations. We will take the commenters' feedback into consideration in future policy development.

After consideration of the public comments received, we are finalizing changes to the severity levels for diagnosis codes Z59.10, Z59.11, Z59.12, Z59.19, Z59.811, Z59.812, and Z59.819, from NonCC to CC for FY 2025, without modification. In addition, these diagnosis codes are reflected in Table 6J.1 – Additions to the CC List—FY 2025 associated with this final rule and available at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>. We refer the reader to section II.C.12.d of the preamble of the proposed rule and this final rule for further information regarding Table 6J.1.

We hope and expect that this finalization will foster the increased documentation and reporting of the diagnosis codes describing social and economic circumstances and continue to serve as an example for providers that when they document and report Z codes, CMS can further examine the claims data and consider future changes to the designation of these codes when reported as a secondary diagnoses. As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48868), if SDOH Z codes are not consistently reported in inpatient claims data, our methodology utilized to mathematically measure the impact on resource use, as described previously, may not adequately reflect what additional resources were expended by the hospital to address these SDOH circumstances in terms of requiring clinical evaluation, extended length of hospital stay, increased nursing care or monitoring or both, and comprehensive discharge planning. We will continue to monitor SDOH Z code reporting, including reporting based on

SDOH screening performed as a result of quality measures in the Hospital Inpatient Quality Reporting program.

Furthermore, we may consider proposing changes for other diagnosis codes, including SDOH codes, in the future based on our analysis of the impact on resource use, per our methodology, as previously described, and consideration of the guiding principles. We continue to be interested in receiving feedback on how we might otherwise foster the documentation and reporting of the diagnosis codes to more accurately reflect each health care encounter and improve the reliability and validity of the coded data.

To inform future rulemaking, feedback and other suggestions may be submitted by October 20, 2024, and directed to MEARIS™ at: <https://mearis.cms.gov/public/home>.

2. Causally Specified Delirium

Additionally, as discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35999 through 36001), we received a request to change the severity level designations of the ICD-10-CM diagnosis codes that describe causally specified delirium from CC to MCC when reported as secondary diagnoses. Causally specified delirium is delirium caused by the physiological effects of a medical condition, by the direct physiological effects of a substance or medication, including withdrawal, or by multiple or unknown etiological factors. The requestor noted that ICD-10-CM diagnosis codes G92.8 (Other toxic encephalopathy), G92.9 (Unspecified toxic encephalopathy) and G93.41 (Metabolic encephalopathy) are currently all designated as MCCs. According to the requestor, a diagnosis of delirium implies an underlying acute encephalopathy, and as such, the severity designation of the diagnosis codes that describe causally specified delirium should be on par with the severity designation of the diagnosis codes that describe toxic encephalopathy and metabolic encephalopathy. The requestor stated that toxic encephalopathy, metabolic encephalopathy, and causally specified delirium all describe core symptoms of impairment of level of consciousness and cognitive change caused by a medical condition or substance.

As noted in the proposed rule, the requestor further stated that there is robust literature detailing the impact delirium can have on cognitive decline, rates of functional decline, subsequent dementia diagnosis, institutionalization, care complexity and costs, readmission rates, and mortality. The requestor considered each of the nine guiding principles discussed earlier in this section and noted how each of the principles could be applied in evaluating changes to the severity designations of the diagnosis codes that describe causally specified delirium in their request. Specifically, the requestor stated that delirium is a textbook example that maps to the nine guiding principles for evaluating a potential change in severity designation in that delirium (1) has a bidirectional link with dementia, (2) indexes physiological vulnerability across populations, (3) impacts healthcare systems across levels of care, (4) complicates postoperative recovery, (5) consigns patients to higher levels of care, and for longer, (6) impedes patient engagement in care, (7) has several recent treatment guidelines, (8) indicates neuronal/brain injury, and (9) represents a common expression of terminal illness.

The requestor identified 37 ICD-10-CM diagnosis codes that describe causally specified delirium. In the proposed rule we stated we agree that these 37 diagnosis codes are all currently designated as CCs. We refer the reader to Appendix G of the ICD-10 MS-DRG Version 41.1 Definitions Manual (available on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for the complete list of diagnoses designated as CCs when reported as secondary diagnoses, except when used in conjunction with the principal diagnosis in the corresponding CC Exclusion List in Appendix C.

To evaluate this request, as discussed in the proposed rule, we analyzed the claims data in the September 2023 update of the FY 2023 MedPAR file. The following table shows the analysis for each of the diagnosis codes identified by the requestor that describe causally specified delirium.

ICD-10-CM Code ^a	Description ^b	Total Count ^c	Cnt1 ^d	C1 ^e	Cnt2 ^f	C2 ^g	Cnt3 ^h	C3 ⁱ
-----------------------------	--------------------------	--------------------------	-------------------	-----------------	-------------------	-----------------	-------------------	-----------------

F05	Delirium due to known physiological condition	146,281	4,906	1.68	37,811	2.46	103,564	3.38

F19.931	Other psychoactive substance use, unspecified with withdrawal delirium	28	-	-	10	2.95	18	3.39

^a This column is the secondary diagnosis code (SDX).

^b This column is the title of the SDX.

^c The total count of discharge claims with the SDX.

^d Count of discharge claims with the SDX but with no other SDX or with all other SDX a NonCC.

^e "C1" impact on resource use of the SDX for discharge claims in "Cnt1".

^f Count of discharge claims with the SDX and with at least one other SDX that is a CC but none that is an MCC.

^g "C2" impact on resource use of the SDX for discharge claims in "Cnt2".

^h Count of discharge claims with the SDX and with at least one other SDX that is a MCC.

ⁱ "C3" impact on resource use of the SDX for discharge claims in "Cnt3".

As discussed in the proposed rule, we analyzed these data as described in FY 2008 IPPS final rule (72 FR 47158 through 47161). The table shows that the C1 values of the diagnosis codes that describe causally specified delirium range from a low of 0.35 to a high of 4.00. As stated earlier, a C1 value close to 2.0 suggests the condition is more like a CC than a NonCC but not as significant in resource usage as an MCC. On average, the C1 values of the diagnoses that describe causally specified delirium suggest that these codes are more like a NonCC than a CC. In the proposed rule, we noted diagnosis code F11.221 (Opioid dependence with intoxication delirium) had a C1 value of 4.00, however our analysis reflects that this diagnosis code was reported as a secondary diagnosis in only 42 claims, and only one claim reported F11.221 as a secondary diagnosis with no other secondary diagnosis or with all other secondary diagnoses that are NonCCs.

The C2 findings of the diagnosis codes that describe causally specified delirium range from a low of 0.28 to a high of 3.22 and the C3 findings range from a low of 1.25 to a high of 3.85. We stated that the data are clearly mixed between the C2 and C3 findings, and do not consistently support a change in the severity level. On average, the C2 and C3 findings again suggest that these codes that describe causally specified delirium are more similar to a NonCC.

As discussed in the proposed rule, in considering the nine guiding principles, as summarized previously, we note that delirium is a diagnosis that can impede patient cooperation or management of care or both. Delirium is a confusional state that can manifest as agitation, tremulousness, and hallucinations or even somnolence and decreased arousal. In addition, patients diagnosed with delirium can require a higher level of care by needing intensive monitoring, and a greater number of caregivers. Managing disruptive behavior, particularly agitation and combative behavior, is a challenging aspect in caring for patients diagnosed with delirium. Prevention and treatment of delirium can include avoiding factors known to cause or aggravate delirium; identifying and treating the underlying acute illness; and where appropriate using low-dose, short-acting pharmacologic agents.

In the proposed rule we stated that after considering the C1, C2, and C3 values of the 37 ICD-10-CM diagnosis codes that describe causally specified delirium and consideration of the nine guiding principles, we believe these 37 codes should not be designated as MCCs. While there is a lack of consistent claims data to support a severity level change from CCs to MCCs, we stated we recognize patients with delirium can utilize increased hospital resources and can be at a higher severity level. Therefore, we proposed to retain the severity designation of the 37 codes listed previously as CCs for FY 2025.

Comment: Some commenters agreed with CMS' proposal to retain the severity designation of the 37 ICD-10-CM diagnosis codes that describe causally specified delirium as CCs for FY 2025.

Response: We appreciate the commenters' support of our proposal.

Comment: Many other commenters disagreed with the proposal and urged CMS to change the designation of the 37 ICD-10-CM diagnosis codes that describe causally specified delirium to MCC for FY 2025. Commenters stated that delirium is a complex condition to manage and stated the diagnosis fully satisfies CMS' nine guiding principles for re-evaluating changes to severity levels. Many commenters noted that the terms "delirium" and

“encephalopathy” are often used interchangeably and refer to a shared set of acute neurocognitive conditions that require additional resources to treat. Some commenters stated that all diagnoses of delirium imply an underlying acute encephalopathy, while others stated acute encephalopathy is another name for delirium. A commenter noted that ICD-10-CM diagnosis codes G92.8 (Other toxic encephalopathy), G92.9 (Unspecified toxic encephalopathy) and G93.41 (Metabolic encephalopathy) have a higher severity level designation even though, in their view, the diagnosis codes that describe causally specified delirium provide even greater specificity. The commenter further stated that designating the diagnosis codes that describe causally specified delirium as MCCs is the logical conclusion of understanding the integrated nature of delirium and acute encephalopathy and is justified by a robust body of scientific literature and clinical practice guidelines.

Some commenters stated that practitioners have been inclined to report the ICD-10-CM diagnosis codes that describe toxic or metabolic encephalopathy, that are designated as MCCs, rather than report diagnosis codes that describe delirium, which they state is the Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, Text Revision (DSM-5-TR) preferred terminology to describe the syndrome of cognitive and behavioral changes that can occur in response to acute physical illness. Commenters stated that parity in the severity level designation of the codes that describe causally specified delirium with the severity level designation of the codes that describe acute encephalopathy is essential to enhancing awareness of the clinical and economic costs associated with managing delirium and will encourage widespread delirium prevention efforts. Another commenter stated that if parity is not achieved between the codes that describe causally specified delirium and codes that describe toxic or metabolic encephalopathy, clinicians will continue to favor reporting the relatively uninformative diagnoses of toxic or metabolic encephalopathy, thereby directing attention away from delirium guidelines and care pathways. Other commenters suggested that retaining the severity designation of delirium as a CC reinforces the stigma of mental health conditions,

promotes the use of non-specific diagnoses that require no more than a cursory evaluation of mental status, directs clinicians away from the use of delirium clinical practice guidelines, stands against the broad consensus recommendation to use the term “delirium” across invested major medical specialty organizations, and discourages efforts to detect and manage delirium.

Several commenters suggested that the mathematical analysis of the FY 2023 MedPAR file provided in the proposed rule is confounded given that delirium is being preferentially coded as toxic or metabolic encephalopathy. A commenter noted that there is robust literature detailing the impact of delirium on care complexity and costs, readmissions, rates of functional decline, institutionalization, cognitive decline, subsequent dementia diagnosis, and mortality and stated that the evidence suggests that delirium is underdiagnosed or being classified as encephalopathy and is having an impact on the data available for analysis.

Another commenter stated that they believe the September 2023 update of the FY 2023 MedPAR file generally supports the request to change delirium from a CC to an MCC in their review of the analyses for each of the diagnosis codes identified by the requestor that describe causally specified delirium presented in the proposed rule. Specifically, the commenter stated that based on their review of the C1, C2, and C3 values presented for ICD-10-CM code F05 (Delirium due to known physiological condition), which are 1.68, 2.46, and 3.38, respectively, F05 appears to be performing very similarly to many other conditions that are currently designated as MCCs. The commenter further stated that based on their analysis, the weighted average of the C1, C2, and C3 values of the 37 diagnosis codes that describe causally specified delirium are 1.68, 2.47, 3.38, respectively. This commenter stated they also reviewed the updated impact on resource use files provided on the CMS website so that the public can review the mathematical data for the impact on resource use generated using claims from the FY 2023 MedPAR file and stated that many codes currently designated as MCCs have C values similar to the values for causally specified delirium and stated on this basis alone, the severity designation of codes that describe causally specified delirium deserves to be changed from a CC to an MCC.

The commenter specifically referenced the mathematical data for the impact on resource use generated using claims from the FY 2023 MedPAR file for the following codes that are designated as MCCs in Version 41.1:

ICD-10-CM Code ^a	Description ^b	Total Count ^c	Cnt1 ^d	C1 ^e	Cnt2 ^f	C2 ^g	Cnt3 ^h	C3 ⁱ
I21.A1	Myocardial infarction type 2	196,719	6,487	1.3296	37,250	2.2642	152,982	3.1808
G92.8	Other toxic encephalopathy	169,559	4,810	1.9340	46,280	2.6277	118,469	3.4668
G93.41	Metabolic encephalopathy	533,311	17,545	1.8706	161,169	2.4593	354,597	3.2801
G93.6	Cerebral edema	59,971	3,036	1.5753	17,160	2.5086	39,775	3.1508

^a This column is the secondary diagnosis code (SDX).

^b This column is the title of the SDX.

^c The total count of discharge claims with the SDX.

^d Count of discharge claims with the SDX but with no other SDX or with all other SDX a NonCC.

^e "C1" impact on resource use of the SDX for discharge claims in "Cnt1".

^f Count of discharge claims with the SDX and with at least one other SDX that is a CC but none that is an MCC.

^g "C2" impact on resource use of the SDX for discharge claims in "Cnt2".

^h Count of discharge claims with the SDX and with at least one other SDX that is a MCC.

ⁱ "C3" impact on resource use of the SDX for discharge claims in "Cnt3".

Response: We appreciate the commenters sharing their concerns regarding the severity level designations of the ICD-10-CM diagnosis codes that describe causally specified delirium and thank the commenters for their feedback. We reviewed the commenters' concerns and while we recognize patients with delirium can utilize increased hospital resources, we continue to believe there is a lack of consistent claims data to support a severity level change of these diagnosis codes from CCs to MCCs for FY 2025.

In response to the analysis of the impact on resource use files performed by the commenter, as stated in prior rulemaking (84 FR 42150), C1, C2, and C3 values are a measure of the ratio of average costs for patients with these conditions to the expected average cost across all cases. We have stated a value close to 1.0 in the C1 field would suggest that the code produces the same expected value as a NonCC diagnosis. That is, average costs for the case are similar to the expected average costs for that subset and the diagnosis is not expected to increase resource usage. A higher value in the C1 (or C2 and C3) field suggests more resource usage is associated with the diagnosis and an increased likelihood that it is more like a CC or major CC than a NonCC. Thus, a value close to 2.0 suggests the condition is more like a CC than a NonCC but not as significant in resource usage as an MCC. A value close to 3.0 suggests the condition is expected to consume resources more similar to an MCC than a CC or NonCC.

Accordingly, the C1, C2, and C3 values highlighted by the commenter for the diagnosis codes reflected in the previous table currently designated as MCCs generally suggests that the conditions actually are more like CCs rather than NonCCs or MCCs and suggests the severity designation of the diagnoses designated as MCCs should be changed to CCs. We will consider these codes as we continue our comprehensive CC/MCC analysis, using a combination of mathematical analysis of claims data and the application of nine guiding principles to determine the extent to which presence of each code as a secondary diagnosis results in increased hospital resource use and will provide more detail in future rulemaking.

In response to the commenters that suggested that delirium “fully satisfies CMS’ nine guiding principles”, as stated earlier, the nine guiding principles are not intended to turn the analysis into a quantitative exercise, requiring that every diagnosis code satisfy each principle. As discussed in prior rulemaking and earlier in this section, our intended approach is first, CMS will use the guiding principles in making an initial clinical assessment of the appropriate severity level designation for each ICD-10-CM code as a secondary diagnosis. CMS will then use a mathematical analysis of claims data as discussed in the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) to determine if the presence of the ICD-10-CM code as a secondary diagnosis appears to, or does not appear to, increase hospital resource consumption. There may be instances in which we would decide that the clinical analysis weighs in favor of proposing to maintain or proposing to change the severity designation of an ICD-10-CM code after application of the nine guiding principles. The nine guiding principles are intended to provide a framework for assessing relevant clinical factors to help denote if, and to what degree, additional resources are required above and beyond those that are already being utilized to address the principal diagnosis or other secondary diagnoses that might also be present on the claim.

In response to the suggestion that clinicians favor reporting encephalopathy as opposed to delirium, we note that providers are responsible for ensuring that they are documenting as specifically and accurately as possible for the conditions they are treating and the services they

render to correctly reflect the severity of illness and capture how truly sick a patient is when causally specified delirium or encephalopathy are present. In addition, as we noted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38012), coding advice is issued independently from payment policy. We also note that, historically, we have not provided coding advice in rulemaking with respect to policy (82 FR 38045). As one of the Cooperating Parties for ICD-10, we collaborate with the American Hospital Association (AHA) through the *Coding Clinic for ICD-10-CM and ICD-10-PCS* to promote proper coding. We recommend that an entity seeking coding guidance on reporting causally specified delirium or encephalopathy submit any questions pertaining to correct coding to the AHA.

We consulted with the staff at the Centers for Disease Control's (CDC's) National Center for Health Statistics (NCHS), because NCHS has the lead responsibility for maintaining the ICD-10-CM diagnosis codes. The NCHS' staff acknowledged the terms delirium and encephalopathy are differentiated in the classification, such that coding would usually depend on the specific terms used in the medical record documentation. NCHS confirmed that they would consider further review of the classification, including review of the Excludes notes, for these two diagnoses. As such, we believe it would be appropriate to maintain the current severity level designations of the ICD-10-CM diagnosis codes that describe causally specified delirium at this time in order to further examine the relevant clinical factors and possible similarities in resource consumption in order to best represent this subset of patients within the MS-DRG classification.

Therefore, after consideration of the public comments we received, and for the reasons discussed, we are finalizing our proposal, without modification, to maintain the current severity level designation of the 37 ICD-10-CM diagnosis codes that describe causally specified delirium listed previously as CCs for FY 2025.

d. Additions and Deletions to the Diagnosis Code Severity Levels for FY 2025

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36001), we noted the following tables identify the proposed additions and deletions to the diagnosis code MCC severity levels

list and the proposed additions and deletions to the diagnosis code CC severity levels list for FY 2025 and are available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html>

Table 6I.1—Proposed Additions to the MCC List—FY 2025;

Table 6J.1— Proposed Additions to the CC List—FY 2025; and

Table 6J.2— Proposed Deletions to the CC List—FY 2025

Comment: Commenters agreed with the proposed additions and deletions to the MCC and CC lists as shown in tables 6I.1, 6J.1, and 6J.2 associated with the proposed rule.

Response: We appreciate the commenters' support.

The following tables associated with this final rule reflect the finalized severity levels under Version 42 of the ICD-10 MS-DRGs for FY 2025 and are available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS>;

Table 6I. —Complete MCC List—FY 2025; Table 6I.1—Additions to the MCC List— FY 2025;

Table 6I.2—Deletions to the MCC List— FY 2025; Table 6J. —Complete CC List—FY 2025;

Table 6J.1—Additions to the CC List— FY 2025; and Table 6J.2—Deletions to the CC List—FY 2025.

e. CC Exclusions List for FY 2025

In the September 1, 1987 final notice (52 FR 33143) concerning changes to the DRG classification system, we modified the GROUPER logic so that certain diagnoses included on the standard list of CCs would not be considered valid CCs in combination with a particular principal diagnosis. We created the CC Exclusions List for the following reasons: (1) to preclude coding of CCs for closely related conditions; (2) to preclude duplicative or inconsistent coding from being treated as CCs; and (3) to ensure that cases are appropriately classified between the complicated and uncomplicated DRGs in a pair.

In the May 19, 1987 proposed notice (52 FR 18877) and the September 1, 1987 final notice (52 FR 33154), we explained that the excluded secondary diagnoses were established using the following five principles:

- Chronic and acute manifestations of the same condition should not be considered CCs for one another;
- Specific and nonspecific (that is, not otherwise specified (NOS)) diagnosis codes for the same condition should not be considered CCs for one another;
- Codes for the same condition that cannot coexist, such as partial/total, unilateral/bilateral, obstructed/unobstructed, and benign/malignant, should not be considered CCs for one another;
- Codes for the same condition in anatomically proximal sites should not be considered CCs for one another; and
- Closely related conditions should not be considered CCs for one another.

The creation of the CC Exclusions List was a major project involving hundreds of codes. We have continued to review the remaining CCs to identify additional exclusions and to remove diagnoses from the master list that have been shown not to meet the definition of a CC. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50541 through 50544) for detailed information regarding revisions that were made to the CC and CC Exclusion Lists under the ICD-9-CM MS-DRGs.

The ICD-10 MS-DRGs Version 41.1 CC Exclusion List is included as Appendix C in the ICD-10 MS-DRG Definitions Manual (available in two formats; text and HTML). The manuals are available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html>) and includes two lists identified as Part 1 and Part 2. Part 1 is the list of all diagnosis codes that are defined as a CC or MCC when reported as a secondary diagnosis. For all diagnosis codes on the list, a link is provided to a collection of diagnosis codes which, when reported as the principal diagnosis, would cause the CC or MCC

diagnosis to be considered as a NonCC. Part 2 is the list of diagnosis codes designated as an MCC only for patients discharged alive; otherwise, they are assigned as a NonCC.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36002 through 36006), effective for the April 1, 2024, release of the ICD-10 MS-DRG Definitions Manual, Version 41.1, a new section has been added to Appendix C as follows:

Part 3: Secondary Diagnosis CC/MCC Severity Exclusions in Select MS-DRGs

Part 3 lists diagnosis codes that are designated as a complication or comorbidity (CC) or major complication or comorbidity (MCC) and included in the definition of the logic for the listed MS-DRGs. When reported as a secondary diagnosis and grouped to one of the listed MS-DRGs, the diagnosis is excluded from acting as a CC/MCC for severity in DRG assignment.

The purpose of this new section is to include the list of MS-DRGs subject to what is referred to as suppression logic. In addition to the suppression logic excluding secondary diagnosis CC or MCC conditions that may be included in the definition of the logic for a DRG, it is also based on the presence of other secondary diagnosis logic defined within certain base DRGs. Therefore, if a MS-DRG has secondary diagnosis logic, the suppression is activated regardless of the severity of the secondary diagnosis code(s) for appropriate grouping and MS-DRG assignment.

In the proposed rule we noted that each MS-DRG is defined by a particular set of patient attributes including principal diagnosis, specific secondary diagnoses, procedures, sex, and discharge status. The patient attributes which define each MS-DRG are displayed in a series of headings which indicate the patient characteristics used to define the MS-DRG. These headings indicate how the patient's diagnoses and procedures are used in determining MS-DRG assignment. Following each heading is a complete list of all the ICD-10-CM diagnosis or ICD-10-PCS procedure codes included in the MS-DRG. One of these headings is secondary diagnosis.

- **Secondary diagnosis.** Indicates that a specific set of secondary diagnoses are used in the definition of the MS-DRG. For example, a secondary diagnosis of acute leukemia with chemotherapy is used to define MS-DRG 839.

The full list of MS-DRGs where suppression occurs is shown in the following table.

MS-DRG 008
MS-DRG 010
MS-DRG 019
*MS-DRGs 082-084
*MS-DRGs 177-179
*MS-DRGs 280-282
*MS-DRGs 283-285
*MS-DRGs 456-458
*MS-DRGs 582-583
MS-DRG 768
MS-DRG 790
MS-DRG 791
MS-DRG 792
MS-DRG 793
MS-DRG 794
*MS-DRGs 796-798
*MS-DRGs 805-807
*MS-DRGs 837-839
MS-DRG 927
*MS-DRGs 928-929
MS-DRG 933
MS-DRG 934
MS-DRG 935
MS-DRG 955
MS-DRG 956
*MS-DRGs 957-959
*MS-DRGs 963-965
*MS-DRGs 974-976
MS-DRG 977

* The MS-DRG(s) contain diagnoses that are specifically excluded from acting as a CC/MCC for severity in MS-DRG assignment.

In the proposed rule we stated we believe this additional information about the suppression logic may further assist users of the ICD-10 MS-DRG GROUPER software and related materials.

As noted in the proposed rule, during our review of the MS-DRGs containing secondary diagnosis logic in association with the suppression logic previously discussed, we identified another set of MS-DRGs containing secondary diagnosis logic in the definition of the MS-DRG. Specifically, we identified MS-DRGs 673, 674, and 675 (Other Kidney and Urinary Tract Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract), as displayed in the ICD-10 MS-DRG Version 41.1 Definitions Manual (which is available on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) which contains secondary diagnosis logic.

As stated in the proposed rule, of the seven logic lists included in the definition of MS-DRGs 673, 674, and 675, there are three “Or Principal Diagnosis” logic lists and one “With Secondary Diagnosis” logic list. The first “Or Principal Diagnosis” logic list is comprised of 21 diagnosis codes describing conditions such as chronic kidney disease, kidney failure, and complications related to a vascular dialysis catheter or kidney transplant. The second “Or Principal Diagnosis” logic list is comprised of four diagnosis codes describing diabetes with diabetic chronic kidney disease followed by a “With Secondary Diagnosis” logic list that includes diagnosis codes N18.5 (Chronic kidney disease, stage 5) and N18.6 (End stage renal disease). These logic lists are components of the special logic in MS-DRGs 673, 674, and 675 for certain MDC 11 diagnoses reported with procedure codes for the insertion of tunneled or totally implantable vascular access devices. The third “Or Principal Diagnosis” logic list is comprised of three diagnosis codes describing Type 1 diabetes with different kidney complications as part of the special logic in MS-DRGs 673, 674, and 675 for pancreatic islet cell transplantation performed in the absence of any other surgical procedure.

Under the Version 41.1 ICD-10 MS-DRGs, diagnosis code N18.5 (Chronic kidney disease, stage 5) is currently designated as a CC and diagnosis code N18.6 (End stage renal disease) is designated as an MCC. As discussed in the proposed rule, in our review of the MS-DRGs containing secondary diagnosis logic in association with the suppression logic, we noted that currently, when some diagnosis codes from the “Or Principal Diagnosis” logic lists in MS-DRGs 673, 674, and 675 are reported as the principal diagnosis and either diagnosis code N18.5 or N18.6 from the “With Secondary Diagnosis” logic list is reported as a secondary diagnosis, some cases are grouping to MS-DRG 673 (Other Kidney and Urinary Tract Procedures with MCC) or to MS-DRG 674 (Other Kidney and Urinary Tract Procedures with CC) in the absence of any other MCC or CC secondary diagnoses being reported.

In our analysis of this issue as discussed in the proposed rule, we noted diagnosis codes N18.5 and N18.6 are excluded from acting as a CC or MCC, when reported with principal diagnoses from Principal Diagnosis Collection Lists 1379 and 1380, respectively, as reflected in Part 1 of Appendix C in the CC Exclusion List. We refer the reader to Part 1 of Appendix C in the CC Exclusion List as displayed in the ICD-10 MS-DRG Version 41.1 Definitions Manual (which is available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>) for the complete list of principal diagnoses in Principal Diagnosis Collection Lists 1379 and 1380. Specifically, when codes N18.5 or N18.6 are reported as secondary diagnoses, we noted they are considered as NonCCs when the diagnosis codes from the “Or Principal Diagnosis” logic lists in MS-DRGs 673, 674, and 675 reflected in the following table are reported as the principal diagnosis under the CC Exclusion logic.

Principal Diagnoses Codes in the “Or Principal Diagnosis” Logic List for MS-DRGs 673, 674, and 675 currently listed in Principal Diagnosis Collection List 1379 or 1380 in ICD-10 MS-DRG GROUPER Version 41		
Principal Diagnosis ICD-10-CM Code	Description	PDX Collection Number
E09.22	Drug or chemical induced diabetes mellitus with diabetic chronic kidney disease	1379: 294 codes 1380: 295 codes
E10.22	Type 1 diabetes mellitus with diabetic chronic kidney disease	
E11.22	Type 2 diabetes mellitus with diabetic chronic kidney disease	
E13.22	Other specified diabetes mellitus with diabetic chronic kidney disease	
N17.0	Acute kidney failure with tubular necrosis	
N17.1	Acute kidney failure with acute cortical necrosis	
N17.2	Acute kidney failure with medullary necrosis	
N17.8	Other acute kidney failure	
N17.9	Acute kidney failure, unspecified	
N18.5	Chronic kidney disease, stage 5	
N18.6	End stage renal disease	
N19	Unspecified kidney failure	

In the proposed rule, we also noted that currently, a subset of diagnosis codes from the first “Or Principal Diagnosis” logic list in MS-DRGs 673, 674, and 675 are not listed in Principal

Diagnosis Collection Lists 1379 or 1380 for diagnosis codes N18.5 and N18.6, respectively. As a result, when one of the 13 diagnosis codes listed in the following table are reported as the principal diagnosis, and either diagnosis code N18.5 or N18.6 from the “With Secondary Diagnosis” logic list are reported as a secondary diagnosis, the cases are grouping to MS-DRG 673 (Other Kidney and Urinary Tract Procedures with MCC) or to MS-DRG 674 (Other Kidney and Urinary Tract Procedures with CC) when also reported with a procedure code describing the insertion of a tunneled or totally implantable vascular access device.

Principal Diagnoses Codes in the “Or Principal Diagnosis” Logic List for MS-DRGs 673, 674, and 675 not listed in Principal Diagnosis Collection List 1379 or 1380 in ICD-10 MS-DRG GROUPER Version 41	
Principal Diagnosis ICD-10-CM Code	Description
E88.3	Tumor lysis syndrome
I12.0	Hypertensive chronic kidney disease with stage 5 chronic kidney disease or end stage renal disease
I13.11	Hypertensive heart and chronic kidney disease without heart failure, with stage 5 chronic kidney disease, or end stage renal disease
R34	Anuria and oliguria
T79.5XXA	Traumatic anuria, initial encounter
T82.41XA	Breakdown (mechanical) of vascular dialysis catheter, initial encounter
T82.42XA	Displacement of vascular dialysis catheter, initial encounter
T82.43XA	Leakage of vascular dialysis catheter, initial encounter
T82.49XA	Other complication of vascular dialysis catheter, initial encounter
T86.11	Kidney transplant rejection
T86.12	Kidney transplant failure
T86.13	Kidney transplant infection
T86.19	Other complication of kidney transplant

We noted in the proposed rule that consistent with how other similar logic lists function in the ICD-10 GROUPER software for case assignment to the “with MCC” or “with CC” MS-DRGs, the logic for case assignment to MS-DRG 673 is intended to require any *other* diagnosis designated as an MCC and reported as a secondary diagnosis for appropriate assignment, and not the diagnoses currently listed in the logic for the definition of the MS-DRG. Likewise, the logic for case assignment to MS-DRG 674 is intended to require any *other* diagnosis designated as a CC and reported as a secondary diagnosis for appropriate assignment.

Therefore, for FY 2025, we proposed to correct the logic for case assignment to MS-DRGs 673, 674, and 675 by adding suppression logic to exclude diagnosis codes N18.5 (Chronic kidney disease, stage 5) and N18.6 (End stage renal disease) from the logic list entitled “With Secondary Diagnosis” from acting as a CC or an MCC, respectively, when reported as a secondary diagnosis with one of the 13 previously listed principal diagnosis codes from the “Or Principal Diagnosis” logic lists in MS-DRGs 673, 674, and 675 for appropriate grouping and MS-DRG assignment. Under this proposal, when diagnosis codes N18.5 or N18.6 are reported as a secondary diagnosis with one of the 13 previously listed principal diagnosis codes, the GROUPER will assign MS-DRG 675 (Other Kidney and Urinary Tract Procedures without CC/MCC) in the absence of any other MCC or CC secondary diagnoses being reported. In the proposed rule we also noted that the current list of MS-DRGs subject to suppression logic as previously discussed and listed under Version 41.1 includes MS-DRGs that are not subdivided by a two-way severity level split (“with MCC and without MCC” or “with CC/MCC and without CC/MCC”) or a three-way severity level split (with MCC, with CC, and without CC/MCC, respectively), or the listed MS-DRG includes diagnoses that are not currently designated as a CC or MCC. To avoid potential confusion, we proposed to refine how the suppression logic is displayed under Appendix C - Part 3 to not display the MS-DRGs where the suppression logic has no impact on the grouping (meaning the logic list for the affected MS-DRG contains diagnoses that are all designated as NonCCs, or the MS-DRG is not subdivided by a severity level split) as reflected in the draft Version 42 ICD-10 MS-DRG Definitions Manual, which is available in association with the proposed rule at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>.

Comment: Commenters stated they did not agree with the proposed application of the suppression logic within MS-DRGs 673, 674, and 675 when diagnosis codes N18.5 and N18.6 are reported as a secondary diagnosis in conjunction with one of the principal diagnosis codes listed in Part 1 of Appendix C in the CC Exclusion List. The commenters stated that ICD-10-

CM codes N18.5 and N18.6 are the highest level of severity for kidney failure with end stage renal disease and stage 5, both of which require dialysis and/or kidney transplant. According to the commenters, the only principal diagnoses that could meet one of the five principles would be I12.0 (Hypertensive chronic kidney disease with stage 5 chronic kidney disease or end stage renal disease) or I13.11 (Hypertensive heart and chronic kidney disease without heart failure, with stage 5 chronic kidney disease or end-stage renal disease) as these two codes actually indicate stage 5 chronic kidney disease or end stage renal disease in the narrative description. The commenters stated their belief that the five conditions established for exclusions were not met for the majority of the diagnoses on the principal diagnosis list and for that reason should not be subject to suppression logic.

Response: We wish to clarify for the commenters that the suppression logic is not the same as the CC Exclusion List logic under Part 1 of Appendix C – CC Exclusion List in the ICD-10 MS-DRG Definitions Manual. As previously described, Part 1 of Appendix C is the list of all diagnosis codes that are defined as a CC or MCC when reported as a secondary diagnosis. For all diagnosis codes on the list, a link is provided to a collection of diagnosis codes which, when reported as the principal diagnosis, would cause the CC or MCC diagnosis to be considered as a NonCC. Separate from the CC Exclusion List logic, effective for the April 1, 2024, release of the ICD-10 MS-DRG Definitions Manual, Version 41.1, a new section was added to Appendix C for the suppression logic as listed under Part 3 of Appendix C. As previously described, Part 3 lists diagnosis codes that are designated as a CC or MCC and are included in the definition of the logic for the listed MS-DRGs. As such, when reported as a secondary diagnosis, the diagnosis is intended to be excluded from acting as a CC or MCC for severity in DRG assignment. We stated in the proposed rule that, because the logic for case assignment to MS-DRGs 673, 674, and 675 includes diagnosis codes N18.5 and N18.6 in the definition of the “With Secondary Diagnosis” logic list, we were proposing to correct the logic for appropriate grouping, consistent with other secondary diagnosis logic. Therefore, when

diagnosis codes N18.5 or N18.6 are reported as a secondary diagnosis with one of the 13 previously listed principal diagnosis codes from the “Or Principal Diagnosis” logic lists in MS-DRGs 673, 674, and 675, for appropriate grouping and consistency they should be excluded from acting as a CC or MCC.

We note that, because the commenters raised concerns regarding the principal diagnoses listed under Part 1 of Appendix C – CC Exclusions List in Principal Diagnosis Collection Lists 1378 and 1379 that currently exclude diagnosis codes N18.5 and N18.6 from acting as a CC or MCC under the CC exclusion logic in accordance with the list of five principles established in 1987, we intend to perform a broad review of the conditions in these lists to determine if any modifications are warranted and to ensure they continue to be clinically appropriate. To inform future rulemaking, feedback and other suggestions may be submitted by October 20, 2024, and directed to MEARIS™ at: <https://mearis.cms.gov/public/home>.

After consideration of the public comments we received, and for the reasons discussed, we are finalizing our proposal to add suppression logic to exclude diagnosis codes N18.5 (Chronic kidney disease, stage 5) and N18.6 (End stage renal disease) from the logic list entitled “With Secondary Diagnosis” from acting as a CC or an MCC, respectively, when reported as a secondary diagnosis with one of the 13 previously listed principal diagnosis codes from the “Or Principal Diagnosis” logic lists in MS-DRGs 673, 674, and 675, without modification, effective October 1, 2024 for FY 2025.

We also note that during our review of the 37 diagnosis codes that describe causally specified delirium as discussed in section II.C.12.c.2. of the preamble of this final rule, we identified diagnosis code F05 (Delirium due to known physiological condition) as a condition that is listed on a subset of the Principal Diagnosis Collection Lists under Part 1 of Appendix C – CC Exclusions List. Specifically, we found diagnosis code F05 listed on Principal Diagnosis Collection List numbers 642, 643, 645, 646, and 647. Diagnosis code F05 is listed on the Unacceptable Principal Diagnosis Code edit code list in the Medicare Code Editor and is not

appropriate to report as a principal diagnosis according to the ICD-10-CM Tabular List of Diseases and Injuries instructional note to “Code first the underlying physiological condition, such as: dementia (F03.9-)”. Consistent with the MCE Unacceptable Principal Diagnosis Code edit code list and the instructional note in the ICD-10-CM Tabular List of Diseases and Injuries , we are removing diagnosis code F05 from the previously listed Principal Diagnosis Collection Lists effective October 1, 2024, for FY 2025.

Lastly, we are finalizing our proposal to refine how the suppression logic is displayed under Appendix C - Part 3, without modification, effective October 1, 2024, for FY 2025. Under this finalization, MS-DRGs where the suppression logic has no impact on the grouping (meaning the logic list for the affected MS-DRG contains diagnoses that are all designated as NonCCs, or the MS-DRG is not subdivided by a severity level split) will not be displayed in Appendix C - Part 3 as reflected in the Version 42 ICD-10 MS-DRG Definitions Manual, which is available in association with this final rule at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>.

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed additional changes to the ICD-10 MS-DRGs Version 42 CC Exclusion List based on the diagnosis code updates as discussed in section II.C.12. of the proposed rule and set forth in Tables 6G.1, 6G.2, 6H.1, and 6H.2 associated with the proposed rule and available on the CMS website at:

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS>.

We did not receive any public comments opposing the proposed CC Exclusions List, however, during our internal review of the proposed CC Exclusions List we identified some inconsistencies with the 77 new Hodgkin lymphoma diagnosis codes that were proposed to be designated as a CC (based on the predecessor code designation and now finalized as reflected in Table 6A.- New Diagnosis Codes – FY 2025 associated with this final rule). We determined that clinically, all 77 Hodgkin lymphoma diagnosis codes should be excluded from acting as a CC when another Hodgkin lymphoma diagnosis code is reported as the principal diagnosis.

Therefore, for FY 2025, we are finalizing, with modification, the CC exclusions for the 77 Hodgkin lymphoma codes after internal review as reflected in Tables 6G.1 and 6G.2 in association with this final rule.

The finalized CC Exclusions List as displayed in Tables 6G.1, 6G.2, 6H.1, 6H.2, and 6K, associated with this final rule reflect the severity levels under V42 of the ICD–10 MS–DRGs. We have developed Table 6G.1.—Secondary Diagnosis Order Additions to the CC Exclusions List—FY 2025; Table 6G.2.—Principal Diagnosis Order Additions to the CC Exclusions List—FY 2025; Table 6H.1.—Secondary Diagnosis Order Deletions to the CC Exclusions List—FY 2025; and Table 6H.2.—Principal Diagnosis Order Deletions to the CC Exclusions List—FY 2025; and Table 6K. Complete List of CC Exclusions-FY 2025.

For Table 6G.1, each secondary diagnosis code finalized for addition to the CC Exclusion List is shown with an asterisk and the principal diagnoses finalized to exclude the secondary diagnosis code are provided in the indented column immediately following it. For Table 6G.2, each of the principal diagnosis codes for which there is a CC exclusion is shown with an asterisk and the conditions finalized for addition to the CC Exclusion List that will not count as a CC are provided in an indented column immediately following the affected principal diagnosis. For Table 6H.1, each secondary diagnosis code finalized for deletion from the CC Exclusion List is shown with an asterisk followed by the principal diagnosis codes that currently exclude it. For Table 6H.2, each of the principal diagnosis codes is shown with an asterisk and the finalized deletions to the CC Exclusions List are provided in an indented column immediately following the affected principal diagnosis. Tables 6G.1., 6G.2., 6H.1., and 6H.2. associated with this final rule are available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html>.

13. Changes to the ICD-10-CM and ICD-10-PCS Coding Systems

To identify new, revised, and deleted diagnosis and procedure codes, for FY 2025, we have developed Table 6A.--New Diagnosis Codes, Table 6B.--New Procedure Codes, Table 6C.-

-Invalid Diagnosis Codes, Table 6D. --Invalid Procedure Codes, Table 6E.--Revised Diagnosis Code Titles, and Table 6F. --Revised Procedure Code Titles for this final rule.

These tables are not published in the Addendum to the proposed rule or final rule, but are available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html> as described in section VI. of the Addendum to this final rule. As discussed in section II.C.15. of the preamble of the proposed rule and this final rule, the code titles are adopted as part of the ICD-10 (previously ICD-9-CM) Coordination and Maintenance Committee meeting process. Therefore, although we publish the code titles in the IPPS proposed and final rules, they are not subject to comment in the proposed or final rules.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36006), we proposed the MDC and MS-DRG assignments for the new diagnosis codes and procedure codes as set forth in Table 6A. – New Diagnosis Codes and Table 6B. – New Procedure Codes. We also stated that the proposed severity level designations for the new diagnosis codes are set forth in Table 6A. and the proposed O.R. status for the new procedure codes are set forth in Table 6B. Consistent with our established process, we examined the MS-DRG assignment and the attributes (severity level and O.R. status) of the predecessor diagnosis or procedure code, as applicable, to inform our proposed assignments and designations.

Specifically, we reviewed the predecessor code and MS-DRG assignment most closely associated with the new diagnosis or procedure code, and in the absence of claims data, we considered other factors that may be relevant to the MS-DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We noted that this process does not automatically result in the new diagnosis or procedure code being proposed for assignment to the same MS-DRG or to have the same designation as the predecessor code.

In this FY 2025 IPPS/LTCH PPS final rule, we present a summation of the comments we received in response to the proposed assignments, our responses to those comments, and our finalized policies.

Comment: Commenters expressed support for the finalization of three new ICD-10-CM diagnosis codes describing presymptomatic Type 1 diabetes mellitus by stage and three new codes describing hypoglycemia by level, as shown in the following table and reflected in Table 6A. – New Diagnosis Codes – FY 2025 in association with the proposed rule and available at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>.

ICD-10-CM Code	Description
E10.A0	Type 1 diabetes mellitus, presymptomatic, unspecified
E10.A1	Type 1 diabetes mellitus, presymptomatic, Stage 1
E10.A2	Type 1 diabetes mellitus, presymptomatic, Stage 2
E16.A1	Hypoglycemia level 1
E16.A2	Hypoglycemia level 2
E16.A3	Hypoglycemia level 3

The commenters stated these new diagnosis codes are intended to facilitate standardized diabetes and hypoglycemia reporting and enable consistent quantification, tracking, and outcomes measurement. According to the commenters, the more granular presymptomatic diabetes diagnosis codes will help identify early disease progression and support appropriate intervention, including documentation of an individual’s need for a continuous glucose monitor (CGM). The commenters urged CMS to incorporate these finalized diagnosis codes throughout Medicare payment and coverage policies.

Response: We thank the commenters for their support.

Comment: Commenters expressed support for the proposed CC status designation and proposed MS-DRG assignments under MDC 17 and MDC 25 for the diagnosis codes describing lymphoma in remission as reflected in Table 6A.- New Diagnosis Codes- FY 2025 in association with the proposed rule and available at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>. The commenters stated that patients with these diagnoses

are generally more complex and resource-intensive, warranting the CC designation. The commenters requested that we finalize the proposed designation and MS-DRG assignments for FY 2025.

Response: We thank the commenters for their support.

Comment: A couple of commenters requested that CMS designate the following 16 new procedure codes that describe introduction of the AGENT™ Paclitaxel-Coated Balloon Catheter that is indicated to treat coronary in-stent restenosis (ISR) in patients with coronary artery disease as operating room (O.R.) procedures, with assignment to surgical MS-DRGs.

ICD-10-PCS Code	Description
XW0J3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0K3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0L3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0K3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0L3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0M3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, four or more arteries, percutaneous approach, new technology group 10

Specifically, the commenters requested assignment of the previously listed procedure codes to the following surgical MS-DRGs:

- MS-DRG 250 Percutaneous Cardiovascular Procedures without Intraluminal Device with MCC

- MS-DRG 251 Percutaneous Cardiovascular Procedures without Intraluminal Device without MCC
- MS-DRG 321 Percutaneous Cardiovascular Procedures with Intraluminal Device with MCC or 4+ Arteries/Intraluminal Devices
- MS-DRG 322 Percutaneous Cardiovascular Procedures with Intraluminal Device without MCC
- MS-DRG 323 Coronary Intravascular Lithotripsy with Intraluminal Device with MCC
- MS-DRG 324 Coronary Intravascular Lithotripsy with Intraluminal Device without MCC
- MS-DRG 325 Coronary Intravascular Lithotripsy without Intraluminal Device

The commenters stated that based on the usual surgical hierarchy rules, the reporting of one of the vessel preparation steps (that is, angioplasty, atherectomy, or lithotripsy), or placement of a new stent in connection with the reported use of the AGENT™ Paclitaxel-Coated Balloon Catheter would mean the procedure would map to one of the previously listed surgical MS-DRGs. The commenters also stated their belief that designating the new procedure codes as O.R. procedures with assignment to the previously listed MS-DRGs would reflect the surgical nature and complexity of the procedure and would be appropriate for the time being.

Response: The 16 new procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter were finalized following the March 19, 2024, ICD-10 Coordination and Maintenance Committee meeting and made available via the CMS website on June 5, 2025, at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>. The procedure codes are also reflected in Table 6B- New Procedure Codes – FY 2025 associated with this final rule.

Under our established process, we reviewed the predecessor code and MS-DRG assignment most closely associated with the new procedure codes. We note that because the procedure codes describing the use of an AGENT™ Paclitaxel-Coated Balloon Catheter are describing delivery of the paclitaxel to the coronary vessel(s), the predecessor code is 3E073GC

(Introduction of other therapeutic substance into coronary artery, percutaneous approach), which is designated as a non-O.R. procedure and does not affect MS-DRG assignment. As discussed at the March 19, 2024, ICD-10 Coordination and Maintenance Committee meeting and in the commenters' feedback, a preparatory step (that is, vessel preparation by either angioplasty, atherectomy, or lithotripsy) is required to be performed first, before the AGENT™ Paclitaxel-Coated Balloon Catheter is deployed. We note that each type of vessel preparation procedure is designated as an O.R. procedure and maps to one of the previously listed surgical MS-DRGs. We also note that the commenters are correct that based on the surgical hierarchy, the reporting of one of the vessel preparation steps (that is, angioplasty, atherectomy, or lithotripsy), or placement of a new stent in connection with the use of the AGENT™ Paclitaxel-Coated Balloon Catheter would result in assignment to one of the previously listed surgical MS-DRGs. We note that use of the AGENT™ Paclitaxel-Coated Balloon Catheter to deliver the paclitaxel to the coronary vessel(s) cannot occur in the absence of a surgical vessel preparation and therefore, it is the vessel preparation procedure that will determine the surgical MS-DRG assignment to one of the previously listed surgical MS-DRGs. As such, we do not agree with designating the 16 new procedure codes as O.R. procedure codes since the resulting MS-DRG assignment is dependent on the surgical vessel preparation procedure that would be reported when the AGENT™ Paclitaxel-Coated Balloon Catheter is used to deliver the paclitaxel to the coronary vessel(s) and result in assignment to one of the previously listed surgical MS-DRGs regardless. We refer the reader to the ICD-10 MS-DRG Definitions Manual, Version 42 available in association with this final rule on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps> for complete documentation of the GROUPER logic for the previously listed surgical MS-DRGs under MDC 05. Accordingly, consistent with our established process and for the reasons discussed, we are designating the 16 new procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter as non-O.R. for FY 2025.

Comment: A commenter expressed its appreciation to the ICD-10 Coordination and Maintenance Committee for creating and implementing new ICD-10-CM Z codes to describe Duffy null status. The commenter stated that the new codes were requested to ensure that people who have lower absolute neutrophil count (ANC) due to Duffy phenotype are accurately documented within the medical record and are not considered to have “abnormal” ANC levels.

The commenter indicated that the new codes will be critical for proper payment, accurate documentation, appropriate clinical care and management, and the ability to conduct research. The commenter also indicated that accurate documentation of the Duffy status will decrease duplicative testing and allow for more precise medication administration, consistent with need.

Response: We thank the commenter for its support.

Comment: Some commenters suggested that ICD-10-PCS procedure code 02583ZF (Destruction of conduction mechanism using irreversible electroporation, percutaneous approach) also be added to proposed new MS-DRG 317 (Concomitant Left Atrial Appendage Closure and Cardiac Ablation) in MDC 05. A couple commenters stated that pulsed field ablation is becoming the standard of care for atrial fibrillation ablation, and it should be included in the proposed new MS-DRG if patients who have atrial fibrillation are to be effectively, safely, and efficiently managed.

Response: We appreciate the commenters’ feedback. As discussed in section II.C.4.a. of the preamble of this final rule, we are finalizing MS-DRG 317 for FY 2025. Upon review, we believe it is appropriate to add procedure code 02583ZF to the logic for case assignment to MS-DRG 317 as the description of the code describes a type of cardiac ablation and is clinically coherent with the other procedure codes describing cardiac ablation that were proposed and finalized for assignment to MS-DRG 317 effective for FY 2025. We are therefore, finalizing, with modification, the MS-DRG assignments for procedure code 02583ZF as reflected in Table 6B.— New Procedure Codes in association with this final rule.

After consideration of the public comments received, we are finalizing the MDC and MS–DRG assignments for the new diagnosis codes and procedure codes as set forth in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes associated with this final rule. In addition, the finalized severity level designations for the new diagnosis codes are set forth in Table 6A. and the finalized O.R. status for the new procedure codes are set forth in Table 6B associated with this final rule.

In association with this final rule, we are making the following tables available on the CMS website at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html>:

- Table 6A.—New Diagnosis Codes—FY 2025;
- Table 6B.—New Procedure Codes—FY 2025;
- Table 6C.—Invalid Diagnosis Codes—FY 2025;
- Table 6D.—Invalid Procedure Codes—FY 2025;
- Table 6E.—Revised Diagnosis Code Titles—FY 2025;
- Table 6F.—Revised Procedure Code Titles—FY 2025;
- Table 6G.1.— Secondary Diagnosis Order Additions to the CC Exclusions List—FY 2025;
- Table 6G.2.— Principal Diagnosis Order Additions to the CC Exclusions List—FY 2025;
- Table 6H.1.— Secondary Diagnosis Order Deletions to the CC Exclusions List—FY 2025;
- Table 6H.2.— Principal Diagnosis Order Deletions to the CC Exclusions List—FY 2025;
- Table 6I.— Complete MCC List—FY 2025;
- Table 6I.1.— Additions to the MCC List—FY 2025;
- Table 6J.1.— Complete CC List—FY 2025;

- Table 6J.1.— Additions to the CC List—FY 2025;
- Table 6J.2.— Deletions to the CC List—FY 2025; and
- Table 6K.— Complete List of CC Exclusions—FY 2025.

14. Changes to the Surgical Hierarchies

Some inpatient stays entail multiple surgical procedures, each one of which, occurring by itself, could result in assignment of the case to a different MS-DRG within the MDC to which the principal diagnosis is assigned. Therefore, it is necessary to have a decision rule within the GROUPER by which these cases are assigned to a single MS-DRG. The surgical hierarchy, an ordering of surgical classes from most resource-intensive to least resource-intensive, performs that function. Application of this hierarchy ensures that cases involving multiple surgical procedures are assigned to the MS-DRG associated with the most resource-intensive surgical class.

A surgical class can be composed of one or more MS-DRGs. For example, in MDC 11, the surgical class “kidney transplant” consists of a single MS-DRG (MS-DRG 652) and the class “major bladder procedures” consists of three MS-DRGs (MS-DRGs 653, 654, and 655).

Consequently, in many cases, the surgical hierarchy has an impact on more than one MS-DRG. The methodology for determining the most resource-intensive surgical class involves weighting the average resources for each MS-DRG by frequency to determine the weighted average resources for each surgical class. For example, assume surgical class A includes MS-DRGs 001 and 002 and surgical class B includes MS-DRGs 003, 004, and 005. Assume also that the average costs of MS-DRG 001 are higher than that of MS-DRG 003, but the average costs of MS-DRGs 004 and 005 are higher than the average costs of MS-DRG 002. To determine whether surgical class A should be higher or lower than surgical class B in the surgical hierarchy, we would weigh the average costs of each MS-DRG in the class by frequency (that is, by the number of cases in the MS-DRG) to determine average resource consumption for the surgical class. The surgical classes would then be ordered from the class with the highest average

resource utilization to that with the lowest, with the exception of “other O.R. procedures” as discussed in this final rule.

This methodology may occasionally result in assignment of a case involving multiple procedures to the lower-weighted MS-DRG (in the highest, most resource-intensive surgical class) of the available alternatives. However, given that the logic underlying the surgical hierarchy provides that the GROUPER search for the procedure in the most resource-intensive surgical class, in cases involving multiple procedures, this result is sometimes unavoidable.

We note that, notwithstanding the foregoing discussion, there are a few instances when a surgical class with a lower average cost is ordered above a surgical class with a higher average cost. For example, the “other O.R. procedures” surgical class is uniformly ordered last in the surgical hierarchy of each MDC in which it occurs, regardless of the fact that the average costs for the MS-DRG or MS-DRGs in that surgical class may be higher than those for other surgical classes in the MDC. The “other O.R. procedures” class is a group of procedures that are only infrequently related to the diagnoses in the MDC but are still occasionally performed on patients with cases assigned to the MDC with these diagnoses. Therefore, assignment to these surgical classes should only occur if no other surgical class more closely related to the diagnoses in the MDC is appropriate.

A second example occurs when the difference between the average costs for two surgical classes is very small. We have found that small differences generally do not warrant reordering of the hierarchy because, as a result of reassigning cases on the basis of the hierarchy change, the average costs are likely to shift such that the higher-ordered surgical class has lower average costs than the class ordered below it.

Based on the changes that we proposed to make for FY 2025, as discussed in section II.C. of the preamble of the proposed rule and this final rule, we proposed to modify the existing surgical hierarchy for FY 2025 as follows.

As discussed in section II.C.4.a. of the preamble of the proposed rule and this final rule, we proposed to revise the surgical hierarchy for the MDC 05 (Diseases and Disorders of the Circulatory System) MS-DRGs as follows: In the MDC 05 MS-DRGs, we proposed to sequence proposed new MS-DRG 317 (Concomitant Left Atrial Appendage Closure and Cardiac Ablation) above MS-DRG 275 (Cardiac Defibrillator Implant with Cardiac Catheterization and MCC) and below MS-DRGs 231, 232, 233, 234, 235, and 236 (Coronary Bypass with or without PTCA, with or without Cardiac Catheterization or Open Ablation, with and without MCC, respectively). As discussed in section II.C.4.b. of the preamble of the proposed rule and this final rule, we proposed to revise the title for MS-DRG 276 from “Cardiac Defibrillator Implant with MCC” to “Cardiac Defibrillator Implant with MCC or Carotid Sinus Neurostimulator”.

As discussed in section II.C.6.b. of the preamble of the proposed rule and this final rule, we proposed to delete MS-DRGs 453, 454, and 455 (Combined Anterior and Posterior Spinal Fusion with MCC, with CC, and without CC/MCC, respectively). Based on the changes we proposed to make for those MS-DRGs in MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue), we proposed to revise the surgical hierarchy for MDC 08 as follows: In MDC 08, we proposed to sequence proposed new MS-DRGs 426, 427, and 428 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with MCC, with CC, and without CC/MCC, respectively) above proposed new MS-DRG 402 (Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical). We proposed to sequence proposed new MS-DRGs 429 and 430 (Combined Anterior and Posterior Cervical Spinal Fusion with MCC and without MCC, respectively) above MS-DRGs 456, 457, and 458 (Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions with MCC, with CC, and without CC/MCC, respectively) and below proposed new MS-DRG 402. We proposed to sequence proposed new MS-DRGs 447 and 448 (Multiple Level Spinal Fusion Except Cervical with MCC and without MCC, respectively) above proposed

revised MS-DRGs 459 and 460 (Single Level Spinal Fusion Except Cervical with and without MCC, respectively) and below MS-DRGs 456, 457, and 458.

Lastly, as discussed in section II.C.9. of the preamble of the proposed rule and this final rule, we proposed to revise the surgical hierarchy for the MDC 17 (Myeloproliferative Diseases and Disorders, Poorly Differentiated Neoplasms) MS-DRGs as follows: For the MDC 17 MS-DRGs, we proposed to sequence proposed new MS-DRG 850 (Acute Leukemia with Other Procedures) above MS-DRGs 823, 824, and 825 (Lymphoma and Non-Acute Leukemia with Other Procedures with MCC, with CC, and without CC/MCC, respectively) and below MS-DRGs 820, 821, and 822 (Lymphoma and Leukemia with Major O.R. Procedures with MCC, with CC, and without CC/MCC, respectively).

Our proposal for Appendix D MS-DRG Surgical Hierarchy by MDC and MS-DRG of the version of the ICD-10 MS-DRG Definitions Manual Version 42 is illustrated in the following tables.

Proposed Surgical Hierarchy: MDC 05	
MS-DRG 215	Other Heart Assist System Implant
MS-DRG 212	Concomitant Aortic and Mitral Valve Procedures
MS-DRGs 216-221	Cardiac Valve and Other Major Cardiothoracic Procedures
MS-DRGs 231-236	Coronary Bypass
Proposed New MS-DRG 317	Concomitant Left Atrial Appendage Closure and Cardiac Ablation
MS-DRG 275	Cardiac Defibrillator Implant with Cardiac Catheterization and MCC
Proposed New Title MS-DRG 276	Cardiac Defibrillator Implant with MCC or Carotid Sinus Neurostimulator
MS-DRG 277	Cardiac Defibrillator Implant without MCC
MS-DRGs 266-267	Endovascular Cardiac Valve Replacement and Supplement Procedures
MS-DRGs 268-269	Aortic and Heart Assist Procedures
MS-DRGs 228-229	Other Cardiothoracic Procedures
MS-DRGs 319-320	Other Endovascular Cardiac Valve Procedures
MS-DRGs 270-272	Other Major Cardiovascular Procedures
MS-DRGs 239-241	Amputation for Circulatory System Disorders Except Upper Limb and Toe
MS-DRGs 242-244	Permanent Cardiac Pacemaker Implant
MS-DRG 245	AICD Generator Procedures
MS-DRG 265	AICD Lead Procedures
MS-DRGs 273-274	Percutaneous and Other Intracardiac Procedures
MS-DRGs 323-325	Coronary Intravascular Lithotripsy
MS-DRGs 321-322	Percutaneous Cardiovascular Procedures with Intraluminal Device
MS-DRGs 250-251	Percutaneous Cardiovascular Procedures without Intraluminal Device
MS-DRGs 278-279	Ultrasound Accelerated and Other Thrombolysis
MS-DRGs 252-254	Other Vascular Procedures
MS-DRGs 255-257	Upper Limb and Toe Amputation for Circulatory System Disorders
MS-DRGs 258-259	Cardiac Pacemaker Device Replacement
MS-DRGs 260-262	Cardiac Pacemaker Revision Except Device Replacement
MS-DRG 263	Vein Ligation and Stripping
MS-DRG 264	Other Circulatory O.R Procedures

Proposed Surgical Hierarchy: MDC 08	
Delete MS-DRGs 453-455	Combined Anterior and Posterior Spinal Fusion

Proposed New MS-DRGs 426-428	Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical
Proposed New MS-DRG 402	Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical
Proposed New MS-DRGs 429-430	Combined Anterior and Posterior Cervical Spinal Fusion
MS-DRGs 456-458	Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions
Proposed New MS-DRGs 447-448	Multiple Level Spinal Fusion Except Cervical
Proposed New Title MS-DRGs 459-460	Single Level Spinal Fusion Except Cervical
MS-DRGs 461-462	Bilateral or Multiple Major Joint Procedures of Lower Extremity
MS-DRGs 463-465	Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders
MS-DRGs 466-468	Revision of Hip or Knee Replacement
MS-DRGs 521-522	Hip Replacement with Principal Diagnosis of Hip Fracture
MS-DRGs 469-470	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity
MS-DRGs 471-473	Cervical Spinal Fusion
MS-DRGs 474-476	Amputation for Musculoskeletal System and Connective Tissue Disorders
MS-DRGs 477-479	Biopsies of Musculoskeletal System and Connective Tissue
MS-DRGs 480-482	Hip and Femur Procedures Except Major Joint
MS-DRG 483	Major Joint or Limb Reattachment Procedures of Upper Extremities
MS-DRGs 485-489	Knee Procedures
MS-DRGs 518-520	Back and Neck Procedures Except Spinal Fusion
MS-DRGs 492-494	Lower Extremity and Humerus Procedures Except Hip, Foot and Femur
MS-DRGs 495-497	Local Excision and Removal of Internal Fixation Devices Except Hip and Femur
MS-DRGs 498-499	Local Excision and Removal of Internal Fixation Devices of Hip and Femur
MS-DRGs 500-502	Soft Tissue Procedures
MS-DRGs 503-505	Foot Procedures
MS-DRG 506	Major Thumb or Joint Procedures
MS-DRGs 507-508	Major Shoulder or Elbow Joint Procedures
MS-DRG 509	Arthroscopy
MS-DRGs 510-512	Shoulder, Elbow or Forearm Procedures, Except Major Joint Procedures
MS-DRGs 513-514	Hand or Wrist Procedures, Except Major Thumb or Joint Procedures
MS-DRGs 515-517	Other Musculoskeletal System and Connective Tissue O.R. Procedures

Proposed Surgical Hierarchy: MDC 17	
MS-DRGs 820-822	Lymphoma and Leukemia with Major O.R. Procedures
Proposed New MS-DRG 850	Acute Leukemia with Other Procedures
MS-DRGs 823-825	Lymphoma and Non-Acute Leukemia with Other Procedures
MS-DRGs 826-828	Myeloproliferative disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures
MS-DRGs 829-830	Myeloproliferative disorders or Poorly Differentiated Neoplasms with Other O.R. Procedures

Comment: A few commenters stated that they acknowledged the proposed conforming changes to the surgical hierarchy in association with the proposed MS-DRG classification changes, and acknowledged that the MS-DRG weight impacts the cost analysis, which in turn affects the hierarchy in the GROUPER. Regarding the proposed changes to MDC 08, the commenters stated that it is important to consider that it is not all multiple level spinal fusion procedures that appear to have the greatest impact on the proposed surgical hierarchy sequencing, rather it appears that it is the combined spinal fusion procedures. The commenters specified that the four highest MS-DRG categories listed in the proposed surgical hierarchy table for MDC 08 reflect combined spinal fusion procedures (MS-DRGs 453, 454, 455, 426, 427, 428, 420, 429, and 430). The commenters also remarked that proposed MS-DRGs 447 and 448,

which describe multiple level spinal fusion procedures, are proposed to be sequenced below proposed MS-DRG 402 that describes single level combined anterior and posterior spinal fusion procedures, and below existing MS-DRGs 456, 457, and 458 that include both single level and multiple level spinal fusion procedures. The commenters stated that although they agreed with the proposed surgical hierarchy, the data appear to indicate that it is not only the multiple level spinal fusion procedures that are impacting the length of stay and average costs among the proposed MS-DRGs since the proposed MS-DRGs describing combined spinal fusion procedures appear to warrant the highest hierarchy regardless of single level or multiple levels. According to the commenters, the discussion in the proposed rule suggested that the number of levels impacts resource utilization, however, the data to differentiate cases where both multiple and single level spinal fusion procedures were performed on the same patient or during the same operative episode did not appear to impact resource utilization based on the data analysis provided.

Response: We appreciate the commenters' feedback and support. We note that while the commenters listed MS-DRGs 453, 454, and 455 among one of the four categories reflecting combined spinal fusion procedures having the greatest impact in the proposed surgical hierarchy for MDC 08, we believe that since those MS-DRGs were proposed to be deleted, the commenters' intent was for CMS to instead consider the three categories of proposed spinal fusion MS-DRGs (426, 427, and 428; 402; 429 and 430) for which the proposed logic for case assignment was derived from MS-DRGs 453, 454, and 455. Because the proposed logic for case assignment to the three categories of proposed spinal fusion MS-DRGs includes both concepts, (that is, multiple level combined spinal fusion procedures and single level combined spinal fusion procedures), we believe additional review is warranted with respect to the commenters' concerns regarding which aspect may have a greater impact on resource utilization. We intend to consider if the development of evaluation criteria would be useful for future proposed

modifications to the surgical hierarchy for MS-DRGs that have meaningful changes to the clinical logic.

In the absence of a specific example, we are unclear why the commenter referenced data to differentiate cases where both multiple and single level spinal fusion procedures were performed on the same patient or during the same operative episode and its impact on resource utilization with respect to the data analysis provided in the proposed rule since, as stated in the proposed rule, the spinal fusion cases (for example, from MS-DRGs 453, 454, and 455) were separated into three categories (single level combined anterior and posterior fusions except cervical, multiple level combined anterior and posterior fusions except cervical, and combined anterior and posterior cervical spinal fusions), according to the proposed logic lists made available in Tables 6P.2d, 6P.2e, and 6P.2f in association with the proposed rule. The data analysis findings presented in the proposed rule show the difference in the number of cases, average length of stay, and average costs between multiple level and single level combined anterior and posterior spinal fusion cases. In consideration of the proposed logic, it would not be possible for a case to be reflected under both proposed MS-DRG categories at the same time.

Therefore, after consideration of the public comments we received, and based on the changes that we are finalizing for FY 2025, as discussed in section II.C. of the preamble of this final rule, we are finalizing our proposals to modify the existing surgical hierarchy, effective with the ICD-10 MS-DRGs Version 42, with modification. As discussed in section II.C.6.b., we are deleting MS-DRGs 459 and 460 and creating new MS-DRGs 450 and 451 (Single Level Spinal Fusion Except Cervical with MCC and without MCC, respectively). The finalized surgical hierarchy for MDC 08 is shown in the following table.

Surgical Hierarchy: MDC 08	
MS-DRGs 426-428	Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical
MS-DRG 402	Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical
MS-DRGs 429-430	Combined Anterior and Posterior Cervical Spinal Fusion
MS-DRGs 456-458	Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions
MS-DRGs 447-448	Multiple Level Spinal Fusion Except Cervical
MS-DRGs 450-451	Single Level Spinal Fusion Except Cervical
MS-DRGs 461-462	Bilateral or Multiple Major Joint Procedures of Lower Extremity

MS-DRGs 463-465	Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders
MS-DRGs 466-468	Revision of Hip or Knee Replacement
MS-DRGs 521-522	Hip Replacement with Principal Diagnosis of Hip Fracture
MS-DRGs 469-470	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity
MS-DRGs 471-473	Cervical Spinal Fusion
MS-DRGs 474-476	Amputation for Musculoskeletal System and Connective Tissue Disorders
MS-DRGs 477-479	Biopsies of Musculoskeletal System and Connective Tissue
MS-DRGs 480-482	Hip and Femur Procedures Except Major Joint
MS-DRG 483	Major Joint or Limb Reattachment Procedures of Upper Extremities
MS-DRGs 485-489	Knee Procedures
MS-DRGs 518-520	Back and Neck Procedures Except Spinal Fusion
MS-DRGs 492-494	Lower Extremity and Humerus Procedures Except Hip, Foot and Femur
MS-DRGs 495-497	Local Excision and Removal of Internal Fixation Devices Except Hip and Femur
MS-DRGs 498-499	Local Excision and Removal of Internal Fixation Devices of Hip and Femur
MS-DRGs 500-502	Soft Tissue Procedures
MS-DRGs 503-505	Foot Procedures
MS-DRG 506	Major Thumb or Joint Procedures
MS-DRGs 507-508	Major Shoulder or Elbow Joint Procedures
MS-DRG 509	Arthroscopy
MS-DRGs 510-512	Shoulder, Elbow or Forearm Procedures, Except Major Joint Procedures
MS-DRGs 513-514	Hand or Wrist Procedures, Except Major Thumb or Joint Procedures
MS-DRGs 515-517	Other Musculoskeletal System and Connective Tissue O.R. Procedures

For issues pertaining to the surgical hierarchy, as with other MS-DRG related requests, we encourage interested parties to submit comments no later than October 20, 2024, via the Medicare Electronic Application Request Information System™ (MEARIS™) at <https://mearis.cms.gov/public/home>, so that they can be considered for possible inclusion in the annual proposed rule. We will consider these public comments for possible proposals in future rulemaking as part of our annual review process.

15. Maintenance of the ICD-10-CM and ICD-10-PCS Coding Systems

In September 1985, the ICD-9-CM Coordination and Maintenance Committee was formed. This is a Federal interdepartmental committee, co-chaired by the Centers for Disease Control and Prevention's (CDC) National Center for Health Statistics (NCHS) and CMS, charged with maintaining and updating the ICD-9-CM system. The final update to ICD-9-CM codes was made on October 1, 2013. Thereafter, the name of the Committee was changed to the ICD-10 Coordination and Maintenance Committee, effective with the March 19-20, 2014 meeting. The ICD-10 Coordination and Maintenance Committee addresses updates to the ICD-10-CM and ICD-10-PCS coding systems. The Committee is jointly responsible for approving coding changes, and developing errata, addenda, and other modifications to the coding systems

to reflect newly developed procedures and technologies and newly identified diseases. The Committee is also responsible for promoting the use of Federal and non-Federal educational programs and other communication techniques with a view toward standardizing coding applications and upgrading the quality of the classification system.

The official list of ICD-9-CM diagnosis and procedure codes by fiscal year can be found on the CMS website at: <https://www.cms.gov/medicare/coding-billing/icd-10-codes/icd-9-cm-diagnosis-procedure-codes-abbreviated-and-full-code-titles>.

The official list of ICD-10-CM and ICD-10-PCS codes can be found on the CMS website at: <http://www.cms.gov/Medicare/Coding/ICD10/index.html>.

The NCHS has lead responsibility for the ICD-10-CM and ICD-9-CM diagnosis codes included in the Tabular List and Alphabetic Index for Diseases, while CMS has lead responsibility for the ICD-10-PCS and ICD-9-CM procedure codes included in the Tabular List and Alphabetic Index for Procedures.

The Committee encourages participation in the previously mentioned process by health-related organizations. In this regard, the Committee holds public meetings for discussion of educational issues and proposed coding changes. These meetings provide an opportunity for representatives of recognized organizations in the coding field, such as the American Health Information Management Association (AHIMA), the American Hospital Association (AHA), and various physician specialty groups, as well as individual physicians, health information management professionals, and other members of the public, to contribute ideas on coding matters. After considering the opinions expressed during the public meetings and in writing, the Committee formulates recommendations, which then must be approved by the agencies.

The Committee presented proposals for coding changes for implementation in FY 2025 at a public meeting held on September 12-13, 2023, and finalized the coding changes after consideration of comments received at the meetings and in writing by November 15, 2023.

The Committee held its Spring 2024 meeting on March 19-20, 2024. The deadline for submitting comments on these code proposals was April 19, 2024. It was announced at this meeting that any new diagnosis and procedure codes for which there was consensus of public support, and for which complete tabular and indexing changes would be made by June 2024 would be included in the October 1, 2024 update to the ICD-10-CM diagnosis and ICD-10-PCS procedure code sets. As discussed in earlier sections of the preamble of this final rule, there are new, revised, and deleted ICD-10-CM diagnosis codes and ICD-10-PCS procedure codes that are captured in Table 6A.—New Diagnosis Codes, Table 6B.—New Procedure Codes, Table 6C.—Invalid Diagnosis Codes, Table 6D. – Invalid Procedure Codes, Table 6E.—Revised Diagnosis Code Titles, and Table 6F. – Revised Procedure Code Titles for this final rule, which are available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>.

The code titles are adopted as part of the ICD-10 Coordination and Maintenance Committee process. Therefore, although we make the code titles available for the IPPS proposed and final rules, they are not subject to comment in the proposed or final rule. Because of the length of these tables, they are not published in the Addendum to the proposed or final rule. Rather, they are available on the CMS website as discussed in section VI. of the Addendum to the proposed rule and this final rule.

Recordings for the virtual meeting discussions of the procedure codes at the Committee's September 12-13, 2023 meeting and the March 19-20, 2024 meeting can be obtained from the CMS website at: <https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials>. The materials for the discussions relating to diagnosis codes at the September 12-13, 2023 meeting and March 19-20, 2024 meeting can be found at: <https://www.cdc.gov/nchs/icd/icd-10-maintenance/meetings.html>. These websites also provide detailed information about the Committee, including information on requesting a new code, participating in a Committee meeting, timeline requirements and meeting dates.

We encourage commenters to submit questions and comments on coding issues involving diagnosis codes via E-mail to: nchsicd10cm@cdc.gov.

Questions and comments concerning the procedure codes should be submitted via E-mail to: ICDProcedureCodeRequest@cms.hhs.gov.

As discussed in the proposed rule, CMS implemented 41 new procedure codes including the insertion of a palladium-103 collagen implant into the brain, the excision or resection of intestinal body parts using a laparoscopic hand-assisted approach, the transfer of omentum for pedicled omentoplasty procedures, and the administration of talquetamab into the ICD-10-PCS classification effective with discharges on and after April 1, 2024. The procedure codes are as follows:

Procedure Code	Description	O.R.	MDC	MS-DRG
00H005Z	Insertion of radioactive element, palladium-103 collagen implant into brain, open approach	Y	01 01 21 24	023-024 025-027 907-909 955
02583ZF	Destruction of conduction mechanism using irreversible electroporation, percutaneous approach	Y	05	273-274
07TP4ZG	Resection of spleen, percutaneous endoscopic approach, hand-assisted	Y	05 06 08 16 17 17 21 24	264 356-358 515-517 799-801 820-822 826-828 907-909 957-959
097N0ZZ	Dilation of nasopharynx, open approach	Y	01 03 21 24	040-042 143-145 907-909 957-959
097N7ZZ	Dilation of nasopharynx, via natural or artificial opening	Y	01 03 21 24	040-042 143-145 907-909 957-959
097N8ZZ	Dilation of nasopharynx, via natural or artificial opening endoscopic	Y	01 03 21 24	040-042 143-145 907-909 957-959
0DBF4ZG	Excision of right large intestine, percutaneous endoscopic approach, hand-assisted	Y	05 06 10 17 17 21 24	264 329-331 628-630 820-822 826-828 907-909 957-959
0DBG4ZG	Excision of left large intestine, percutaneous endoscopic approach, hand-assisted	Y	05 06 10 17 17 21 24	264 329-331 628-630 820-822 826-828 907-909 957-959

0DBJ4ZG	Excision of appendix, percutaneous endoscopic approach, hand-assisted	Y	06	397-399
0DBL4ZG	Excision of transverse colon, percutaneous endoscopic approach, hand-assisted	Y	05 06 10 17 17 21 24	264 329-331 628-630 820-822 826-828 907-909 957-959
0DBM4ZG	Excision of descending colon, percutaneous endoscopic approach, hand-assisted	Y	05 06 10 17 17 21 24	264 329-331 628-630 820-822 826-828 907-909 957-959
0DBN4ZG	Excision of sigmoid colon, percutaneous endoscopic approach, hand-assisted	Y	05 06 10 17 17 21 24	264 329-331 628-630 820-822 826-828 907-909 957-959
0DTF4ZG	Resection of right large intestine, percutaneous endoscopic approach, hand-assisted	Y	05 06 10 17 17 21 24	264 329-331 628-630 820-822 826-828 907-909 957-959
0DTG4ZG	Resection of left large intestine, percutaneous endoscopic approach, hand-assisted	Y	05 06 10 17 17	264 329-331 628-630 820-822 826-828 907-909 957-959
0DTJ4ZG	Resection of appendix, percutaneous endoscopic approach, hand-assisted	Y	05 06 13 21 24	264 397-399 749-750 907-909 957-959
0DTL4ZG	Resection of transverse colon, percutaneous endoscopic approach, hand-assisted	Y	05 06 17 17 21 24	264 329-331 820-822 826-828 907-909 957-959
0DTM4ZG	Resection of descending colon, percutaneous endoscopic approach, hand-assisted	Y	05 06 17 17 21 24	264 329-331 820-822 826-828 907-909 957-959
0DTN4ZG	Resection of sigmoid colon, percutaneous endoscopic approach, hand-assisted	Y	06 11 17 17 21 24	329-331 673-675 820-822 826-828 907-909 957-959
0DXU0ZV	Transfer omentum to thoracic region, open approach	Y	04 21 24	166-168 907-909 957-959
0DXU0ZW	Transfer omentum to abdominal region, open approach	Y	06 21 24	353-355 907-909 957-959
0DXU0ZX	Transfer omentum to pelvic region, open approach	Y	06	350-352
0DXU0ZY	Transfer omentum to inguinal region, open approach	Y	06	350-352

0DXU4ZV	Transfer omentum to thoracic region, percutaneous endoscopic approach	Y	04 21 24	166-168 907-909 957-959
0DXU4ZW	Transfer omentum to abdominal region, percutaneous endoscopic approach	Y	06 21 24	353-355 907-909 957-959
0DXU4ZX	Transfer omentum to pelvic region, percutaneous endoscopic approach	Y	06	350-352
0DXU4ZY	Transfer omentum to inguinal region, percutaneous endoscopic approach	Y	06	350-352
0FB04ZG	Excision of liver, percutaneous endoscopic approach, hand-assisted	Y	07 21 24	405-407 907-909 957-959
0FB14ZG	Excision of right lobe liver, percutaneous endoscopic approach, hand-assisted	Y	07 21 24	405-407 907-909 957-959
0FB24ZG	Excision of left lobe liver, percutaneous endoscopic approach, hand-assisted	Y	07 21 24	405-407 907-909 957-959
0FBG4ZG	Excision of pancreas, percutaneous endoscopic approach, hand-assisted	Y	07 10 21 24	405-407 628-630 907-909 957-959
0FT04ZG	Resection of liver, percutaneous endoscopic approach, hand-assisted	Y	07 21 24	405-407 907-909 957-959
0FT14ZG	Resection of right lobe liver, percutaneous endoscopic approach, hand-assisted	Y	07 21 24	405-407 907-909 957-959
0FT24ZG	Resection of left lobe liver, percutaneous endoscopic approach, hand-assisted	Y	07 21 24	405-407 907-909 957-959
0FT44ZG	Resection of gallbladder, percutaneous endoscopic approach, hand-assisted	Y	06 07 07 17 17 21 24	356-358 411-413 417-419 820-822 826-828 907-909 957-959
0FTG4ZG	Resection of pancreas, percutaneous endoscopic approach, hand-assisted	Y	07 21 24	405-407 907-909 957-959
0TT04ZG	Resection of right kidney, percutaneous endoscopic approach, hand-assisted	Y	11 21 24	656-661 907-909 957-959
0TT14ZG	Resection of left kidney, percutaneous endoscopic approach, hand-assisted	Y	11 21 24	656-661 907-909 957-959
0TT24ZG	Resection of bilateral kidneys, percutaneous endoscopic approach, hand-assisted	Y	11 21 24	656-661 907-909 957-959
3E0L317*	Introduction of other thrombolytic into pleural cavity, percutaneous approach	N		
XW01329*	Introduction of talquetamab antineoplastic into subcutaneous tissue, percutaneous approach, new technology group 9	N		
XX2KXP9*	Monitoring of interstitial fluid volume, sub-epidermal moisture using electrical biocapacitance, external approach, new technology group 9	N		

*As the procedure codes are designated as non-O.R. procedures, there is no assigned MDC or MS-DRG. The ICD-10 MS-DRG assignment is dependent on the reported principal diagnosis, any secondary diagnoses defined as a complication or comorbidity (CC) or major complication or comorbidity (MCC), procedures or services performed, age, sex, and discharge status.

The 41 procedure codes are also reflected in Table 6B- New Procedure Codes in association with the proposed rule and available on the CMS website at: <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS>. As with the other new procedure codes and MS-DRG assignments included in Table 6B in association with the proposed rule, we solicited public comments on the most appropriate MDC, MS-DRG, and operating room status assignments for these codes for FY 2025, as well as any other options for the GROUPER logic. We discuss the comments we received on these assignments in section II.C.13. of this final rule as well as our finalized assignments, including to add new procedure code 02583ZF to the logic for case assignment to new MS-DRG 317 for FY 2025, as reflected in Table 6B.— New Procedure Codes in association with this final rule.

In the proposed rule, we also noted that Change Request (CR) 13458, Transmittal 12384, titled “April 2024 Update to the Medicare Severity – Diagnosis Related Group (MS-DRG) Grouper and Medicare Code Editor (MCE) Version 41.1” was issued on November 30, 2023 (available on the CMS website at: <https://www.cms.gov/regulations-and-guidance/guidance/transmittals/2023-transmittals/r12384cp>) regarding the release of an updated version of the ICD-10 MS-DRG GROUPER and Medicare Code Editor software, Version 41.1, effective with discharges on and after April 1, 2024, reflecting the new procedure codes. The updated software, along with the updated ICD-10 MS-DRG Version 41.1 Definitions Manual and the Definitions of Medicare Code Edits Version 41.1 manual is available at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>.

In the September 7, 2001 final rule implementing the IPPS new technology add-on payments (66 FR 46906), we indicated we would attempt to include proposals for procedure codes that would describe new technology discussed and approved at the Spring meeting as part of the code revisions effective the following October.

Section 503(a) of the Medicare Modernization Act (Pub. L. 108-173) included a requirement for updating diagnosis and procedure codes twice a year instead of a single update on October 1 of each year. This requirement was included as part of the amendments to the Act relating to recognition of new technology under the IPPS. Section 503(a) of Public Law 108-173 amended section 1886(d)(5)(K) of the Act by adding a clause (vii) which states that the Secretary shall provide for the addition of new diagnosis and procedure codes on April 1 of each year, but the addition of such codes shall not require the Secretary to adjust the payment (or diagnosis-related group classification) until the fiscal year that begins after such date. This requirement improves the recognition of new technologies under the IPPS by providing information on these new technologies at an earlier date. Data will be available 6 months earlier than would be possible with updates occurring only once a year on October 1.

In the FY 2005 IPPS final rule, we implemented section 1886(d)(5)(K)(vii) of the Act, as added by section 503(a) of Public Law 108-173, by developing a mechanism for approving, in time for the April update, diagnosis and procedure code revisions needed to describe new technologies and medical services for purposes of the new technology add-on payment process. We also established the following process for making these determinations. Topics considered during the Fall ICD-10 (previously ICD-9-CM) Coordination and Maintenance Committee meeting were considered for an April 1 update if a strong and convincing case was made by the requestor during the Committee's public meeting. The request needed to identify the reason why a new code was needed in April for purposes of the new technology process. Meeting participants and those reviewing the Committee meeting materials were provided the opportunity to comment on the expedited request. We refer the reader to the FY 2022 IPPS/LTCH PPS final rule (86 FR 44950) for further discussion of the implementation of this prior April 1 update for purposes of the new technology add-on payment process.

However, as discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44950 through 44956), we adopted an April 1 implementation date, in addition to the annual October 1 update,

beginning with April 1, 2022. We noted that the intent of this April 1 implementation date is to allow flexibility in the ICD-10 code update process. With this new April 1 update, CMS now uses the same process for consideration of all requests for an April 1 implementation date, including for purposes of the new technology add-on payment process (that is, the prior process for consideration of an April 1 implementation date only if a strong and convincing case was made by the requestor during the meeting no longer applies). We are continuing to use several aspects of our existing established process to implement new codes through the April 1 code update, which includes presenting proposals for April 1 consideration at the September ICD-10 Coordination and Maintenance Committee meeting, requesting public comments, reviewing the public comments, finalizing codes, and announcing the new codes with their assignments consistent with the new GROUPER release information. We note that under our established process, requestors indicate whether they are submitting their code request for consideration for an April 1 implementation date or an October 1 implementation date. The ICD-10 Coordination and Maintenance Committee makes efforts to accommodate the requested implementation date for each request submitted. However, the Committee determines which requests are to be presented for consideration for an April 1 implementation date or an October 1 implementation date. As discussed earlier in this section of the preamble of this final rule, there were code proposals presented for an April 1, 2024 implementation at the September 12–13, 2023 Committee meetings. Following the receipt of public comments, the code proposals were approved and finalized, therefore, there were new codes implemented April 1, 2024.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule, consistent with the process we outlined for the April 1 implementation date, we announced the new codes in November 2023 and provided the updated code files in December 2023 and ICD-10-CM Official Guidelines for Coding and Reporting in January 2024. In the February 05, 2024 **Federal Register** (89 FR 7710), notice for the March 19-20, 2024 ICD-10 Coordination and Maintenance Committee Meeting was published that includes the tentative agenda and identifies which topics are related

to a new technology add-on payment application. By February 1, 2024, we made available the updated Version 41.1 ICD-10 MS-DRG GROUPER software and related materials on the CMS web page at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software>.

ICD-9-CM addendum and code title information is published on the CMS website at <https://www.cms.gov/medicare/coding-billing/icd-10-codes/updates-revisions-icd-9-cm-procedure-codes-addendum>. ICD-10-CM and ICD-10-PCS addendum and code title information is published on the CMS website at <https://www.cms.gov/medicare/coding-billing/icd-10-codes>. CMS also sends electronic files containing all ICD-10-CM and ICD-10-PCS coding changes to its Medicare contractors for use in updating their systems and providing education to providers. Information on ICD-10-CM diagnosis codes, along with the Official ICD-10-CM Coding Guidelines, can be found on the CDC website at <https://www.cdc.gov/nchs/icd/icd-10-cm/files.html>. Additionally, information on new, revised, and deleted ICD-10-CM diagnosis and ICD-10-PCS procedure codes is provided to the AHA for publication in the Coding Clinic for ICD-10. The AHA also distributes coding update information to publishers and software vendors.

In the proposed rule, we noted that for FY 2024, there are currently 74,044 diagnosis codes and 78,638 procedure codes. We also noted that as displayed in Table 6A.—New Diagnosis Codes and in Table 6B.—New Procedure Codes associated with the proposed rule (and available on the CMS website at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>), there are 252 new diagnosis codes that had been finalized for FY 2025 at the time of the development of the proposed rule and 41 new procedure codes that were effective with discharges on and after April 1, 2024.

As discussed in section II.C.13 of the preamble of this final rule, we are making Table 6A.— New Diagnosis Codes, Table 6B.—New Procedure Codes, Table 6C.—Invalid Diagnosis Codes, Table 6D.—Invalid Procedure Codes, Table 6E.—Revised Diagnosis Code Titles and

Table 6F.— Revised Procedure Code Titles available on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>

in association with this final rule. As shown in Table 6B.—New Procedure Codes, there were procedure codes discussed at the March 19–20, 2024 ICD–10 Coordination and Maintenance Committee meeting that were not finalized in time to include in the proposed rule and are identified with an asterisk. We refer the reader to Table 6B.—New Procedure Codes associated with this final rule and available on the CMS website at:

<https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps>

for the detailed list of these 371 new procedure codes finalized for FY 2025.

We also note, as reflected in Table 6C.—Invalid Diagnosis Codes and in Table 6D.—Invalid Procedure Codes, there are a total of 36 diagnosis codes and 61 procedure codes that will become invalid effective October 1, 2024. Based on these code updates, effective October 1, 2024, there are a total of 74,260 ICD-10-CM diagnosis codes and 78,948 ICD-10-PCS procedure codes for FY 2025 as shown in the following table.

FY 2024 ICD-10-CM	74,044 total codes	FY 2024 ICD-10-PCS	78,638 total codes
FY 2025 ICD-10-CM	252 additions	FY 2025 ICD-10-PCS	371 additions
FY 2025 ICD-10-CM	36 deletions	FY 2025 ICD-10-PCS	61 deletions
FY 2025 ICD-10-CM	74,260 total codes	FY 2025 ICD-10-PCS	78,948 total codes

As stated previously, the public is provided the opportunity to comment on any requests for new diagnosis or procedure codes discussed at the ICD-10 Coordination and Maintenance Committee meeting. The code titles are adopted as part of the ICD-10 Coordination and Maintenance Committee process. Thus, although we publish the code titles in the IPPS proposed and final rules, they are not subject to comment in the proposed or final rules.

16. Replaced Devices Offered without Cost or with a Credit

a. Background

In the FY 2008 IPPS final rule with comment period (72 FR 47246 through 47251), we discussed the topic of Medicare payment for devices that are replaced without cost or where

credit for a replaced device is furnished to the hospital. We implemented a policy to reduce a hospital's IPPS payment for certain MS-DRGs where the implantation of a device that subsequently failed or was recalled determined the base MS-DRG assignment. At that time, we specified that we will reduce a hospital's IPPS payment for those MS-DRGs where the hospital received a credit for a replaced device equal to 50 percent or more of the cost of the device.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51556 through 51557), we clarified this policy to state that the policy applies if the hospital received a credit equal to 50 percent or more of the cost of the replacement device and issued instructions to hospitals accordingly.

b. Changes for FY 2025

As discussed in section II.C.5. of the preamble of the proposed rule and this final rule, for FY 2025, we proposed to revise the title of MS-DRG 276 from "Cardiac Defibrillator Implant with MCC" to "Cardiac Defibrillator Implant with MCC or Carotid Sinus Neurostimulator".

As stated in the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24409), we generally map new MS-DRGs onto the list when they are formed from procedures previously assigned to MS-DRGs that are already on the list. Currently, MS-DRG 276 is on the list of MS-DRGs subject to the policy for payment under the IPPS for replaced devices offered without cost or with a credit as shown in the following table. Therefore, we proposed that if the applicable proposed MS-DRG changes are finalized, we would make conforming changes to the title of MS-DRG 276 as reflected in the table that follows. We also proposed to continue to include the existing MS-DRGs currently subject to the policy.

As discussed in section II.C.5. of the preamble of this final rule, we are finalizing our proposal to revise the title of MS-DRG 276 from "Cardiac Defibrillator Implant with MCC" to "Cardiac Defibrillator Implant with MCC or Carotid Sinus Neurostimulator". We did not receive any public comments opposing our proposal make conforming changes to the title of MS-DRG 276 in the list of MS-DRGs that will be subject to the replaced devices offered without cost or with a credit policy effective October 1, 2024. Additionally, we did not receive any

public comments opposing our proposal to continue to include the existing MS-DRGs currently subject to the policy. Therefore, we are finalizing the list of MS-DRGs in the following table that will be subject to the replaced devices offered without cost or with a credit policy effective October 1, 2024.

MDC	MS-DRG	MS-DRG Title
Pre-MDC	001	Heart Transplant or Implant of Heart Assist System with MCC
Pre-MDC	002	Heart Transplant or Implant of Heart Assist System without MCC
01	023	Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator
01	024	Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC
01	025	Craniotomy and Endovascular Intracranial Procedures with MCC
01	026	Craniotomy and Endovascular Intracranial Procedures with CC
01	027	Craniotomy and Endovascular Intracranial Procedures without CC/MCC
01	040	Peripheral, Cranial Nerve and Other Nervous System Procedures with MCC
01	041	Peripheral, Cranial Nerve and Other Nervous System Procedures with CC or Peripheral Neurostimulator
01	042	Peripheral, Cranial Nerve and Other Nervous System Procedures without CC/MCC
03	140	Major Head and Neck Procedures with MCC
03	141	Major Head and Neck Procedures with CC
03	142	Major Head and Neck Procedures without CC/MCC
05	215	Other Heart Assist System Implant
05	216	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization with MCC
05	217	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization with CC
05	218	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization without CC/MCC
05	219	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization with MCC
05	220	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization with CC
05	221	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization without CC/MCC
05	242	Permanent Cardiac Pacemaker Implant with MCC
05	243	Permanent Cardiac Pacemaker Implant with CC
05	244	Permanent Cardiac Pacemaker Implant without CC/MCC
05	245	AICD Generator Procedures
05	258	Cardiac Pacemaker Device Replacement with MCC
05	259	Cardiac Pacemaker Device Replacement without MCC
05	260	Cardiac Pacemaker Revision Except Device Replacement with MCC
05	261	Cardiac Pacemaker Revision Except Device Replacement with CC

05	262	Cardiac Pacemaker Revision Except Device Replacement without CC/MCC
05	265	AICD Lead Procedures
05	266	Endovascular Cardiac Valve Replacement and Supplement Procedures with MCC
05	267	Endovascular Cardiac Valve Replacement and Supplement Procedures without MCC
05	268	Aortic and Heart Assist Procedures Except Pulsation Balloon with MCC
05	269	Aortic and Heart Assist Procedures Except Pulsation Balloon without MCC
05	270	Other Major Cardiovascular Procedures with MCC
05	271	Other Major Cardiovascular Procedures with CC
05	272	Other Major Cardiovascular Procedures without CC/MCC
05	275	Cardiac Defibrillator Implant with Cardiac Catheterization and MCC
05	276	Cardiac Defibrillator Implant with MCC or Carotid Sinus Neurostimulator
05	277	Cardiac Defibrillator Implant without MCC
05	319	Other Endovascular Cardiac Valve Procedures with MCC
05	320	Other Endovascular Cardiac Valve Procedures without MCC
08	461	Bilateral or Multiple Major Joint Procedures of Lower Extremity with MCC
08	462	Bilateral or Multiple Major Joint Procedures of Lower Extremity without MCC
08	466	Revision of Hip or Knee Replacement with MCC
08	467	Revision of Hip or Knee Replacement with CC
08	468	Revision of Hip or Knee Replacement without CC/MCC
08	469	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity with MCC or Total Ankle Replacement
08	470	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity without MCC
08	521	Hip Replacement with Principal Diagnosis of Hip Fracture with MCC
08	522	Hip Replacement with Principal Diagnosis of Hip Fracture without MCC

The final list of MS-DRGs subject to the IPPS policy for replaced devices offered without cost or with a credit will be issued to providers in the form of a Change Request (CR).

17. Out of Scope Public Comments Received

We received public comments on MS-DRG related issues that were outside the scope of the proposals included in the FY 2025 IPPS/LTCH PPS proposed rule.

Because we consider these public comments to be outside the scope of the proposed rule, we are not addressing them in this final rule. As stated in section II.C.1.b. of the preamble of this

final rule, we encourage individuals with comments about MS-DRG classifications to submit these comments no later than October 20, 2024, via the Medicare Electronic Application Request Information System™ (MEARIS™) at: <https://mearis.cms.gov/public/home>, so that they can be considered for possible inclusion in the annual proposed rule. We will consider these public comments for possible proposals in future rulemaking as part of our annual review process.

D. Recalibration of the FY 2025 MS-DRG Relative Weights

1. Data Sources for Developing the Relative Weights

Consistent with our established policy, in developing the MS-DRG relative weights for FY 2025, we proposed to use two data sources: claims data and cost report data. The claims data source is the MedPAR file, which includes fully coded diagnostic and procedure data for all Medicare inpatient hospital bills. The FY 2023 MedPAR data used in this final rule include discharges occurring on October 1, 2022, through September 30, 2023, based on bills received by CMS through March 31, 2024, from all hospitals subject to the IPPS and short-term, acute care hospitals in Maryland (which at that time were under a waiver from the IPPS).

The FY 2023 MedPAR file used in calculating the relative weights includes data for approximately 6,916,571 Medicare discharges from IPPS providers. Discharges for Medicare beneficiaries enrolled in a Medicare Advantage managed care plan are excluded from this analysis. These discharges are excluded when the MedPAR “GHO Paid” indicator field on the claim record is equal to “1” or when the MedPAR DRG payment field, which represents the total payment for the claim, is equal to the MedPAR “Indirect Medical Education (IME)” payment field, indicating that the claim was an “IME only” claim submitted by a teaching hospital on behalf of a beneficiary enrolled in a Medicare Advantage managed care plan. In addition, the March 2024 update of the FY 2023 MedPAR file complies with version 5010 of the X12 HIPAA Transaction and Code Set Standards, and includes a variable called “claim type.” Claim type “60” indicates that the claim was an inpatient claim paid as fee-for-service. Claim types “61,” “62,” “63,” and “64” relate to encounter claims, Medicare Advantage IME claims, and HMO no-pay claims. Therefore, the calculation of the relative weights for FY 2025 also excludes claims with claim type values not equal to “60.” The data exclude CAHs, including hospitals that subsequently became CAHs after the period from which the data were taken. In addition, the data exclude Rural Emergency Hospitals (REHs), including hospitals that subsequently became REHs after the period from which the data were taken. We note that the FY 2025 relative

weights are based on the ICD-10-CM diagnosis codes and ICD-10-PCS procedure codes from the FY 2023 MedPAR claims data, grouped through the ICD-10 version of the FY 2025 GROUPER (Version 42).

The second data source used in the cost-based relative weighting methodology is the Medicare cost report data files from the Healthcare Cost Report Information System (HCRIS). In general, we use the HCRIS dataset that is 3 years prior to the IPPS fiscal year. Specifically, for this final rule, we used the March 2024 update of the FY 2022 HCRIS for calculating the FY 2025 cost-based relative weights. Consistent with our historical practice, for this FY 2025 final rule, we are providing the version of the HCRIS from which we calculated these 19 cost-to-charge-ratios (CCRs) on the CMS website at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS>. Click on the link on the left side of the screen titled “FY 2025 IPPS Final Rule Home Page” or “Acute Inpatient Files for Download.”

2. Methodology for Calculation of the Relative Weights

a. General

We calculated the FY 2025 relative weights based on 19 CCRs. The methodology we proposed to use to calculate the FY 2025 MS-DRG cost-based relative weights based on claims data in the FY 2023 MedPAR file and data from the FY 2022 Medicare cost reports is as follows:

- To the extent possible, all the claims were regrouped using the FY 2025 MS-DRG classifications discussed in sections II.B. and II.C. of the preamble of this final rule.
- The transplant cases that were used to establish the relative weights for heart and heart-lung, liver and/or intestinal, and lung transplants (MS-DRGs 001, 002, 005, 006, and 007, respectively) were limited to those Medicare-approved transplant centers that have cases in the FY 2023 MedPAR file. (Medicare coverage for heart, heart-lung, liver and/or intestinal, and lung transplants is limited to those facilities that have received approval from CMS as transplant centers.)

- Organ acquisition costs for kidney, heart, heart-lung, liver, lung, pancreas, and intestinal (or multivisceral organs) transplants continue to be paid on a reasonable cost basis. Because these acquisition costs are paid separately from the prospective payment rate, it is necessary to subtract the acquisition charges from the total charges on each transplant bill that showed acquisition charges before computing the average cost for each MS-DRG and before eliminating statistical outliers.

Section 108 of the Further Consolidated Appropriations Act, 2020 provides that, for cost reporting periods beginning on or after October 1, 2020, costs related to hematopoietic stem cell acquisition for the purpose of an allogeneic hematopoietic stem cell transplant shall be paid on a reasonable cost basis. We refer the reader to the FY 2021 IPPS/LTCH PPS final rule for further discussion of the reasonable cost basis payment for cost reporting periods beginning on or after October 1, 2020 (85 FR 58835 through 58842). For FY 2022 and subsequent years, we subtract the hematopoietic stem cell acquisition charges from the total charges on each transplant bill that showed hematopoietic stem cell acquisition charges before computing the average cost for each MS-DRG and before eliminating statistical outliers.

- Claims with total charges or total lengths of stay less than or equal to zero were deleted. Claims that had an amount in the total charge field that differed by more than \$30.00 from the sum of the routine day charges, intensive care charges, pharmacy charges, implantable devices charges, supplies and equipment charges, therapy services charges, operating room charges, cardiology charges, laboratory charges, radiology charges, other service charges, labor and delivery charges, inhalation therapy charges, emergency room charges, blood and blood products charges, anesthesia charges, cardiac catheterization charges, CT scan charges, and MRI charges were also deleted.

- At least 92.6 percent of the providers in the MedPAR file had charges for 14 of the 19 cost centers. All claims of providers that did not have charges greater than zero for at least 14 of the 19 cost centers were deleted. In other words, a provider must have no more than five blank

cost centers. If a provider did not have charges greater than zero in more than five cost centers, the claims for the provider were deleted.

- Statistical outliers were eliminated by removing all cases that were beyond 3.0 standard deviations from the geometric mean of the log distribution of both the total charges per case and the total charges per day for each MS-DRG.

- Effective October 1, 2008, because hospital inpatient claims include a Present on Admission (POA) field for each diagnosis present on the claim, only for purposes of relative weight-setting, the POA indicator field was reset to “Y” for “Yes” for all claims that otherwise have an “N” (No) or a “U” (documentation insufficient to determine if the condition was present at the time of inpatient admission) in the POA field.

Under current payment policy, the presence of specific HAC codes, as indicated by the POA field values, can generate a lower payment for the claim. Specifically, if the particular condition is present on admission (that is, a “Y” indicator is associated with the diagnosis on the claim), it is not a HAC, and the hospital is paid for the higher severity (and, therefore, the higher weighted MS-DRG). If the particular condition is not present on admission (that is, an “N” indicator is associated with the diagnosis on the claim) and there are no other complicating conditions, the DRG GROUPER assigns the claim to a lower severity (and, therefore, the lower weighted MS-DRG) as a penalty for allowing a Medicare inpatient to contract a HAC. While the POA reporting meets policy goals of encouraging quality care and generates program savings, it presents an issue for the relative weight-setting process. Because cases identified as HACs are likely to be more complex than similar cases that are not identified as HACs, the charges associated with HAC cases are likely to be higher as well. Therefore, if the higher charges of these HAC claims are grouped into lower severity MS-DRGs prior to the relative weight-setting process, the relative weights of these particular MS-DRGs would become artificially inflated, potentially skewing the relative weights. In addition, we want to protect the integrity of the budget neutrality process by ensuring that, in estimating payments, no increase to the

standardized amount occurs as a result of lower overall payments in a previous year that stem from using weights and case-mix that are based on lower severity MS-DRG assignments. If this would occur, the anticipated cost savings from the HAC policy would be lost.

To avoid these problems, we reset the POA indicator field to “Y” only for relative weight-setting purposes for all claims that otherwise have an “N” or a “U” in the POA field. This resetting “forced” the more costly HAC claims into the higher severity MS-DRGs as appropriate, and the relative weights calculated for each MS-DRG more closely reflect the true costs of those cases.

In addition, in the FY 2013 IPPS/LTCH PPS final rule, for FY 2013 and subsequent fiscal years, we finalized a policy to treat hospitals that participate in the Bundled Payments for Care Improvement (BPCI) initiative the same as prior fiscal years for the IPPS payment modeling and ratesetting process without regard to hospitals’ participation within these bundled payment models (77 FR 53341 through 53343). Specifically, because acute care hospitals participating in the BPCI Initiative still receive IPPS payments under section 1886(d) of the Act, we include all applicable data from these subsection (d) hospitals in our IPPS payment modeling and ratesetting calculations as if the hospitals were not participating in those models under the BPCI initiative. We refer readers to the FY 2013 IPPS/LTCH PPS final rule for a complete discussion on our final policy for the treatment of hospitals participating in the BPCI initiative in our ratesetting process. For additional information on the BPCI initiative, we refer readers to the CMS’ Center for Medicare and Medicaid Innovation’s website at <https://innovation.cms.gov/initiatives/Bundled-Payments/index.html> and to section IV.H.4. of the preamble of the FY 2013 IPPS/LTCH PPS final rule (77 FR 53341 through 53343).

The participation of hospitals in the BPCI initiative concluded on September 30, 2018. The participation of hospitals in the BPCI Advanced model started on October 1, 2018. The BPCI Advanced model, tested under the authority of section 1115A of the Act, is comprised of a single payment and risk track, which bundles payments for multiple services that beneficiaries

receive during a Clinical Episode. Acute care hospitals may participate in BPCI Advanced in one of two capacities: as a model Participant or as a downstream Episode Initiator. Regardless of the capacity in which they participate in the BPCI Advanced model, participating acute care hospitals will continue to receive IPPS payments under section 1886(d) of the Act. Acute care hospitals that are Participants also assume financial and quality performance accountability for Clinical Episodes in the form of a reconciliation payment. For additional information on the BPCI Advanced model, we refer readers to the BPCI Advanced webpage on the CMS Center for Medicare and Medicaid Innovation's website at <https://innovation.cms.gov/initiatives/bpci-advanced>. Consistent with our policy for FY 2024, and consistent with how we have treated hospitals that participated in the BPCI Initiative, for FY 2025, we continue to believe it is appropriate to include all applicable data from the subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations because, as noted previously, these hospitals are still receiving IPPS payments under section 1886(d) of the Act. Consistent with the FY 2024 IPPS/LTCH PPS final rule, we also proposed to include all applicable data from subsection (d) hospitals participating in the Comprehensive Care for Joint Replacement (CJR) Model in our IPPS payment modeling and ratesetting calculations.

The charges for each of the 19 cost groups for each claim were standardized to remove the effects of differences in area wage levels, IME and DSH payments, and for hospitals located in Alaska and Hawaii, the applicable cost-of-living adjustment. Because hospital charges include charges for both operating and capital costs, we standardized total charges to remove the effects of differences in geographic adjustment factors, cost-of-living adjustments, and DSH payments under the capital IPPS as well. Charges were then summed by MS-DRG for each of the 19 cost groups so that each MS-DRG had 19 standardized charge totals. Statistical outliers were then removed. These charges were then adjusted to cost by applying the national average CCRs developed from the FY 2022 cost report data.

The 19 cost centers that we used in the relative weight calculation are shown in a

supplemental data file, Cost Center HCRIS Lines Supplemental Data File, posted via the internet on the CMS website for this final rule and available at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS>. The supplemental data file shows the lines on the cost report and the corresponding revenue codes that we used to create the 19 national cost center CCRs. We stated in the proposed rule that if we receive comments about the groupings in this supplemental data file, we may consider these comments as we finalize our policy. However, we did not receive any comments on the groupings in this table, and therefore, we are finalizing the groupings as proposed.

Consistent with historical practice, we account for rare situations of non-monotonicity in a base MS-DRG and its severity levels, where the mean cost in the higher severity level is less than the mean cost in the lower severity level, in determining the relative weights for the different severity levels. If there are initially non-monotonic relative weights in the same base DRG and its severity levels, then we combine the cases that group to the specific non-monotonic MS-DRGs for purposes of relative weight calculations. For example, if there are two non-monotonic MS-DRGs, combining the cases across those two MS-DRGs results in the same relative weight for both MS-DRGs. The relative weight calculated using the combined cases for those severity levels is monotonic, effectively removing any non-monotonicity with the base DRG and its severity levels. For this FY 2025 final rule, this calculation was applied to address non-monotonicity for cases that grouped to the following: MS-DRG 016 and MS-DRG 017, MS-DRG 095 and MS-DRG 096, MS-DRG 504 and MS-DRG 505, MS-DRG 797 and MS-DRG 798. In the supplemental file titled AOR/BOR File, we include statistics for the affected MS-DRGs both separately and with cases combined.

We invited public comments on our proposals related to recalibration of the proposed FY 2025 relative weights and the changes in relative weights from FY 2024.

We received several comments that we consider to be out of scope. For example, a commenter requested a “device intensive” cost threshold. Because we consider these comments

to be out of scope, we are not responding in this final rule.

After consideration of the comments received, we are finalizing our proposals without modifications related to the recalibration of the FY 2025 relative weights. We summarize and respond to comments relating to the methodology for calculating the relative weight for MS-DRG 018 in the next section of this final rule.

b. Relative Weight Calculation for MS-DRG 018

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58451 through 58453), we created MS-DRG 018 for cases that include procedures describing CAR T-cell therapies. We also finalized our proposal to modify our existing relative weight methodology to ensure that the relative weight for MS-DRG 018 appropriately reflects the relative resources required for providing CAR T-cell therapy outside of a clinical trial, while still accounting for the clinical trial cases in the overall average cost for all MS-DRGs (85 FR 58599 through 58600).

Specifically, we stated that clinical trial claims that group to new MS-DRG 018 would not be included when calculating the average cost for MS-DRG 018 that is used to calculate the relative weight for this MS-DRG, so that the relative weight reflects the costs of the CAR T-cell therapy drug. We stated that we identified clinical trial claims as claims that contain ICD-10-CM diagnosis code Z00.6 or contain standardized drug charges of less than \$373,000, which was the average sales price of KYMRIAH and YESCARTA, the two CAR T-cell biological products licensed to treat relapsed/refractory large B-cell lymphoma as of the time of the development of the FY 2021 final rule. In addition, we stated that (a) when the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the claim will be included when calculating the average cost for new MS-DRG 018 to the extent such cases can be identified in the historical data, and (b) when there is expanded access use of immunotherapy, these cases will not be included when calculating the average cost for new MS-DRG 018 to the extent such cases can be identified in the historical data.

We also finalized our proposal to calculate an adjustment to account for the CAR T-cell

therapy cases identified as clinical trial cases in calculating the national average standardized cost per case that is used to calculate the relative weights for all MS-DRGs and for purposes of budget neutrality and outlier simulations. We calculate this adjustor by dividing the average cost for cases that we identify as clinical trial cases by the average cost for cases that we identify as non-clinical trial cases, with the additional refinements that (a) when the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the claim will be included when calculating the average cost for cases not determined to be clinical trial cases to the extent such cases can be identified in the historical data, and (b) when there is expanded access use of immunotherapy, these cases will be included when calculating the average cost for cases determined to be clinical trial cases to the extent such cases can be identified in the historical data. We stated that to the best of our knowledge, there were no claims in the historical data used in the calculation of this adjustment for cases involving a clinical trial of a different product, and to the extent the historical data contain claims for cases involving expanded access use of immunotherapy we believe those claims would have drug charges less than \$373,000.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58842), we also finalized an adjustment to the payment amount for applicable clinical trial and expanded access use immunotherapy cases that group to MS-DRG 018, and indicated that we would provide instructions for identifying these claims in separate guidance. Following the issuance of the FY 2021 IPPS/LTCH PPS final rule, we issued guidance²⁰ stating that providers may enter a Billing Note NTE02 “Expand Acc Use” on the electronic claim 837I or a remark “Expand Acc Use” on a paper claim to notify the MAC of expanded access use of CAR T-cell therapy. In this case, the MAC would add payer-only condition code “ZB” so that Pricer will apply the payment adjustment in calculating payment for the case. In cases when the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the

²⁰ <https://www.cms.gov/files/document/r10571cp.pdf>

provider may enter a Billing Note NTE02 “Diff Prod Clin Trial” on the electronic claim 837I or a remark “Diff Prod Clin Trial” on a paper claim. In this case, the MAC would add payer-only condition code “ZC” so that the Pricer will not apply the payment adjustment in calculating payment for the case.

In the FY 2022 IPPS/LTCH PPS final rule, we revised MS-DRG 018 to include cases that report the procedure codes for CAR T-cell and non-CAR T-cell therapies and other immunotherapies (86 FR 44798 through 44806). We also finalized our proposal to continue to use the proxy of standardized drug charges of less than \$373,000 (86 FR 44965) to identify clinical trial claims. We also finalized use of this same proxy for the FY 2023 IPPS/LTCH PPS final rule (87 FR 48894).

Following the issuance of the FY 2023 IPPS/LTCH PPS final rule, we issued guidance²¹ stating where there is expanded access use of immunotherapy, the provider may submit condition code “90” on the claim so that Pricer will apply the payment adjustment in calculating payment for the case. We stated that MACs would no longer append Condition Code ‘ZB’ to inpatient claims reporting Billing Note NTE02 “Expand Acc Use” on the electronic claim 837I or a remark “Expand Acc Use” on a paper claim, effective for claims for discharges that occur on or after October 1, 2022.

In the FY 2024 IPPS/LTCH PPS final rule, we explained that the MedPAR claims data now includes a field that identifies whether or not the claim includes expanded access use of immunotherapy. We stated that for the FY 2022 MedPAR claims data, this field identifies whether or not the claim includes condition code ZB, and for the FY 2023 MedPAR data and subsequent years, this field will identify whether or not the claim includes condition code 90. We further noted that the MedPAR files now also include a variable that indicates whether the claim includes the payer-only condition code “ZC”, which identifies a case involving the clinical trial of a different product where the CAR T-cell, non-CAR T-cell, or other

²¹ <https://www.cms.gov/files/document/r11727cp.pdf>

immunotherapy product is purchased in the usual manner.

Accordingly, and as discussed further in the FY 2024 IPPS/LTCH PPS final rule, we finalized two modifications to our methodology for identifying clinical trial claims and expanded access use claims in MS-DRG 018 (88 FR 58791). First, we finalized to exclude claims with the presence of condition code “90” (or, for FY 2024 ratesetting, which was based on the FY 2022 MedPAR data, the presence of condition code “ZB”) and claims that contain ICD–10–CM diagnosis code Z00.6 without payer-only code “ZC” that group to MS–DRG 018 when calculating the average cost for MS–DRG 018. Second, we finalized to no longer use the proxy of standardized drug charges of less than \$373,000 to identify clinical trial claims and expanded access use cases when calculating the average cost for MS–DRG 018. Accordingly, we finalized that in calculating the relative weight for MS–DRG 018 for FY 2024, only those claims that group to MS–DRG 018 that (1) contain ICD–10–CM diagnosis code Z00.6 and do not include payer-only code “ZC” or (2) contain condition code “ZB” (or, for subsequent fiscal years, condition code “90”) would be excluded from the calculation of the average cost for MS–DRG 018. Consistent with this, we also finalized modifications to our calculation of the adjustment to account for the CAR T-cell therapy cases identified as clinical trial cases in calculating the national average standardized cost per case that is used to calculate the relative weights for all MS–DRGs. We refer readers to the FY 2024 IPPS/LTCH PPS final rule for further discussion of these modifications (88 FR 58791).

In the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to continue to use our methodology as modified in the FY 2024 IPPS/LTCH PPS final rule for identifying clinical trial claims and expanded access use claims in MS-DRG 018. First, we exclude claims with the presence of condition code “90” and claims that contain ICD-10-CM diagnosis code Z00.6 without payer-only code “ZC” that group to MS–DRG 018 when calculating the average cost for MS–DRG 018. Second, we no longer use the proxy of standardized drug charges of less than \$373,000 to identify clinical trial claims and expanded access use cases when calculating the

average cost for MS–DRG 018. Accordingly, we proposed that in calculating the relative weight for MS-DRG 018 for FY 2025, only those claims that group to MS-DRG 018 that (1) contain ICD-10-CM diagnosis code Z00.6 and do not include payer-only code “ZC” or (2) contain condition code “90” would be excluded from the calculation of the average cost for MS-DRG 018.

We also proposed to continue to use the methodology as modified in the FY 2024 IPPS/LTCH PPS final rule to calculate the adjustment to account for the CAR T-cell therapy cases identified as clinical trial cases in calculating the national average standardized cost per case that is used to calculate the relative weights for all MS–DRGs:

- Calculate the average cost for cases assigned to MS–DRG 018 that either (a) contain ICD–10–CM diagnosis code Z00.6 and do not contain condition code “ZC” or (b) contain condition code “90”.
- Calculate the average cost for all other cases assigned to MS–DRG 018.
- Calculate an adjustor by dividing the average cost calculated in step 1 by the average cost calculated in step 2.
- Apply the adjustor calculated in step 3 to the cases identified in step 1 as applicable clinical trial or expanded access use cases, then add this adjusted case count to the non-clinical trial case count prior to calculating the average cost across all MS–DRGs.

Under our proposal to continue to apply this methodology, based on the December 2023 update of the FY 2023 MedPAR file used for the proposed rule, we estimated that the average costs of cases assigned to MS–DRG 018 that are identified as clinical trial cases (\$116,831) were 34 percent of the average costs of the cases assigned to MS–DRG 018 that are identified as non-clinical trial cases (\$342,684). Accordingly, as we did for FY 2024, we proposed to adjust the transfer-adjusted case count for MS–DRG 018 by applying the proposed adjustor of 0.34 to the applicable clinical trial and expanded access use immunotherapy cases, and to use this adjusted case count for MS–DRG 018 in calculating the national average cost per case, which is used in

the calculation of the relative weights. Therefore, in calculating the national average cost per case for purposes of the proposed rule, each case identified as an applicable clinical trial or expanded access use immunotherapy case was adjusted by 0.34. As we did for FY 2024, we applied this same adjustor for the applicable cases that group to MS–DRG 018 for purposes of budget neutrality and outlier simulations. We also proposed to update the value of the adjustor based on more recent data for the final rule.

Comment: A few commenters supported the proposal to continue to exclude CAR T-cell therapy clinical trial cases from the calculation of the relative weight for MS-DRG 018. A commenter stated that the proposal for CAR T-cell therapy payment is largely responsive to previous requests for a permanent reimbursement solution for CAR T-cell therapy in a manner that reflects the cost of care.

Response: We thank commenters for their support and input on the proposed methodology.

Comment: Some commenters expressed concern that CMS no longer uses the \$373,000 threshold to identify clinical trial cases. The commenters stated that a small number of claims are still coded incorrectly, and that this has the potential to reduce the relative weight for MS-DRG 018 due to the presence of lower cost cases that should be flagged as clinical trial cases. Another commenter expressed concern that CMS' methodology may not be accurately capturing some cases where the CAR T product is not purchased in the usual manner, such as when the patient receives the product as part of a patient assistance program. This commenter suggested that CMS establish a mechanism for hospitals to report when a product is obtained at no cost for reasons other than participation in a clinical trial or expanded access use. A commenter requested that CMS provide the proportion of cases with drug charges below \$373,000 that do not have a clinical trial or expanded access use code.

Response: As we stated in the FY 2024 IPPS/LTCH PPS final rule, while there continues to be a small percentage of claims that report standardized drug charges of less than \$373,000

and do not report ICD-10-CM code Z00.6, we do not believe it is necessary to continue the use of the proxy until the number of cases reaches zero. With respect to the commenter's suggestion regarding a mechanism for reporting products obtained at no cost for reasons other than participation in a clinical trial or expanded access use, we may consider this in the future. With respect to the commenter who requested that CMS provide the proportion of cases with drug charges below \$373,000, that proportion is 4%, which is the same percentage as last year. We note that information on obtaining the MedPAR Limited Data Set is available on the CMS website, at <https://www.cms.gov/Research-Statistics-Data-and-Systems/Files-for-Order/LimitedDataSets/MEDPARLDSHospitalNational>.

After consideration of the public comments we received, we are finalizing our proposals without modifications regarding the calculation of the relative weight for MS-DRG 018. Applying this finalized methodology, based on the March 2024 update of the FY 2023 MedPAR file used for this final rule, we estimated that the average costs of cases assigned to MS-DRG 018 that are identified as clinical trial cases (\$111,211) were 33 percent of the average costs of the cases assigned to MS-DRG 018 that are identified as non-clinical trial cases (\$334,119). Accordingly, as we did for FY 2024, we are finalizing our proposal to adjust the transfer-adjusted case count for MS-DRG 018 by applying the adjustor of 0.33 to the applicable clinical trial and expanded access use immunotherapy cases, and to use this adjusted case count for MS-DRG 018 in calculating the national average cost per case, which is used in the calculation of the relative weights. Therefore, in calculating the national average cost per case for purposes of this final rule, each case identified as an applicable clinical trial or expanded access use immunotherapy case was adjusted by 0.33. As we did for FY 2024, we are applying this same adjustor for the applicable cases that group to MS-DRG 018 for purposes of budget neutrality and outlier simulations.

d. Cap for Relative Weight Reductions

In the FY 2023 IPPS/LTCH PPS final rule, we finalized a permanent 10-percent cap on

the reduction in an MS-DRG's relative weight in a given fiscal year, beginning in FY 2023. We also finalized a budget neutrality adjustment to the standardized amount for all hospitals to ensure that application of the permanent 10-percent cap does not result in an increase or decrease of estimated aggregate payments. We refer the reader to the FY 2023 IPPS/LTCH PPS final rule for further discussion of this policy. In the Addendum to this IPPS/LTCH PPS final rule, we present the budget neutrality adjustment for reclassification and recalibration of the FY 2025 MS-DRG relative weights with application of this cap. We are also making available on the CMS website a supplemental file demonstrating the application of the permanent 10 percent cap for FY 2025. For a further discussion of the budget neutrality adjustment for FY 2025, we refer readers to the Addendum of this final rule.

3. Development of National Average Cost-To-Charge Ratios (CCRs)

We developed the national average CCRs as follows:

Using the FY 2022 cost report data, we removed CAHs, Indian Health Service hospitals, all-inclusive rate hospitals, and cost reports that represented time periods of less than 1 year (365 days). We included hospitals located in Maryland because we include their charges in our claims database. Then we created CCRs for each provider for each cost center (see the supplemental data file for line items used in the calculations) and removed any CCRs that were greater than 10 or less than 0.01. We normalized the departmental CCRs by dividing the CCR for each department by the total CCR for the hospital for the purpose of trimming the data. Then we took the logs of the normalized cost center CCRs and removed any cost center CCRs where the log of the cost center CCR was greater or less than the mean log plus/minus 3 times the standard deviation for the log of that cost center CCR. Once the cost report data were trimmed, we calculated a Medicare-specific CCR. The Medicare-specific CCR was determined by taking the Medicare charges for each line item from Worksheet D-3 and deriving the Medicare-specific costs by applying the hospital-specific departmental CCRs to the Medicare-specific charges for each line item from Worksheet D-3. Once each hospital's Medicare-specific costs were

established, we summed the total Medicare-specific costs and divided by the sum of the total Medicare-specific charges to produce national average, charge-weighted CCRs.

After we multiplied the total charges for each MS-DRG in each of the 19 cost centers by the corresponding national average CCR, we summed the 19 “costs” across each MS-DRG to produce a total standardized cost for the MS-DRG. The average standardized cost for each MS-DRG was then computed as the total standardized cost for the MS-DRG divided by the transfer-adjusted case count for the MS-DRG. The average cost for each MS-DRG was then divided by the national average standardized cost per case to determine the relative weight. The final FY 2025 cost-based relative weights were then normalized by an adjustment factor of 1.92336 so that the average case weight after recalibration was equal to the average case weight before recalibration. The normalization adjustment is intended to ensure that recalibration by itself neither increases nor decreases total payments under the IPPS, as required by section 1886(d)(4)(C)(iii) of the Act. We then applied the permanent 10-percent cap on the reduction in a MS-DRG’s relative weight in a given fiscal year; specifically for those MS-DRGs for which the relative weight otherwise would have declined by more than 10 percent from the FY 2024 relative weight, we set the final FY 2025 relative weight equal to 90 percent of the FY 2024 relative weight. The final relative weights for FY 2025 as set forth in Table 5 associated with this final rule and available on the CMS website at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS> reflect the application of this cap.

The 19 national average CCRs for FY 2025 are as follows:

NATIONAL AVERAGE CCRS	
Group	CCR
Routine Days	0.418
Intensive Days	0.36
Drugs and Cellular Therapies	0.178
Supplies & Equipment	0.297
Implantable Devices	0.259
Inhalation Therapy	0.162
Therapy Services	0.265
Anesthesia	0.071

NATIONAL AVERAGE CCRS	
Group	CCR
Labor & Delivery	0.381
Operating Room	0.16
Cardiology	0.088
Cardiac Catheterization	0.104
Laboratory	0.102
Radiology	0.127
MRIs	0.067
CT Scans	0.033
Emergency Room	0.153
Blood and Blood Products	0.246
Other Services	0.336

Since FY 2009, the relative weights have been based on 100 percent cost weights based on our MS-DRG grouping system.

When we recalibrated the DRG weights for previous years, we set a threshold of 10 cases as the minimum number of cases required to compute a reasonable weight. We proposed to use that same case threshold in recalibrating the proposed MS-DRG relative weights for FY 2025. Using data from the FY 2023 MedPAR file, there were 8 MS-DRGs that contain fewer than 10 cases. For FY 2025, because we do not have sufficient MedPAR data to set accurate and stable cost relative weights for these low-volume MS-DRGs, we proposed to compute relative weights for the low-volume MS-DRGs by adjusting their final FY 2024 relative weights by the percentage change in the average weight of the cases in other MS-DRGs from FY 2024 to FY 2025. The crosswalk table is as follows.

LOW-VOLUME MS-DRGS		
Low-Volume MS-DRG	MS-DRG Title	Crosswalk to MS-DRG
789	Neonates, Died or Transferred to Another Acute Care Facility	Final FY 2024 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
790	Extreme Immaturity or Respiratory Distress Syndrome, Neonate	Final FY 2024 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
791	Prematurity with Major Problems	Final FY 2024 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
792	Prematurity without Major Problems	Final FY 2024 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
793	Full-Term Neonate with Major Problems	Final FY 2024 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)

LOW-VOLUME MS-DRGS		
Low-Volume MS-DRG	MS-DRG Title	Crosswalk to MS-DRG
794	Neonate with Other Significant Problems	Final FY 2024 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
795	Normal Newborn	Final FY 2024 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
797	Vaginal delivery with sterilization and/or D&C with CC	Final FY 2024 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)

Comment: A commenter requested that CMS consider if there are mechanisms to reform the role of CCRs in the reimbursement methodology to prevent differential hospital charge practices from skewing reimbursement rates for hospitals—such as either eliminating the role of CCRs or creating a bridge or other CCR for gene and cell therapies that it stated could be used for more accurate rate-setting in the future. Another commenter requested that CMS utilize the “other” CCR for CAR T-cell therapy product charges as a strategy to address charge compression starting in FY 2025 and until CMS proposes an alternative payment solution.

Response: We continue to believe it would not be appropriate to utilize the “other” CCR for CAR T-cell therapy product charges associated with revenue code 0891. Under our cost-based weight methodology, many revenue codes are mapped to each of the 19 cost centers. We believe that relative to those 19 cost centers, cellular therapies are most similar to drugs given that hospitals have generally calibrated their CAR T-cell therapy product charges to the “drugs” cost center CCR. To provide additional clarity, we have renamed the “drugs” cost center to the “drugs and cellular therapies” cost center. We may consider changes to the CCRs used for gene and cellular therapies in future rulemaking.

After consideration of the public comments we received, we are finalizing our proposals without modification.

E. Add-On Payments for New Services and Technologies for FY 2025

1. Background

Effective for discharges beginning on or after October 1, 2001, section 1886(d)(5)(K)(i) of the Act requires the Secretary to establish (after notice and opportunity for public comment) a mechanism to recognize the costs of new medical services and technologies (sometimes collectively referred to in this section as “new technologies”) under the IPPS. Section 1886(d)(5)(K)(vi) of the Act specifies that a medical service or technology will be considered new if it meets criteria established by the Secretary after notice and opportunity for public comment. Section 1886(d)(5)(K)(ii)(I) of the Act specifies that a new medical service or technology may be considered for new technology add-on payment if, based on the estimated costs incurred with respect to discharges involving such service or technology, the DRG prospective payment rate otherwise applicable to such discharges under this subsection is inadequate. The regulations at 42 CFR 412.87 implement these provisions and § 412.87(b) specifies three criteria for a new medical service or technology to receive the additional payment: (1) The medical service or technology must be new; (2) the medical service or technology must be costly such that the DRG rate otherwise applicable to discharges involving the medical service or technology is determined to be inadequate; and (3) the service or technology must demonstrate a substantial clinical improvement over existing services or technologies. In addition, certain transformative new devices and antimicrobial products may qualify under an alternative inpatient new technology add-on payment pathway, as set forth in the regulations at § 412.87(c) and (d).

We note that section 1886(d)(5)(K)(i) of the Act requires that the Secretary establish a mechanism to recognize the costs of new medical services and technologies under the payment system established under that subsection, which establishes the system for paying for the operating costs of inpatient hospital services. The system of payment for capital costs is established under section 1886(g) of the Act. Therefore, as discussed in prior rulemaking (72 FR

47307 through 47308), we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs.

In this rule, we highlight some of the major statutory and regulatory provisions relevant to the new technology add-on payment criteria, as well as other information. For further discussion on the new technology add-on payment criteria, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51572 through 51574), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42288 through 42300), and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58736 through 58742).

a. New Technology Add-on Payment Criteria

(1) Newness Criterion

Under the first criterion, as reflected in § 412.87(b)(2), a specific medical service or technology will no longer be considered “new” for purposes of new medical service or technology add-on payments after CMS has recalibrated the MS–DRGs, based on available data, to reflect the cost of the technology. We note that we do not consider a service or technology to be new if it is substantially similar to one or more existing technologies. That is, even if a medical product receives a new FDA approval or clearance, it may not necessarily be considered “new” for purposes of new technology add-on payments if it is “substantially similar” to another medical product that was approved or cleared by FDA and has been on the market for more than 2 to 3 years. In the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43813 through 43814), we established criteria for evaluating whether a new technology is substantially similar to an existing technology, specifically whether: (1) a product uses the same or a similar mechanism of action to achieve a therapeutic outcome; (2) a product is assigned to the same or a different MS–DRG; and (3) the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population. If a technology meets all three of these criteria, it would be considered substantially similar to an existing technology and would

not be considered "new" for purposes of new technology add-on payments. For a detailed discussion of the criteria for substantial similarity, we refer readers to the FY 2006 IPPS final rule (70 FR 47351 through 47352) and the FY 2010 IPPS/LTCH PPS final rule (74 FR 43813 through 43814).

(2) Cost Criterion

Under the second criterion, § 412.87(b)(3) further provides that, to be eligible for the add-on payment for new medical services or technologies, the MS-DRG prospective payment rate otherwise applicable to discharges involving the new medical service or technology must be assessed for adequacy. Under the cost criterion, consistent with the formula specified in section 1886(d)(5)(K)(ii)(I) of the Act, to assess the adequacy of payment for a new technology paid under the applicable MS-DRG prospective payment rate, we evaluate whether the charges of the cases involving a new medical service or technology will exceed a threshold amount that is the lesser of 75 percent of the standardized amount (increased to reflect the difference between cost and charges) or 75 percent of one standard deviation beyond the geometric mean standardized charge for all cases in the MS-DRG to which the new medical service or technology is assigned (or the case-weighted average of all relevant MS-DRGs if the new medical service or technology occurs in many different MS-DRGs). The MS-DRG threshold amounts generally used in evaluating new technology add-on payment applications for FY 2025 are presented in a data file that is available, along with the other data files associated with the FY 2024 IPPS/LTCH PPS final rule and correction notification, on the CMS website at:

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index>.

We note that, under the policy finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58603 through 58605), beginning with FY 2022, we use the proposed threshold values associated with the proposed rule for that fiscal year to evaluate the cost criterion for all applications for new technology add-on payments and previously approved technologies that

may continue to receive new technology add-on payments, if those technologies would be assigned to a proposed new MS-DRG for that same fiscal year.

As finalized in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41275), beginning with FY 2020, we include the thresholds applicable to the next fiscal year (previously included in Table 10 of the annual IPPS/LTCH PPS proposed and final rules) in the data files associated with the prior fiscal year. Accordingly, the final thresholds for applications for new technology add-on payments for FY 2026 are presented in a data file that is available on the CMS website, along with the other data files associated with this FY 2025 final rule, by clicking on the FY 2025 IPPS Final Rule Home Page at:

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index>.

In the September 7, 2001 final rule that established the new technology add-on payment regulations (66 FR 46917), we discussed that applicants should submit a significant sample of data to demonstrate that the medical service or technology meets the high-cost threshold. Specifically, applicants should submit a sample of sufficient size to enable us to undertake an initial validation and analysis of the data. We also discussed in the September 7, 2001 final rule (66 FR 46917) the issue of whether the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule at 45 CFR parts 160 and 164, subparts A and E, applies to claims information that providers submit with applications for new medical service or technology add-on payments. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51573) for further information on this issue.

(3) Substantial Clinical Improvement Criterion

Under the third criterion at § 412.87(b)(1), a medical service or technology must represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42288 through 42292), we prospectively codified in our regulations at § 412.87(b) the

following aspects of how we evaluate substantial clinical improvement for purposes of new technology add-on payments under the IPPS:

- The totality of the circumstances is considered when making a determination that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries.

- A determination that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries means--

- ++ The new medical service or technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments;

- ++ The new medical service or technology offers the ability to diagnose a medical condition in a patient population where that medical condition is currently undetectable, or offers the ability to diagnose a medical condition earlier in a patient population than allowed by currently available methods, and there must also be evidence that use of the new medical service or technology to make a diagnosis affects the management of the patient.

- ++ The use of the new medical service or technology significantly improves clinical outcomes relative to services or technologies previously available as demonstrated by one or more of the following: a reduction in at least one clinically significant adverse event, including a reduction in mortality or a clinically significant complication; a decreased rate of at least one subsequent diagnostic or therapeutic intervention; a decreased number of future hospitalizations or physician visits; a more rapid beneficial resolution of the disease process treatment including, but not limited to, a reduced length of stay or recovery time; an improvement in one or more activities of daily living; an improved quality of life; or, a demonstrated greater medication adherence or compliance; or

++ The totality of the circumstances otherwise demonstrates that the new medical service or technology substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries.

- Evidence from the following published or unpublished information sources from within the United States or elsewhere may be sufficient to establish that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries: clinical trials, peer reviewed journal articles; study results; meta-analyses; consensus statements; white papers; patient surveys; case studies; reports; systematic literature reviews; letters from major healthcare associations; editorials and letters to the editor; and public comments. Other appropriate information sources may be considered.

- The medical condition diagnosed or treated by the new medical service or technology may have a low prevalence among Medicare beneficiaries.

- The new medical service or technology may represent an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of a subpopulation of patients with the medical condition diagnosed or treated by the new medical service or technology.

We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42288 through 42292) for additional discussion of the evaluation of substantial clinical improvement for purposes of new technology add-on payments under the IPPS.

We note, consistent with the discussion in the FY 2003 IPPS final rule (67 FR 50015), that while FDA has regulatory responsibility for decisions related to marketing authorization (for example, approval, clearance, etc.), we do not rely upon FDA criteria in our evaluation of substantial clinical improvement for purposes of determining what services and technologies qualify for new technology add-on payments under Medicare. This criterion does not depend on

the standard of safety and effectiveness on which FDA relies but on a demonstration of substantial clinical improvement in the Medicare population.

b. Alternative Inpatient New Technology Add-on Payment Pathway

Beginning with applications for FY 2021 new technology add-on payments, under the regulations at § 412.87(c), a medical device that is part of FDA's Breakthrough Devices Program may qualify for the new technology add-on payment under an alternative pathway. Additionally, under the regulations at § 412.87(d) for certain antimicrobial products, beginning with FY 2021, a drug that is designated by FDA as a Qualified Infectious Disease Product (QIDP), and, beginning with FY 2022, a drug that is approved by FDA under the Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD), may also qualify for the new technology add-on payment under an alternative pathway. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739) for further discussion on this policy. We note that CMS reviews the application based on the information provided by the applicant only under the alternative pathway specified by the applicant at the time of application submission. To receive approval for the new technology add-on payment under that alternative pathway, the technology must have the applicable FDA designation and meet all other requirements in the regulations in § 412.87(c) and (d), as applicable.

(1) Alternative Pathway for Certain Transformative New Devices

For applications received for new technology add-on payments for FY 2021 and subsequent fiscal years, a medical device designated under FDA's Breakthrough Devices Program that has received FDA marketing authorization will be considered not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS, and will not need to meet the requirement under § 412.87(b)(1) that it represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. Under this alternative pathway, a medical device that has

received FDA marketing authorization (that is, has been approved or cleared by, or had a De Novo classification request granted by, FDA) as a Breakthrough Device, for the indication covered by the Breakthrough Device designation, will need to meet the requirements of § 412.87(c). We note that in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58734 through 58736), we clarified our policy that a new medical device under this alternative pathway must receive marketing authorization for the indication covered by the Breakthrough Devices Program designation. We refer the reader to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58734 through 58736) for further discussion regarding this clarification.

(2) Alternative Pathway for Certain Antimicrobial Products

For applications received for new technology add-on payments for certain antimicrobial products, beginning with FY 2021, if a technology is designated by FDA as a QIDP and received FDA marketing authorization, and, beginning with FY 2022, if a drug is approved under FDA's LPAD pathway and used for the indication approved under the LPAD pathway, it will be considered not substantially similar to an existing technology for purposes of new technology add-on payments and will not need to meet the requirement that it represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. Under this alternative pathway for QIDPs and LPADs, a medical product that has received FDA marketing authorization and is designated by FDA as a QIDP or approved under the LPAD pathway will need to meet the requirements of § 412.87(d). We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739) for further discussion on this policy.

We note that, in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739), we clarified that a new medical product seeking approval for the new technology add-on payment under the alternative pathway for QIDPs must receive FDA marketing authorization for the indication covered by the QIDP designation. We also finalized our policy to expand our alternative new technology add-on payment pathway for certain antimicrobial products to

include products approved under the LPAD pathway and used for the indication approved under the LPAD pathway.

c. Additional Payment for New Medical Service or Technology

The new medical service or technology add-on payment policy under the IPPS provides additional payments for cases with relatively high costs involving eligible new medical services or technologies, while preserving some of the incentives inherent under an average-based prospective payment system. The payment mechanism is based on the cost to hospitals for the new medical service or technology. As noted previously, we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs (72 FR 47307 through 47308).

For discharges occurring before October 1, 2019, under § 412.88, if the costs of the discharge (determined by applying operating cost-to-charge ratios (CCRs) as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), CMS made an add-on payment equal to the lesser of: (1) 50 percent of the costs of the new medical service or technology; or (2) 50 percent of the amount by which the costs of the case exceed the standard DRG payment.

Beginning with discharges on or after October 1, 2019, for the reasons discussed in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42297 through 42300), we finalized an increase in the new technology add-on payment percentage, as reflected at § 412.88(a)(2)(ii). Specifically, for a new technology other than a medical product designated by FDA as a QIDP, beginning with discharges on or after October 1, 2019, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 65 percent of the costs of the new medical service or technology; or (2) 65 percent of the amount by which the costs of the case exceed the standard DRG payment. For a new technology that is a medical product designated by FDA as a

QIDP, beginning with discharges on or after October 1, 2019, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. For a new technology that is a medical product approved under FDA's LPAD pathway, beginning with discharges on or after October 1, 2020, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. As set forth in § 412.88(b)(2), unless the discharge qualifies for an outlier payment, the additional Medicare payment will be limited to the full MS-DRG payment plus 65 percent (or 75 percent for certain antimicrobial products (QIDPs and LPADs)) of the estimated costs of the new technology or medical service. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42297 through 42300) for further discussion on the increase in the new technology add-on payment beginning with discharges on or after October 1, 2019.

As discussed further in section II.E.10. of this final rule, we are finalizing our proposal that for certain gene therapies approved for new technology add-on payments in the FY 2025 IPPS/LTCH PPS final rule that are indicated and used specifically for the treatment of SCD, effective with discharges on or after October 1, 2024 and concluding at the end of the 2- to 3-year newness period for such therapy, if the costs of a discharge (determined by applying CCRs as described in § 412.84(h)) involving the use of such therapy for the treatment of SCD exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the

new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. We note that these payment amounts would only apply to Casgevy™ (exagamglogene autotemcel) and Lyfgenia™ (lovotibeglogene autotemcel), when indicated and used specifically for the treatment of SCD, which CMS has determined in this FY 2025 IPPS/LTCH PPS final rule meet the criteria for approval for new technology add-on payment, as further discussed in section II.E.5. of this final rule.

We note that, consistent with the prospective nature of the IPPS, we finalize the new technology add on payment amount for technologies approved or conditionally approved for new technology add-on payments in the final rule for each fiscal year and do not make mid-year changes to new technology add-on payment amounts. Updated cost information may be submitted and included in rulemaking to be considered for the following fiscal year.

Section 503(d)(2) of the MMA (Pub. L. 108–173) provides that there shall be no reduction or adjustment in aggregate payments under the IPPS due to add-on payments for new medical services and technologies. Therefore, in accordance with section 503(d)(2) of the MMA, add-on payments for new medical services or technologies for FY 2005 and subsequent years have not been subjected to budget neutrality.

d. Evaluation of Eligibility Criteria for New Medical Service or Technology Applications

In the FY 2009 IPPS final rule (73 FR 48561 through 48563), we modified our regulation at § 412.87 to codify our longstanding practice of how CMS evaluates the eligibility criteria for new medical service or technology add-on payment applications. That is, we first determine whether a medical service or technology meets the newness criterion, and only if so, do we then make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. We specified that all applicants for new technology add-on payments must have FDA approval or clearance by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. In the FY 2021 IPPS/LTCH PPS final rule, to more precisely describe the various

types of FDA approvals, clearances and classifications that we consider under our new technology add-on payment policy, we finalized a technical clarification to the regulation to indicate that new technologies must receive FDA marketing authorization (such as pre-market approval (PMA); 510(k) clearance; the granting of a De Novo classification request, or approval of a New Drug Application (NDA)) by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. Consistent with our longstanding policy, we consider FDA marketing authorization as representing that a product has received FDA approval or clearance when considering eligibility for the new technology add-on payment (85 FR 58742).

Additionally, in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58739 through 58742), we finalized our proposal to provide conditional approval for new technology add-on payment for a technology for which an application is submitted under the alternative pathway for certain antimicrobial products at § 412.87(d) that does not receive FDA marketing authorization by July 1 prior to the particular fiscal year for which the applicant applied for new technology add-on payments, provided that the technology otherwise meets the applicable add-on payment criteria. Under this policy, cases involving eligible antimicrobial products would begin receiving the new technology add-on payment sooner, effective for discharges the quarter after the date of FDA marketing authorization, provided that the technology receives FDA marketing authorization before July 1 of the fiscal year for which the applicant applied for new technology add-on payments.

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958), we finalized that, beginning with the new technology add-on payment applications for FY 2025, for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application, applicants must have a complete and active FDA market authorization request at the time of new technology add-on payment application submission and must provide documentation of FDA acceptance or filing to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the

applicant has submitted to FDA. See § 412.87(e) and further discussion in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958). We also finalized that, beginning with FY 2025 applications, in order to be eligible for consideration for the new technology add-on payment for the upcoming fiscal year, an applicant for new technology add-on payments must have received FDA approval or clearance by May 1 (rather than July 1) of the year prior to the beginning of the fiscal year for which the application is being considered (except for an application that is submitted under the alternative pathway for certain antimicrobial products), as reflected at §§ 412.87(f)(2) and (f)(3), as amended and redesignated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958, 88 FR 59331).

e. New Technology Liaisons

Many interested parties (including device/biologic/drug developers or manufacturers, industry consultants, others) engage CMS for coverage, coding, and payment questions or concerns. In order to streamline engagement by centralizing the different innovation pathways within CMS including new technology add-on payments, CMS has established a team of new technology liaisons that can serve as an initial resource for interested parties. This team is available to assist with all of the following:

- Help to point interested parties to or provide information and resources where possible regarding process, requirements, and timelines.
- Coordinate and facilitate opportunities for interested parties to engage with various CMS components.
- Serve as a primary point of contact for interested parties and provide updates on developments where possible or appropriate.

We receive many questions from parties interested in pursuing new technology add-on payments who may not be entirely familiar with working with CMS. While we encourage interested parties to first review our resources available at

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech>,

we know that there may be additional questions about the application process. Interested parties with further questions regarding Medicare's coverage, coding, and payment processes, and how they can navigate these processes, whether for new technology add-on payments or otherwise, should review the updated resource guide available at: <https://www.cms.gov/medicare/coding-billing/guide-medical-technology-companies-other-interested-parties>. Parties that would like to further discuss questions or concerns with CMS should contact the new technology liaison team at MedicareInnovation@cms.hhs.gov.

f. Application Information for New Medical Services or Technologies

Applicants for add-on payments for new medical services or technologies for FY 2026 must submit a formal request, including a full description of the clinical applications of the medical service or technology and the results of any clinical evaluations demonstrating that the new medical service or technology represents a substantial clinical improvement (unless the application is under one of the alternative pathways as previously described), along with a significant sample of data to demonstrate that the medical service or technology meets the high-cost threshold. CMS will review the application based on the information provided by the applicant under the pathway specified by the applicant at the time of application submission. Complete application information, along with final deadlines for submitting a full application, will be posted as it becomes available on the CMS website at:

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech.html>.

To allow interested parties to identify the new medical services or technologies under review before the publication of the proposed rule for FY 2026, once the application deadline has closed, CMS will post on its website a list of the applications submitted, along with a brief description of each technology as provided by the applicant.

As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48986 through 48990), we finalized our proposal to publicly post online new technology add-on payment.

applications, including the completed application forms, certain related materials, and any additional updated application information submitted subsequent to the initial application submission (except certain volume, cost and other information identified by the applicant as confidential), beginning with the application cycle for FY 2024, at the time the proposed rule is published. We also finalized that with the exception of information included in a confidential information section of the application, cost and volume information, and materials identified by the applicant as copyrighted and/or not otherwise releasable to the public, the contents of the application and related materials may be posted publicly, and that we will not post applications that are withdrawn prior to publication of the proposed rule. We refer the reader to the FY 2023 IPPS/LTCH PPS final rule (87 FR 48986 through 48990) for further information regarding this policy.

We note that the burden associated with this information collection requirement is the time and effort required to collect and submit the data in the formal request for add-on payments for new medical services and technologies to CMS. The aforementioned burden is subject to the PRA and approved under OMB control number 0938–1347 and has an expiration date of December 31, 2026.

2. Public Input Before Publication of a Notice of Rulemaking on Add-On Payments

Section 1886(d)(5)(K)(viii) of the Act, as amended by section 503(b)(2) of the MMA, provides for a mechanism for public input before publication of a notice of proposed rulemaking regarding whether a medical service or technology represents a substantial clinical improvement. The process for evaluating new medical service and technology applications requires the Secretary to do all of the following:

- Provide, before publication of a proposed rule, for public input regarding whether a new service or technology represents an advance in medical technology that substantially improves the diagnosis or treatment of Medicare beneficiaries.

- Make public and periodically update a list of the services and technologies for which applications for add-on payments are pending.
- Accept comments, recommendations, and data from the public regarding whether a service or technology represents a substantial clinical improvement.
- Provide, before publication of a proposed rule, for a meeting at which organizations representing hospitals, physicians, manufacturers, and any other interested party may present comments, recommendations, and data regarding whether a new medical service or technology represents a substantial clinical improvement to the clinical staff of CMS.

In order to provide an opportunity for public input regarding add-on payments for new medical services and technologies for FY 2025 prior to publication of the FY 2025 IPPS/LTCH PPS proposed rule, we published a notice in the Federal Register on September 28, 2023 (88 FR 66850) and held a virtual town hall meeting on December 13, 2023. In the announcement notice for the meeting, we stated that the opinions and presentations provided during the meeting would assist us in our evaluations of applications by allowing public discussion of the substantial clinical improvement criterion for the FY 2025 new medical service and technology add-on payment applications before the publication of the FY 2025 IPPS/LTCH IPPS proposed rule.

Approximately 130 individuals registered to attend the virtual town hall meeting. We posted the recordings of the virtual town hall on the CMS webpage at:

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech>.

We considered each applicant's presentation made at the town hall meeting, as well as written comments received by the December 18, 2023 deadline, in our evaluation of the new technology add-on payment applications for FY 2025 in the development of the FY 2025 IPPS/ LTCH PPS proposed rule. In response to the published notice and the December 13, 2023 New Technology Town Hall meeting, we received written comments regarding the applications for FY 2025 new technology add on payments. As explained earlier and in the Federal Register notice announcing the New Technology Town Hall meeting (88 FR 66850 through 66853), the purpose of the

meeting was specifically to discuss the substantial clinical improvement criterion with regard to pending new technology add-on payment applications for FY 2025. Therefore, we did not summarize any written comments in the proposed rule that were unrelated to the substantial clinical improvement criterion. In section II.E.5. of the preamble of the proposed rule, we summarized comments regarding individual applications, or, if applicable, indicated that there were no comments received in response to the New Technology Town Hall meeting notice or New Technology Town Hall meeting, at the end of each discussion of the individual applications.

3. ICD-10-PCS Section “X” Codes for Certain New Medical Services and Technologies

As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49434), the ICD-10-PCS includes a new section containing the new Section “X” codes, which began being used with discharges occurring on or after October 1, 2015. Decisions regarding changes to ICD-10-PCS Section “X” codes will be handled in the same manner as the decisions for all of the other ICD-10-PCS code changes. That is, proposals to create, delete, or revise Section “X” codes under the ICD-10-PCS structure will be referred to the ICD-10 Coordination and Maintenance Committee. In addition, several of the new medical services and technologies that have been, or may be, approved for new technology add-on payments may now, and in the future, be assigned a Section “X” code within the structure of the ICD-10-PCS. We posted ICD-10-PCS Guidelines on the CMS website at: <https://www.cms.gov/Medicare/Coding/ICD10>, including guidelines for ICD-10-PCS Section “X” codes. We encourage providers to view the material provided on ICD-10-PCS Section “X” codes.

4. FY 2025 Status of Technologies Receiving New Technology Add-On Payments for FY 2024

In this section of the final rule, we discuss the FY 2025 status of 31 technologies approved for FY 2024 new technology add-on payments, as set forth in the tables that follow. In the proposed rule, we presented our proposals to continue the new technology add-on payments for FY 2025 for those technologies that were approved for the new technology add-on payment

for FY 2024, and which would still be considered “new” for purposes of new technology add-on payments for FY 2025. We also presented our proposals to discontinue new technology add-on payments for FY 2025 for those technologies that were approved for the new technology add-on payment for FY 2024, and which would no longer be considered “new” for purposes of new technology add-on payments for FY 2025.

Additionally, we noted that we conditionally approved DefenCath® (taurolidine/heparin) for FY 2024 new technology add-on payments under the alternative pathway for certain antimicrobial products (88 FR 58942 through 58944), subject to the technology receiving FDA marketing authorization by July 1, 2024. DefenCath® (taurolidine/heparin) received FDA marketing authorization on November 15, 2023, and was eligible to receive new technology add-on payments in FY 2024 beginning with discharges on or after January 1, 2024. As DefenCath® (taurolidine/heparin) received FDA marketing authorization prior to July 1, 2024, and was approved for new technology add-on payments in FY 2024, we proposed and are finalizing to continue making new technology add-on payments for DefenCath® for FY 2025.

Our policy is that a medical service or technology may continue to be considered “new” for purposes of new technology add-on payments within 2 or 3 years after the point at which data begin to become available reflecting the inpatient hospital code assigned to the new service or technology. Our practice has been to begin and end new technology add-on payments on the basis of a fiscal year, and we have generally followed a guideline that uses a 6-month window before and after the start of the fiscal year to determine whether to extend the new technology add-on payment for an additional fiscal year. In general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product’s entry onto the U.S. market occurs in the latter half of the fiscal year (70 FR 47362).

In the proposed rule, we provided a table listing the technologies for which we proposed to continue making new technology add-on payments for FY 2025 because they were still considered “new” for purposes of new technology add-on payments. This table also presented

the newness start date, new technology add-on payment start date, 3-year anniversary date of the product's entry onto the U.S. market, relevant final rule citations from prior fiscal years, proposed maximum add-on payment amount, and coding assignments for each technology. We referred readers to the cited final rules in the following table for a complete discussion of the new technology add-on payment application, coding, and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

We invited public comments on our proposals to continue new technology add-on payments for FY 2025 for the technologies listed in Table II.E.-01 of the proposed rule.

Comment: We received multiple comments in support of our proposed continuation of new technology add-on payments for FY 2025 for those technologies that were approved for the new technology add-on payment for FY 2024, and which would still be considered “new” for purposes of new technology add-on payments for FY 2025.

Response: We appreciate the support of the commenters.

Comment: A commenter restated a comment it made in response to previous proposed rules that requiring a manufacturer to submit information rebutting a presumption that the date of first availability is the date of FDA marketing authorization adds unnecessary burden and complexity to the new technology add-on payment application and review process. The commenter further stated that CMS did not appear to have applied this policy consistently and that it has defaulted to the FDA approval date despite other reasons being provided by applicants regarding the first date of commercial availability. The commenter believed that a more efficient and appropriate policy would be for the newness period to begin with the date of the first claim, which it stated is consistent with the definition of newness used in determining the period of eligibility for Transitional Pass-through status in the Hospital Outpatient Prospective Payment System (OPPS).

Response: We thank the commenter for its feedback. As we discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45136), regarding the commenter's belief that beginning the

newness period on the date of first claim would be a more efficient and appropriate policy and is consistent with the definition of newness used in determining the period of eligibility for Transitional Pass-through status in OPPS, we note that “newness” for the purposes of the OPPS pass-through payment is separate and distinct from “newness” for the purposes of the IPPS new technology add-on payment. We note that “newness” for purposes of the OPPS pass-through payment refers to a drug, biological, or device's eligibility for pass-through payment status. In particular, under § 419.64(a), for a drug or biological's eligibility for OPPS pass-through payment (subject to certain exceptions), “newness” means that the drug or biological was first payable as an outpatient hospital service after December 31, 1996. Under § 419.66(b), for a device's eligibility for OPPS pass-through payment, “newness” means that CMS received the applicant's pass-through application within 3 years from the date of the initial FDA marketing authorization, unless there is a documented, verifiable delay in U.S. market availability after FDA marketing authorization is granted, in which case CMS will consider the pass-through payment application if it is submitted within 3 years from the date of market availability for the device. However, it appears the commenter is referring not to “newness” in terms of eligibility for OPPS pass-through status, but rather to the limited two-to-three-year period of pass-through payment. Under §§ 419.64(c)(2) and 419.66(g), this pass-through payment period begins on the date on which CMS makes its first pass-through payment for a drug, biological, or device.

For new technology add-on payments, as we have discussed in prior rulemaking (77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the technology on the U.S. market. Furthermore, as we have stated in prior rulemaking, the newness period does not necessarily start with the approval date for the medical service or technology. Instead, it begins with availability of the technology on the market, which is when data become available. We have consistently applied this standard, and believe that it is most consistent with the purpose of new technology add-on payments (69 FR 49003), because section 1886(d)(5)(K)(ii)(II) of the Act requires CMS to

establish a mechanism to provide for the collection of data with respect to the costs of a new medical service or technology for a period of not less than two years and not more than three years beginning on the date on which an inpatient hospital code is issued for the service or technology. Our regulations at § 412.87(b)(2), 412.87(c)(2), and 412.87(d)(2) further allow new medical services and technologies to be considered new for the first 2 to 3 years after the point at which data begin to become available reflecting the inpatient hospital code assigned to the new service or technology, which is during the period when the costs of the new technology are not yet fully reflected in the DRG weights. The costs of the new medical service or technology, once paid for by Medicare for this 2-year to 3-year period, are accounted for in the MedPAR data that are used to recalibrate the DRG weights on an annual basis. Therefore, it is appropriate to limit the add-on payment window for those technologies to this 2-to 3-year timeframe. For these reasons, we continue to disagree that the appropriate policy would be for the newness period to begin with the date of the first claim.

Comment: The applicant for REZZAYO™ (rezafungin for injection), submitted a comment regarding its newness start date of March 22, 2023, to explain why REZZAYO™ was not available on the US market until July 26, 2023. The applicant explained that the market entry for REZZAYO™ was delayed due to the steps needed to comply with FDA requirements. The applicant stated that REZZAYO™ received FDA approval on March 22, 2023, and that the product was subjected to a post marketing commitment (PMC) protocol. According to the applicant, the PMC stated that the manufacturer would complete necessary qualification and validation studies of the current assay high-performance liquid chromatography analytical procedure to be used for the gross content and assay of reconstituted solution tests in the drug product specification, and update the relevant sections of Module 3 accordingly. The applicant stated that FDA required this information be submitted to FDA via a Changes Being Effected in 0 Days Supplement (CBE-0). The applicant stated that to meet the requirements of the PMC and prepare the CBE-0 for submission, the manufacturer was unable to use anything more than a

nominal amount of existing batches of product due to vial size differentials, which meant the manufacturer needed to manufacture new product for its analyses pursuant to the PMC, and that the applicant had to ensure that new product that met these requirements was created prior to launch. The applicant explained that due to the PMC requirements, REZZAYO™ needed to undergo an additional manufacturing cycle prior to launch, and the changes in vial size required changes to REZZAYO's labeling and packaging. The applicant stated that label and packaging changes alone can take an additional six weeks. The applicant stated that the manufacturer was able to complete the PMC requirements and submitted the CBE-0 on July 19, 2023, and that REZZAYO™ was made available for sale to hospitals following the first sale and shipment to a wholesaler on July 26, 2023, as reflected in the Medicaid Drug Rebate Program database.

Response: We thank the applicant for its comment. As stated previously, while CMS may consider a documented delay in the technology's market availability in determining when the newness period begins, our policy for determining whether to extend new technology add-on payments for an additional year generally applies regardless of the volume of claims for the technology after the beginning of the newness period (83 FR 41280). We do not consider the date of first sale of a product as an indicator of the entry of a product onto the U.S. market. Although the applicant states that REZZAYO™ was made available for sale to hospitals following the first sale and shipment to a wholesaler on July 26, 2023, it is unclear from the information provided if the technology may have first become available on the market between the date of completion of the PMC and submission of the CBE-0 on July 19, 2023, and its first sale on July 26, 2023, as an applicant may commence distribution of a drug product manufactured using a change proposed in a CBE-0 supplement after FDA receives that supplement.²² Therefore, based on the information provided by the applicant regarding the documented delay in the technology's availability on the U.S. market, and absent additional

²² FDA - Drug Product Distribution After a Complete Response Action to a Changes Being Effected Supplement <https://www.fda.gov/media/107451/download>

information from the applicant, we consider the beginning of the newness period to commence on July 19, 2023.

Comment: We received multiple comments in support of our proposed continuation of new technology add-on payments for FY 2025 for the SAINT Neuromodulation System. A couple of commenters described their experiences and timelines for installation, training, and use of the SAINT Neuromodulation System at their hospitals. Commenters also supported modification of the technology's newness date to April 5, 2024, to recognize the delay in commercial availability.

In particular, the applicant for the SAINT Neuromodulation System submitted a comment to provide an update on its launch timeline and the commercial availability of technology in the provider market. The applicant confirmed that the SAINT Neuromodulation System is currently launching in the United States, and requested that CMS assign a newness date of April 5, 2024. The applicant stated that although SAINT received FDA clearance on September 1, 2022, there were significant product development, manufacturing design, and compliance steps that the company needed to complete before the device could become commercially available and be used to treat patients. It stated that initially, it had planned to develop and manufacture its own hardware; however, after much time and effort, it was determined in the second half of 2023 that the best course was to work with third-party manufacturers for the stimulator and neuronavigation hardware. The applicant provided a summary and timeline of all the activities that it completed prior to the device becoming commercially available to treat patients on April 5, 2024. The timeline also included information regarding the installation, training, and use of the SAINT Neuromodulation System at two hospitals after April 5, 2024.

Response: We thank the applicant and commenters for their comments. In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58937 through 58938), we noted that the applicant stated that ICD-10-PCS code X0Z0X18 (Computer-assisted transcranial magnetic stimulation of prefrontal cortex, new technology group 8) may be used to uniquely describe procedures involving the use

of the SAINT Neuromodulation System, effective October 1, 2022. We note that between October 1, 2022 and April 4, 2024 (inclusive), we identified 5 claims reporting this ICD-10-PCS code that were associated with an acute care hospital under the IPPS. Three of those claims were made in FY 2024, and all 3 received new technology add-on payment. Therefore, based on our review of the data, we cannot determine a newness date based on a documented delay in the technology's availability on the U.S. market. We continue to consider the beginning of the newness period to commence on September 1, 2022, the date of FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Comment: The applicant for DefenCath® (taurolidine/heparin), submitted a comment in support of our proposed continuation of new technology add-on payments for FY 2025 for DefenCath® and to update its Wholesale Acquisition Cost (WAC). The applicant noted that DefenCath® received conditional new technology add-on payment approval for FY 2024. The applicant stated that DefenCath® was approved by the FDA on November 15, 2023, via the Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD pathway), and that as such, hospitals were eligible to receive new technology add-on payments for DefenCath® as of January 1, 2024, which was the first date of the first quarter post FDA approval. The applicant stated that its original application included a WAC price of \$390 per mL to determine reimbursement, which it stated was based upon market conditions at the time of the submission of the application. The applicant explained that after the submission of its application for FY 2024, and following FDA approval of DefenCath®, it performed additional market research and pricing analysis, and decided to launch with a WAC price that is significantly lower than what was originally submitted. The applicant stated that it launched DefenCath® on April 15, 2024, in the inpatient setting with the WAC price of \$249.99 per 3mL vial (\$83.33 per mL), and urged CMS to finalize its proposal to continue making new technology add-on payments in FY 2025 for DefenCath®.

Another commenter also submitted a comment requesting that CMS reassess the new technology add-on payment amount for DefenCath® based on the WAC price of \$249.99 per 3mL vial, and expressed its concern about the impact DefenCath® will have on the Medicare program. The commenter stated that DefenCath® was late to the market with a clinical study using a control group which did not represent the current standard of care, and that it does not improve patient care or outcomes beyond the commenter's product, ClearGuard™ HD Antimicrobial Barrier Caps. The commenter also stated that DefenCath® requires additional labor resources to implement. Therefore, the commenter recommended that CMS monitor the value associated with DefenCath®.

Response: We thank the applicant and commenter for their comments and the updated cost information and recommendations. We have updated the new technology add-on payment amount for DefenCath® accordingly.

Although the applicant states that DefenCath® was launched on April 15, 2024, we did not receive information regarding a documented delay in market availability, and absent additional information from the applicant, we cannot determine a newness date based on a documented delay in the technology's availability on the U.S. market. Therefore, we continue to consider the beginning of the newness period to commence on November 15, 2023, the date of FDA marketing authorization for the indication covered by its QIDP designation.

DefenCath®'s current new technology add-on payment amount is \$17,111.25, based on a WAC of \$1,170 per 3mL vial. As we noted in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58943), on average, patients would receive 9.75 HD treatments per inpatient stay based upon the average length of stay of 13.3 days, which would require 19.5 vials. For FY 2025, the maximum new technology add-on payment amount is \$3,656.10, based on an updated WAC of \$249.99 per 3mL vial, as reflected in Table II.E.-01 in this final rule.

We further note that, as discussed in section II.E.5.d. of this final rule, because ELREXFIO™ and TALVEY™ are substantially similar to TECVAYLI®, we are using a single

cost for purposes of determining the new technology add-on payment amount for ELREXFIO™, TALVEY™, and TECVAYLI® for FY 2025. As discussed in section II.E.5.d. of this final rule, we determined a weighted average of the cost of ELREXFIO™, TALVEY™, and TECVAYLI® based upon the projected numbers of cases involving each technology to determine the maximum new technology add-on payment. To compute the weighted average cost, we summed the total number of projected cases for each technology provided by the applicants, which equaled 4,376 cases (152 cases for ELREXFIO™ plus 2,318 cases for TALVEY™ plus 1,906 cases for TECVAYLI®). We then divided the number of projected cases for each of the technologies by the total number of cases, which resulted in the following case weighted percentages: 3.47 percent for ELREXFIO™, 52.97 percent for TALVEY™ and 43.56 percent for TECVAYLI®. For each technology, we then multiplied the estimated cost per patient by the case-weighted percentage ($0.0347 * \$15,112 = \524.39 for ELREXFIO™, $0.5297 * \$25,164.44 = \$13,329.60$ for TALVEY™ and $0.4356 * \$13,754.67 = \$5,991.53$ for TECVAYLI®). This resulted in a case-weighted average cost of \$19,845.52 for the technology.

Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of ELREXFIO™, TALVEY™, or TECVAYLI® is \$12,899.59 for FY 2025, as reflected in Table II.E.-01 of this final rule.

After consideration of the public comments we received, we are finalizing our proposals to continue new technology add-on payments for FY 2025 for the technologies that were approved for new technology add-on payment for FY 2024 and would still be considered “new” for purposes of new technology add-on payments for FY 2025, as listed in the proposed rule and in the following Table II.E.-01 in this section of this final rule.

We note that the following Table II.E.-01 is the same as Table II.E.-01 that was presented in the proposed rule, but Table II.E.-01 in this final rule includes the updated cost information for

TECVAYLI® and DefenCath® and the updated newness start date for REZZAYO™, as discussed previously. Table II.E.-01 in this final rule also presents the newness start date, new technology add-on payment start date, 3-year anniversary date of the product's entry onto the U.S. market, relevant final rule citations from prior fiscal years, maximum add-on payment amount, and coding assignments for each technology. We refer readers to the final rules cited in the following table for a complete discussion of the new technology add-on payment application, coding, and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

TABLE ILE.-01: CONTINUATION OF TECHNOLOGIES APPROVED FOR FY 2024 NEW TECHNOLOGY ADD-ON PAYMENTS STILL CONSIDERED NEW FOR FY 2025 BECAUSE THE 3-YEAR ANNIVERSARY DATE WILL OCCUR ON OR AFTER APRIL 1, 2025

	Technology	Newness Start Date	NTAP Start Date	3-year Anniversary Date of Entry onto U.S. Market	Previous Final Rule Citations	Maximum NTAP Amount for FY 2025	Coding Used to Identify Cases Eligible for NTAP
1	<i>Thoraflex™ Hybrid Device</i>	04/19/2022	10/1/2022	04/19/2025	87 FR 48974 through 48975 88 FR 58800	\$22,750.00	X2RX0N7 in combination with X2VW0N7
2	<i>ViviStim® Paired VNS System</i>	04/29/2022	10/1/2022	04/29/2025	87 FR 48975 through 48977 88 FR 58800	\$23,400.00	X0HQ3R8
3	<i>GORE® TAG® Thoracic Branch Endoprosthesis</i>	05/13/2022	10/1/2022	05/13/2025	87 FR 48966 through 48969 88 FR 58800	\$27,807.00	02VW3DZ in combination with 02VX3EZ
4	<i>Cerament® G</i>	05/17/2022	10/1/2022	05/17/2025	87 FR 48961 through 48966 88 FR 58800	\$4,918.55	XW0V0P7
5	<i>iFuse Bedrock Granite Implant System</i>	05/26/2022	10/1/2022	05/26/2025	87 FR 48969 through 48974 88 FR 58800	\$9,828.00	XNH6058 or XNH6358 or XNH7058 or XNH7358 or XRGE058 or XRGE358 or XRGF058 or XRGF358
6	<i>CYTALUX® (pafolacianine) (ovarian indication)</i>	04/15/2022	10/1/2023	04/15/2025	88 FR 58804 through 58810	\$2,762.50	8E0U0EN, 8E0U3EN, 8E0U4EN, 8E0U7EN, or 8E0U8EN
7	<i>CYTALUX® (pafolacianine) (lung indication)</i>	06/05/2023	10/1/2023	06/05/2026	88 FR 58810 through 58818	\$2,762.50	8E0W0EN, 8E0W3EN, 8E0W4EN, 8E0W7EN, or 8E0W8EN

23	TOPS™ System	06/15/2023	10/1/2023	06/15/2026	88 FR 58940 through 58942	\$11,375.00	XRHB018 in combination with M48.062
24	XACDURO® (sulbactam/durlobactam)	05/23/2023	10/1/2023	05/23/2026	88 FR 58946 through 58948	\$13,680.00	XW033K9 or XW043K9 in combination with one of the following: Y95 and J15.61; <u>OR</u> J95.851 and B96.83

In the proposed rule, we provided Table II.E.-02 listing the technologies for which we proposed to discontinue making new technology add-on payments for FY 2025 because they were no longer “new” for purposes of new technology add-on payments. This table also presented the newness start date, new technology add-on payment start date, the 3-year anniversary date of the product’s entry onto the U.S. market, and relevant final rule citations from prior fiscal years. We referred readers to the cited final rules in the following table for a complete discussion of each new technology add-on payment application and the coding and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

We invited public comments on our proposals to discontinue new technology add-on payments for FY 2025 for the technologies listed in Table II.E.-02 of the proposed rule.

Comment: A commenter urged CMS to prevent new access hurdles from arising with newer treatments by continuing new technology add-on payments that are now in place for low volume inpatient stays until the MS-DRG calculations reflect the cost of the treatment, as the commenter asserted that is what the new technology add-on payment mechanism was intended to do.

Response: As we have stated previously, our policy for determining whether to extend new technology add-on payments for an additional year generally applies regardless of the volume of claims for the technology after the beginning of the newness period. We do not believe that case volume is a relevant consideration for making the determination as to whether a product is considered “new” for purposes of new technology add-on payments. Consistent with the statute and our implementing regulations, a technology is no longer considered “new” once it is more than 2 to 3 years old, and the costs of the procedures are considered to be included in the relative weights irrespective of how frequently the technology has been used in the Medicare population (83 FR 41280).

Comment: The manufacturer of Intercept® Fibrinogen Complex (IFC), pathogen reduced cryoprecipitated fibrinogen complex (PRCFC), submitted a comment stating that due to manufacturing delays, its new technology add-on payment should be extended an additional year. The commenter explained that the IFC manufacturing process is unusual in that the IFC product must be made at blood centers, and that it has contracted with several blood centers. The commenter stated that each of these contracted blood centers must be licensed through FDA approval of a Biologics License Application (BLA) for manufacturing to ship the IFC product across state lines. The commenter stated that a complaint filed by a manufacturer of a competitive product resulted in FDA placing the BLA reviews of several of its contracted blood centers on hold and that the BLA reviews remain pending. The commenter stated that at the end of the first year of its new technology add-on payment (FY 2022), only three blood centers were authorized to ship IFC across state lines, and that as of June 2024, it was still waiting for FDA clearance of four additional blood center contract manufacturing facilities, which would increase manufacturing capacity by another 100 percent. The commenter stated that therefore, the majority of hospitals in the country did not have access to IFC in FY 2022 and FY 2023. The commenter asserted that its new technology add-on payment should be extended through FY 2025 given the significant delay in manufacturing due to the delay in BLA approvals and the resulting lack of national IFC availability.

Response: We thank the commenter for its comment. Consistent with the statute and our implementing regulations, a technology is no longer considered as “new” once it is more than 2 to 3 years old, irrespective of how frequently the medical service or technology has been used in the Medicare population (70 FR 47349, 85 FR 58610). As such, once a technology has been available on the U.S. market for more than 2 to 3 years, we consider the costs to be included in the MS-DRG relative weights regardless of whether the technology's use in the Medicare population has been frequent or infrequent (88 FR 58802).

After consideration of the public comments we received, we are finalizing our proposal to discontinue new technology add-on payments for the technologies as listed in the proposed rule and in the following Table II.E.-02 of this final rule for FY 2025 because they are no longer “new” for purposes of new technology add-on payments. This table also presents the newness start date, new technology add-on payment start date, the 3-year anniversary date of the product’s entry onto the U.S. market, and relevant final rule citations from prior fiscal years. We refer readers to the final rules cited in the following table for a complete discussion of each new technology add-on payment application and the coding and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

TABLE II.E.-02: DISCONTINUATION OF TECHNOLOGIES APPROVED FOR FY 2024 NEW TECHNOLOGY ADD-ON PAYMENTS NO LONGER CONSIDERED NEW FOR FY 2025 BECAUSE 3-YEAR ANNIVERSARY DATE WILL OCCUR PRIOR TO APRIL 1, 2025

	Technology	Newness Start Date	NTAP Start Date	3-year Anniversary Date of Entry onto U.S. Market	Previous Final Rule Citations

5. FY 2025 Applications for New Technology Add-On Payments (Traditional Pathway)

As discussed previously, in the FY 2023 IPPS/LTCH PPS final rule, we finalized our policy to publicly post online applications for new technology add-on payment beginning with FY 2024 applications (87 FR 48986 through 48990). As noted in the FY 2023 IPPS/LTCH PPS final rule, we are continuing to summarize each application in this final rule. However, while we are continuing to provide discussion of the concerns or issues we identified with respect to applications submitted under the traditional pathway, we are providing more succinct information as part of the summaries in the proposed and final rules regarding the applicant's assertions as to how the medical service or technology meets the newness, cost, and substantial clinical improvement criteria. We refer readers to

<https://mearis.cms.gov/public/publications/ntap> for the publicly posted FY 2025 new technology add-on payment applications and supporting information (with the exception of certain cost and volume information, and information or materials identified by the applicant as confidential or copyrighted), including tables listing the ICD-10-CM codes, ICD-10-PCS codes, and/or MS-DRGs related to the analyses of the cost criterion for certain technologies for the FY 2025 new technology add-on payment applications.

We received 16 applications for new technology add-on payments for FY 2025 under the new technology add-on payment traditional pathway. As discussed previously, in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958), we finalized that beginning with the new technology add-on payment applications for FY 2025, for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application, applicants must have a complete and active FDA market authorization request at the time of new technology add-on payment application submission and must provide documentation of FDA acceptance or filing to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. See § 412.87(e) and further discussion in the FY 2024 IPPS/LTCH PPS final rule (88

FR 58948 through 58958). Of the 16 applications received under the traditional pathway, one applicant was not eligible for consideration for new technology add-on payment because it did not meet these requirements, and three applicants withdrew their application prior to the issuance of the proposed rule. In accordance with the regulations under § 412.87(f), applicants for FY 2025 new technology add-on payments must have received FDA approval or clearance by May 1 of the year prior to the beginning of the fiscal year for which the application is being considered. Subsequently, prior to the issuance of this final rule, two additional applications were withdrawn for odronextamab (R/R DLBCL indication) and odronextamab (R/R FL indication). We are not including in this final rule the description and discussion of applications that were withdrawn or that are ineligible for consideration for FY 2025. We are addressing the remaining 10 applications. We note that the manufacturer for Casgevy™ (exagamglogene autotemcel) submitted a single application, but for two separate indications, each of which is discussed separately in this section. We are not approving new technology add-on payments for 6 technologies: Casgevy™ (exagamglogene autotemcel) for the indication of transfusion-dependent β -thalassemia, DuraGraft®, FloPatch FP120, Lantidra™ (donislecel-jujn (allogeneic pancreatic islet cellular suspension for hepatic portal vein infusion), AMTAGVI™ (lifileucel), and Quicktome Software Suite, for the reasons discussed in the following sections. For the remaining 5 technologies, we are approving new technology add-on payments for FY 2025 for Casgevy™ (exagamglogene autotemcel) for the indication of sickle cell disease, HEPZATO™ KIT (melphalan for injection/hepatic delivery system), and Lyfgenia™ (lovotibeglogene autotemcel). Because the remaining two technologies, ELREXFIO™ (elranatamab-bcmm) and TALVEY™ (talquetamab-tgvs), are considered substantially similar to TECVAYLI™ (teclistamab-cqyv), which was approved for new technology add-on payments for FY 2024 and is still considered “new” for purposes of new technology add-on payments for FY 2025, these technologies are also eligible for the new technology add-on payment for FY 2025. A discussion of these applications is presented in the following sections.

a. Casgevy™ (exagamglogene autotemcel) First Indication: Sickle Cell Disease (SCD)

Vertex Pharmaceuticals, Inc. submitted an application for new technology add-on payments for Casgevy™ for FY 2025 for use in sickle cell disease. According to the applicant, Casgevy™ is a one-time, clustered regularly interspaced short palindromic repeats (CRISPR)/CRISPR-associated protein 9 (Cas9) modified autologous cluster of differentiation (CD)34+ hematopoietic stem & progenitor cell (HSPC) cellular therapy approved for the treatment of sickle cell disease (SCD) in patients 12 years and older with recurrent vaso-occlusive crises (VOC). Per the applicant, using a CRISPR/Cas9 gene editing technique, the patient's CD34+ HSPCs are edited ex vivo via Cas9, a nuclease enzyme that uses a highly specific guide ribonucleic acid (gRNA), at the critical transcription factor binding site GATA1 in the erythroid specific enhancer region of the B-cell lymphoma/leukemia 11A (BCL11A) gene. According to the applicant, as a result of the editing, GATA1 binding is irreversibly disrupted, and BCL11A expression is reduced, resulting in an increased production of fetal hemoglobin (HbF), and recapitulating a naturally occurring, clinically benign condition called hereditary persistence of fetal hemoglobin (HPFH) that reduces or eliminates SCD symptoms. As stated by the applicant, Casgevy™ infusion induces increased HbF production in SCD patients to ≥ 20 percent, which is known to be associated with fewer SCD complications via addressing the underlying cause of SCD by preventing RBC sickling. We note that the applicant is also seeking new technology add-on payments for Casgevy™ for FY 2025 for use in treating transfusion-dependent beta thalassemia (TDT), as discussed separately later in this section.

Please refer to the online application posting for Casgevy™, available at <https://mearis.cms.gov/public/publications/ntap/NTP2310171VPTU>, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, Casgevy™ was granted Biologics License Application (BLA) approval from FDA on December 8, 2023, for treatment of SCD in patients 12 years of age or older with recurrent VOCs. According to the applicant,

Casgevy™ became commercially available immediately after FDA approval. Casgevy™ is available in 20 mL vials containing 4 to 13×10^6 CD34+ cells/mL frozen in 1.5 to 20 mL of solution. The minimum dose is 3×10^6 CD34+ cells per kg of body weight, which may be contained within multiple vials.

Effective April 1, 2023, the following ICD-10-PCS codes may be used to uniquely describe procedures involving the use of Casgevy™: XW133J8 (Transfusion of exagamglogene autotemcel into peripheral vein, percutaneous approach, new technology group 8) and XW143J8 (Transfusion of exagamglogene autotemcel into central vein, percutaneous approach, new technology group 8). The applicant provided a list of ICD-10-CM diagnosis codes that may be used to identify this indication for Casgevy™. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant. We believe the relevant ICD-10-CM codes to identify the indication of SCD would be: D57.1 (Sickle-cell disease without crisis), D57.20 (Sickle-cell/Hb-C disease without crisis), D57.40 (Sickle-cell thalassemia without crisis), D57.42 (Sickle-cell thalassemia beta zero without crisis), D57.44 (Sickle-cell thalassemia beta plus without crisis), or D57.80 (Other sickle-cell disorders without crisis). In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36031), we invited public comments on the use of these ICD-10-CM diagnosis codes to identify the indication of SCD for purposes of the new technology add-on payment, if approved. We note that we did not receive any comments on the use of these codes.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered “new” for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that Casgevy™ is not substantially similar to other currently available technologies, because Casgevy™ is the first approved therapy to use CRISPR gene editing technology and no other approved technology

uses the same or a similar mechanism of action; and therefore, the technology meets the newness criterion. The following table summarizes the applicant’s assertions regarding the substantial similarity criteria. Please see the online application posting for Casgevy™ for the applicant’s complete statements in support of its assertion that Casgevy™ is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	Casgevy™ is the first technology to use the CRISPR/Cas9 gene editing mechanism of action. No other approved technologies use this mechanism of action, and CRISPR technology has never previously been used in humans outside of clinical trials. Casgevy™ is a one-time treatment that uses ex vivo non-viral CRISPR/Cas9 to precisely edit the erythroid-specific enhancer region of BCL11A in CD34+ HSPCs. The technology consists of the Cas9 nuclease and single guide RNA (sgRNA), which together form a ribonucleoprotein (RNP) complex. The Cas9/sgRNA complex binds DNA at a precise location, and Cas9 cuts the DNA strand, generating a DNA double-stranded break. Naturally occurring DNA repair systems are activated to resolve the double-strand break. These changes in the target DNA sequence suppress the BCL11A gene and reactivate production of HbF. While other therapeutic approaches such as Hydroxyurea impact production of HbF, no other approved technology has been able to reactivate production of endogenous HbF to levels known to eliminate disease complications (for example, VOCs), consistent with individuals with a clinically benign condition called HPFH who experience no or minimal disease complications from SCD when they co-inherit both HPFH and SCD.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	In the FY 2024 IPPS/LTCH PPS Final Rule, CMS finalized assignment of the ICD-10-PCS codes (XW133J8 and XW143J8) describing the transfusion of Casgevy™ to MS-DRGs 016 and 017. MS-DRGs 016 and 017 are also currently used for autologous stem-cell transplants but not allogeneic stem cell transplants currently used in the treatment of SCD. Allogeneic stem cell transplants are reimbursed on a reasonable cost basis by operation of section 1886(d)(5)(M) of the Social Security Act.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	Yes	Casgevy™ is the first therapy to use the CRISPR/Cas9 gene editing mechanism of action. There are currently several approved therapies that are used to treat patients living with SCD. However, no other approved single product would act as a stand-alone one-time treatment intended permanently to address the root cause of SCD.

As discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36032), we noted that Casgevy™ may have the same or similar mechanism of action to Lyfgenia™, for which we also received an FY 2025 new technology add-on payment application. Casgevy™ and Lyfgenia™ are both gene therapies using modified autologous CD34+ HSPC therapies administered via stem cell transplantation for the treatment of SCD. Lyfgenia™ was approved by FDA for this indication on December 8, 2023. We noted that both technologies are autologous, ex-vivo modified hematopoietic stem-cell biological products. For these technologies, patients are required to undergo CD34+ HSPC mobilization followed by apheresis to extract CD34+ HSPCs for manufacturing and then myeloablative conditioning using busulfan to deplete the patient's bone marrow in preparation for the technologies' modified stem cells to engraft to the

bone marrow. Once engraftment occurs for both technologies, the patient's cells start to produce a different form of hemoglobin in order to reduce the sickling hemoglobin. We further noted that both technologies appeared to map to the same MS-DRGs, MS-DRGs 016 and 017 (Autologous Bone Marrow Transplant with CC/MCC, and without CC/MCC, respectively), and to treat the same or similar disease (SCD) in the same or similar patient population (patients 12 years of age and older who have a history of VOCs). Accordingly, as it appeared that Casgevy™ and Lyfgenia™ may use the same or similar mechanism of action to achieve a therapeutic outcome (that is, to reduce the amount of sickling hemoglobin to reduce and prevent VOEs associated with SCD), were assigned to the same MS-DRGs, and treated the same or similar patient population and disease, we stated our belief that these technologies may be substantially similar to each other such that they should be considered as a single application for purposes of new technology add-on payments. We noted that if we determined that this technology is substantially similar to Lyfgenia™, we believed the newness period would begin on December 8, 2023, the date both Casgevy™ and Lyfgenia™ received FDA approval for SCD. We stated we were interested in information on how these two technologies may differ from each other with respect to the substantial similarity criteria and newness criterion, to inform our analysis of whether Casgevy™ and Lyfgenia™ are substantially similar to each other, and therefore, should be considered as a single application for purposes of new technology add-on payments.

We invited public comments on whether Casgevy™ meets the newness criterion, including whether Casgevy™ is substantially similar to Lyfgenia™ and whether these technologies should be evaluated as a single technology for purposes of new technology add-on payments.

Comment: The applicant for Casgevy™ submitted a public comment regarding substantial similarity for Lyfgenia™ and Casgevy™. The applicant asserted Casgevy™ represents the first therapy approved to use CRISPR/Cas9 gene editing technology and stated that no other approved technologies use this mechanism of action, and CRISPR/Cas9 technology

has never previously been used in humans outside of clinical trials. The applicant stated that Casgevy™ is a one-time treatment that uses ex vivo non-viral CRISPR/Cas9 to precisely edit the erythroid-specific enhancer region of BCL11A in CD34+ HSPCs. The applicant stated that, while other non-gene therapy-based therapeutic approaches impact production of HbF, no other approved technology has been able to reactivate production of endogenous HbF to levels known to eliminate disease complications (for example, VOC), consistent with individuals with a clinically benign condition called hereditary persistence of fetal hemoglobin (HPFH) who experience no or minimal disease complications from SCD when they co-inherit both HPFH and SCD; therefore, it stated Casgevy™ satisfies the newness criterion. The applicant stated that CMS focused on perceived similarities in treatment journey and categorical product characteristics between Casgevy™ and certain other technologies, but did not acknowledge material differences in the underlying technology which impact the safety and efficacy profile of these products. The applicant further explained that after Casgevy™ infusion, the edited CD34+ cells engraft in the bone marrow and differentiate to erythroid lineage cells with reduced BCL11A expression, and that this reduced BCL11A expression results in an increase in γ -globin expression and HbF protein production in erythroid cells. The applicant stated that in patients with severe SCD, HbF expression reduces intracellular hemoglobin S (HbS) concentration, preventing the red blood cells from sickling and addressing the underlying cause of disease, thereby eliminating VOCs. The applicant stated that, as such, Casgevy™ is not similar to the current standard of care (bone marrow transplant), nor to other technologies used in the treatment of SCD, and that none of these treatments use a mechanism of action that relies on CRISPR gene editing to reduce intracellular HbS concentration in SCD patients. The applicant explained how Lyfgenia™ uses a separate technology, gene replacement therapy, that utilizes a viral-based mechanism to introduce exogenous genetic material into patients' HSPCs, to add functional copies of a modified β A-globin gene into patients' hematopoietic stem cells (HSCs) through transduction of autologous CD34+ cells with B8305 lentiviral vector (LVV). The applicant

stated that due to the LVV-based mechanism of action and the semi-random nature of viral integration, there is a potential risk of LVV-mediated insertional oncogenesis after treatment with Lyfgenia™ used in the treatment of SCD, as documented in FDA-approved labeling. The applicant stated that Casgevy™, with its non-viral mechanism of action using CRISPR/Cas9 gene editing, does not employ a viral vector and does not insert a transgene; therefore, insertional oncogenesis cannot occur as a matter of scientific principle. The applicant further stated that Casgevy™ uses a unique underlying technology and manufacturing process and has distinct product characteristics that differentiate it from other technologies used to treat SCD. The applicant asserted in its comments that if CMS were to consider gene replacement therapy and gene editing technologies to be substantially similar, it could set a precedent based on overgeneralization which could deter further innovation.

Another commenter who is the manufacturer of Lyfgenia™ also submitted a public comment regarding the newness criterion. With respect to mechanism of action, the applicant stated that Lyfgenia™ has a unique mechanism of action that differs from Casgevy™'s because it is a one-time gene therapy that adds functional copies of the β^{A-T87Q} -globin gene into a patient's own HSCs ex-vivo through the transduction of autologous CD34+ cells with a BB305 LVV to durably produce HbA^{T87Q}. The commenter added that HbA^{T87Q} is a modified adult hemoglobin (HbA) specifically designed to be anti-sickling while maintaining the same structure and function as naturally occurring HbA. According to the commenter, Lyfgenia™ consists of an autologous CD34+ cell-enriched population from patients with SCD that contains HSCs transduced with BB305 LVV encoding the β^{A-T87Q} -globin gene, suspended in a cryopreservation solution. The commenter stated the BB305 LVV encodes a single amino acid variant of β -globin gene, β^{A-T87Q} -globin: a human β -globin with a genetically engineered single amino acid change (threonine [Thr; T] to glutamine [Gln; Q] at position 87 (T87Q)). The commenter asserted HbA^{T87Q} is nearly identical to wildtype (or "innate") HbA, which is not prone to sickling. The commenter stated the T87Q substitution introduced in β^{A-T87Q} -globin is designed to physically

block or sterically inhibit polymerization of hemoglobin, thus rendering further “anti-sickling” properties to β^{A-T87Q} -globin. According to the commenter, this results in a transgenic, non-immunogenic protein that can be measured in blood allowing for monitoring of the therapeutic protein in vivo and quantification relative to other globin species used to treat SCD. The commenter stated that Lyfgenia™ is not substantially similar to the CRISPR-Cas9 gene editing technique of Casgevy™. The commenter also stated that, as described previously, Lyfgenia™ adds functional copies of a modified β -globin (HBB) gene, β^{A-T87Q} globin gene, into patients’ own HSCs to durably produce HbA^{T87Q}, a modified adult HbA specifically designed to be anti-sickling while maintaining the same morphology and function as naturally occurring HbA. According to the commenter, the CRISPR/Cas9 gene editing technique mechanism of action described for Casgevy™ in the proposed rule differs substantially from Lyfgenia™, as is evident by Casgevy™’s unique editing approach in which GATA1 binding is irreversibly disrupted, and BCL11A expression is reduced, resulting in an increased production of HbF, and recapitulating a naturally occurring, clinically benign condition called HPFH that reduces or eliminates SCD symptoms.

According to the commenter, increasing HbA^{T87Q} versus increasing HbF are fundamentally distinct mechanistic approaches. For individuals without SCD, HbF production is decreased shortly after birth, coinciding with an increase in HbA, and Lyfgenia™ is designed to replicate this natural state by introducing the production of HbA^{T87Q}. The commenter stated HbA^{T87Q} is nearly identical to HbA in several keyways: sequence homology, protein structure, oxygen affinity and oxygen dissociation curves. The commenter stated that HbF has ~50 percent homology to HbA (two β globin chains are replaced with two γ -chains) and has a higher observed oxygen affinity and different oxygen unloading properties than HbA. According to the commenter, from a clinical perspective, current standard of care approaches (for example, the use of hydroxyurea) are available to increase levels of HbF with variable effectiveness, while the mechanism of action Lyfgenia™ affords is unique in increasing a modified HbA. The

commenter commented that while both gene therapies are indicated for the treatment of SCD, the mechanistic approach of each is fundamentally and significantly different from the other, and therefore Lyfgenia™ and Casgevy™ are not substantially similar and should not be considered as a single application for the purposes of new technology add-on consideration.

The commenter also described potential risks associated with consideration of the two technologies as a single application. Specifically, the commenter stated that if Lyfgenia™ and Casgevy™ are treated as a single application and paid under a single maximum new technology add-on payment amount, this could potentially undermine CMS's aim to improve timely, meaningful access to SCD gene therapies for Medicare patients. Per the commenter, not only do the two therapies have distinct mechanisms of action but they also differ in the length of follow-up and the features of the population in which they were studied (for example, the commenter stated that the Lyfgenia™ clinical trials did not exclude patients with a history of chronic pain and included some patients with a history of stroke), and patients should have a choice to work with physicians to decide which therapy is most appropriate, based solely on their specific individual clinical circumstances. The commenter further asserted that given these differences, the finalization of a single new technology add-on payment amount for both therapies could hamper patient access to the most appropriate gene therapy, and potentially create a fiscally problematic and financial loss for IPPS hospitals, given the difference in the wholesale acquisition costs of both therapies, and CMS could potentially over-pay for one product, while under-paying for the other through the use of the historical blended weighted average cost utilizing volume estimates. Therefore, the commenter stated that Lyfgenia™ is not substantially similar to Casgevy™ and should not be considered as a single application with Casgevy™ for the purposes of new technology add-on payments.

Response: We thank the applicant and the other commenters for their comments. Based on our review of comments received and information submitted by the applicant as part of its FY 2025 new technology add-on payment application for Casgevy™, we agree that Casgevy™ and

Lyfgenia™ do not have the same mechanism of action because Casgevy™ modifies a patients' own HSPCs to increase HbF expression to subsequently reduce the expression of intracellular sickled hemoglobin concentration, which is a distinct mechanism of action compared to Lyfgenia™, which modifies a patients' own HSPCs to increase HbA^{T87Q} (modified adult hemoglobin). Therefore, we agree with the applicant that Casgevy™ has a unique mechanism of action and is not substantially similar to existing treatment options for the treatment of SCD in patients 12 years of age or older with recurrent VOCs and meets the newness criterion. We consider the beginning of the newness period for Casgevy™ to commence on December 8, 2023, when Casgevy™ was granted BLA approval from FDA for the treatment of SCD in patients 12 years of age or older with recurrent VOCs.

With respect to the cost criterion, the applicant searched the FY 2022 MedPAR file and provided multiple analyses to demonstrate that Casgevy™ meets the cost criterion. The applicant included two cohorts in the analyses to identify potential cases representing patients who may be eligible for Casgevy™: the first cohort included all cases in MS-DRG 014 (Allogeneic Bone Marrow Transplant) to account for the low volume of SCD or transfusion-dependent beta thalassemia (TDT) cases, and the second cohort included cases in MS-DRG 014 (Allogeneic Bone Marrow Transplant) with any ICD-10-CM diagnosis code of SCD or TDT. The applicant explained that the cost analyses for SCD and TDT were combined because the volume of cases with a sickle cell disease or beta thalassemia diagnosis code was very low, and because it believed both indications would be approved in time for new technology add-on payment. In addition, the applicant noted that when searching for cases in MS-DRG 014 with SCD or beta thalassemia diagnosis codes, there were no beta thalassemia cases. The applicant noted that cases included in the analysis may not be a completely accurate representation of cases that will be eligible for Casgevy™ but that the analyses were provided in recognition of the low volume of cases.

The applicant performed two analyses for each cohort: one with all prior drug charges maintained, representing a scenario in which there is no change to patient drug regimen with the use of Casgevy™; and another with all prior drug charges removed, representing a scenario in which no ancillary drugs are used in the treatment of Casgevy™ patients. Per the applicant, this was done because some patients receiving Casgevy™ could receive fewer ancillary drugs during the inpatient stay, but it was difficult to know with certainty whether this would be the case or to identify the exact differences in drug regimens between patients receiving Casgevy™ and those receiving allogeneic bone marrow transplants. The applicant noted the analyses with drug charges removed were likely an over-estimation of the ancillary drug charges that would be removed in cases involving the use of Casgevy™, but these were provided as sensitivity analyses.

According to the applicant, eligible cases for Casgevy™ will be mapped to either Pre-MDC MS-DRGs 016 or 017, depending on whether complications or comorbidities (CCs) or major complications or comorbidities (MCCs) are present. For each analysis, the applicant used the FY 2025 new technology add-on payment threshold for Pre-MDC MS-DRG 016 for all identified cases, because it was typically higher than the threshold for Pre-MDC MS-DRG 017. Each analysis followed the order of operations described in the table later in this section.

For the first cohort, the applicant included all cases associated with MS-DRG 014 (Allogeneic Bone Marrow Transplant). The applicant used the inclusion/exclusion criteria described in the following table and identified 996 claims mapping to MS-DRG 014. With all prior drug charges maintained (Scenario 1), the applicant calculated a final inflated average case-weighted standardized charge per case of \$12,325,062, which exceeded the average case-weighted threshold amount of \$182,491. With all prior drug charges removed (Scenario 2), the applicant calculated a final inflated average case-weighted standardized charge per case of \$12,181,526, which exceeded the average case-weighted threshold amount of \$182,491.

For the second cohort, the applicant searched for cases within MS-DRG 014 with any ICD-10-CM diagnosis codes representing SCD or TDT. The applicant used the inclusion/exclusion criteria described in the following table and identified 11 claims mapping to MS-DRG 014. With all prior drug charges maintained (Scenario 3), the applicant calculated a final inflated average case-weighted standardized charge per case of \$12,125,212, which exceeded the average case-weighted threshold amount of \$182,491. With all prior drug charges removed (Scenario 4), the applicant calculated a final inflated average case-weighted standardized charge per case of \$12,086,551, which exceeded the average case-weighted threshold amount of \$182,491.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant maintained that Casgevy™ meets the cost criterion.

CASGEVY™ COST ANALYSIS²³	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	For the list of ICD-10-CM codes, see the online posting for Casgevy™.
List of MS-DRGs	014 (Allogeneic Bone Marrow Transplant with CC/MCC)
Inclusion/exclusion criteria	Cohort 1: The applicant included all cases assigned to MS-DRG 014 (Allogeneic Bone Marrow Transplant). Cohort 2: The applicant searched for cases within MS-DRG 014 (Allogeneic Bone Marrow Transplant) with any ICD-10-CM diagnosis codes representing SCD or TDT using the codes listed in the online posting for Casgevy™.
Charges removed for prior technology	Scenarios 1 and 3 (the first scenario of each cohort): The applicant removed 100% of charges associated with allogeneic bone marrow transplants, as treatment with Casgevy™ would eliminate the need for an allo-HSCT. The applicant did not remove any indirect charges related to ancillary drugs. Scenarios 2 and 4 (the second scenario of each cohort): The applicant removed 100% of charges associated with allogeneic bone marrow transplants, as treatment with Casgevy™ would eliminate the need for an allo-HSCT. The applicant removed all indirect charges related to ancillary drugs.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2024 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 11.9% to the standardized charges, based on the two-year inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.184 for drugs from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

²³ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36034), we invited public comments on whether Casgevy™ meets the cost criterion.

Comment: The applicant reiterated that the cost criterion analyses submitted with the application demonstrate that Casgevy™ meets the cost criterion.

Response: We thank the applicant for its comments. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios. Therefore, Casgevy™ meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that Casgevy™ represents a substantial clinical improvement over existing technologies because it is anticipated to expand patient eligibility for potentially curative SCD therapies, have improved clinical outcomes relative to available therapies, and avoid certain serious risks or side effects associated with existing potentially curative treatment options for SCD. The applicant provided one study to support these claims, as well as eight background articles about clinical outcomes and safety risks of other SCD treatments.²⁴ The following table summarizes the applicant’s assertions regarding the substantial clinical improvement criterion. Please see the online posting for Casgevy™ for the applicant’s complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments.	
Applicant statements in support	Supporting evidence provided by the applicant
Casgevy™ is anticipated to expand patient eligibility for potentially curative therapies for SCD due to the lack of necessity for HLA-matching as an autologous therapy.	CASGEVY (exagamglogene autotemcel) [package insert]. Boston, MA: Vertex Pharmaceuticals, Inc.; 2023 The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available.	
Applicant statements in support	Supporting evidence provided by the applicant
Casgevy™ is the first gene therapy specifically approved for the treatment of SCD in patients 12 years	The applicant provided background information to support this claim, which can be accessed via the online posting for the technology.

²⁴ Background articles are not included in the following table but can be accessed via the online posting for the technology.

and older with recurrent VOCs.	
Casgevy™ is anticipated to have significantly improved clinical outcomes relative to available therapies as shown by elimination of severe VOCs in SCD patients 12 years and older with recurrent VOCs.	<p>Locatelli F, et al. Presented at the 28th Annual European Hematology Association; 11 June 2023. Frangoul H, et al. Presented at the 65th Annual American Society of Hematology. 11 Dec 2023.</p> <p>The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.</p>
Casgevy™ is expected to avoid certain serious risks or side effects associated with approved viral-based gene therapies for SCD.	<p>CASGEVY (exagamglogene autotemcel) [package insert]. Boston, MA: Vertex Pharmaceuticals, Inc.; 2023.</p> <p>Locatelli F, et al. Presented at the 28th Annual European Hematology Association; 11 June 2023.</p> <p>The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.</p>
Casgevy™ is expected to avoid certain serious risks or side effects associated with existing potentially curative treatment options for SCD.	<p>Locatelli F, et al. Presented at the 28th Annual European Hematology Association; 11 June 2023.</p> <p>The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.</p>

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36035 through 36036), after reviewing the information provided by the applicant, we stated we had the following concerns regarding whether Casgevy™ meets the substantial clinical improvement criterion. We noted that the only assessment of the technology submitted was from conference presentations that provided data on the ongoing CLIMB-121 trial, a phase 1/2/3 single-arm trial assessing a single dose of Casgevy™ in patients 12 to 35 years old with SCD and a history of two or more severe VOCs per year over 2 years. The most recent data presented at ASH in December 2023,²⁵ which appears to supersede the earlier results from Locatelli, et al. (2023),²⁶ indicated 44 participants received Casgevy™ for SCD, of which only 30 participants were evaluable for the primary and key secondary endpoints because they were followed for at least 16 months (up to 45.5 months) post Casgevy™ infusion. The applicant stated 96.7 percent of patients achieved the primary efficacy endpoint (free of severe VOCs for at least 12 consecutive months) and 100 percent of patients achieved the key secondary efficacy endpoint (free from in-patient hospitalization for severe VOCs for at least 12 consecutive months). Additionally, the applicant noted a safety profile consistent with myeloablative busulfan and autologous HSCT and that there were no

²⁵ Frangoul H, et al. Presented at the 65th Annual American Society of Hematology. 11 Dec 2023.

²⁶ Locatelli F, et al. Presented at the 28th Annual European Hematology Association; 11 June 2023.

malignancies nor serious adverse events related to Casgevy™. However, we noted that the provided evidence did not include peer-reviewed literature that directly assessed the use of Casgevy™ for SCD. We questioned whether the small study population may limit the generalizability of these study outcomes to a Medicare population. In addition, from the evidence submitted, we noted we were unable to determine where the study took place (that is, within the United States (U.S.) or in locations outside the U.S), which may also limit generalizability to the Medicare population. Additionally, we questioned if the short follow-up duration was sufficient to assess improvements in long-term clinical outcomes.

Furthermore, the applicant asserted that Casgevy™ significantly improves clinical outcomes relative to services or technologies previously available. Regarding the claim that Casgevy™ is the first gene therapy specifically approved for the treatment of SCD in patients 12 years and older with recurrent VOCs, the applicant claimed it was first to submit and have its BLA accepted for a genetic therapy for treatment of SCD. The applicant stated the PDUFA date for Casgevy™ was December 8, 2023, and the PDUFA date for another gene therapy for SCD was December 20, 2023, however, we note that Casgevy™ and another product were both approved on December 8, 2023, as the first gene therapies for SCD. While this claim was made in support of the assertion that Casgevy™ significantly improves clinical outcomes, we noted that the information submitted regarding PDUFA dates and FDA approvals did not appear to provide data regarding a significantly improved clinical outcome under § 412.87(b)(1)(ii)(C).

With regards to the claim that Casgevy™ is expected to avoid certain serious risks or side effects associated with approved viral-based gene therapies for SCD, the applicant cited the potential risk of insertional oncogenesis after treatment with Lyfgenia™, listed per the package insert for this other gene therapy for SCD. We noted that because clinical trials are conducted under widely varying conditions, we questioned whether adverse reaction rates observed in the clinical trials of one drug can be directly compared to rates in the clinical trials of another drug.

We also questioned if the follow-up duration for patients treated with Casgevy™ was sufficient to assess improvement in the rate of malignancy.

With regard to the claim that Casgevy™ is expected to avoid certain serious risks or side effects associated with existing potentially curative treatment options for SCD, the applicant stated that there are significant risks associated with allo-HSCT, including graft failure (up to 9 percent frequency), acute and chronic graft-versus-host disease (GVHD) (with chronic GVHD up to 18 percent frequency), severe infection, hematologic malignancy, bleeding events, and death. In contrast, the applicant claimed Casgevy™ does not require an allogeneic donor as each patient is their own donor, and therefore, does not have the risks of acute and chronic GVHD or the immunologic risks of secondary graft failure/rejection, in addition to not requiring post-transplant immunosuppressive therapies. However, we stated that we were interested in additional evidence regarding the frequency and clinical relevance of side effects such as severe infection, hematologic malignancy, bleeding events, and death for both therapies.

We invited public comments on whether Casgevy™ meets the substantial clinical improvement criterion.

Comment: A few commenters, including the applicant, stated support for approval of Casgevy™ for new technology add-on payments for the SCD indication and disagreed with CMS's concerns. A commenter stated that for beneficiaries with SCD, the available therapy of HSCT is a potentially curative treatment especially for patients with significant barriers to access such as lack of a matched sibling who could potentially serve as a donor and the potential increased risks from the side effects of stem cell transplant.

Response: We thank the commenters for their input and have taken it into consideration in determining whether Casgevy™ meets the substantial clinical improvement criterion as discussed later in this section.

Comment: In response to our concerns about the lack of any published, peer-reviewed studies that directly assessed the use of Casgevy™ within the U.S., the applicant provided

additional information from a published phase 3, single-group, open-label study by Frangoul, et al. (2024)²⁷ which assessed Casgevy™ in patients 12 to 35 years of age with SCD who had at least two severe VOCs in each of the 2 years before screening. The applicant stated that the study was conducted in both the U.S. and European Union in which a total of 44 patients received exagamglogene autotemcel, and the median follow-up was 19.3 months (range, 0.8 to 48.1). The applicant stated that of the 30 patients who had sufficient follow-up to be evaluated, 29 (97 percent; 95 percent CI, 83 to 100) were free from VOCs for at least 12 consecutive months, and all 30 (100 percent; 95 percent CI, 88 to 100) were free from hospitalizations for VOCs for at least 12 consecutive months (P<0.001 for both comparisons against the null hypothesis of a 50 percent response).

In response to our concerns about providing peer-reviewed evidence of the safety profile of Casgevy™, the applicant stated that the Frangoul, et al. (2024) study showed that the safety profile of Casgevy™ was generally consistent with that of myeloablative busulfan conditioning and autologous HSPC transplantation and that no cancers occurred. The applicant stated that, while patients treated with Casgevy™ experienced adverse effects, the adverse effects are consistent with the conditioning regimen, similar to adverse effects in autologous transplant. The applicant stated that in the CLIMB SCD-121 trial²⁸ for SCD, the most common adverse events were stomatitis (55 percent), febrile neutropenia (48 percent), platelet count decrease (48 percent), and appetite decrease (41 percent). The applicant stated that patients treated with Casgevy™ did not have any reported cases of graft-versus-host-disease (GVHD), which is a common and potentially serious side effect that can be seen in allogeneic transplant.

In response to our concern regarding oncogenesis with gene therapy, the applicant stated that the two primary potential mechanisms for oncogenesis post-treatment include a late effect of

²⁷ Frangoul H., et al. Exagamglogene Autotemcel for Severe Sickle Cell Disease, *New England Journal of Medicine*, 390, 18, (1649-1662), (2024). doi/full/10.1056/NEJMoa2309676

²⁸ Frangoul H., et al. Exagamglogene Autotemcel for Severe Sickle Cell Disease, *New England Journal of Medicine*, 390, 18, (1649-1662), (2024). doi/full/10.1056/NEJMoa2309676

alkylating chemotherapy or oncogene activation from off-target editing or insertional oncogenesis, as seen in other technologies used in treatment of SCD. In Frangoul, et al. (2024) no off-target editing was found through multiple orthogonal approaches. The applicant clarified, however, that alkylating agents generally require 5 to 7 years before secondary malignancies occur, and although off-target genome editing was not observed in the edited CD34+ cells evaluated from healthy donors and patients, the risk of unintended, off-target editing in an individual's CD34+ cells cannot be ruled out due to genetic variants and therefore, the clinical significance of potential off-target editing is unknown. The applicant further stated that longest follow-up in both the CLIMB SCD-121 and CLIMB THAL-111 trials has surpassed 4 years, and stated that it will continue to follow study patients for up to 15 years. The applicant further asserted that due to Casgevy™'s mechanism of action, which does not employ a viral vector and does not insert a transgene, insertional oncogenesis by definition cannot occur.

In response to our concerns about sample size, the applicant stated its belief that the study sample sizes are appropriate. The applicant stated that SCD affects an estimated 100,000 Americans and that the sample size of the studies reflects the challenges associated with enrolling larger studies for rare conditions, as well as significant challenges in conducting larger studies for autologous gene therapy that must be individualized to each patient.

In response to our concern about the generalizability of the evidence to the Medicare population, the applicant commented that it believed the study population reflects the patient population for these medical conditions, including Medicare-covered patients who, as noted, may be dually eligible for Medicare and Medicaid (and thus often not over the age of 65). The commenter also stated that, as noted in the CMS SCD Action Plan²⁹, 11 percent of patients with SCD are enrolled in Medicare. The applicant stated that the CLIMB-121's study population is generalizable as it included patients aged 12-35, reflective of dual Medicare and Medicaid-

²⁹ Centers for Medicare & Medicaid Services. CMS Sickle Cell Disease Action Plan. <https://www.cms.gov/files/document/sickle-cell-disease-action-plan.pdf> (September 2023).

eligible populations. The applicant stated that CMS has previously shared SCD prevalence data, indicating that more than 70 percent of Medicare fee-for-service beneficiaries with SCD are dual eligibles and more than 80 percent of these beneficiaries with SCD are covered under Medicare through disability insurance benefits.

Response: We thank the applicant for the additional information and have taken it into consideration in determining whether Casgevy™ meets the substantial clinical improvement criterion, discussed later in this section.

Comment: A commenter, who is the manufacturer of Lyfgenia™, stated that it was not possible to make direct comparisons between the safety or efficacy of Casgevy™ and Lyfgenia™. The commenter stated that while Lyfgenia™’s prescribing information includes a warning as to the potential risk of insertional oncogenesis after treatment, there have been no cases of insertional oncogenesis nor any positive results for replication competent lentivirus observed³⁰ across the utilization of the BB305 vector across all clinical studies. The commenter also cited the prescribing information for Casgevy™ stating: “[a]lthough not observed in healthy donors and patients, the risk of unintended, off-target editing in CD34+ cells due to uncommon genetic variants cannot be ruled out.” The commenter further stated that although no cases of insertional oncogenesis have been observed with BB305 across the clinical program, two cases of acute myeloid leukemia were observed in patients treated with an earlier version of Lyfgenia™ using a different manufacturing process and transplant procedure, and that patients treated with Lyfgenia™ may develop hematologic malignancies and should have lifelong monitoring.

Response: We thank the applicant and other commenters for their comments regarding the substantial clinical improvement criterion. Based on the additional information received, we agree with the applicant that Casgevy™ represents a substantial clinical improvement over existing technologies because Casgevy™ offers a treatment option for certain patients with SCD

³⁰ Kanter J, et al. 2023.

who are not eligible for bone marrow transplant due to a lack of HLA matching and who experience recurrent VOs and have not been able to achieve adequate control of the condition with existing treatments such as hydroxyurea.

After consideration of the public comments and the information included in the applicant's new technology add-on payment application, we have determined that Casgevy™ for the indication of SCD meets the criteria for approval for new technology add-on payment. Therefore, we are approving new technology add-on payments for this technology for SCD for FY 2025.

Cases involving the use of Casgevy™ for the indication of SCD that are eligible for new technology add-on payments will be identified by ICD-10-PCS codes: XW133J8 (Transfusion of exagamglogene autotemcel into peripheral vein, percutaneous approach, new technology group 8) or XW143J8 (Transfusion of exagamglogene autotemcel into central vein, percutaneous approach, new technology group 8) in combination with one of the following ICD-10-CM codes: D57.1 (Sickle-cell disease without crisis), D57.20 (Sickle-cell/Hb-C disease without crisis), D57.40 (Sickle-cell thalassemia without crisis), D57.42 (Sickle-cell thalassemia beta zero without crisis), D57.44 (Sickle-cell thalassemia beta plus without crisis), or D57.80 (Other sickle-cell disorders without crisis).

In its application, the applicant estimated that the cost of Casgevy™ is \$2,200,000 per patient. As discussed in section II.E.10 of the preamble of this final rule, we are revising the maximum new technology add-on payment percentage to 75 percent, for a medical product that is a gene therapy that is indicated and used specifically for the treatment of SCD and approved for new technology add-on payments for the treatment of SCD in the FY 2025 IPPS/LTCH PPS final rule. Accordingly, under § 412.88(a)(2) as revised in this final rule, we limit new technology add-on payments to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS-DRG payment for the case. As a result, the

maximum new technology add-on payment for a case involving the use of Casgevy™ for the treatment of SCD is \$1,650,000 for FY 2025.

b. Casgevy™ (exagamglogene autotemcel) Second Indication: Transfusion-Dependent β -Thalassemia (TDT)

Vertex Pharmaceuticals, Inc. submitted an application for new technology add-on payments for Casgevy™ for FY 2025 for TDT. According to the applicant, Casgevy™ is a one-time, clustered regularly interspaced short palindromic repeats (CRISPR)/CRISPR-associated protein 9 (Cas9) modified autologous cluster of differentiation (CD)34+ hematopoietic stem & progenitor cell (HSPC) cellular therapy indicated for the treatment of TDT in patients 12 years of age or older. Per the applicant, using a CRISPR/Cas9 gene editing technique, the patient's CD34+ HSPCs are edited ex vivo via Cas9, a nuclease enzyme that uses a highly-specific guide ribonucleic acid (gRNA), at the critical transcription factor binding site GATA1 in the erythroid specific enhancer region of the B-cell lymphoma/leukemia 11A (BCL11A) gene. According to the applicant, as a result of the editing, GATA1 binding is irreversibly disrupted, and BCL11A expression is reduced, resulting in an increased production of fetal hemoglobin (HbF). As stated by the applicant, this increase in HbF recapitulates a naturally occurring, clinically benign condition called hereditary persistence of fetal hemoglobin (HPFH). The applicant stated that as a result, Casgevy™ infusion induces increased HbF production in TDT patients so that circulating red blood cells (RBC) exhibit nearly 100 percent HbF, eliminating the need for RBC transfusions. As previously discussed earlier in this section, the applicant is also seeking new technology add-on payments for Casgevy™ for FY 2025 for use in treating SCD.

Please refer to the online application posting for Casgevy™, available at <https://mearis.cms.gov/public/publications/ntap/NTP2310171VPTU>, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, Casgevy™ was granted BLA approval from FDA on January 16, 2024, for the treatment of TDT in patients 12 years of

age and older. The applicant also explained that the minimum dosage of Casgevy™ is 3×10^6 CD34+ cells per kg of patient's weight. A single dose of Casgevy™ is supplied in one or more vials, with each vial containing 4 to 13×10^6 cells/mL suspended in 1.5 to 20 mL of cryo-preservative medium.

Effective April 1, 2023, the following ICD–10–PCS codes may be used to uniquely describe procedures involving the use of Casgevy™: XW133J8 (Transfusion of exagamglogene autotemcel into peripheral vein, percutaneous approach, new technology group 8) and XW143J8 (Transfusion of exagamglogene autotemcel into central vein, percutaneous approach, new technology group 8). The applicant provided a list of diagnosis codes that may be used to currently identify this indication for Casgevy™ under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36036), we stated our belief that the relevant ICD-10-CM codes to identify the indication of TDT would be: D56.1 (Beta thalassemia), D56.2 (Delta-beta thalassemia), or D56.5 (Hemoglobin E-beta thalassemia). We invited public comments on the use of these ICD-10-CM diagnosis codes to identify the indication of TDT for purposes of the new technology add-on payment, if approved.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered “new” for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that Casgevy™ is not substantially similar to other currently available technologies because Casgevy™ is the first approved therapy to use CRISPR gene editing as its mechanism of action, and therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting

for Casgevy™ for the applicant’s complete statements in support of its assertion that Casgevy™ is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
<p>Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?</p>	<p>No</p>	<p>Casgevy™ is the first technology to use the CRISPR/Cas9 gene editing mechanism of action. No other approved technologies use this mechanism of action, and CRISPR technology has never previously been used in humans outside of clinical trials. Casgevy™ is a one-time treatment that uses ex vivo non-viral CRISPR/Cas9 to precisely edit the erythroid-specific enhancer region of BCL11A in CD34+ HSPCs. The technology consists of the Cas9 nuclease and single guide RNA (sgRNA), which together form a ribonucleoprotein (RNP) complex. The Cas9/sgRNA complex binds DNA at a precise location, and Cas9 cuts the DNA strand, generating a DNA double-stranded break. Naturally occurring DNA repair systems are activated to resolve the double-strand break. These changes in the target DNA sequence suppress the BCL11A gene and reactivate production of HbF. While other therapeutic approaches such as Hydroxyurea impact production of HbF, no other approved technology has been able to reactivate production of endogenous HbF to levels known to eliminate disease complications (for example, transfusion dependence), consistent with individuals with a clinically benign condition called HPFH who experience no or minimal disease complications from TDT when they co-inherit both HPFH and TDT. There is a currently approved viral-based gene therapy for treatment of adult and pediatric patients with β-thalassemia who require regular RBC transfusions; however, this gene therapy, Zynteglo™ (betibeglogene autotemcel), utilizes a different mechanism of action, using a different technology called gene transfer to use a modified, inert lentivirus to add working exogenous copies of the beta-globin gene to increase functional hemoglobin A.</p>
<p>Is the technology assigned to the same MS-DRG as existing technologies?</p>	<p>Yes</p>	<p>In the FY 2024 IPPS final rule, CMS finalized assignment of the ICD-10-PCS codes (XW133J8 and XW143J8) describing the transfusion of exa-cel to MS-DRGs 016 and 017. MS-DRGs 016 and 017 are also currently used for autologous stem-cell transplants—but not allogeneic stem cell transplants currently used in the treatment of TDT. Allogeneic stem cell transplants are reimbursed on a reasonable cost basis by operation of section 1886(d)(5)(M) of the Act.</p>
<p>Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?</p>	<p>Yes</p>	<p>Casgevy™ is the first therapy to use the CRISPR/Cas9 gene editing mechanism of action. No other approved single product would act as a stand-alone one-time treatment intended permanently to address the root cause of both SCD and TDT.</p>

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36037), we questioned whether Casgevy™ may be the same or similar to other gene therapies used to treat TDT, specifically Zynteglo™, which was approved for treatment of TDT on August 17, 2022. Casgevy™ and Zynteglo™ are both gene therapies using modified autologous CD34+ HSPC therapies administered via stem cell transplantation for the treatment of TDT. Both technologies are autologous, ex-vivo modified hematopoietic stem-cell biological products. For these technologies, patients are required to undergo CD34+ HSPC mobilization followed by apheresis to extract CD34+ HSPCs for manufacturing and then myeloablative conditioning using busulfan to deplete the patient's bone marrow in preparation for the technologies' modified stem cells to

engraft to the bone marrow. Once engraftment occurs, the patient's cells start to produce a different form of hemoglobin to increase total hemoglobin and reduce the need for RBC transfusions. Therefore, we noted that it appeared as if Casgevy™ and Zynteglo™ would use a similar mechanism of action to achieve a therapeutic outcome for the treatment of TDT. Further, both technologies appeared to map to the same MS-DRGs, MS-DRG 016 (Autologous Bone Marrow Transplant with CC/MCC) and 017 (Autologous Bone Marrow Transplant without CC/MCC), and to treat the same or similar disease (beta thalassemia) in the same or similar patient population (patients who require regular blood transfusions). Accordingly, we stated our belief that these technologies may be substantially similar to each other. We noted that if Casgevy™ is substantially similar to Zynteglo™ for the treatment of TDT, we believed the newness period for this technology would begin on August 17, 2022, the BLA approval date for Zynteglo™.

We invited public comments on whether Casgevy™ is substantially similar to existing technologies and whether Casgevy™ meets the newness criterion.

Comment: The applicant objected to the use of the Zynteglo™ market entry date as the start of the newness period. With respect to substantial similarity, the applicant stated that Casgevy™ is a nonviral, autologous cell therapy that is designed to reactivate fetal hemoglobin production by means of ex vivo CRISPR/Cas9 gene editing at the erythroid enhancer region of BCL11A in a patient's own hematopoietic stem and progenitor cells (HSPCs). The applicant stated that after Casgevy™ infusion, the edited CD34+ cells engraft in the bone marrow and differentiate to erythroid lineage cells with reduced BCL11A expression. The applicant stated that reduced BCL11A expression results in an increase in γ -globin expression and HbF protein production in erythroid cells. The applicant stated that in patients with TDT, γ -globin production improves the α -globin to non- α -globin imbalance thereby reducing ineffective erythropoiesis and hemolysis and increasing total hemoglobin levels, addressing the underlying cause of disease, and eliminating the dependence on regular RBC transfusions. The applicant asserted that

Casgevy™ is not similar to the current standard of care for TDT (non-curative, lifelong regular blood transfusions), nor to other technologies used in the treatment of TDT, because it relies on a completely different mechanism of action than either of these treatments and therefore, Casgevy™ satisfies the newness criterion.

Another commenter, who is the manufacturer of Zynteglo™, also stated that these technologies are not substantially similar to one another. The commenter stated the CRISPR/Cas9 gene editing technique of Casgevy™ is not substantially similar to the gene editing approach used for Zynteglo™, which works by adding functional copies of a modified form of the β^{A-T87Q} -globin gene into a patient's own HSPCs to allow them to make normal to near-normal levels of total hemoglobin without regular red blood cell transfusions.

Response: Based on our review of comments received and information submitted by the applicant as part of its FY 2025 new technology add-on payment application for Casgevy™, we agree with the applicant that Casgevy™ modifies HSPCs to stimulate production of endogenous HbF, and does not modify HSPCs to increase HbA^{T87Q} (modified adult hemoglobin) as seen with Zynteglo™, in order to increase total hemoglobin levels. Therefore, we agree with the applicant that Casgevy™ has a unique mechanism of action and is not substantially similar to existing treatment options for the treatment of TDT in patients 12 years of age and older and meets the newness criterion. We therefore consider the beginning of the newness period to commence on January 16, 2024, when Casgevy™ was granted BLA approval from FDA for the treatment of TDT in patients 12 years of age and older.

With respect to the cost criterion, the applicant searched the FY 2022 MedPAR file and provided multiple analyses to demonstrate that Casgevy™ meets the cost criterion. The applicant included two cohorts in the analyses to identify potential cases representing patients who may be eligible for Casgevy™: the first cohort included all cases in MS-DRG 014 (Allogeneic Bone Marrow Transplant) to account for the low volume of SCD or TDT cases, and the second cohort included cases in MS-DRG 014 (Allogeneic Bone Marrow Transplant) with any ICD-10-CM

diagnosis code of SCD or TDT. The applicant explained that the cost analyses for SCD and TDT were combined because the volume of cases with a sickle cell disease or beta thalassemia diagnosis code was very small, and because it believed both indications would be approved in time for new technology add-on payment. In addition, the applicant noted that when searching for cases in MS-DRG 014 with SCD or beta thalassemia diagnosis codes, there were no beta thalassemia cases. The applicant noted that cases included in the analysis may not be a completely accurate representation of cases that will be eligible for Casgevy™ but that the analyses were provided in recognition of the low volume of cases.

The applicant performed two analyses for each cohort: one with all prior drug charges maintained, representing a scenario in which there is no change to patient drug regimen with the use of Casgevy™; and the other with all prior drug charges removed, representing a scenario in which no ancillary drugs are used in the treatment of Casgevy™ patients. Per the applicant, this was done because some patients receiving Casgevy™ could receive fewer ancillary drugs during the inpatient stay, but it was difficult to know with certainty whether this would be the case or to identify the exact differences in drug regimens between patients receiving Casgevy™ and those receiving allogeneic bone marrow transplants. The applicant noted the analyses with drug charges removed were likely an over-estimation of the ancillary drug charges that would be removed in cases involving the use of Casgevy™, but these were provided as sensitivity analyses.

According to the applicant, eligible cases for Casgevy™ will be mapped to either Pre-MDC MS-DRG 016 (Autologous Bone Marrow Transplant with CC/MCC) or Pre-MDC MS-DRG 017 (Autologous Bone Marrow Transplant without CC/MCC), depending on whether complications or comorbidities (CCs) or major complications or comorbidities (MCCs) are present. For each analysis, the applicant used the FY 2025 new technology add-on payment threshold for Pre-MDC MS-DRG 016 for all identified cases, because it was typically higher

than the threshold for Pre-MDC MS-DRG 017. Each analysis followed the order of operations described in the table later in this section.

For the first cohort, the applicant included all cases associated with MS-DRG 014 (Allogeneic Bone Marrow Transplant). The applicant used the inclusion/exclusion criteria described in the following table and identified 996 claims mapping to MS-DRG 014. With all prior drug charges maintained (Scenario 1), the applicant calculated a final inflated average case-weighted standardized charge per case of \$12,325,062, which exceeded the average case-weighted threshold amount of \$182,491. With all prior drug charges removed (Scenario 2), the applicant calculated a final inflated average case-weighted standardized charge per case of \$12,181,526, which exceeded the average case-weighted threshold amount of \$182,491.

For the second cohort, the applicant searched for cases within MS-DRG 014 (Allogeneic Bone Marrow Transplant) with any ICD-10-CM diagnosis codes representing SCD or TDT. The applicant used the inclusion/exclusion criteria described in the following table and identified 11 claims mapping to MS-DRG 014 (Allogeneic Bone Marrow Transplant). With all prior drug charges maintained (Scenario 3), the applicant calculated a final inflated average case-weighted standardized charge per case of \$12,125,212, which exceeded the average case-weighted threshold amount of \$182,491. With all prior drug charges removed (Scenario 4), the applicant calculated a final inflated average case-weighted standardized charge per case of \$12,086,551, which exceeded the average case-weighted threshold amount of \$182,491.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that Casgevy™ meets the cost criterion.

CASGEVY™ COST ANALYSIS³¹	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	For the list of ICD-10-CM codes, see the online posting for Casgevy™.
List of MS-DRGs	014 (Allogeneic Bone Marrow Transplant with CC/MCC)

³¹ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

Inclusion/exclusion criteria	Cohort 1: The applicant included all cases assigned to MS-DRG 014 (Allogeneic Bone Marrow Transplant). Cohort 2: The applicant searched for cases within MS-DRG 014 (Allogeneic Bone Marrow Transplant) with any ICD-10-CM diagnosis codes representing SCD or TDT using the codes listed in the online posting for Casgevy™.
Charges removed for prior technology	Scenarios 1 and 3 (the first scenario of each cohort): The applicant removed 100% of charges associated with allogeneic bone marrow transplants, as treatment with Casgevy™ would eliminate the need for an allogeneic hematopoietic stem cell transplant (allo-HSCT). The applicant did not remove any indirect charges related to ancillary drugs. Scenarios 2 and 4 (the second scenario of each cohort): The applicant removed 100% of charges associated with allogeneic bone marrow transplants, as treatment with Casgevy™ would eliminate the need for an allo-HSCT. The applicant removed all indirect charges related to ancillary drugs.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2024 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 11.9% to the standardized charges, based on the two-year inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.184 for drugs from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36039), we invited public comments on whether Casgevy™ meets the cost criterion.

Comment: The applicant reiterated that the cost criterion analyses submitted with the application demonstrate that Casgevy™ meets the cost criterion.

Response: We thank the applicant for its comments. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios. Therefore, Casgevy™ meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that Casgevy™ represents a substantial clinical improvement over existing technologies because it is expected to avoid certain serious risks or side effects associated with the existing approved gene therapy for TDT, Zynteglo™. The applicant provided one study to support these claims, as well as two package inserts.³² The following table summarizes the applicant’s assertion regarding the substantial clinical improvement criterion. Please see the online posting for Casgevy™ for the applicant’s complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

Substantial Clinical Improvement Assertion #1: The technology significantly improves clinical outcomes relative to services or technologies previously available.
--

³² Background articles are not included in the following table but can be accessed via the online posting for the technology.

Applicant statements in support	Supporting evidence provided by the applicant
<p>Casgevy™ is expected to avoid certain serious risks or side effects associated with approved viral-based gene therapies for TDT.</p>	<p>CASGEVY (exagamglogene autotemcel) [package insert]. Boston, MA: Vertex Pharmaceuticals, Inc.; 2023.</p> <p>Locatelli F, et al. Presented at the 28th Annual European Hematology Association; 11 June 2023.</p> <p>The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.</p>

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36039), after reviewing the information provided by the applicant, we stated we had the following concerns regarding whether Casgevy™ meets the substantial clinical improvement criterion. We noted that the provided evidence did not include any peer-reviewed literature that directly assessed the use of Casgevy™ for TDT. We noted that the only assessment of the technology submitted was from a conference presentation³³ that provided data on the CLIMB-111 trial, an ongoing phase 1/2/3 single-arm trial assessing a single dose of Casgevy™ in patients 12 to 35 years old with TDT. The data submitted by the applicant indicated that 48 participants aged 12 to 35 years received Casgevy™ for TDT, of which only 27 participants were evaluable for the primary and key secondary endpoints because they were followed for at least 16 months (up to 43.7 months) after Casgevy™ infusion. Per the applicant’s conference presentation, 88.9 percent of participants achieved both the primary efficacy endpoint (transfusion independence for 12 consecutive months while maintaining a weighted average hemoglobin of at least 9 g/dL) and the key secondary efficacy endpoint (transfusion independence for 6 consecutive months while maintaining a weighted average hemoglobin of at least 9 g/dL). The applicant noted that two patients had serious adverse events related to Casgevy™. Due to the small study population and the median age of participants in the study, we questioned if these study outcomes would be generalizable to a Medicare population. In addition, from the evidence submitted, we stated we were also unable to determine where the study took place (that is, within the U.S. or in locations outside the U.S), which may also limit generalizability to the Medicare population. We also

³³ Locatelli F, et al. Presented at the 28th Annual European Hematology Association; 11 June 2023.

questioned if the short follow-up duration was sufficient to assess improvements in long-term clinical outcomes.

Furthermore, we stated that with regard to the claim that Casgevy™ is expected to avoid certain serious risks or side effects associated with approved viral-based gene therapies for TDT, the applicant stated that Zynteglo™ utilizes gene transfer to use a modified, inert lentivirus to add working exogenous copies of the β -globin gene to increase functional hemoglobin A; due to this mechanism of action and the semi-random nature of viral integration, the applicant stated that treatment with Zynteglo™ carries the risk of lentiviral vector (LVV)-mediated insertional oncogenesis after treatment. The applicant explained that Casgevy™ is an autologous ex-vivo modified hematopoietic stem-cell biological product which uses a non-viral mechanism of action (CRISPR/Cas9 gene editing), and therefore, this technology does not carry a risk for insertional oncogenesis. The applicant also noted that gene editing approaches, including CRISPR/Cas9, have the potential to produce off-target edits, but in trials to date, off-target gene editing has not been observed in the edited CD34+ cells from healthy donors or patients. We noted that we were unclear regarding the frequency and related clinical relevance of LVV-mediated oncogenesis, and we questioned if the follow-up duration for patients treated with Casgevy™ was sufficient to assess improvement in the rate of malignancy. We also noted we were interested in more information on the overall safety profile comparison between Casgevy™ and Zynteglo™, as well as any comparisons of Casgevy™ to another potentially curative treatment, allogeneic hematopoietic stem cell transplant for patients with TDT.

We invited public comments on whether Casgevy™ meets the substantial clinical improvement criterion.

Comment: A few commenters, including the applicant, stated support for approval of Casgevy™ for new technology add-on payments for the TDT indication. A commenter further stated that it disagreed with CMS's concerns because for patients with TDT, available treatments have historically included regular blood transfusions or transplantation of bone marrow, options

that present significant risk and complications; in the young population, bone marrow transplant results in a 23% rejection rate, which can ultimately become fatal. The commenter stated that for a large number of patients with TDT, a gene therapy is the only transformative, durable, and potentially curative treatment option and thus, represents a substantial improvement.

The applicant submitted a public comment regarding the substantial clinical improvement criterion. The applicant stated that following its application submission, additional data were published in the peer-reviewed New England Journal of Medicine for the TDT therapy indication which provides further support for why Casgevy™ satisfies the substantial clinical improvement criterion, as well as further evidence of safety and effectiveness and the transformative potential of Casgevy™ to treat TDT. The applicant stated that in Locatelli, et al. (2024), the authors directly assessed the use of Casgevy™ for TDT in a phase 3, single-group, open-label study (CLIMB THAL-111) in patients 12 to 35 years of age with TDT and a β^0 / β^0 , β^0 / β^0 -like, or non- β^0 / β^0 – like genotype. The applicant stated that the study showed a total of 52 patients with TDT received exagamglogene-autotemcel and were included in this prespecified interim analysis; the median follow-up was 20.4 months (range, 2.1 to 48.1) and neutrophils and platelets were engrafted in each patient. Among the 35 patients with sufficient follow-up data for evaluation, transfusion independence occurred in 32 patients (91 percent; 95 percent confidence interval, 77 to 98; $P < 0.001$ against the null hypothesis of a 50 percent response). During transfusion independence, the mean total hemoglobin level was 13.1 g per deciliter and the mean HbF level was 11.9 g per deciliter, and HbF had a pancellular distribution (≥ 94 percent of red cells). The authors of the study reported that the safety profile of Casgevy™ was generally consistent with that of myeloablative busulfan conditioning and autologous HSCT transplantation and no deaths or cancers occurred.

The applicant also stated that the study population from the CLIMB THAL-111 trial was generalizable to the Medicare population, stating that Casgevy™ was studied in trials conducted in the United States and the European Union. The applicant stated that the sample size for the

studies were appropriate because TDT is a rare medical condition, and impacts only an estimated 1,000 to 1,500 Americans. The applicant stated that sample sizes of the studies involving Casgevy™ are reflective of the challenges associated with enrolling larger studies for rare conditions, as well as significant challenges in conducting larger studies for an autologous gene therapy that must be individualized to each patient. The applicant stated its belief that the study populations are reflective of the patient population for these conditions, including Medicare covered populations who will often be dual eligible (and thus often not over age 65).

The applicant stated that peer-reviewed data demonstrates the well-tolerated safety profile of Casgevy™ for TDT. The applicant stated that while patients treated with Casgevy™ experienced adverse effects, the adverse effects are consistent with the conditioning regimen, similar to adverse effects in autologous transplant. The applicant stated that in the CLIMB THAL-111 trial for TDT, the most common adverse events were febrile neutropenia (54 percent), stomatitis (40 percent), anemia (38 percent), and thrombocytopenia (35 percent), and that the patients treated with Casgevy™ did not have any reported cases of graft-versus-host-disease (GVHD), which is a common and potentially serious side effect associated with allogeneic stem cell transplant.

The applicant stated that with respect to CMS's question about the length of the follow-up durations being studied, a long-term follow-up study is also continuing to monitor total and fetal hemoglobin levels and safety, including (but not limited to) the potential for secondary cancers, vaso-occlusive events, and markers of end-organ damage in patients who have completed the current study (CLIMB-131; NCT04208529); other studies are being conducted to assess the risk of secondary cancers and off-target effects after genome editing.

In response to CMS's concern regarding oncogenesis with gene therapy, the applicant noted that the two primary potential mechanisms for oncogenesis post-treatment include a late effect of alkylating chemotherapy or oncogene activation from off-target editing or insertional oncogenesis, as seen in other technologies used in treatment of TDT. The applicant stated in

newly published peer-reviewed research in *New England Journal of Medicine*³⁴, no off-target editing was found through multiple orthogonal approaches, but that alkylating agents, however, generally require five to seven years before secondary malignancies occur. The applicant stated that the longest follow-up in the CLIMB THAL-111 trial had surpassed four years, and that it would continue to follow study patients for up to 15 years.

In response to CMS's concern regarding whether variations in clinical trial conditions allows for adequate comparison of adverse event rates between clinical trials with respect to the applicant's claim that Casgevy™ is expected to avoid potential risk associated with other technologies and allogenic bone marrow transplant procedures used in treatment of TDT, the applicant noted that the adverse event profile for Casgevy™ in TDT is consistent with busulfan myeloablative conditioning and HSPC transplant. The applicant further stated that the Casgevy™'s mechanism of action does not employ a viral vector and does not insert a transgene, and therefore, insertional oncogenesis, a documented risk found in FDA-approved labeling for other viral-based technologies used in the treatment of TDT, by definition, cannot occur as a matter of scientific principle. The applicant further stated that although off-target genome editing was not observed in the edited CD34+ cells evaluated from healthy donors and patients, or in clinical trials to date, the risk of unintended, off-target editing in an individual's CD34+ cells cannot be ruled out due to genetic variants. In addition, the applicant stated that the clinical significance of potential off-target editing is unknown. The applicant stated that as an autologous therapy, which is manufactured from the patient's own HSPCs, which are modified with CRISPR/Cas9 gene editing technology and administered to the patient, there is no risk of GVHD or graft rejection, nor a need for immunosuppressive drugs, because the drug product is based on the patient's own cells and, according to the applicant, this is supported by clinical data generated to date in the CLIMB SCD-121 and CLIMB THAL-111 study, in which no GVHD or graft

³⁴ Frangoul H., et al. Exagamglogene Autotemcel for Severe Sickle Cell Disease. *N Eng J Med*. 2024;390:1649-62. doi/full/10.1056/NEJMoa2309676

rejection/failure were observed. The applicant further stated that there are no clinical studies which exist to compare Casgevy™ to other technologies and therefore, no comparisons or conclusions of comparable safety or efficacy can be made.

Another commenter, the manufacturer of Zynteglo™, commented on CMS's request for more information on the overall safety profile comparison between Casgevy™ and Zynteglo™ with regard to the applicant's claim that Casgevy™ is expected to avoid certain serious risks or side effects associated with approved viral-based gene therapies for TDT. The commenter stated that while the Warnings and Precautions section of the Zynteglo™ package insert includes a warning as to the potential risk of insertional oncogenesis after treatment with Zynteglo™, there have been no cases of insertional oncogenesis nor any positive results for replication competent lentivirus observed across the utilization of the BB305 vector across all clinical studies.

Response: We thank the applicant and commenters for the additional information. After further review, we continue to have concerns as to whether Casgevy™ meets the substantial clinical improvement criterion. We continue to question whether there is evidence to demonstrate that Casgevy™ improves clinical outcomes relative to existing technologies because of the lack of comparison to allo-HSCT and Zynteglo™, both of which are previously existing standard of care and potentially curative treatment options for this indication, and which treat the same condition in the same patient population. Without a comparison of outcomes between these existing therapies for TDT, we are unable to make a determination as to whether the technology significantly improves clinical outcomes relative to services or technologies previously available, as asserted by the applicant. We further note that the applicant's only assertion regarding whether Casgevy™ improves clinical outcomes for TDT was regarding the avoidance of a potential risk of a single side effect, and as a commenter stated, there have been no cases of insertional oncogenesis nor any positive results for replication competent lentivirus observed across the utilization of the BB305 vector across all clinical studies. We remain unclear how the provided evidence supports this claim, given that the applicant did not provide any evidence of

this potential side effect occurring with use of the comparator technology. We continue to question if the follow-up duration for TDT patients treated with Casgevy™ is sufficient to adequately support the applicant's single claim, given the lack of existing data presented to assess improvement in long-term clinical outcomes and reduction in clinically significant adverse events, such as the rate of malignancy, compared with existing treatments, especially given the risk of potential unintended off-target editing remains unknown.

After review of the information submitted by the applicant as part of its FY 2025 new technology add-on payment application for Casgevy™ for TDT and consideration of the comments received, we are unable to determine that Casgevy™ for TDT meets the substantial clinical improvement criterion to be approved for new technology add-on payments for the reasons discussed in the proposed rule and in this final rule, and therefore, we are not approving new technology add-on payments for Casgevy™ for TDT for FY 2025.

c. DuraGraft® (vascular conduit solution)

Marizyme, Inc. submitted an application for new technology add-on payments for DuraGraft® for FY 2025. According to the applicant, DuraGraft® is an intraoperative vein-graft preservation solution used during the harvesting and grafting interval during coronary artery bypass graft (CABG) surgery. The applicant stated that the use of DuraGraft® does not change clinical/surgical practice; it replaces solutions currently used for flushing and storage of the saphenous vein grafts (SVG) from harvesting through grafting, including tests for graft leakage. As noted in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26795), Somahlution, Inc., acquired by Marizyme in 2020,³⁵ submitted and withdrew applications for new technology add-on payments for DuraGraft® for FY 2018 and FY 2019. The applicant also submitted an application for new technology add-on payments for FY 2020, as summarized in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19305 through 19312), that it withdrew prior to the

³⁵ NASDAQ. Marizyme, Inc. Completes Acquisition of Somahlution, Inc. and Raises \$7.0 Million in Private Placement | Nasdaq (accessed 1/ 23/2023).

issuance of the FY 2020 IPPS/LTCH PPS final rule (84 FR 42180). We note that the applicant also submitted an application for new technology add-on payments for FY 2024, as summarized in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26795 through 26803), that it withdrew prior to the issuance of the FY 2024 IPPS/LTCH PPS final rule (88 FR 58804).

Please refer to the online application posting for DuraGraft[®], available at <https://mearis.cms.gov/public/publications/ntap/NTP231012EE9NW>, for additional detail describing the technology and intraoperative ischemic injury.

With respect to the newness criterion, according to the applicant, DuraGraft[®] was granted De Novo classification from FDA on October 4, 2023, for adult patients undergoing CABG surgeries and is intended for flushing and storage of SVGs from harvesting through grafting for up to 4 hours. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36040), we noted that, per the applicant, DuraGraft[®] was not yet commercially available due to a delay related to finalizing the label prior to manufacturing.

The applicant stated that, effective October 1, 2017, the following ICD-10-PCS code may be used to uniquely describe procedures involving the use of DuraGraft[®]: XY0VX83 (Extracorporeal introduction of endothelial damage inhibitor to vein graft, new technology group 3). Please refer to the online application posting for the complete list of ICD-10-CM and -PCS codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered “new” for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that DuraGraft[®] is not substantially similar to other currently available technologies because DuraGraft[®] is a first-in-class product as a storage and flushing solution for vascular grafts used during CABG surgery and the components of DuraGraft[®] directly interfere with the mechanisms of oxidative damage,

and that therefore, the technology meets the newness criterion. The following table summarizes the applicant’s assertions regarding the substantial similarity criteria. Please see the online application posting for DuraGraft® for the applicant’s complete statements in support of its assertion that DuraGraft® is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	DuraGraft® is a first-in-class product and there is no product that is similar. Common storage solutions are only salt solutions and have no ability to protect against oxidative damage and metabolic stress, which are the primary mechanisms associated with ischemic injury. They are used to keep the graft wet. DuraGraft® has been formulated into a wetting solution. DuraGraft® treatment is associated with a reduction in both vein graft disease and clinical complications associated with vein graft failure post-CABG. There are currently no commercial products that prevent ischemic injury of vein grafts during CABG surgery or products that reduce vein graft disease or its complications following CABG surgery.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	MS-DRGs used during CABG surgery are aligned to the same MS-DRGs for which DuraGraft® use is indicated.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	Yes	DuraGraft® is used in the CABG patient population.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36040), we stated that in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26796), we expressed concern that the mechanism of action of DuraGraft® may be the same or similar to other vein graft storage solutions. Similarly, we noted that, according to the applicant, DuraGraft® prevents intraoperative ischemic injury to the endothelial layer of free vascular grafts, reducing the risks for post-CABG vein graft disease and graft failure, which are clinical manifestations of graft ischemia reperfusion injury (IRI), and we questioned whether DuraGraft® might have a similar mechanism of action as existing treatments for preventing ischemic injury of vein grafts during CABG surgery and reducing vein graft disease or its complications following CABG surgery. We invited public comments on whether DuraGraft® is substantially similar to existing technologies and whether DuraGraft® meets the newness criterion.

Comment: The applicant stated that the mechanism of action of DuraGraft® is not substantially similar to other products on the market. The applicant asserted that by FDA definition of a de novo request, there are no other legally marketed treatments or products

intended for treating or storing vascular grafts and that the technology has a novel intended use. Therefore, the applicant believed that DuraGraft® met the newness criterion because there no other legally marketed graft storage solutions on the market, there are no other products of this type with FDA market authorization, and that it has a novel intended use according to FDA.

With respect to CMS's concern regarding existing treatments for preventing ischemic injury of vein grafts during CABG surgery, the applicant stated that is not clear which treatments CMS is referring to as there are no legally marketed treatments or products intended for treating or storing vascular grafts besides DuraGraft®. The applicant further stated that while vascular grafts are placed in a liquid, usually Ringers Lactate, Plasmalyte or Normosol, to keep them from drying out between harvesting and implantation, in no way should these liquids be compared to or considered similar to DuraGraft®. The applicant also stated that these liquids cannot prevent ischemic or oxidative damage to vascular grafts. The applicant provided a table showing the components of competing wetting solutions to demonstrate that the solutions do not have the same molecules needed to prevent oxidative damage as DuraGraft®. The applicant stated that on the other hand, the mechanism of action of DuraGraft® as stated in the Instructions for Use (IFU) is through reduction of oxidative damage to maintain the structural and functional integrity of vascular conduits. The applicant asserted that Duragraft®'s primary function is to provide a reducing environment for vascular grafts to prevent oxidative damage which occurs during ischemic storage of grafts, using a combination of L-glutathione and L-Ascorbic acid that is manufactured in such a way as to preserve these molecules in their reduced state. The applicant concluded that, based upon composition, the stated mechanism of action, and preclinical evidence showing maintenance of the graft's structural and functional integrity provided on the DuraGraft® label, there are no similar products.

The applicant also stated that DuraGraft® is considered the first product of its type by FDA. Additionally, the applicant stated that in 2018, CMS established a new ICD-10-PCS code, XYOVX83 (Extracorporeal introduction of endothelial damage inhibitor to vein graft, new

technology group 3), to report DuraGraft® when used in CABG procedures. The applicant stated that this ICD-10-PCS code would not be used with other procedures, outside of a few isolated instances. The applicant stated that claims submitted with this ICD-10-PCS code would be in error as DuraGraft® was not authorized or commercialized in the United States prior to October 2023.

A few commenters submitted comments stating that the mechanism of action is not substantially similar to existing technologies and that DuraGraft® has a novel mechanism of action in preventing oxidative damage to prevent ischemic injury and subsequent Ischemic Reperfusion Injury (IRI).

One commenter stated that they remained concerned that the information provided by the applicant does not show that DuraGraft® meets the newness criterion.

Response: We thank the applicant and the commenters for their comments. Based on our review of comments received and information submitted by the applicant as part of its FY 2025 new technology add-on payment application for DuraGraft®, we agree with the applicant and some of the commenters that DuraGraft® has a unique mechanism of action compared to other vein graft storage solutions because it creates a reducing environment for vascular grafts to prevent oxidative damage which occurs during ischemic storage of grafts. Therefore, we agree with the applicant that DuraGraft® is not substantially similar to existing treatment options and meets the newness criterion.

Comment: In response to our note in the proposed rule that DuraGraft® was not commercially available, the applicant responded that DuraGraft® is not yet commercially available but is expected to be available near the end of the second quarter of 2024.

Response: We thank the applicant for their response. As discussed in prior rulemaking (86 FR 45132; 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the US market. At this time, as there is not sufficient information to determine a newness date based on a

documented delay in the technology’s availability on the U.S. market, we consider the newness date for this technology to be October 4, 2023, the date it was granted De Novo classification from FDA.

With respect to the cost criterion, to identify potential cases representing patients who may be eligible for DuraGraft®, the applicant searched the FY 2022 MedPAR file for cases reporting a combination of ICD-10-CM/PCS codes that represent patients who underwent CABG procedures. Please see the online posting for DuraGraft® for a complete list of MS-DRGs and ICD-10-CM and -PCS codes provided by the applicant. Using the inclusion/exclusion criteria described in the following table, the applicant identified 33,511 cases mapping to 59 MS-DRGs, including MS-DRG 236 (Coronary Bypass Without Cardiac Catheterization Without MCC) representing 21.9 percent of the identified cases. The applicant followed the order of operations described in the following table and calculated a final inflated average case-weighted standardized charge per case of \$321,620, which exceeded the average case-weighted threshold amount of \$235,829. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that DuraGraft® meets the cost criterion.

DURAGRAFT® COST ANALYSIS³⁶	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	For the list of ICD-10-CM codes, see the online posting for DuraGraft®.
List of ICD-10-PCS codes	For the list of ICD-10-PCS codes, see the online posting for DuraGraft®.
List of MS-DRGs	For the list of MS-DRGs, see the online posting for DuraGraft®.
Inclusion/exclusion criteria	The applicant identified cases by using a combination of ICD-10-CM/PCS codes provided by the applicant in the online posting that represent patients who underwent CABG procedures. The applicant excluded cases with the ICD-10-PCS code XY0VX83 (Extracorporeal introduction of endothelial damage inhibitor to vein graft, new technology group 3). Per the applicant, DuraGraft® is first in class product and there is no product that is similar. The applicant stated that since DuraGraft® is the only product that is described by this code and it is not on the market yet, there is no procedure at this time for which this code should be reported.
Charges removed for prior technology	The applicant did not remove charges or indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2022 IPPS/LTCH PPS final rule and correction notice.

³⁶ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.303 for supplies and equipment from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36041), we noted the following concerns regarding the cost criterion. Although the applicant did not remove direct or indirect charges related to the prior technology, we noted that the applicant indicated that the use of DuraGraft[®] replaces solutions currently used for flushing and storage of the SVGs harvested through grafting, including tests for graft leakage, in its discussion of the newness criterion. Therefore, we questioned whether the cost criterion analysis should remove charges for related or prior technologies, such as autologous heparinized blood, Plasmalyte/Normosol, Lactated Ringers, and heparinized saline.

We invited public comments on whether DuraGraft[®] meets the cost criterion.

Comment: The applicant conducted two new cost analyses to address CMS's concerns about not removing direct or indirect charges related to prior technology. Specifically, the applicant removed 25 percent of the medical supply's charges including Plasmalyte/Noromosol, Lactated Ringers and Heparinized saline, and separately removed all blood charges. Under the first analysis, DuraGraft[®] exceeded the average case-weighted cost threshold amount by \$75,125, and under the second analysis, Duragraft[®] exceeded the average case-weighted cost threshold amount by \$85,777. The applicant stated that Duragraft[®] met the cost criterion as it exceeded the cost threshold with inclusion of the charges for related or prior technologies and when charges for the prior technologies are removed.

Response: We thank the applicant for its comments and new cost analyses. We agree that the final inflated average case-weighted standardized charges per case exceeded the average case-weighted threshold amounts. Therefore, DuraGraft[®] meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that DuraGraft[®] represents a substantial clinical improvement over existing technologies because there is no other product or technology that reduces the incidence of peri-operative myocardial

infarction. The applicant provided four studies to support this assertion, as well as 47 background articles about reducing major adverse cardiac events (MACE).³⁷ The following table summarizes the applicant’s assertions regarding the substantial clinical improvement criterion. Please see the online posting for DuraGraft® for the applicant’s complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

Substantial Clinical Improvement Assertion #1: The technology significantly improves clinical outcomes relative to services or technologies previously available.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36042 through 36043), after review of the information provided by the applicant, we stated we had the following concerns regarding whether DuraGraft® meets the substantial clinical improvement criterion. As discussed in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26800 through 26801), we expressed concern regarding the relatively small sample sizes of the Szalkiewicz, et al. (2022)³⁸ and Perrault, et al. (2021)³⁹ studies, as compared to the number of potentially eligible patients for this technology, and relatively short follow-up periods. We continued to question whether the sample was representative of the number of Medicare beneficiaries potentially eligible for DuraGraft®. We referred readers to the FY 2024 IPPS/LTCH PPS proposed rule for further discussion of these concerns. We also stated that, for its FY 2025 application, the applicant also cited Lopez-Menendez, et al. (2021),⁴⁰ which we noted used a sample size of 180, and therefore we similarly questioned whether the results of this study would be replicated with a larger patient sample.

³⁸ Szalkiewicz, P, Emmert, MY, and Heinisch, PP, et al (2022). Graft Preservation confers myocardial protection during coronary artery bypass grafting. *Frontiers in Cardiovascular Medicine*, July 2022, pp 1-10. [DOI 10.3389/fcvm.2022.922357](https://doi.org/10.3389/fcvm.2022.922357)

Sequential multidetector computed tomography assessments after venous graft treatment solution in coronary artery bypass grafting. *Journal of Thoracic and Cardiovascular Surgery*. Jan. 2021, Vol. 161, Number 1, 96-106. <https://doi.org/10.1016/j.jtcvs.2019.10.115>

⁴⁰ Lopez-Menendez J, Castro-Pinto M, and Fajardo E, Miguelena J, et al. Vein graft preservation with an endothelial damage inhibitor in isolated coronary artery bypass surgery: an observational propensity score-matched analysis. *J Thorac Dis* 2023;15(10):5549-5558.

Similar to the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26800 through 26801), we also questioned whether the results from the Haime, et al. (2018)⁴¹ study could be generalized to other patient groups, including non-Veterans, women, or those from other racial or ethnic groups. We continued to question whether the demographic profiles in the Perrault, Szalkiewicz, and Haime studies that the applicant submitted were comparable with those of the U.S. Medicare patients who underwent CABG surgery. For its FY 2025 application, the applicant also cited the Lopez-Menendez, et al. (2021)⁴² study, which was based on a European patient population that was predominantly male (82 percent to 90 percent). However, as we noted in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26800 through 26801), among the Medicare fee-for-service beneficiaries who underwent CABG surgery, male patients accounted for two-thirds (66 percent) of this population. Therefore, we stated that we continued to question whether the findings of these studies would be replicable among the Medicare population.

We invited public comments on whether DuraGraft[®] meets the substantial clinical improvement criterion.

Comment: The applicant reiterated the studies provided in its application in support of substantial clinical improvement for DuraGraft[®] and stated that the FDA label for DuraGraft[®] includes the following data from the Perrault study and the Internal Study Report: DuraGraft-treated SVGs had smaller wall thickness and lesser maximum focal narrowing at 12 months versus saline controls⁴³, and reduced all-cause mortality at 3 years for Duragraft patients compared to patients who received SOC⁴⁴.

⁴¹ Haime, M, McLean RR, and Kurgansky KE, et al (2018). Relationship between intra-operative vein graft treatment with DuraGraft[®] or saline and clinical outcomes after coronary artery bypass grafting, *Expert Review of Cardiovascular Therapy*, 16:12, 963-970. DOI: [10.1080/14779072.2018.1532289](https://doi.org/10.1080/14779072.2018.1532289)

⁴³ Perrault et al.(2021) "Sequential multidetector computed tomography assessments after venous graft treatment solution in coronary artery bypass grafting" *Journal of Cardiothoracic and Cardiovascular Surgery*, 2021, Vol 161, Number 1, 96-106

⁴⁴ Internal Study Report comparing mortality over three years in patients from the DuraGraft Registry undergoing isolated CABG to three-year mortality in standard of care patients from the Society of Thoracic Surgeons (STS) Registry. The data is reported in an Internal Study Report and is expected to be published by August 2024.

In response to CMS's concerns regarding small sample sizes in the Perrault, Szalkiewicz, and Lopez-Menendez studies, the applicant stated that the sample size for the Perrault study was typical for a Class 2 medical device pivotal study under FDA, with 125 patients enrolled. The applicant stated that the study utilized a within-patient control design in that each patient received a DuraGraft® treated graft and a control graft, eliminating the need for a control group. The applicant also stated that the study was powered to observe changes in saphenous vein graft wall thickening, a surrogate endpoint in the pathophysiology of vein graft stenosis after CABG. Additionally, the applicant stated that the study, with each patient acting as their own control point, was powered to demonstrate a difference in the primary multidetector computed tomography (MDCT)-based endpoints. The applicant asserted that despite smaller sample sizes compared to those for drug studies, the size is typical for that of a medical device. Per the applicant, the study demonstrates important graft pathophysiology associated with the use of DuraGraft. The applicant further stated that the outcomes of each study are consistent with the growing body of data on DuraGraft® and is generalizable to the Medicare population. The applicant stated that the Szalkiewicz study was retrospective and powered to demonstrate the change in a surrogate endpoint of myocardial damage. The study was based on a sample size of 272 patients, with a mean age of 72 years (inter-quartile range (IQR): 62 – 75 years) in the DuraGraft® arm and 70 years (IQR: 61 – 76 years) in the control arm. The applicant stated the age is typical of CABG patients and the Medicare population. Regarding the Lopez-Menendez study, the applicant explained that this observational, prospective, single-center study had a follow-up period of 3 years and a sample size of 180 patients, 90 in the DuraGraft® arm and 90 in the control arm. The applicant stated that the study results showed a reduction of MACE in the DuraGraft® arm and, in a subset analysis, the use of DuraGraft® in diabetic patients was associated with better event-free survival. Additionally, the applicant stated that the observational study in the Marizyme internal study report had more than 5,000 patients and demonstrated DuraGraft®'s long-term treatment effects by comparing 3-year mortality from

CABG patients in the DuraGraft® registry to a propensity matched cohort from the STS registry. The applicant asserted that the overall sample size of the patients treated with DuraGraft® in these four studies was 2,700.

The applicant also commented on CMS's concerns about the differences in the distribution of demographic characteristics between the patients in the Perrault, Haime, and Szalkewicz studies and the U.S. Medicare population. To address this concern, the applicant highlighted a head-to-head comparison (described in the DuraGraft IFU) comparing CABG patients on the European DuraGraft® registry, who were exposed to DuraGraft®, to those in the U.S. STS CABG registry, who were not. The applicant stated that outcomes from patients from the European DuraGraft® Registry (n= 2522) were compared to randomly selected patients from the STS registry database in the U.S. who were operated on during the same period (n= 294,725). The applicant stated that prior to propensity score matching, women comprised only 23.9 percent of the population undergoing first-time CABG in the U.S. during the time of the study, while men made up 76.1 percent. The applicant stated that the percentages were also similar to those of Medicare beneficiaries with the top 15 DRGs associated with cardiac surgery in the CMS MedPAR file data from 2022. The applicant stated that after propensity score matching, the sex distribution of the U.S. cohort became comparable to that of the European cohort, with 82.5 percent male and 17.5 percent female. The applicant asserted that the sex distribution of the patient population in the study was similar to that of Medicare patients undergoing first time CABG procedures at the time of the study. The applicant stated that the primary endpoint for the study was mortality through 3 years of follow-up. The applicant stated that the STS database contains data through 30-days after CABG surgery, and the STS' data was merged by STS with the national Death Index, a database maintained by the National Center for Health Statistics (NCHS) which captures all death records for the U.S. and U.S. territories, allowing mortality to be assessed for most STS patients beyond 30 days. The applicant asserted that the study results demonstrated a reduced mortality estimate in DuraGraft® patients at 3 years compared to STS

patients. The applicant stated that this additional information should address CMS's concerns regarding DuraGraft® studies' applicability to the female Medicare population.

With respect to the Perrault study, the applicant stated it was a medical device study conducted with input from FDA, which involved radiologic assessment, using MDCT angiography, to evaluate graft morphology changes post-CABG comparing DuraGraft® treated grafts to saline controls. The applicant stated that some of the study results, reduction in wall thickening and reduction in maximal focal narrowing of the graft following use of DuraGraft®, have been allowed in the DuraGraft® label. The applicant stated that the study patient population was 91.2 percent male and 8.8 percent female and somewhat under-represented Medicare eligible women 8.9 percent versus 23.9 percent based on data in the STS database and CMS data for the timeframe. The applicant stated that the study still represented a study that included women, and taken together with the European DuraGraft® registry described earlier in this section, it was the applicant's conclusion that together these studies are representative of the Medicare eligible population. Additionally, the applicant stated that the average age of the patients, 66.2, was consistent with the age of a Medicare beneficiary.

With respect to the Haime study, the applicant stated that it was a single site study performed at the Boston Veterans Affairs (VA) hospital. According to the applicant, while the group was 99 percent male, the population of the VA hospitals typically represents one with elevated cardiac risk factors. The applicant stated that the characteristics of the study participants are typical for studies of CABG surgery and align with the Medicare population in terms of age, BMI, and presence of a diabetes diagnosis. The applicant stated that according to both CMS and STS data taken from the same time period in which both the Perrault and Registry comparison studies were performed, the percentage of Medicare eligible women undergoing CABG surgery ranges between 23.9 to 25.3 percent. The applicant stated that while the Perrault study included 8.9 percent women, the Registry comparison study patient population was 17.5 percent women. The applicant also stated that the percentage of women in the study reported by Lopez-Menendez

(2023) was 17.8 percent, only a few percentage points lower than the percentage of Medicare eligible women undergoing CABG surgery based on both CMS and STS data.

The applicant commented that its current data does not allow an assessment of whether race changes the effect of DuraGraft[®] and acknowledged that the race of the patients in all the DuraGraft[®] studies was predominantly Caucasian. According to the applicant, in the Marizyme internal study report, it tried to isolate population differences and eliminate possible biases by propensity score matching based on 35 variables most strongly associated with surgical risk. The applicant cited the Shahian 2012 ASCERT study⁴⁵, which identified perioperative as well as longer-term predictors of mortality post-CABG. The applicant also asserted that race and sex have been demonstrated in these multiple studies as lesser determinants of post-CABG mortality compared to other important risk factors such as age, congestive heart failure, chronic obstructive pulmonary disease, renal failure, myocardial infarction, and emergent operative status.

Another commenter cited a study by Gaudino and team (2023)⁴⁶, which examined outcomes in women undergoing CABG in the US from 2011-2020. According to the commenter, the authors of the study acknowledged that women have been chronically underrepresented in cardiology studies, but stated that there is no biological evidence for gender-based differential effect of DuraGraft[®] solution. The commenter further stated that CAD is becoming more common among women, which makes them amenable to medical and invasive treatment options, like CABG surgery. The commenter also referred to a Goldstein 2022 study⁴⁷, which examined the effects of an external saphenous vein graft support device on reducing intimal hyperplasia

and graft failure in patients undergoing CABG, and stated that 20.5 percent of the patients in that study were women.

One commenter stated that the study design for the Perrault study, in which each patient received a DuraGraft® treated graft and a control graft to control for patient-specific graft effects, obviated the need for a separate control patient cohort, thereby decreasing the sample size required for the study. The commenter asserted that the study was powered appropriately as the MDCT scanning measurements were taken every 10mm along the whole of the grafts at 1, 3, and 12 months for the endpoints of the study.

One commenter expressed concern that the data received to date did not support the substantial clinical improvement criterion for DuraGraft®.

Response: We thank the applicant and the commenters for their additional input. After review of the comments and all data received to date, we continue to have concerns that the evidence submitted does not support that the technology meets the substantial clinical improvement criterion.

We continue to question whether the patient samples in the studies provided are representative of the Medicare population, as this could impact the extent to which the results related to DuraGraft®'s effects on clinical outcomes could be generalized to the Medicare population, including those who may potentially need CABG surgery or be eligible for DuraGraft®. According to the applicant, because the matched STS cohort, with 82.5 percent males and 17.5 percent females, was equivalent to the European DuraGraft® Registry, it was very similar to the sex demographics of Medicare patients undergoing first time CABG procedures at the time of the study. However, as we noted in the FY 2024 and FY 2025 IPPS/LTCH PPS proposed rules (88 FR 26801 and 89 FR 36043), male patients accounted for only 66 percent of all CABG patients on Medicare, while women accounted for the remaining 34 percent, and statistics have shown that women tend to have poorer outcomes after CABG surgery. We are also concerned that study results, based on predominantly male and white

samples, may not be replicable among the Medicare population, especially since the proportion of racial and ethnic minorities has continued to grow, from 20.9 percent in 2008 to 27.2 percent in 2022⁴⁸. While the applicant asserted that race and sex were demonstrated in the studies provided to be lesser determinants of post-CABG mortality compared to other important risk factors, such as age, congestive heart failure, chronic obstructive pulmonary disease, renal failure, myocardial infarction (MI) and emergent operative status, the applicant also commented that these factors were not well represented in the same studies, such that it is unclear how they could be accurately demonstrated as a lower determinant of mortality. We note that the poorer clinical outcomes of female and minority CABG patients are well-documented in the literature. Compared to male CABG patients, female CABG patients had worse post-CABG outcomes, including a higher rate of unplanned readmissions within 30 or 90 days post-discharge, inpatient mortality, major cardiovascular and cerebrovascular adverse events (MACCE), like non-fatal MI, transient ischemic attack, cardiovascular-related mortality, and all-cause mortality^{49 50 51}. Compared to white CABG patients, African American CABG patients have a higher risk for poor post-CABG outcomes, like longer length of inpatient stay, MACCE, and all-cause mortality^{52 53}. Study results based on patient samples in which women or racial and ethnic

minorities were under-represented may limit our ability to generalize the findings to a population with different clinical characteristics^{54 55}.

Furthermore, we continue to have concerns about the sample sizes in some of the studies referenced. Based on the information provided, we remain unclear about how the sample sizes were calculated and the parameters used in the calculations, such as the size of the populations that the samples represented, the effect size⁵⁶, and how much of a difference in outcomes was clinically meaningful and reflected a true effect between those who were exposed to Duragraft® and those who were not⁵⁷.

As noted, the applicant stated that the Perrault study showed that DuraGraft®-treated SVGs had smaller mean wall thickness and lesser maximum focal narrowing at 12 months versus saline controls, and that these results were included in the FDA label for DuraGraft®. The applicant stated that the Perrault study was powered to observe changes in SVG wall thickening, which it stated is a surrogate endpoint in the pathophysiology of vein graft stenosis. While we acknowledge that the study demonstrated smaller wall thickness and lesser maximum focal narrowing at 12 months for DuraGraft®-treated SVGs versus saline controls, as included in the FDA label, we also agree that these are surrogate endpoints. As the study was not powered to demonstrate an improved clinical outcome as described under the regulations at 412.87(b)(1)(ii), we do not believe the inclusion of these findings from this study support a finding of substantial clinical improvement. We also note that we do not believe that the inclusion of outcomes on the FDA label by itself supports a finding of substantial clinical improvement. In addition, the Perrault study compared DuraGraft® to saline controls. However, as previously noted, there are other vein graft preservation solutions, including but not limited to Plasmalyte, Normosol,

lactated ringers, and heparinized autologous blood, to which DuraGraft® was not compared. We further note that studies have shown that these solutions have differing effects on graft endothelium.^{58,59} We are unclear how improvements demonstrated by use of DuraGraft® as compared to saline controls demonstrate substantial clinical improvement over other existing technologies without an assessment of comparative outcomes to the other vein graft preservation solutions. .

With regard to the applicant's assertions that results of the Marizyme internal study report showing reduced mortality at three years in DuraGraft® patients were included in the FDA label, we note that the primary endpoint was mortality through 1 year of follow up. While the applicant stated in its comment that the study results demonstrated a reduced mortality estimate at 3 years for Duragraft®-treated patients compared to SOC controls, we note that differences in mortality were not statistically significant at the primary endpoint of 1 year. Similarly, we do not believe the inclusion of outcomes on the FDA label by itself supports a finding of substantial clinical improvement. In addition, although we acknowledge that, as stated by the applicant, it tried to isolate population differences and eliminate possible biases by propensity score matching based on 35 variables most strongly associated with surgical risk, we note that propensity scoring can only control for confounding factors that are measured. Unmeasured confounding factors could still impact the association between exposure to DuraGraft® and clinical outcomes. In particular, it does not appear that intra-operative or post-operative factors that could impact vein integrity or post-CABG outcomes were accounted for in this study (or in other studies provided by the applicant, as we had previously noted in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26801)) including vein distention pressure, time of intra-operative SVG ischemia, or post-operative antiplatelet therapy or lipid-lowering drugs. We

⁵⁹ Bernhard Winkler, David Reineke, Paul Philip Heinisch, Florian Schönhoff, Christoph Huber, Alexander Kadner, Lars Englberger, Thierry Carrel, Graft preservation solutions in cardiovascular surgery, *Interactive CardioVascular and Thoracic Surgery*, Volume 23, Issue 2, August 2016, Pages 300–309, <https://doi.org/10.1093/icvts/ivw056>

further note that the Marizyme internal study report is unpublished, and it is unclear from the report which vein preservation solutions were included in the control arm as the report only states that SOC solution was used. Further, the study only reports all-cause mortality and does not specify how many patients had mortality due to other causes that could not be attributed to use of a vein preservation solution other than DuraGraft®. Therefore, although the applicant stated that this additional information should address CMS's concerns regarding DuraGraft® studies' applicability to the female Medicare population, we continue to question the generalizability of any outcomes associated with use of DuraGraft®.

Therefore, after consideration of the public comments we received and based on the information stated previously, we are unable to determine that DuraGraft® represents a substantial clinical improvement over existing therapies, and we are not approving new technology add-on payments for DuraGraft® for FY 2025.

d. ELREXFIO™ (elranatamab-bcmm) and TALVEY™ (talquetamab-tgvs)

Two manufacturers, Pfizer, Inc. and Johnson & Johnson Health Care Systems, Inc. submitted separate applications for new technology add-on payments for FY 2025 for ELREXFIO™ and TALVEY™, respectively. Both of these technologies are bispecific antibodies (bsAb) used for the treatment of adults with relapsed or refractory multiple myeloma (RRMM) who have received at least four prior lines of therapy, including a proteasome inhibitor (PI), an immunomodulatory (IMiD), and an anti-CD38 monoclonal antibody (mAb). ELREXFIO™ is a B-cell maturation antigen (BCMA) directed cluster of differentiation (CD)3 T-cell engager. Per the applicant, ELREXFIO™ is a bispecific, humanized immunoglobulin 2-alanine (IgG2Δa) kappa antibody derived from two mAbs, administered as a fixed-dose, subcutaneous treatment. TALVEY™ is a G protein-coupled receptor, class C, group 5, member D (GPC5D) targeting bsAb. GPC5D is an orphan receptor expressed at a significantly higher level on malignant multiple myeloma (MM) cells than on normal plasma cells. We note that Pfizer, Inc. submitted an application for new technology add-on payments for ELREXFIO™ for

FY 2024 under the name elranatamab, as summarized in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26803 through 26809), but the technology did not meet the July 1, 2023, deadline for FDA approval or clearance of the technology and, therefore, was not eligible for consideration for new technology add-on payments for FY 2024 (88 FR 58804).

In the FY 2025 IPPS/LTCH PPS proposed rule (86 FR 36043 through 36052 and 36087 through 36092), we discussed these applications as two separate technologies. However, after further consideration and as discussed later in this section, we believe ELREXFIO™ and TALVEY™ are substantially similar to each other and that it is appropriate to evaluate both technologies as one application for new technology add-on payments under the IPPS.

Please refer to the online application posting for ELREXFIO™ available at <https://mearis.cms.gov/public/publications/ntap/NTP2310176PV9B>, for additional detail describing the technology and the disease treated by the technology.

Please refer to the online application posting for TALVEY™, available at <https://mearis.cms.gov/public/publications/ntap/NTP2310163HW2V>, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, the applicant for ELREXFIO™ stated that ELREXFIO™ was granted Biologics License Application (BLA) approval from FDA on August 14, 2023, for the treatment of adult patients with RRMM who have received at least four prior lines of therapy, including a PI, an IMiD, and an anti-CD38 mAb. According to the applicant, ELREXFIO™ was commercially available immediately after FDA approval. Per the applicant, the recommended doses of ELREXFIO™ subcutaneous injection are step-up doses of 12 mg on day 1 and 32 mg on day 4, followed by a first treatment dose of 76 mg on day 8 and subsequent treatment doses as indicated on the label. The applicant noted that treatment doses may be administered in an inpatient or outpatient setting. Per the applicant, patients should be hospitalized for 48 hours after administration of the first step-up dose, and for 24 hours after administration of the second step-up dose. The applicant assumed that there would be a single

inpatient stay, with one 44 mg vial used per dose, resulting in two doses (each a step-up dose) being administered.

The applicant for TALVEY™ stated that TALVEY™ was granted BLA approval from FDA on August 9, 2023, for the treatment of adult patients with RRMM who have received at least four prior lines of therapy, including a PI, an IMiD, and an anti-CD38 mAb. According to the applicant, TALVEY™ was commercially available immediately after FDA approval. Per the applicant, patients may be dosed on a weekly or bi-weekly dosing schedule. The applicant noted that patients on a weekly dosing schedule receive three weight-based doses—a 0.01 mg/kg loading dose, a 0.06 mg/kg loading dose, and the first 0.40 mg/kg treatment dose—during the hospital stay; patients on a bi-weekly dosing schedule receive an additional 0.80 mg/kg treatment dose during the hospital stay.

The applicant for ELREXFIO™ stated that effective October 1, 2023, the following ICD–10–PCS code may be used to uniquely describe procedures involving the use of ELREXFIO™: XW013L9 (Introduction of elranatamab antineoplastic into subcutaneous tissue, percutaneous approach, new technology group 9). The applicant stated that C90.00 (Multiple myeloma not having achieved remission), C90.01 (Multiple myeloma in remission), C90.02 (Multiple myeloma in relapse), and Z51.12 (Encounter for antineoplastic immunotherapy) may be used to currently identify the indication for ELREXFIO™ under the ICD-10-CM coding system.

The applicant for TALVEY™ submitted a request for approval for a unique ICD-10-PCS procedure code for TALVEY™ and was granted approval for the following procedure code effective April 1, 2024: XW01329 (Introduction of talquetamab antineoplastic into subcutaneous tissue, percutaneous approach, new technology group 9). The applicant stated that ICD-10-CM codes C90.00 (Multiple myeloma not having achieved remission) and C90.02 (Multiple myeloma in relapse) may be used to currently identify the indication for TALVEY™.

As stated earlier and for the reasons discussed further later in this section, we believe that

ELREXFIO™ and TALVEY™ are substantially similar to each other such that it is appropriate to analyze these two applications as one technology for purposes of new technology add-on payments, in accordance with our policy. We also discuss in this section the information provided by the applicants, as summarized in the proposed rule, regarding whether ELREXFIO™ and TALVEY™ are substantially similar to existing technologies. As discussed earlier, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered “new” for purposes of new technology add-on payments.

With respect to the substantial similarity criteria, in its application for new technology add-on payments for FY 2025, the applicant for ELREXFIO™ asserted that ELREXFIO™ is not substantially similar to other currently available technologies because it is the only therapy approved for the treatment of patients with RRMM who have received four prior lines of therapy including a PI, IMiD, and mAb, that uses a humanized IgG2Δa antibody for the mechanism of action. Per the applicant, it is also the only BCMA-directed bsAb therapy with clinical study data in its prescribing information supporting its use in patients who have received prior BCMA-directed therapy and that, therefore, the technology meets the newness criterion. The following table summarizes the applicant’s assertions regarding the substantial similarity criteria. Please see the online application posting for ELREXFIO™ for the applicant’s complete statements in support of its assertion that ELREXFIO™ is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
<p>Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?</p>	<p>No</p>	<p>ELREXFIO™ does not use the same or similar mechanism of action as any other therapy because it has a different protein sequence and molecular structure from other therapies.</p> <p>There are currently three bsAb therapies approved for this patient population: ELREXFIO™, TECVAyli®, and TALVEY™. For ELREXFIO™, the two targets are BCMA on the myeloma cancer cell and CD3 on the tumor killing T-cell. In addition to the bsAb targets, the mechanism of action is also influenced by the antibody structure, including the antibody constant IgG regions. ELREXFIO™ is currently the only BCMA-directed bsAb therapy that uses a humanized IgG2Δa kappa antibody backbone. Of the four human IgG isotypes, human IgG2 antibodies have the lowest overall level of effector function, as they only weakly induce complement and cell activation due to</p>

		<p>low affinity for human complement proteins (C1q) and immune cell receptors (Fcγ receptors). Having a low level of effector function in the IgG region is key to the mechanism of these molecules. This means the antibody should activate T-cells only in the presence of BCMA, which is highly expressed on tumor cells. Having these changes in the molecule to lower effector function means it should only stimulate an immune response in the tumor. A different IgG backbone, for example an IgG4, that has a high effector function could stimulate a bigger immune response and increased inflammation which may mean increased risk of immune-mediated toxicities. TECVAYLI® uses an IgG4 antibody backbone, which has a high affinity for Fc gamma receptor subtype I but weak affinities for all other Fc gamma receptor subtypes and are poor inducers of Fc-mediated effector functions. ELREXFIO™ also has a unique complementarity-determining region (CDR) sequence, which is the region of antibody that recognizes and binds to target epitopes. The CDR is critical to the mechanism of action of bsAb therapy because it results in different targeted regions, which impacts how the drug works to target the cancer cells.</p>
<p>Is the technology assigned to the same MS-DRG as existing technologies?</p>	<p>Yes</p>	<p>It is unclear to which MS-DRG the ICD-10-PCS code for administration of ELREXFIO™ (XW013L9) has been assigned as we were unable to identify the assignment in the current MS-DRG Grouper (version 41) on the CMS website. However, we believe that RRMM patients treated with a bsAb therapy, such as TECVAYLI®, ELREXFIO™, or TALVEY™, who have received at least four prior lines of therapy including a PI, an IMiD, and an anti-CD38 mAb will have a diagnosis code that is assigned to MS-DRG 840, 841, 842, 846, 847, or 848.</p>
<p>Does use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?</p>	<p>No</p>	<p>ELREXFIO™ does not involve treatment of the same or similar type of patient population when compared to existing therapies because it is the only BCMA-directed CD3 T-cell engager that includes in its FDA-approved prescribing information clinical study data supporting its use in RRMM patients who received prior BCMA-directed therapy.</p> <p>There are three bsAb therapies, including ELREXFIO™, that are generally indicated for the treatment of adult patients with RRMM who have received at least four prior lines of therapy including a PI, an IMiD, and an anti-CD38 mAb. Two of those, ELREXFIO™ and TECVAYLI®, are BCMA-directed therapies. However, of the two, ELREXFIO™ is the only therapy for which FDA included clinical study data in section 14 of the prescribing information describing efficacy and safety in a patient population that had received prior BCMA-directed therapy. The inclusion of clinical study data on the prior BCMA-exposed patient population in the prescribing information is important because patients who have received prior BCMA-directed therapy have generally received more prior lines of therapy. For example, in MagnetisMM-3, prior BCMA exposed patients had received a median of eight prior lines of therapy (the range being 4-19). Even though the indications for use for ELREXFIO™ are the same as that for TECVAYLI® and TALVEY™, the inclusion of clinical study data is helpful for informing the use of ELREXFIO™ in this particular patient population in addition to treatment of patients without prior BCMA-directed therapy.</p>

With respect to the substantial similarity criteria, in its application for new technology add-on payments for FY 2025, the applicant for TALVEY™ asserted that TALVEY™ is not substantially similar to other currently available technologies because it has a unique mechanism of action as a CD3 T-cell engaging bsAb targeting GPRC5D, and therefore, the technology meets the newness criterion. The following table summarizes the applicant’s assertions regarding

the substantial similarity criteria. Please see the online application posting for TALVEY™ for the applicant’s complete statements in support of its assertion that TALVEY™ is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	TALVEY™ has a unique mechanism of action as the first and only approved therapy targeting GPRC5D. TALVEY™ is a full-sized, bsAb that simultaneously binds GPRC5D on myeloma cells and CD3 on T-cells. This distinction is critical, because the expression of GPRC5D is different from that of BCMA, which is the target of the other approved bsAbs in RRMM. Of note, GPRC5D has limited expression on normal tissues, including the tongue and hair follicles. Critically, GPRC5D is not expressed at a significant level on normal B-cells, which directly contrasts with BCMA expression which is present on B-cells. The tissue expression of GPRC5D determines, in large part, the AE profile of TALVEY™ and differentiates the mechanism of action and AE profile of TALVEY™ from those of BCMA targeting therapies. Other FDA approved T-cell engaging bsAbs include teclistamab, elranatamab (MM), mosunetuzumab, epcoritamab, glofitamab (B-cell non-Hodgkin lymphoma), and blinatumomab (acute lymphoblastic leukemia). While teclistamab and elranatamab are also T-cell engaging bsAbs used to treat multiple myeloma, they both target BCMA. TALVEY™ is the only medicine which targets the novel antigen GPRC5D. Mosunetuzumab, epcoritamab, and glofitamab target CD3 on T-cells and CD20 on non-Hodgkin lymphoma cells and are approved for use in relapsed/refractory B-cell non-Hodgkin lymphoma. Blinatumomab, a bispecific T-cell engager (BiTE) that targets CD3 and CD19, is approved for the treatment of pre-B-cell acute lymphoblastic lymphoma and has a structure different from other bsAbs, containing two Fab fragments that are held together by a chemical linker. TALVEY™ has a novel mechanism of action targeting GPRC5D for the treatment of MM and is differentiated from existing bsAbs due to the uniqueness of both this target and its tissue expression profile, which results in an adverse event profile distinct from those of the currently approved bsAbs in RRMM targeting BCMA.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	TALVEY™ has been assigned to the same MS-DRG and it treats a similar MM patient population as several other approved therapies.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	Yes	TALVEY™ is indicated for the treatment of adults with RRMM who have received at least four prior lines of therapy, including a PI, an IMiD and an anti-CD38 mAb. The indication for TALVEY™ is similar to the approved indications for ide-cel, cilta-cel, teclistamab, and elranatamab. While these are all BCMA targeted therapies indicated for the treatment of MM in patients who have been exposed to at least four prior lines of therapy, TALVEY™ is unique in that it targets the novel antigen GPRC5D. In addition, TALVEY™ has proven efficacy in patients with RRMM who have received prior T-cell redirection therapies such as BCMA-directed Chimeric antigen receptor (CAR) T-cell therapy and bsAbs.

In the FY 2025 IPPS/LTCH PPS proposed rule (86 FR 36046 through 36047 and 36088 through 36089), we stated that we believed ELREXFIO™ and TALVEY™ may be substantially similar to each other. We stated that per the applications for ELREXFIO™ AND TALVEY™, both are bispecific antibodies approved for the treatment of adults with RRMM who have received at least four prior lines of therapy, including a PI, IMiD, and an antiCD38 monoclonal antibody. We noted that per the applicant for ELREXFIO™, ELREXFIO™ is as a bsAb that

uses binding domains that simultaneously bind the BCMA target on tumor cells and the CD3 T-cell receptor. We also noted that the applicant for TALVEY™ stated that TALVEY™ is the only medicine that targets GPRC5D on myeloma cells and that because TALVEY™ binds to different receptors, it has a different mechanism of action from ELREXFIO™. However, we questioned how binding to a different protein (GPRC5D) on the tumor cell would result in a different mechanism of action compared to BCMA targeting bsAbs. Furthermore, we noted that the applicant for TALVEY™ claimed that GPRC5D, the target of TALVEY™, has a unique tissue expression profile, which results in an adverse event profile distinct from those of the currently approved bsAb in RRMM targeting BCMA. However, as this is related to the risk of adverse events from TALVEY™ administration but was not critical to the way the drug treats the underlying disease, we questioned whether this therefore related to an assessment of substantial clinical improvement rather than of substantial similarity. We stated that we would welcome additional information on how molecular differences, such as the regulation of expression of GPRC5D and BCMA on MM cells during treatment, should be considered in determining whether a technology utilizes a different mechanism of action to achieve a therapeutic outcome. Additionally, we noted that similar to TALVEY™, the prescribing information for ELREXFIO™ includes a population with prior exposure to BCMA T-cell redirection therapy.

Accordingly, we noted that, as it appears that ELREXFIO™ and TALVEY™ would use the same or similar mechanism of action to achieve a therapeutic outcome, would be assigned to the same MS-DRG, and would treat the same or similar disease in the same or similar patient population, we believed that these technologies may be substantially similar to each other such that they should be considered as a single application for purposes of new technology add-on payments. We noted that if ELREXFIO™ and TALVEY™ were determined to only be substantially similar to each other, we believed the newness period for ELREXFIO™ and TALVEY™ would begin on August 9, 2023, the date TALVEY™ received FDA approval.

We also stated that we believed ELREXFIO™ and TALVEY™ may be substantially similar to TECVAYLI®, for which we approved an application for new technology add-on payments for FY 2024 (88 FR 58891) for the treatment of adult patients with RRMM after four or more prior lines of therapy, including a PI, an IMiD, and an anti-CD38 mAb. We noted that TECVAYLI®'s mechanism of action is described as a bsAb, with binding domains that simultaneously bind the BCMA target on tumor cells and the CD3 T-cell receptor (88 FR 58886). We stated that the applicant for ELREXFIO™ asserted that ELREXFIO™ has a unique CDR (the region of antibody that recognizes and binds to target epitopes) that is critical to the mechanism of action because it results in different targeted regions, impacting how the drug works to target the cancer cells. However, we noted it was unclear whether these differences result in a substantially different mechanism of action from TECVAYLI®. We stated that because of the apparent similarity with the bsAb for ELREXFIO™ that uses binding domains that simultaneously bind the BCMA target on tumor cells and the CD3 T-cell receptor, we believed that the mechanism of action for ELREXFIO™ may be the same or similar to that of TECVAYLI®. We noted that the applicant for ELREXFIO™ also asserted that ELREXFIO™ is different from TECVAYLI® because the two are based on different immunoglobulin isotypes, and with the lower effector function of IgG2, ELREXFIO™ should only activate T-cells in the presence of BCMA and thus should only stimulate an immune response in the tumor. Based on our understanding, however, that this may relate to the risk of adverse event from ELREXFIO™ administration but was not critical to the way the drug treats the underlying disease, we questioned whether this would therefore relate to an assessment of substantial clinical improvement, rather than of substantial similarity.

We also noted that per the applicant for TALVEY™, TALVEY™ has a different mechanism of action from TECVAYLI® or ELREXFIO™ because it binds to different receptors. The applicant for TALVEY™ noted that TALVEY™ is the only medicine that targets GPRC5D on myeloma cells. As we previously noted, TECVAYLI®'s mechanism of action is described as

a bsAb, with binding domains that simultaneously bind the BCMA target on tumor cells and the CD3 T-cell receptor (88 FR 58886). As discussed previously, the applicant asserted that TALVEY™ had a unique mechanism of action as compared to TECVAYLI® and ELREXFIO™ by binding to different receptors. However, we questioned how binding to a different protein (GPRC5D) on the tumor cell would result in a different mechanism of action compared to BCMA targeting bispecific antibodies. Furthermore, as we noted previously, the applicant for TALVEY™ claimed that the target of TALVEY™, GPRC5D, has a unique tissue expression profile, which results in an adverse event profile distinct from those of the currently approved bispecific antibodies in RRMM targeting BCMA. However, we noted that this was related to the risk of adverse event from TALVEY™ administration but was not critical to the way the drug treats the underlying disease. As a result, we questioned whether this would therefore relate to an assessment of substantial clinical improvement rather than of substantial similarity. We also stated previously that we would welcome additional information on how molecular differences, such as the regulation of expression of GPRC5D and BCMA on MM cells during treatment, should be considered in determining whether a technology utilizes a different mechanism of action to achieve a therapeutic outcome.

We also noted that ELREXFIO™, TALVEY™, and TECVAYLI® may treat the same or similar disease (RRMM) in the same or similar patient population (patients who have previously received a PI, IMiD, and an anti-CD38 mAb). The applicant for ELREXFIO™ claimed that ELREXFIO™ is different from TECVAYLI® because the prescribing information includes a new subpopulation: the patient population that had received prior BCMA-directed therapy. However, we believed that the lack of inclusion of this population in the prescribing information for TECVAYLI® does not necessarily exclude the use of TECVAYLI® in this patient population, nor does FDA prescribing information for TECVAYLI® specifically exclude this patient population. As such, we stated it was unclear whether ELREXFIO™ would in fact treat a patient population different from TECVAYLI®. Accordingly, we noted that as it appears that

ELREXFIO™, TALVEY™, and TECVAYLI® may be using the same or similar mechanism of action to achieve a therapeutic outcome, would be assigned to the same MS-DRG, and treat the same or similar patient population and disease, we believed that these technologies may be substantially similar to each other. We noted that if we determined that these technologies were substantially similar to TECVAYLI®, we believed the newness period for these technologies would begin on November 9, 2022, the date TECVAYLI® became commercially available.

We stated we were interested in receiving information on how these technologies may differ from each other with respect to the substantial similarity and newness criteria to inform our analysis of whether ELREXFIO™, TALVEY™, and TECVAYLI® are substantially similar to each other.

We invited public comments on whether ELREXFIO™ and TALVEY™ are substantially similar to each other and/or existing technologies and whether ELREXFIO™ and TALVEY™ meet the newness criterion.

Comments: The applicant for ELREXFIO™ submitted a comment regarding the newness criterion. The applicant stated that, based on CMS's newness criteria, it would agree ELREXFIO™, TECVAYLI®, and TALVEY™ are all substantially similar according to new technology add-on guidelines because they all are bsAb therapies using a mechanism of action that simultaneously binds to a protein on the tumor cell and the CD3 T-cell receptor, bridging the two to kill the tumor cell. Additionally, the applicant commented that the indication statements for all the therapies are for the treatment of adult patients with RRMM who have received prior therapy and are all assigned to the same MS-DRG. The applicant commented that since TECVAYLI® was approved for new technology add-on payment status effective FY 2024 with a newness period beginning November 9, 2022, CMS should continue new technology add-on payment status for FY 2025 and extend that new technology add-on payment status to ELREXFIO™.

The applicant for TALVEY™ commented that it agreed with CMS that TALVEY™,

TECVAYLI®, and ELREXFIO™ are all approved for the treatment of the same disease (RRMM) and in a similar patient population (patients receiving a PI, IMiD, and an anti-CD38 mAb). However, the applicant did not agree that TALVEY™ has a similar mechanism of action due to the targeting of different antigens on the surface of malignant plasma cells. According to the applicant, TALVEY™ is unique in targeting GPRC5D instead of BCMA and has demonstrated efficacy in patients who are naïve to or exposed to prior bsAb and CAR T-cell therapy. According to the applicant, this emerging population of patients who have been exposed to all other major treatment classes (PI, IMiD, anti-CD38 mAb, and BCMA) is increasingly important, and TALVEY™ has demonstrated efficacy and safety in this growing patient population with an unmet medical need. While GPRC5D and BCMA may have similar expression on plasma cells, the applicant for TALVEY™ stated that the pattern of expression of GPRC5D and BCMA are independent of each other, making GPRC5D a distinct clinical target. Additionally, the applicant asserted that GPRC5D is primarily expressed on malignant plasma cells, while BCMA is also widely expressed on the surface of mature B cells and normal plasma cells, which differentiates the mechanism of action and AE profile of TALVEY™ from those of BCMA targeting therapies. The applicant also stated that TALVEY™ demonstrated an overall response rate of 72 percent (with a durable 9-month duration of response rate of 59 percent) in 32 patients who had received prior T-cell redirection therapy, including 30 patients who had received a prior BCMA CAR-T or bispecific therapy. The applicant added that the limited expression of GPRC5D on normal B cells and plasma cells resulted in serious infections and grade 3-4 infections in 16 percent and 17 percent of patients respectively, compared to 30 percent and 34 percent for TECVAYLI™ and 31 percent and 42 percent for ELREXFIO™.

The applicant for TALVEY™ further commented that a recent publication by Firestone and team (2024)⁶⁰ described antigen escape, or loss of target antigen, as a mechanism of

⁶⁰ Firestone R, Socci N, Shekarkhand T, et al. Antigen escape as a shared mechanism of resistance to BCMA-directed therapies in multiple myeloma. *Blood* 2024 May 10;blood.2023023557. doi: 10.1182/blood.2023023557.

resistance to BCMA-directed therapies in RRMM. The Firestone study stated that one of the patients who was BCMA refractory responded to TALVEY™. The applicant for TALVEY™ asserted that because expression of GPRC5D is independent of BCMA, and those two bsAbs target distinct, independent antigens, TALVEY™ can be used to treat patients who have progressed on or do not respond to TECVAYLI®.

Response: We thank the applicants for their comments regarding the newness criterion for ELREXFIO™ and TALVEY™. While we agree with the applicant for TALVEY™ that TALVEY™ treats a similar population to ELREXFIO™ and TECVAYLI®, we disagree that TALVEY™ is unique in treating patients who are naïve to or exposed to prior bsAb and CAR T-cell therapy. As previously discussed, ELREXFIO™ is also indicated for patients exposed to prior bsAb and CAR T-cell therapy. We also disagree with that TALVEY™ has a unique mechanism of action. While the applicant for TALVEY™ stated that GPRC5D is primarily expressed on malignant plasma cells and that BCMA is also widely expressed on the surface of mature B cells and normal plasma cells, the applicant for TALVEY™ did not demonstrate how this difference affects the mechanism of action by which patients are treated. We note that the applicant for TALVEY™ seemed to assert that a difference in clinical outcomes demonstrates a difference in the mechanism of action from existing technologies. However, we note that a difference in observed outcomes would relate to an assessment of substantial clinical improvement rather than the newness criterion. Therefore, we remain unclear how binding to a different protein (GPRC5D) on the tumor cell affects the downstream molecular process by which TALVEY™ treats the underlying disease compared to ELREXFIO™ and TECVAYLI®.

After consideration of the comments received, and for the reasons discussed, we believe that ELREXFIO™, TALVEY™, and TECVAYLI® use the same or a similar mechanism of action to achieve therapeutic outcomes. Furthermore, as discussed previously, ELREXFIO™ and TALVEY™ map to the same MS-DRG and treat the same patient population (adult patients with RRMM after four or more prior lines of therapy, including a PI, an IMiD, and an anti-CD38

mAb) as TECVAYLI®. Accordingly, because ELREXFIO™ and TALVEY™ meet all three of the substantial similarity criteria, we believe that both are substantially similar to TECVAYLI®. In accordance with our policy, because these technologies are substantially similar to each other, we use the earliest market availability date submitted as the beginning of the newness period for these technologies. Therefore, we consider the beginning of the newness period for ELREXFIO™ and TALVEY™ to be November 9, 2022, the date TECVAYLI® became commercially available.

Consistent with our policy statements in the past regarding substantial similarity, we will not be making a determination on cost and substantial clinical improvement for ELREXFIO™ or TALVEY™. Specifically, we have noted that approval of new technology add-on payments would extend to all technologies that are substantially similar, and if substantially similar technologies are submitted for review in different (and subsequent) years, we evaluate and make a determination on the first application and apply that same determination to the second application (85 FR 58679). Since TECVAYLI® was approved for new technology add-on payments for FY 2024 and is still within its newness period for FY 2025, and we have determined that ELREXFIO™ and TALVEY™ are substantially similar to TECVAYLI®, we apply that same approval for new technology add-on payments to ELREXFIO™ and TALVEY™. We note that we received public comments with regard to the cost and substantial clinical improvement criteria for these technologies, but because the determination made in the FY 2024 IPPS/LTCH PPS final rule for TECVAYLI® is applied to ELREXFIO™ and TALVEY™ due to their substantial similarity, we are not summarizing comments received or making a determination on those criteria in this final rule.

Cases involving the use of ELREXFIO™ that are eligible for new technology add-on payments will be identified by ICD-10-PCS code XW013L9 (Introduction of elranatamab antineoplastic into subcutaneous tissue, percutaneous approach, new technology group 9). Cases involving the use of TALVEY™ that are eligible for new technology add-on payments will be

identified by ICD-10-PCS code XW01329 (Introduction of talquetamab antineoplastic into subcutaneous tissue, percutaneous approach, new technology group 9).

Each of the applicants submitted cost information for its application. The manufacturer of ELREXFIO™ estimated that the cost of ELREXFIO™ is \$15,112 per patient. The manufacturer of TALVEY™ estimated that the cost of TALVEY™ is \$25,164.44 per patient. Because ELREXFIO™ and TALVEY™ are substantially similar to TECVAYLI®, we believe using a single cost for purposes of determining the new technology add-on payment amount is appropriate for ELREXFIO™, TALVEY™, and TECVAYLI®, even though each technology will be identified by its own ICD-10-PCS code (87 FR 48925). We also believe using a single cost provides predictability regarding the add-on payment when using ELREXFIO™, TALVEY™, and TECVAYLI® for the treatment of patients with RRMM. As such, we believe that the use of a weighted average of the cost of ELREXFIO™, TALVEY™, and TECVAYLI® based upon the projected numbers of cases involving each technology to determine the maximum new technology add-on payment would be most appropriate. To compute the weighted average cost, we summed the total number of projected cases for each technology provided by the applicants, which equaled 4,376 cases (152 cases for ELREXFIO™ plus 2,318 cases for TALVEY™ plus 1,906 cases for TECVAYLI®). We then divided the number of projected cases for each of the technologies by the total number of cases, which resulted in the following case weighted percentages: 3.47 percent for ELREXFIO™, 52.97 percent for TALVEY™ and 43.56 percent for TECVAYLI®. For each technology, we then multiplied the estimated cost per patient by the case-weighted percentage ($0.0347 * \$15,112 = \524.39 for ELREXFIO™; $0.5297 * \$25,164.44 = \$13,329.60$ for TALVEY™; and $0.4356 * \$13,754.67 = \$5,991.53$ for TECVAYLI®). This resulted in a case-weighted average cost of \$19,845.52 for the technology.

Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–

DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of ELREXFIO™, TALVEY™, or TECVAYLI® is \$12,899.59 for FY 2025.

e. FloPatch FP120

Flosonics Medical (R.A. 1929803 Ontario Corp.) submitted an application for new technology add-on payments for FloPatch FP120 for FY 2025. According to the applicant, FloPatch FP120 is a wireless, wearable, continuous wave (4 MHz) Doppler ultrasound device that adheres over peripheral vessels (that is, carotid and jugular) that assesses blood flow in the peripheral vessels, enabling rapid and repeatable dynamic assessments of both arterial and venous flow simultaneously. According to the applicant, FloPatch FP120 cardiovascular blood flowmeter adheres to a patient's neck (or any other major vessel) and transmits Doppler-shifted ultrasonic waves from the transducer to the artery and vein at a fixed angle of insonation that are then reflected by moving blood cells back to the transducer. Per the applicant, the signal processing unit wirelessly outputs data to a secure iOS mobile medical application, which displays metrics from the Doppler signal, such as maximal velocity trace and corrected flow time, in a user-friendly interface. Per the applicant, FloPatch FP120 will optimize clinical workflow, is easy-to-use and hands-free, cloud-connected, and can be deployed in under one minute, providing instantaneous results.

Please refer to the online application posting for FloPatch FP120, available at <https://mearis.cms.gov/public/publications/ntap/NTP231017D56F4>, for additional detail describing the technology and the types of conditions that the technology might help diagnose and/or treat.

With respect to the newness criterion, according to the applicant, FloPatch FP120 received 510(k) clearance from FDA on May 3, 2023, for the noninvasive assessment of blood flow in the carotid artery. Per the applicant, in a more recent FDA 510(k) submission, the proposed indication is for use for the noninvasive assessment of blood flow in peripheral vasculature. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36052), we stated that based

on the application submitted by the applicant, the new technology add-on payment application for FloPatch FP120 is not eligible for consideration for FY 2025 for the proposed indication (for use for the noninvasive assessment of blood flow in peripheral vasculature) because documentation of FDA acceptance or filing of the marketing authorization request that indicates that FDA has determined that the application is sufficiently complete to allow for substantive review by FDA, was not provided to CMS at the time of new technology add-on payment application submission. As such, we stated that the new technology add-on payment application for FloPatch FP120 is only eligible for consideration for FY 2025 for the narrower indication for use for the noninvasive assessment of blood flow in carotid artery.

In the proposed rule (89 FR 36052), we noted that prior to the May 3, 2023, clearance, there were two FDA 510(k) clearances for FloPatch FP120; one obtained in 2022 and one in 2020. The indications in the 2020, 2022, and 2023 clearances are identical, that is, for use for the noninvasive assessment of blood flow in the carotid artery.⁶¹ In addition, the 2020 clearance was based on substantial equivalence to the FloPatch FP110 device,⁶² which was an earlier version of FloPatch FP120 and was also FDA-cleared. According to the applicant, FloPatch FP120 was commercially available for this use as of January 1, 2023. However, we stated that, as noted earlier, the provided FDA 510(k) clearance was dated May 3, 2023. Because the market availability date as indicated by the applicant preceded the 2023 clearance date, and because the 2020 and 2022 clearances had the same indication as the 2023 clearance, we questioned when the technology first became commercially available for use for the noninvasive assessment of blood flow in the carotid artery and requested additional information on the market availability date for this indication. Per the applicant, one FloPatch FP120 device would be used per inpatient stay.

⁶¹ K223843, May 3, 2023; K222242, December 9, 2022; and K200337, March 24, 2020.

⁶² K191388, June 21, 2019.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for FloPatch FP120 and was granted approval to use the following procedure code effective October 1, 2024: XX25X0A (Monitoring of blood flow, adhesive ultrasound patch technology, new technology group 10). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for FloPatch FP120 under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered new for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that FloPatch FP120 is not substantially similar to other currently available technologies because FloPatch FP120 offers real-time, non-invasive monitoring of hemodynamic changes of both the arterial and venous blood flow, improving fluid management decisions. Per the applicant, FloPatch FP120 surpasses current methods by providing continuous data, enhancing patient safety, and addressing unmet clinical needs for immediate, precise assessments, and therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for FloPatch FP120, for the applicant's complete statements in support of its assertion that FloPatch FP120 is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
---------------------------------	--------------------	---

<p>Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?</p>	<p>No</p>	<p>The applicant stated that FloPatch FP120 represents a significant advancement in hemodynamic monitoring technology, particularly in its application of Doppler ultrasound techniques. According to the applicant, while FloPatch FP120 employs traditional Doppler ultrasound technology for assessing blood flow, FloPatch FP120 technology enhances this through its unique, patented sensor technology that generates a broad-beam, wide ultrasonic curtain to simultaneously insonate the arterial and venous vessels. The applicant noted that this allows for continuous, automated quantification of Doppler blood flow assessments on a beat-to-beat basis, providing a dynamic, real-time view of a patient's hemodynamic status, which is a significant departure from traditional methods. Furthermore, the applicant maintained that FloPatch FP120's unique capability to continuously assess both arterial and venous blood flow simultaneously offers a more holistic view of a patient's cardiovascular health and facilitates automated and continuous data collection.</p>
<p>Is the technology assigned to the same MS-DRG as existing technologies?</p>	<p>No</p>	<p>According to the applicant, FloPatch FP120 technology is so new that it has not been reviewed or assigned to a MS-DRG, nor is it comparable to existing technologies. In the context of MS-DRGs 870, 871, and 872, which pertain to septicemia or severe sepsis, the assessment of volume responsiveness is crucial. The applicant stated that since the device is new, it has not undergone sufficient review to be officially recognized as a standard or alternative treatment within the existing MS-DRGs.</p>
<p>Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?</p>	<p>No</p>	<p>Per the applicant, existing technology does not provide clinicians with the information they need. The current standard for assessing a patient's volume status and fluid responsiveness involves either invasive cardiac output monitoring, which carries risks and discomfort, or clinical judgment without real-time objective data. The applicant argued that both methods have significant limitations, including the potential for delayed or inaccurate assessments, leading to suboptimal fluid management or worse fluid overload resulting in patient harm and excess costs due to longer and more complex lengths of stay. According to the applicant, in this context, FloPatch FP120 introduces a significant clinical advancement. Per the applicant, FloPatch FP120 utilizes Doppler technology to continuously monitor simultaneous changes in blood flow of the arterial and venous systems, providing direct, real-time data regarding a patient's hemodynamic response to fluid administration. According to the applicant, this capability addresses a critical gap in patient management, particularly in dynamic assessments where understanding fluid responsiveness is crucial for decision-making and avoiding IV fluid overload for septic patients. The applicant stated that because the FP120 offers continuous, non-invasive assessments of changes in blood flow, use of the FP120 device not only reduces the risks associated with invasive procedures but also enhances the accuracy and frequency of assessments. Furthermore, the applicant asserted that the ability of the FP120 device to detect rapid physiological changes in blood flow enables healthcare professionals to make more informed decisions about fluid management, reducing the likelihood of both fluid overload and under-resuscitation. The applicant argued that the immediacy of data provided by the FloPatch FP120 allows for a more responsive form of care. The applicant maintained that by using FloPatch FP120, clinicians can adjust fluid administration in real time, responding to the patient's current hemodynamic state rather than relying on intermittent monitoring or static indicators, which may not accurately reflect the patient's fluid responsiveness. The applicant maintained that the introduction of FloPatch FP120 represents a scientific and operational advancement in the management of patients requiring fluid resuscitation, particularly in settings characterized by a need for rapid, precise, and dynamic decision-making.</p>

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36054), we noted the following concerns with regard to the newness criterion. With respect to the first substantial similarity criterion, whether FloPatch FP120 uses the same or similar mechanism of action for a therapeutic outcome when compared to existing technologies, we stated we had not received information from the applicant regarding predicate devices for FloPatch FP120 that were previously FDA-cleared in its discussion of existing technologies. We stated that there are three

FDA 510(k) clearances for FloPatch FP120, with the same indication for use for the noninvasive assessment of blood flow in the carotid artery.⁶³ In addition, the 2020 clearance was based on substantial equivalence to the FloPatch FP110 device,⁶⁴ an earlier version of FloPatch FP120 that was also FDA-cleared. We noted that all FloPatch FP120 FDA-cleared devices, as well as the FP110 version, had an identical method of attachment of the ultrasound probe to the human body, and the same intended use and indications for use. Accordingly, we stated that since the technology was already approved for use for this same indication outside of the 2- to 3-year newness period, it appeared that it would no longer be considered new for purposes of new technology add-on payments.

In addition, we questioned whether a different placement method or the addition of a wearable functionality for the noninvasive assessment of blood flow would constitute a different mechanism of action, and whether these differences may instead be relevant to the assessment of substantial clinical improvement, rather than of newness. For example, while the applicant described FloPatch FP120 as user-friendly, we questioned whether ease-of-use in itself represented a mechanism of action unique from existing technologies for a therapeutic outcome, as the primary underlying mechanism of action is still Doppler ultrasound technology.

With respect to the second substantial similarity criterion, that is, whether a product is assigned to the same or a different MS-DRG, the applicant asserted that the device is new and has not undergone sufficient review to be recognized as a treatment within the existing MS-DRGs. However, we noted that the applicant also stated that FloPatch FP120 could be relevant to existing MS-DRGs that pertain to septicemia or severe sepsis for the assessment of volume responsiveness. We stated we believed that, based on its indication, cases involving the use of FloPatch FP120 would be assigned to the same MS-DRGs as those involving existing

⁶³ K223843, May 3, 2023; K222242, December 9, 2022; and K200337, March 24, 2020.

⁶⁴ K191388, June 21, 2019.

technologies used for invasive and non-invasive measurements of blood flow, such as for patients with septicemia or severe sepsis.

With respect to the third substantial similarity criterion, that is, whether the technology involves treatment of the same or similar type of disease or patient population when compared to an existing technology, the applicant maintained that existing technologies do not provide clinicians with the information they need, and while FloPatch FP120 serves a similar purpose as existing technology, its process has been optimized by providing a safer, more accurate, and instantaneous method of assessment. While this may be relevant to the assessment of substantial clinical improvement, we stated it did not appear to be related to newness, and we remained unclear about how the patient population for which FloPatch FP120 is used differs from other patients for which existing non-invasive (for example, Doppler ultrasound devices) and invasive technologies are used for hemodynamic monitoring in a same or similar type of disease (such as septicemia or severe sepsis).

Accordingly, we stated that as it appears that the May 3, 2023, FDA 510(k) clearance and prior FDA 510(k) clearances for FloPatch FP120 may use the same or similar mechanism of action to achieve a therapeutic outcome, would be assigned to the same MS-DRG, and treat the same or similar patient population and disease, we believed that these technologies may be substantially similar to each other. We noted that if FloPatch FP120 as described in its 2023 FDA 510(k) clearance is substantially similar to prior versions as described in the 2022 and 2020 FDA 510(k) clearances, we believed the newness period for this technology would begin on March 24, 2020, with the earliest FDA 510(k) clearance date for FloPatch FP120 (K200337) and therefore, because the 3-year anniversary date of the technology's entry onto the U.S. market (March 24, 2023) occurred in FY 2023, the technology would no longer be considered new and would not be eligible for new technology add-on payments for FY 2025.

We invited public comments on whether FloPatch FP120 is substantially similar to existing technologies and whether FloPatch FP120 meets the newness criterion.

Comment: A commenter stated that CMS should deny the new technology add-on payment application because the many previous FDA clearances place the technology outside the FY 2025 eligibility period. The commenter stated that the technology is not new because it is the same technology as previously cleared products and noted the previous versions of FloPatch's 510(k) clearances in 2020 and 2022. The commenter also stated that, as CMS noted, Doppler ultrasound technology is the primary technology that FloPatch FP120 uses, and that many existing devices use the same or similar technology. In addition, the commenter stated that the applicant assertion that existing technologies do not provide clinicians with the information they need and that the current standard for assessing a patient's fluid responsiveness involves invasive cardiac output monitoring or clinical judgment without real-time objective data is not true because there are several existing products – such as (among others) point-of-care ultrasound, the Edwards's Hemosphere monitor, the Deltex TrueVue/ODM+, and the Caretaker Medical monitor – that use the same or similar technology to assess a patient's fluid responsiveness. The commenter also agreed with CMS that FloPatch FP120 would be assigned to the same MS-DRGs as those involving existing technologies used for invasive and non-invasive measurements of blood flow, such as for patients with septicemia or severe sepsis, and stated that many other technologies also do not require invasive procedures. The commenter further stated that it believed that FloPatch FP120 fails to meet the newness criterion because it uses the same technology (Doppler ultrasound) to perform the same task (monitor changes in blood flow) to assess the same reaction (response to fluid administration) to inform the same activity (fluid management) for patients with the same disease or condition (sepsis or septicemia) compared to those devices that are already available to Medicare beneficiaries.

Response: We thank the commenter for its input. Based on the information submitted, we believe that the May 2, 2023, FDA-cleared FloPatch FP120 technology uses a similar or same mechanism of action as existing technologies, including the previously FDA-cleared FloPatch FP120 products and Doppler ultrasound. We agree with the commenter that cases involving the

use of FloPatch FP120 are assigned to the same MS-DRGs as those involving the use of the previously FDA-cleared FloPatch products and other existing technologies for invasive and non-invasive measurement of blood flow for patients with septicemia or severe sepsis. We also agree with the commenter that FloPatch FP120 informs the same clinical activity (fluid management) for patients with the same disease or condition (sepsis and septicemia) as the previously FDA-cleared FloPatch products and other existing technologies.

Because FloPatch FP120 meets all three of the substantial similarity criteria, we believe FloPatch FP120 is substantially similar to the version of FloPatch FP120 that was FDA-cleared on March 24, 2020, an existing noninvasive technology that assesses blood flow in the carotid artery. Therefore, we consider the newness period for FloPatch FP120 to begin on the date it first received FDA 510(k) clearance for the noninvasive assessment of blood flow in the carotid artery. Since FloPatch FP 120 has been on the U.S. market since 2020, the 3-year anniversary date of its entry onto the market occurred prior to FY 2025. Therefore, FloPatch FP120 does not meet the newness criterion, and is not eligible for new technology add-on payments for FY 2025. We note that we received public comments with regard to the cost and substantial clinical improvement criteria for this technology, but because we have determined that the technology does not meet the newness criterion and therefore is not eligible for approval for new technology add-on payments for FY 2025, we are not summarizing comments received or making a determination on those criteria in this final rule.

f. HEPZATO™ KIT (melphalan for injection/hepatic delivery system)

Delcath System submitted an application for new technology add-on payments for HEPZATO™ KIT for FY 2025. According to the applicant, HEPZATO™ KIT is a drug/device combination product consisting of melphalan and the Hepatic Delivery System (HDS), indicated as a liver-directed treatment for adult patients with uveal melanoma with unresectable hepatic metastases. Per the applicant, the HDS is used to perform percutaneous hepatic perfusion (PHP), an intensive local hepatic chemotherapy procedure, in which the alkylating agent melphalan

hydrochloride is delivered intra-arterially to the liver with simultaneous extracorporeal filtration of hepatic venous blood return (hemofiltration).

Please refer to the online application posting for HEPZATO™ KIT, available at <https://mearis.cms.gov/public/publications/ntap/NTP2310160RLLX>, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, HEPZATO™ KIT was granted approval as a New Drug Application (NDA) from FDA on August 14, 2023, for use as a liver-directed treatment for adult patients with uveal melanoma with unresectable hepatic metastases affecting less than 50 percent of the liver and no extrahepatic disease or extrahepatic disease limited to the bone, lymph nodes, subcutaneous tissues, or lung that is amenable to resection or radiation. According to the applicant, the technology became available for sale on January 8, 2024, because manufacturing did not commence until after FDA approval was granted. Melphalan hydrochloride, a component of HEPZATO™ KIT, is administered by intra-arterial infusion into the hepatic artery at a dose of 3 mg/kg of body weight with a maximum dose of 220 mg during a single treatment. The drug is infused over 30 minutes, followed by a 30-minute washout period. According to the applicant, treatments should be administered every 6 to 8 weeks, but can be delayed until recovery from toxicities, and as per clinical judgement.

The applicant stated that, effective October 1, 2023, the following ICD-10-PCS code may be used to uniquely describe procedures involving the use of HEPZATO™ KIT: XW053T9 (Introduction of melphalan hydrochloride antineoplastic into peripheral artery, percutaneous approach, new technology group 9). We note that we have also identified ICD-10-PCS code 5A1C00Z (Performance of biliary filtration, single), as an additional, relevant code, which may be used in combination with XW053T9 to more uniquely identify procedures involving the use of HEPZATO™ KIT. The applicant provided a list of diagnosis codes that may be used to currently identify the indication for HEPZATO™ KIT under the ICD-10-CM coding system.

Please refer to the online application posting for the complete list of ICD-10-CM and ICD-10-PCS codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered “new” for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that HEPZATO™ KIT is not substantially similar to other currently available technologies because it offers the first liver-directed treatment option to patients with liver-dominant metastatic ocular melanoma (mOM) who may be poor candidates for liver resection and/or who may have difficulty tolerating systemic chemotherapy. According to the applicant, HEPZATO™ KIT uses a unique PHP procedure to isolate liver circulation and deliver a high concentration of melphalan to liver tumors via infusion followed by filtration of the hepatic venous flow to remove melphalan out of the blood with extracorporeal filters, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant’s assertions regarding the substantial similarity criteria. Please see the online application posting for HEPZATO™ KIT for the applicant’s complete statements in support of its assertion that HEPZATO™ KIT is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
<p>Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?</p>	<p>No</p>	<p>The HEPZATO™ KIT uses a liver-directed PHP procedure to isolate liver circulation and deliver a high concentration of the chemotherapeutic, melphalan to liver tumors via infusion followed by filtration of the hepatic venous flow to remove melphalan out of the blood with extracorporeal filters before returning the blood to the patient’s systemic circulation. Regional treatment of the liver is possible by utilizing its unique dual blood supply. Whereas normal liver cells receive their blood primarily from the portal vein, liver tumors are supplied almost exclusively (up to 95%) by the hepatic artery. This allows for isolation of the hepatic arterial inflow and venous outflow, where a 30-minute infusion of melphalan can be delivered directly to unresectable liver metastases while sparing healthy liver tissue by limiting systemic exposure. Chemosaturation with PHP relies on placing a unique double-balloon catheter percutaneously into the inferior vena cava to isolate the hepatic venous blood. High doses of melphalan can then be infused directly into the hepatic artery. A fenestrated section</p>

		in the double-balloon catheter allows the isolated hepatic blood to be filtered extra-corporeally before being returned to systemic circulation. There are currently no other FDA approved liver-directed therapies for patients with liver-dominant mOM.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	Use of the HEPZATO™ KIT will likely be assigned to the following DRGs where other chemotherapies administered during inpatient stays would also be assigned: 826 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with MCC); 827 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with CC); 828 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures without CC/MCC); 829 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with other Procedures with CC/MCC); 830 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with other Procedures without CC/MCC); 846 (Chemotherapy without Acute Leukemia as Secondary Diagnosis with MCC); 847 (Chemotherapy without Acute Leukemia as Secondary Diagnosis with CC); or 848 (Chemotherapy without Acute Leukemia as Secondary Diagnosis without CC/MCC).
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	The HEPZATO™ KIT treats patients with liver-dominant mOM who may be poor candidates for liver resection and/or who may have difficulty tolerating systemic chemotherapy. This patient population does not have FDA approved treatment options available. Where possible, metastatic ocular melanoma is treated through surgical resection, although this is not always feasible, and clinicians may employ a range of liver-directed and systemic therapies. Liver-directed therapies can be utilized to deliver targeted treatment to the liver, including regional isolation perfusion of the liver, embolization techniques, and ablative procedures. Systemic therapies use drugs to deliver treatment throughout the body via blood circulation so as to have an effect on all cells throughout the body, including cancerous cells. However, there are currently no systemic therapies that have reliably demonstrated improvement in overall survival outcomes in patients with mOM in the liver.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36060), we invited public comments on whether HEPZATO™ KIT is substantially similar to existing technologies and whether HEPZATO™ KIT meets the newness criterion. We also invited public comments on drug-device combination technology considerations for new technology add-on payments. Specifically, we stated that we were seeking comment on whether reformatting the delivery mechanism for a drug would represent a new mechanism of action for drug-device combination technologies, and on factors that should be considered when considering new technology add-on payments for technologies that may use a drug or device component that is no longer new in combination with a new drug or device component.

Comment: We received several comments regarding the newness criterion stating general support for HEPZATO™ KIT as a new treatment for uveal melanoma patients.

Response: We thank commenters for their input.

Comment: The applicant submitted a public comment reiterating that HEPZATO™ KIT does not use the same or a similar mechanism of action when compared to existing technologies to treat mOM and uses a different and novel technology as compared to existing technologies. The applicant stated that HEPZATO™ KIT uses a liver-directed PHP procedure to isolate liver circulation and deliver a high concentration of the chemotherapeutic drug melphalan to liver tumors via infusion, followed by filtration of the hepatic venous flow to remove melphalan from the blood with extracorporeal filters before returning the blood to the patient's systemic circulation. The applicant stated that HEPZATO™ KIT is the only FDA-approved product that saturates the entire liver with high-dose chemotherapy, thus allowing complete treatment of the liver metastases that are often the life-limiting component for mOM patients. The applicant further explained that melphalan was not approved by FDA to treat liver metastases from uveal melanoma until the approval of HEPZATO™ KIT.⁶⁵ The applicant further asserted that other liver-directed treatments only treat specific liver tumors and do not treat smaller tumors or micro-metastases, which limits the efficacy and beneficial clinical outcomes of other treatments in many mOM patients. Therefore, by uniquely saturating the whole liver with a high dose of a proven chemotherapy agent, the applicant asserted that HEPZATO™ KIT treats not only specific liver tumors, but also the multiple small tumors and micro-metastases in mOM. The applicant also stated that another liver-directed therapy, transarterial chemoembolization (TACE), does not treat the whole liver, leaving the patient prone to disease progression due to the growth of the untreated, smaller lesions. The applicant further explained that, in contrast, HEPZATO™ KIT's

⁶⁵ *Drugs Approved for Melanoma*, National Cancer Institute, <http://www.cancer.gov/about-cancer/treatment/drugs/melanoma> (last updated April 1, 2024).

extracorporeal hemofiltration allows for administration of up to 12 times the conventional intravenous melphalan dose, while limiting systemic toxicities to manageable levels.⁶⁶

The applicant also stated that by isolating the liver throughout the procedure and actively filtering out melphalan during the 30-minute infusion and subsequent 30-minute washout period, HEPZATO™ KIT creates an improved tumor response of 36.3 percent as compared to 12.5 percent of best alternative care (BAC) patients ($p=0.013$), and 7.7 percent of patients achieved a complete response in this difficult-to-treat disease.⁶⁷ Finally, the applicant stated that because treatment with HEPZATO™ KIT is minimally invasive, patients can receive multiple treatments extending the duration of response (DOR), resulting in patients with an objective response to treatment with HEPZATO™ KIT achieving responses that lasted for a median of 14 months compared to a reported median DOR of 11.1 months for patients treated with KIMMTRAK®.

Response: We thank the applicant for its comments. Based on our review of comments received and information submitted by the applicant as part of its FY 2025 new technology add-on payment application for HEPZATO™ KIT, we agree with the applicant that HEPZATO™ KIT uses a unique mechanism of action because it is the only FDA-approved product that isolates the liver circulation and allows for the delivery of a high concentration of a chemotherapeutic agent to liver tumors while limiting systemic exposure. Therefore, we agree with the applicant that HEPZATO™ KIT is not substantially similar to existing treatment options and meets the newness criterion. We consider the beginning of the newness period to commence on January 8, 2024, when HEPZATO™ KIT became available for sale on the market.

Comment: In response to the request for comments on drug-device combination technology considerations for new technology add-on payments, the applicant stated that CMS should consider whether the combination either offers a treatment option for a patient population

⁶⁶ Aronson JK. Meyler's side effects of drugs: The international encyclopedia of adverse drug reactions and interactions. Elsevier Science & Technology; 2015:822.

⁶⁷ Zager JS, Orloff M, Ferrucci PF, et al. Efficacy and Safety of the Melphalan/Hepatic Delivery System in Patients with Unresectable Metastatic Uveal Melanoma: Results from an Open-Label, Single-Arm, Multicenter Phase 3 Study. *Ann Surg Oncol*. Published online May 4, 2024. doi:10.1245/s10434-024-15293-x.

unresponsive to, or ineligible for, currently available treatments or significantly improves clinical outcomes relative to technologies previously available. The applicant asserted that approving technologies like HEPZATO™ KIT signals CMS's support of finding new methodologies to repurpose older drugs that, under an existing technology, are not effective in treating specific cohorts of the targeted disease population. Another commenter expressed concern that there could be a scenario where a new drug-device combination product, with the potential to provide meaningful improvements to a specific patient population, is not approved for new technology add-on payment, limiting patient access to the treatment, despite meeting the substantial clinical improvement criterion because the newness criterion was not set up to evaluate the technology appropriately. The commenter further stated that if a substantial clinical improvement is not evaluated if the newness criterion is not satisfied, then there is a risk that treatments providing meaningful improvements could be overlooked. The commenter stated that the mechanism of action should be evaluated for the treatment provided by the drug-device combination, as a whole. Specifically, the commenter stated that if the mechanism of action for treatment provided with the drug-device combination is different from that of treatment with just the drug component that is no longer new, or that of treatment with the device component that is no longer new with a different drug, then it should not be considered substantially similar. The commenter also stated that the specific patient population that benefits from the drug-device combination should also be considered carefully when making a determination of substantial similarity, and that if the drug device combination provides treatment for the same type of disease as a drug or device component that is not considered new, the specific populations for both need to be compared. The commenter stated that if the drug-device combination provides meaningful treatment to a broader or more specific patient population, it should not be considered substantially similar. Additionally, the commenter stated that if the drug device combination provides meaningful treatment to the same patients that are treated with the existing drug or device component that is not new, but the drug-device combination provides a new

treatment option for patients that do not respond well to the existing treatment options, the drug-device combination should not be considered substantially similar. The commenter stated that these considerations align with the criteria currently used to evaluate if technologies applying for new technology add-on payment would be considered substantially similar to existing treatment options, but that the current language for the third criterion for substantial similarity (that is, the new use of the technology involves the treatment of the same or similar type of disease and patient population when compared to an existing technology) is broad enough to cause drug-device combinations to be overlooked without evaluating the clinical improvement they may provide for specific patients. The commenter stated that if a drug-device combination provides treatment for patients that do not respond well to existing treatment options, then the patient populations could be considered "similar", however, it is important to evaluate the clinical improvement of the drug-device combination to identify if it would serve as a potential new treatment for patients running out of treatment options with the long-term goal of reducing the number of treatments these patients need to try before finding an effective solution.

Response: We thank the commenters for their feedback. We will continue to consider these issues relating to the assessment of the mechanism of action for a technology involving a drug-device combination. We agree that the specific patient population that benefits from the drug-device combination should be considered carefully, and that if the drug device combination provides treatment for the same type of disease as a drug or device component that is not considered new, the patient population being treated should be assessed. We note that the third criterion for substantial similarity (that is, the new use of the technology involves the treatment of the same or similar type of disease and patient population when compared to an existing technology) involves these considerations. However, where the commenter stated that if a new technology add-on payment applicant's technology is being assessed for substantial similarity with another technology, and the applicant technology treats a narrower population (and the

technologies are otherwise the same or substantially similar under our criteria), we disagree that the applicant technology should be determined to not be substantially similar.

Regarding the concern that the third criterion for substantial similarity is broad enough to cause drug-device combinations to be overlooked without evaluating the clinical improvement they may provide for specific patients, and also the applicant's comment that CMS should consider whether the combination either offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments or significantly improves clinical outcomes relative to technologies previously available, we do not agree that we should evaluate clinical improvement while assessing the newness criterion. Rather, we follow a logical sequence of determinations, moving from the newness criterion to the cost criterion and finally to the substantial clinical improvement criterion, as discussed in the FY 2006 IPPS final rule. Therefore, we are reluctant to import substantial clinical improvement considerations into the decision about whether technologies are new (70 FR 47348). Regarding patient populations unresponsive to, or ineligible for, currently available treatments, as noted, the third criterion for substantial similarity considers whether the new use of the technology involves the treatment of the same or similar type of disease and patient population when compared to an existing technology.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that it meets the cost criterion. For each analysis, the applicant searched the FY 2022 MedPAR file using a combination of ICD-10-CM and/or PCS codes to identify potential cases representing patients who may be eligible for HEPZATO™ KIT. The applicant explained that it used different codes to demonstrate different cohorts that may be eligible for HEPZATO™ KIT because it is indicated for a rare condition, hepatic-dominant mOM, which does not have a unique ICD-10-CM diagnosis code to identify potential cases with the specific diagnosis of interest, nor a unique ICD-10-PCS procedure code that would identify patients receiving this specific procedure. The applicant believed the cases identified in the analysis are the closest

proxies to the cases potentially eligible for the use of HEPZATO™ KIT. Each analysis followed the order of operations described in the table later in this section.

For the first analysis, the applicant searched for cases with ICD-10-PCS code 3E05305 (Introduction of other antineoplastic into peripheral artery, percutaneous approach) for the PHP procedure, and ICD-10-CM code Z51.11 (Encounter for antineoplastic chemotherapy) as the primary diagnosis for the administration of chemotherapy during an inpatient stay. In addition, the applicant narrowed the analysis to cases with liver-dominant mOM using at least one secondary liver metastases diagnosis plus at least one ocular melanoma diagnosis. Please see the online posting for HEPZATO™ KIT for the complete list of codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 11 claims mapping to one MS-DRG: 829 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Other Procedures with CC/MCC). The applicant calculated a final inflated average case-weighted standardized charge per case of \$1,068,530, which exceeded the average case-weighted threshold amount of \$104,848.

For the second analysis, the applicant searched for the following combination of ICD-10-CM diagnosis codes: Z51.11 (Encounter for antineoplastic chemotherapy) as the primary diagnosis code, in combination with at least one of the following secondary liver metastases codes: C78.7 (Secondary malignant neoplasm of liver and intrahepatic bile duct), or C22.9 (Malignant neoplasm of liver, not specified as primary or secondary). The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 1,134 claims mapping to nine MS-DRGs, with 94 percent of identified cases mapping to three MS-DRGs: 829 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Other Procedures with CC/MCC), as well as 846 and 847 (Chemotherapy without Acute Leukemia as Secondary Diagnosis with MCC, and with CC, respectively). The applicant calculated a final inflated average case-weighted standardized charge per case of \$1,066,207, which exceeded the average case-weighted threshold amount of \$81,652.

For the third analysis, the applicant searched for cases where the ICD-10-CM code Z51.11 (Encounter for antineoplastic chemotherapy) is the primary diagnosis or the ICD-10 PCS code 3E05305 (Introduction of other antineoplastic into peripheral artery, percutaneous approach) is reported. In addition, the case also needed to include at least one of the following secondary liver metastases codes: C78.7 (Secondary malignant neoplasm of liver and intrahepatic bile duct) or C22.9 (Malignant neoplasm of liver, not specified as primary or secondary). The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 1,277 claims mapping to 12 MS-DRGs with 92 percent of identified cases mapping to three MS-DRGs: 829 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Other Procedures with CC/MCC); as well as 846 and 847 (Chemotherapy without Acute Leukemia as Secondary Diagnosis with MCC, and with CC, respectively). The applicant calculated a final inflated average case-weighted standardized charge per case of \$1,067,772, which exceeded the average case-weighted threshold amount of \$80,245.

For the fourth analysis, the applicant searched for cases reporting the following combination of ICD-10-CM diagnosis codes: C78.7 (Secondary malignant neoplasm of liver and intrahepatic bile duct) or C22.9 (Malignant neoplasm of liver), in combination with at least one ocular melanoma ICD-10-CM code. Please see the online posting for HEPZATO™ KIT for the complete list of codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 1,059 claims mapping to 91 MS-DRGs with none exceeding 4.91 percent. The applicant calculated a final inflated average case-weighted standardized charge per case of \$1,062,553, which exceeded the average case-weighted threshold amount of \$66,104.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that HEPZATO™ KIT meets the cost criterion.

⁶⁸ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

	<p>least one of the following secondary liver metastases ICD-10-CM codes: C78.7 (Secondary malignant neoplasm of liver and intrahepatic bile duct) or C22.9 (Malignant neoplasm of liver, not specified as primary or secondary). The applicant provided this analysis to focus on the melphalan hydrochloride chemotherapy component of the HEPZATO™ KIT.</p> <p>Analysis 3: The applicant selected claims based on the ICD-10-CM diagnosis code Z51.11 (Encounter for antineoplastic chemotherapy) as the primary diagnosis and/or reporting of the ICD-10-PCS code listed previously. In addition, cases must include at least one of the following secondary liver metastases codes: C78.7 (Secondary malignant neoplasm of liver and intrahepatic bile duct) or C22.9 (Malignant neoplasm of liver, not specified as primary or secondary). The applicant included this analysis to focus on the combination of the melphalan hydrochloride chemotherapy component of the HEPZATO™ KIT and the PHP procedure.</p> <p>Analysis 4: The applicant selected claims based on reporting of at least one secondary liver metastasis diagnosis [either C78.7 (Secondary malignant neoplasm of liver and intrahepatic bile duct) or C22.9 (Malignant neoplasm of liver)], in combination with at least one ocular melanoma ICD-10-CM code. Please see the online posting for HEPZATO™ KIT for the complete list of ICD-10-CM codes provided by the applicant. The applicant provided this analysis to demonstrate how the costs/charges of HEPZATO KIT compared to existing treatment options for liver-dominant mOM, so the focus was inclusion of diagnosis codes for the target patient population.</p>
Charges removed for prior technology	The applicant stated HEPZATO™ KIT is expected to replace other drugs patients currently receive for the treatment of metastatic ocular melanoma. As such, averages of charges (per MS-DRG) associated with the drug cost center in the FY 2022 MedPAR file were removed. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Standardizing and Impact Files posted with the FY 2022 IPPS/LTCH PPS final rule correction notice.
Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.18 for drugs from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36062), we invited public comments on whether HEPZATO™ KIT meets the cost criterion.

Comment: Multiple commenters stated that DRG payment to the hospitals will not be sufficient to account for the cost of the HEPZATO™ KIT treatment. The applicant commented that the MS-DRG rate otherwise applicable to the HEPZATO™ KIT is inadequate, and stated that use of the HEPZATO™ KIT will likely fall within one of the following MS-DRGs where other chemotherapies administered during inpatient stays would also be assigned: 826 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with MCC); 827 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures with CC); 828 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Major O.R. Procedures without CC/MCC); 829 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with other Procedures with CC/MCC); 830 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with other Procedures without CC/MCC); 846 (Chemotherapy without Acute Leukemia as Secondary Diagnosis with MCC);

847 (Chemotherapy without Acute Leukemia as Secondary Diagnosis with CC); or 848 (Chemotherapy without Acute Leukemia as Secondary Diagnosis without CC/MCC). The applicant stated that the payment rate for each of these MS-DRGs is far below the cost of HEPZATO™ KIT, which is reported in REDBOOK as having a wholesale acquisition cost of \$182,500 per 250 mg. The applicant stated that, as such, HEPZATO™ KIT clearly qualifies under the cost test for new technology add-on payment designation.

Response: We thank commenters for their comments.

We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all the scenarios. Therefore, HEPZATO™ KIT meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that HEPZATO™ KIT represents a substantial clinical improvement over existing technologies because it offers a minimally invasive, targeted, effective, and safe treatment option to patients with liver-dominant mOM who may be poor candidates for liver resection or who may have difficulty tolerating systemic chemotherapy which results in a substantial clinical improvement in response and survival rates over best available care (BAC) and quality of life compared to pre-treatment. The applicant provided 11 studies to support these claims, as well as one background article about use of chemosaturation with PHP (CS-PHP) as a palliative treatment option for patients with unresectable cholangiocarcinoma.⁶⁹ The following table summarizes the applicant’s assertions regarding the substantial clinical improvement criterion. Please see the online posting for HEPZATO™ KIT for the applicant’s complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	Supporting evidence provided by the applicant
Offers a treatment option for a patient population	None Provided.

⁶⁹ Background articles are not included in the following table but can be accessed via the online posting for the technology.

unresponsive or ineligible for, currently available treatments	
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36064 through 36066), after review of the information provided by the applicant, we stated we had the following concerns regarding whether HEPZATO™ KIT meets the substantial clinical improvement criterion. With respect to the applicant’s assertion that HEPZATO™ KIT offers a treatment option for a patient population unresponsive or ineligible for currently available treatments, while the applicant stated that HEPZATO™ KIT offers an additional treatment option to patients with liver-dominant mOM who may be poor candidates for liver resection or who may have difficulty tolerating systemic chemotherapy, we stated the applicant did not provide evidence in support of this assertion. We noted that we would be interested in information regarding whether there are potential Medicare patient populations that may have difficulty tolerating (or be unresponsive to) KIMMTRAK® or other currently available treatments but would be a good candidate for HEPZATO™ KIT.

Regarding the claim that HEPZATO™ KIT improves survival over other treatment options, we stated that the applicant provided seven peer-reviewed cohort studies, summary material from an unpublished study, and one randomized controlled clinical study to support the

claim. We noted that the seven peer reviewed cohort studies^{70,71,72,73,74,75,76} provided a range of results of overall survival as reported for patients treated with the HEPZATO™ KIT (median overall survival after first CS-PHP ranged from 9.6 months to 27.4 months depending on the study, and median 1-year overall survival rate ranged from 44 percent to 77 percent depending on study). A few of the seven peer-reviewed cohort studies (Karydis et al. (2018); Tong et al. (2022); Meier et al. (2021)) reported statistically significant improvement in overall survival (OS) when compared to non-responders or stable disease groups. Only one of the seven studies, Dewald et al. (2021), compared results to alternative treatments, but statistical significance was not achieved (P = 0.97) with CS-PHP resulting in a median OS of 24.1 months compared with 23.6 months for patients receiving other therapies. We noted that we believed additional evidence supporting that HEPZATO™ KIT offers a significant difference in OS rates compared to currently available treatments would be helpful in our evaluation of the applicant's assertion. We also stated that several of the studies provided as evidence include small, non-randomized studies without the use of comparators or controls, which may affect the ability to draw meaningful conclusions about treatment outcomes from the results of the studies. We also noted that a majority of the studies provided (Bruning et al. (2020); Vogl et al. (2017); Dewald et al. (2021); Meijer et al. (2021); and Artzner et al. (2019)) were conducted outside the U.S. We

questioned if there may be differences in treatment guidelines between these countries that may have affected clinical outcomes.

We stated that the applicant also submitted summary presentation material evidence to support this claim in the form of a poster and slides for the FOCUS study,⁷⁷ in which 144 patients were enrolled, with 91 patients receiving PHP treatment and 32 patients receiving BAC. According to the applicant, preliminary results from the phase III FOCUS Trial show that progression free survival (PFS) was 9.03 months among PHP patients and just over 3 months among BAC patients. OS among treated PHP patients was 19.25 months and among treated BAC patients was 14.49 months. However, this study had yet to be published and was not yet available for analysis and peer review. We stated that as of the time of the proposed rule, we were unable to verify the methods, results, and conclusions of this study as the applicant only provided evidence in the form of a poster and presentation. For example, one citation provided by the applicant in the form of a non-peer-reviewed conference presentation details preliminary results from the FOCUS Phase III Trial. We noted we would be interested in the statistical analysis (including p value and CI data) surrounding the OS rates. In addition, we stated that the poster notes that due to slow enrollment and patient reluctance to receive BAC treatment, the trial design was amended to a single arm design with all eligible patients receiving PHP after discussion with FDA. We noted we would be interested in detail about these specific eligibility requirements, as well as how the potential for confounding variables resulting from any differences in the resulting populations were identified and mitigated.

We further noted that in the published randomized clinical trial⁷⁸ (RCT) provided by the applicant, the median hepatic progression free survival (hPFS), the primary endpoint of the trial, was 7.0 months for patients using HEPZATO™ KIT compared to 1.6 months for patients

⁷⁷ Delcath ASCO 2022 FOCUS Trial Poster; FOCUS Trial Ongoing (See online posting for Hepzato™ Kit).

⁷⁸ Hughes MS, Zager J, Faries M, et al. Results of a Randomized Controlled Multicenter Phase III Trial of Percutaneous Hepatic Perfusion Compared with Best Available Care for Patients with Melanoma Liver Metastases. *Ann Surg Oncol.* Apr 2016;23(4):1309-19.

receiving BAC. However, the median overall survival (OS) with the treatment of HEPZATO™ KIT was 10.6 months (95 percent CI 6.9–13.6 months) compared to 10.0 months (95 percent CI 6.0–13.1 months) for the group of patients who received BAC. We stated that the study notes that median OS was not significantly different (PHP-Mel 10.6 months vs. BAC 10.0 months), but OS was 13.1 months (95 percent CI 10.0–20.3 months) in BAC patients who crossed over and received treatment with PHP-Mel (n = 28, 57.1 percent). In the study discussion of OS, Hughes et al. concluded that the 57 percent of patients who were allowed to crossover confounded the ability to analyze any survival advantage associated with PHP Mel. We noted we would be interested in additional evidence in our evaluation of the applicant's assertion that HEPZATO™ KIT substantially improves survival over other treatment options.

Regarding the claim that HEPZATO™ KIT increases response rate over BAC, we noted that across the retrospective studies, response rates ranged from an overall response rate of 42.3 percent [Dewald et al (2021)] to a partial response of 89 percent [Vogl et al. (2017)] depending on the study. However, as the applicant cited many of the same retroactive studies that it referenced in support of the claim of improved survival [Bruning et al. (2020); Vogl et al. (2017); Dewald et al. (2021); Meijer et al. (2021); Artzner et al. (2019); Tong et al. (2022); Karydis et al. (2018)], we noted we had the same questions as discussed previously regarding the ability to draw meaningful conclusions from the results of these studies in evaluation of this claim.

Regarding the unpublished FOCUS study (Delcath ASCO 2022 FOCUS Trial Poster),⁷⁹ previously described, the applicant stated that in the preliminary results from the FOCUS Trial, the overall response rate (ORR) among PHP patients was 36.3 percent, nearly three times better than that of the 12.5 percent ORR among BAC patients. However, as previously noted, we stated we would be interested in details about the eligibility requirements, and how the potential for

⁷⁹ Delcath ASCO 2022 FOCUS Trial Poster; FOCUS Trial Ongoing (See online posting for Hepzato™ Kit).

confounding variables resulting from any differences in the resulting populations were identified and mitigated.

Lastly, we stated that with regard to the assertion that HEPZATO™ KIT improves quality of life over pre-treatment, the applicant submitted the Vogl et al. (2017) study as evidentiary support. The study was a retrospective, multi-center study reporting outcome and safety after percutaneous isolated hepatic perfusion (PIHP) with Melphalan for patients with uveal melanoma and metastatic disease limited to the liver. Thirty-five PIHP treatments were performed in 18 patients (8 male, 10 female) at seven hospitals across the U.S and Germany between January 2012 and December 2016. Patients' life quality was assessed using four-point scale questionnaires to rate overall health and life quality after therapy, how much their health and quality of life had changed after therapy, and how pleased they were with PIHP. We noted that the study used a subjective four-point measurement scale to determine quality-of-life used in the study. We stated that we questioned if a more objective assessment tool would be more helpful in evaluating a patient's quality of life. We noted it was unclear if the survey questions were asked verbally, and by whom, or if the survey was answered in writing by the patient alone. As the study was not randomized and the patients' responses were not anonymous, we noted that we questioned if there may have been resulting response bias, or interviewer bias that would impact our ability to draw meaningful conclusions about a subjective measurement of improved quality of life. In addition, we noted that the study utilized the Delcath Hepatic CHEMOSAT® Delivery System for Melphalan components as part of the treatment, and it was unclear if the technologies used in the study were the same as HEPZATO™ KIT, or what differences may exist between the technologies. We noted we would be interested in information about any differences between Delcath's HEPZATO™ KIT and the technologies used in this study for PIHP with Melphalan.

We invited public comments on whether HEPZATO™ KIT meets the substantial clinical improvement criterion.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS’s concerns from the proposed rule. The applicant asserted that HEPZATO™ KIT is the only FDA-approved therapy for the approximately 55 percent of patients with mOM who are not eligible for KIMMTRAK® or whose disease has progressed despite using other therapies. The applicant further asserted that the mechanism of action in KIMMTRAK® depends on the presence of the HLA-A*02:01 allele and only approximately 45 percent of people in the U.S. are HLA-A*02:01–positive. Therefore, the applicant concluded that more than half of patients with mOM are ineligible for KIMMTRAK® treatment. The applicant also stated that all patients in the FOCUS study had unresectable liver metastases, and that accordingly, the FOCUS study results demonstrate efficacy for this patient population. The applicant stated that at the doses that patients can tolerate, systemic chemotherapy has been found to have low efficacy. The applicant also cited study results asserting that single-agent and combination chemotherapies have mostly been ineffective in patients with metastatic uveal melanoma, with ORRs ranging from zero to eight percent with the alkylating agents dacarbazine or temozolomide and up to 10 percent with fotemustine, and that most of these clinical studies have been nonrandomized single-arm trials, with only eight randomized trials evaluating systemic therapy alone completed since 2000.⁸⁰ Lastly, the applicant asserted the evidence demonstrates that HEPZATO™ KIT is effective in Medicare beneficiaries who are unresponsive to, or have difficulty tolerating, other treatments. The applicant stated that a subgroup analysis of the FOCUS study demonstrates that HEPZATO™ KIT is a treatment option for Medicare-age patients, as there were similar ORR, OS, and PFS results in patients ≥ 65 years old and < 65 years old, and differences were not statistically significant. The applicant stated that a large proportion of Medicare-aged mOM patients first treated with KIMMTRAK® are likely to experience disease progression and

⁸⁰ Carvajal 2023, supra note 2, p. 107.

leading immunotherapies have relatively short PFS in mOM patients; therefore, both categories of patients would be good candidates for treatment with HEPZATO™ KIT.

The applicant noted that the previously unpublished FOCUS study (Delcath ASCO 2022 FOCUS Trial Poster) has since been published, but did not make the study available for review.⁸¹ In response to our interest in receiving additional detail about specific eligibility requirements and how potential for confounding variables resulting from any differences in the resulting populations were identified and mitigated, the applicant stated that the study began as a randomized trial with two treatment arms (HEPZATO™ KIT and BAC), but at the midpoint of the trial, many patients randomized to the BAC arm withdrew consent prior to treatment. Per the applicant, subsequent to discussion with FDA and investigators, all parties supported amending the trial to a single-arm design, in which all enrolled patients would receive melphalan/HDS treatment. The applicant stated that potential differences in demographic and baseline characteristics between patients in the two portions of the study were examined and no significant differences were found among potential confounding variables. Per the applicant, patients in the FOCUS study who had received prior therapy and patients who had not been treated for mOM experienced similar ORR (37.5 percent and 35.3 percent; $p=0.83$), OS (20.83 months and 20.53 months; $p=0.499$), and PFS (9.18 months and 9.00 months; $p=0.86$). The applicant also provided a subgroup analysis of patients in the FOCUS study ≥ 65 years old and < 65 years old and stated that there were statistically insignificant differences in ORR (30.0 percent and 39.3 percent; $p=0.488$), OS (20.53 months and 20.83 months; $p=0.574$), and PFS (9.00 months and 9.07 months; $p=0.494$). The applicant provided additional FOCUS study results, noting patients treated with HEPZATO™ KIT, who were treatment-naive (56.0 percent) or previously treated (44.0 percent) and could have limited extrahepatic disease (29.7 percent), had an ORR of 36.3 percent (95 percent CI: 26.44, 47.01) with 7.7 percent complete response and

⁸¹ Zager JS, Orloff M, Ferrucci PF, et al. Efficacy and Safety of the Melphalan/Hepatic Delivery System in Patients with Unresectable Metastatic Uveal Melanoma: Results from an Open-Label, Single-Arm, Multicenter Phase 3 Study. *Ann Surg Oncol*. Published online May 4, 2024. doi:10.1245/s10434-024-15293-x.

28.6 percent partial response; tumor responses were durable, with a median DOR of 14.0 months (95 percent CI: 8.31, 17.74); disease control rate was 73.6 percent (95 percent CI: 63.35, 82.31); median OS was 20.5 months (95 percent CI: 16.79, 25.26); and median PFS was 9.0 months (95 percent CI: 6.34, 11.56). Lastly, the applicant expressed its opinion that the retrospective single-center and multicenter investigations of mOM patients in Europe reinforce the conclusion of HEPZATO™ KIT's efficacy noting that in general, these studies have found ORR and PFS results that are similar to or exceed those reported in the FOCUS study and OS results similar to or exceeding the typical OS of mOM patients (approximately 12 months), with five of the seven studies reporting a median OS between 14.9 and 27.4 months.

In response to CMS's request for additional evidence that HEPZATO™ KIT substantially improves survival over other treatment options, the applicant stated that the Dewald et al. (2021) study⁸² supports this claim and reported an ORR of 42.3 percent and disease control rate (DCR) of 80.8 percent, exceeding those reported in the literature for alternative treatments for mOM (DCR range of 64.7 percent to 80.2 percent). The applicant cited another study, Dewald et al. (2022), which reports on a larger group of patients and treatments (66 patients, 145 treatments) that reported an ORR 59 percent, a DCR of 93.4 percent, and a median OS of 18.4 months.⁸³ The applicant also provided details on a post-hoc analysis of FOCUS study patients treated with HEPZATO™ KIT, in which Zager and colleagues (2024) reported that patients treated with HEPZATO™ KIT were found to have a statistically significant relationship between OS and best overall response. According to the applicant, the results from a post hoc analysis of the relationship between tumor response and survival demonstrated a statistically significant difference ($p < 0.0001$) between the patients who had a best overall response of partial response [median OS of 28.2 months (95 percent CI, 23.46–34.46 months)], stable disease [median OS of

⁸² Dewald CLA, Hinrichs JB, et al. Chemosaturation with Percutaneous Hepatic Perfusion: Outcome and Safety in Patients with Metastasized Uveal Melanoma. *Rofo*. 2021 Aug;193(8):928-936. English, German. doi: 10.1055/a1348-1932. Epub 2021 Feb 3.

⁸³ Dewald CLA, Warnke MM, et al. Percutaneous Hepatic Perfusion (PHP) with Melphalan in Liver-Dominant Metastatic Uveal Melanoma: The German Experience. *Cancers (Basel)*. 2022 Jan; 14(1): 118. doi: 10.3390/cancers14010118.

19.3 months (95 percent CI, 15.90–23.00 months)], and progressive disease [median OS of 12.0 months (95 percent CI, 8.18–14.03 months)].⁸⁴ According to the applicant, this correlation between response and survival suggests that the favorable response rate seen with HEPZATO™ KIT leads to beneficial survival outcomes relative to other treatments.

Regarding the claim that HEPZATO™ KIT improves quality of life over pre-treatment, the applicant stated that CMS questioned whether the Vogel study was reliable, given that it was unclear whether the study survey questions were asked verbally, and by whom, or if the survey was answered in writing by the patient alone. The applicant acknowledged that the details related to the conduct of the survey were not reported in the 2017 article by Vogel and colleagues, so response bias and interviewer bias cannot be ruled out. The applicant further stated that there is no reason to believe the study authors did not control for bias, and that the Vogel study is only one of many studies that demonstrated efficacy. The applicant cited a single-center, prospective cohort study of patient-reported quality of life assessments collected before and after treatment with CHEMOSAT® in which patients completed the European Organization for Research and Treatment of Cancer (EORTC) QLQ-C30 version 3, a validated self-report questionnaire that assesses quality of life (QoL) in cancer patients and consists of a global health status scale, functional scales, and symptom scales.⁸⁵ The study authors found that global health status 21 days after treatment with CHEMOSAT® was consistent with global health status pre-treatment, despite temporary decreases in global health status scores at day 2/3 and day 7 post-treatment. Specifically, the study authors concluded that CHEMOSAT® treatment has limited impact on QoL of patients with metastasized UM, and that the general GHS returns to baseline within 3 weeks despite moderate decline in fatigue and physical and role functioning scores. Regarding CMS's concern that it was unclear if the technologies used in the study are the same as

⁸⁴ Zager JS, Orloff M, Ferrucci PF, et al. Efficacy and Safety of the Melphalan/Hepatic Delivery System in Patients with Unresectable Metastatic Uveal Melanoma: Results from an Open-Label, Single-Arm, Multicenter Phase 3 Study. *Ann Surg Oncol*. Published online May 4, 2024. doi:10.1245/s10434-024-15293-x.

⁸⁵ Tong TML, Fiocco M, van Duijn-de Vreugd JJ, et al. Quality of life analysis of patients treated with percutaneous hepatic perfusion for uveal melanoma liver metastases. *Cardiovasc Intervent Radiol*. Published online April 8, 2024. doi:10.1007/s00270-024-03713-0.

HEPZATO™ KIT, or what differences may exist between the technologies (89 FR 36066), the applicant stated that in Europe the marketed product known as CHEMOSAT® uses the same procedural “Instructions for Use” as the HEPZATO™ KIT. The applicant further stated that the only difference between CHEMOSAT® used in treatments outside the US and HEPZATO™ KIT used in the FOCUS study is that CHEMOSAT® is used in conjunction with the hospital’s melphalan supply, whereas HEPZATO™ KIT is prepackaged with melphalan.

We received several additional comments in support of the application for HEPZATO™ KIT. Generally, these additional commenters stated that HEPZATO™ KIT provides a clinically meaningful pathway for mOM patients who previously did not have an approved treatment option and asserted that such treatments will continue to improve outcomes and ultimately make mOM a survivable disease. The commenters asserted that approval would increase access to treatments for a patient population with very limited treatment options, and some of these commenters cited aforementioned study results, inclusive of the FOCUS trial response rates and noting a statistically significant relationship between overall survival and best overall response in patients treated with HEPZATO™ KIT.

We also received one comment stating that it did not support approval of HEPZATO™ KIT. The commenter stated its belief that HEPZATO™ KIT is not necessarily safer or easier to tolerate because patients receiving treatment with HEPZATO™ KIT in the Zager et al. (2024)⁸⁶ study experienced a higher rate of treatment discontinuation due to adverse events (17.9 percent) compared to patients in another study who received treatment with KIMMTRAK® (2 percent).⁸⁷ The commenter also asserted that between these two studies, there was a 73 percent 1-year survival rate for KIMMTRAK® and 80 percent 1-year survival rate for HEPZATO™ KIT. However, the commenter stated that patients in the FOCUS trial had better ECOG performance

⁸⁶ Zager JS, Orloff M, Ferrucci PF, et al. Efficacy and Safety of the Melphalan/Hepatic Delivery System in Patients with Unresectable Metastatic Uveal Melanoma: Results from an Open-Label, Single-Arm, Multicenter Phase 3 Study. *Ann Surg Oncol*. Published online May 4, 2024. doi:10.1245/s10434-024-15293-x.

⁸⁷ Nathan et al, *New England Journal of Medicine*, 2021;385:1196-1206

statuses and more stringent exclusion criteria, including limitations on extrahepatic disease. Lastly, the commenter asserted that, other than HLA-A*02:01-negative patients, there does not appear to be a population of mOM patients that would qualify for HEPZATO™ KIT therapy and not qualify for treatment with KIMMTRAK®.

Response: We thank the applicant and other commenters for their comments regarding the substantial clinical improvement criterion. Based on review of the information submitted by the applicant and the additional information received, we agree with the applicant that HEPZATO™ KIT offers a treatment option for adult patients with uveal melanoma with unresectable hepatic metastases who are ineligible for existing therapies because they may be poor candidates for liver resection or who may have difficulty tolerating systemic chemotherapy and are HLA-A*02:01-negative and therefore ineligible for treatment with KIMMTRAK®. Therefore, we agree that HEPZATO™ KIT represents a substantial clinical improvement over existing technologies.

After consideration of the public comments we received and the information included in the applicant's new technology add-on payment application, we have determined that HEPZATO™ KIT meets the criteria for approval for new technology add-on payment. Therefore, we are approving new technology add-on payments for this technology for FY 2025. Cases involving the use of HEPZATO™ KIT that are eligible for new technology add-on payments will be identified by ICD-10-PCS codes: XW053T9 (Introduction of melphalan hydrochloride antineoplastic into peripheral artery, percutaneous approach), in combination with 5A1C00Z (Performance of biliary filtration, single).

In its application, the applicant stated that the cost of HEPZATO™ KIT is \$182,500 per treatment and that patients will receive up to six treatments administered at a dose of 3 mg/kg of body weight, with a maximum dose of 220 mg in a single administration. The applicant anticipates an average of four treatments per patient (based on the median of four treatments per person in the FOCUS trial) but those treatments would be administered across four separate

inpatient stays as treatment cycles must take place 6-8 weeks apart. The average cost will therefore be \$182,500 per inpatient stay. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of HEPZATO™ KIT is \$118,625 for FY 2025.

g. Lantidra™ (donislecel-jujn (allogeneic pancreatic islet cellular suspension for hepatic portal vein infusion))

CellTrans Inc. submitted an application for new technology add-on payments for Lantidra™ for FY 2025. According to the applicant, Lantidra™ is an allogeneic pancreatic islet cellular therapy indicated for the treatment of adults with Type 1 diabetes (T1D) who are unable to approach target hemoglobin A1c (HbA1c) because of repeated episodes of severe hypoglycemia despite intensive diabetes management and education. Per the applicant, Lantidra™ is used in conjunction with concomitant immunosuppression. The applicant asserted that the route of administration for Lantidra™ is infusion into the hepatic portal vein only. The applicant noted that following transplant, the patient is monitored for graft function and safety issues, including potential adverse reactions due to immunosuppression. The applicant stated that the primary mechanism of action for Lantidra™ is the secretion of insulin by the beta cells within the infused allogeneic islet of Langerhans, which are responsible for regulating blood glucose levels in response to glucose stimulation.

Please refer to the online application posting for Lantidra™, available at <https://mearis.cms.gov/public/publications/ntap/NTP231017H5N2T>, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, Lantidra™ was granted approval for a Biologics License Application (BLA) from FDA on June 28, 2023, for the treatment of adults with T1D who are unable to approach target HbA1c because of current repeated episodes of severe hypoglycemia despite intensive diabetes management and education.

According to the applicant, the technology was commercially available on January 8, 2024. The applicant stated that the approved manufacturing site for Lantidra™ is at the University of Illinois (UI) Health, UI in Chicago and time was needed to transfer islet cell transplant clinical protocols to the UI Health transplant division.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36066), we noted that under national coverage determination (NCD) 260.3.1 Islet Cell Transplantation in the Context of a Clinical Trial, Medicare will pay for the routine costs, as well as transplantation and appropriate related items and services, for Medicare beneficiaries participating in a National Institutes of Health (NIH)-sponsored clinical trial(s). Specifically, Medicare will cover transplantation of pancreatic islet cells, the insulin producing cells of the pancreas. Coverage may include the costs of acquisition and delivery of the pancreatic islet cells, as well as clinically necessary inpatient and outpatient medical care and immunosuppressants. Because Lantidra™ may be covered by Medicare when it is used in the setting of a clinical trial, we stated we would evaluate whether Lantidra™ is eligible for new technology add-on payments for FY 2025. We noted that any payment made under the Medicare program for services provided to a beneficiary would be contingent on CMS's coverage of the item, and any restrictions on the coverage would apply.

The applicant stated that the recommended minimum dose is 5,000 equivalent islet number (EIN)/kg for the initial infusion, and 4,500 EIN/kg for subsequent infusion(s) in the same recipient. The maximum dose per infusion is dictated by the estimated tissue volume, which should not exceed 10 cc per infusion, and the total EIN present in the infusion bag (up to a maximum of 1×10^6 EIN per bag). A second infusion may be performed if the patient does not achieve independence from exogenous insulin within 1-year post-infusion or within 1-year after losing independence from exogenous insulin after a previous infusion. A third infusion may be performed using the same criteria as for the second infusion.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for Lantidra™ and was granted approval to use the following procedure code effective October

1, 2024: XW033DA (Introduction of donislecel-jujn allogeneic pancreatic islet cellular suspension into peripheral vein, percutaneous approach, new technology group 10).

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered new for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that Lantidra™ has not been assigned to the same MS-DRG when compared to an existing technology to achieve a therapeutic outcome. The following table summarizes the applicant’s assertions regarding the substantial similarity criteria. Please see the online application posting for Lantidra™ for the applicant’s complete statements in support of its assertion that Lantidra™ is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	Yes	According to the applicant, whole pancreas transplant is the only treatment currently available for type 1 diabetes with severe hypoglycemia. The applicant stated that Lantidra™ uses the same mechanism of action as whole pancreas transplant, that is, glucose responsive secretion of insulin from allogeneic islet beta cells once infused into the hepatic portal vein.
Is the technology assigned to the same MS-DRG as existing technologies?	No	A whole (solid) pancreas transplant is assigned to MS-DRG 010. The procedure to infuse Lantidra™ is distinct (via administration into the hepatic portal vein). Applicable MS-DRGs may be 637 (Diabetes with MCC), 638 (Diabetes with CC), 639 (Diabetes without CC/MCC).
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	Yes	Whole pancreas transplant and Lantidra™ are the only treatment options for patients who have not achieved glycemic control despite intensive insulin treatment and diabetes management. Lantidra™ is the only FDA approved cellular therapy to treat patients with Type 1 diabetes.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36067), we invited public comments on whether Lantidra™ is substantially similar to existing technologies and whether Lantidra™ meets the newness criterion.

Comment: The applicant submitted a public comment regarding the newness criterion. The applicant stated that in its application, it should have responded no to the question, “Does the use of the technology involve the treatment of the same/similar type of disease and the

same/similar patient population when compared to an existing technology?” The applicant further clarified that it did state in its application that, due to its minimally invasive administration, Lantidra™ addresses an unmet need for a small distinct subset of patients with hard-to-control T1D complicated by severe hypoglycemia who cannot receive a whole pancreas transplant due to medical or surgical risk.

Response: We thank the applicant for its clarification. Although the applicant states in its public comment that Lantidra™ treats a new patient population because it addresses an unmet need for a small distinct subset of patients with hard-to-control T1D complicated by severe hypoglycemia who cannot receive a whole pancreas transplant due to medical or surgical risk, we note in addition to whole pancreas transplant, there are other existing technologies for managing glucose control and hypoglycemia. Technologies that are currently available for use in patients with hard-to-control T1D include continuous glucose monitors and automated insulin delivery systems, which can be utilized to manage or reduce severe hypoglycemic episodes, such as the Medtronic MiniMed™ 670G system, Medtronic MiniMed™ 780G, and Tandem Diabetes Care Control-IQ® Technology. We therefore question the applicant’s assertion that Lantidra™ meets an unmet need for this specific patient population, given there are several other evidence-based treatment options available that may potentially manage the high glucose variability for this subset of patients.

We also agree with the applicant that the underlying mechanism of action of Lantidra™ is similar to that of whole pancreas transplant. However, we note that the mechanism of action for Lantidra™ is different than that of the previously mentioned technologies used for treatment in the subset of patients with hard-to-control T1D complicated by severe hypoglycemia who cannot receive a whole pancreas transplant due to medical or surgical risk, as identified by the applicant.

In addition, we note that although Lantidra™ would map to a different MS-DRG than whole (solid) pancreas transplant, we believe that Lantidra™ would map to the same MS-DRGs

as existing insulin delivery therapies and technologies used to treat the subset of patients with hard-to-control T1D complicated by severe hypoglycemia who cannot receive a whole pancreas transplant due to medical or surgical risk.

Therefore, based on our review of the comments received and information submitted by the applicant as part of its FY 2025 new technology add-on payment application for Lantidra™, we agree with the applicant that Lantidra™ is not substantially similar to existing treatment options because it has a unique mechanism of action compared to existing insulin delivery therapies and technologies when used to treat the subset of patients with hard-to-control T1D complicated by severe hypoglycemia who cannot receive a whole pancreas transplant due to medical or surgical risk. Therefore, Lantidra™ meets the newness criterion. We consider the beginning of the newness period to commence on January 8, 2024, when Lantidra™ became commercially available.

With respect to the cost criterion, the applicant included the two most recent patient cases with charges of Lantidra™ billed by a hospital that administered the technology, based on that hospital's billing data file on the undiscounted costs. The applicant stated that it attempted to identify potential cases representing patients who may be eligible for Lantidra™ by searching the FY 2022 MedPAR file and the 100 percent sample FY 2022 Standard Analytical Files (SAF) for cases reporting ICD-10-CM/PCS codes and MS-DRGs codes that were relevant to FDA-approved indication and administration of Lantidra™, however, it could not confirm if cost data from the two most recent patient cases were included in the FY 2022 MedPAR file or SAF. As a result, the applicant provided the charges billed by the hospital for these two cases. The applicant stated that the MS-DRG coded for the two cases was MS-DRG 639 (Diabetes without CC/MCC). The applicant followed the order of operations described in the following table and calculated a final inflated average case-weighted standardized charge per case of \$374,547, which exceeded the average case-weighted threshold amount of \$32,311. Because the final

inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that Lantidra™ meets the cost criterion.

LANTIDRA™ COST ANALYSIS	
Data Source and Time Period	2022 Undiscounted Costs from Hospital Billing Paid by Sponsor
List of MS-DRGs	639 (Diabetes without CC/MCC)
Inclusion/exclusion criteria	The applicant included two most recent patient cases with charges of Lantidra™ billed by the hospital.
Charges removed for prior technology	The applicant did not remove charges or indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2022 IPPS/LTCH PPS final rule and correction notice.
Inflation factor	The applicant applied an inflation factor of 10.00% to the standardized charges.
Charges added for the new technology	The applicant added the cost for Lantidra™ but did not convert the previous costs to charges for the new technology. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36067 through 36068), we noted the following concerns regarding the cost criterion. We noted that the applicant did not remove any charges or indirect charges related to prior technology without providing further details. We stated we were interested in additional information regarding whether Lantidra™ would replace any prior technology. We noted we were also interested in how the applicant estimated an inflation factor of 10 percent to apply to the standardized charges. With respect to the cases included in the cost analysis, we noted that the applicant limited the cost analysis to the two most recent patient cases with charges of Lantidra™ billed by the hospital, which the applicant asserted were the best available data for the FY 2022 cost analysis. We noted the MS-DRG coded for these two cases was MS-DRG 639 (Diabetes without CC/MCC). We stated we were interested in information as to whether cases in other MS-DRGs would be potentially eligible for Lantidra™ and if these cases should also be included in the cost analysis by using appropriate inclusion/exclusion criteria based on reporting of ICD-10-CM/PCS codes.

We invited public comments on whether Lantidra™ meets the cost criterion.

Comment: The applicant clarified that they used a close approximation of expected hospital charges for the administration of Lantidra™ in the cost analysis. Specifically, it

estimated the average unstandardized charge per case to be \$63,211 (hospital room \$6,122, drugs \$23,200, laboratory tests \$11,160, imaging \$12,871, procedure \$5,035, and physician services \$4,823), which the applicant stated represented actual hospital charges for the administration of Lantidra™ paid by the sponsor for two cases in 2022.

With respect to the estimation of an inflation factor of 10 percent that the applicant applied to the standard charges, the applicant stated that, as claims data were not used in the cost analysis of Lantidra™, rather than applying the most recent final rule inflation factor, it used the 10 percent inflation factor in the cost threshold example tab in the FY2025 NTAP Cost Analysis spreadsheet.

To address the request for additional analysis, the applicant performed four additional cost analyses. The applicant stated that each scenario and corresponding sensitivity analysis utilized the FY 2022 MedPAR file and the results showed Lantidra™ met the cost criterion. The applicant stated that cost-to-charge ratios (CCR) were used to estimate hospital charges in the additional analysis, which may inflate charges by a multiple of approximately five times the cost and may not represent actual estimated hospital charges for the administration of Lantidra™.

Per the applicant, the first analysis was to evaluate cases identified by ICD-10-PCS code E033U1 (Introduction of nonautologous pancreatic islet cells into peripheral vein, percutaneous approach), which best describes procedures similar to the administration of Lantidra™. However, the applicant stated that no cases were identified and a cost analysis could not be performed.

In the second analysis, the applicant evaluated cases with an ICD-10-CM code E10649 (Type 1 diabetes mellitus with hypoglycemia without coma), regardless of MS-DRG assignment. The applicant stated this diagnosis code best describes patients that may be suitable to receive Lantidra™ based on the labeled indication. The applicant identified 14,866 cases across 523 MS-DRGs. The applicant removed 100 percent of all drug charges, which it stated was a conservative analysis as it is highly likely that patients would still receive some drugs as part of

their hospital admission. The applicant stated since it could not identify which drugs Lantidra™ would necessarily replace, the analysis removed all of the drug charges to provide a conservative cost estimate. The applicant stated the analysis estimated hospital charges associated with Lantidra™ of \$1,666,667 by dividing the per-administration wholesale acquisition cost (WAC) of \$300,000 by the national average CCR for drugs provided in the CMS template (0.180). Using the CMS new technology add-on payment template for evaluating the cost criterion, the applicant estimated a final average inflated standardized charge per case of \$1,759,387, which it stated is greater than the average case-weighted threshold amount of \$80,720. The applicant conducted a sensitivity analysis by applying an estimated CAR-T CCR (0.2669) to the cost of Lantidra™, and stated that the final average case-weighted standardized charge per case exceeded the average case-weighted threshold amount (\$1,216,737 and \$80,720, respectively).

In the third analysis, the applicant identified 67,277 cases in MS-DRGs 637 (Diabetes with MCC), 638 (Diabetes with CC), and 639 (Diabetes without CC/MCC). Per the applicant, the majority of Lantidra™ cases are expected to be assigned to these MS-DRGs. As in the second analysis, the applicant removed 100 percent of all drug charges for the reasons described earlier in this section. The applicant stated that using the CMS new technology add-on payment template for evaluating the cost criterion, this analysis resulted in a final average inflated standardized charge per case of \$1,709,127, which is greater than the average case-weighted threshold amount of \$49,659. The applicant conducted a sensitivity analysis by applying an estimated CAR-T CCR (0.2669) to the cost of Lantidra™, and stated that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount (\$1,166,476 and \$49,659, respectively).

In the fourth analysis, to further refine the analysis to patients that may be eligible for Lantidra™, the applicant evaluated cases within MS-DRGs 637-639 with ICD-10-CM code E10649 (Type 1 diabetes mellitus with hypoglycemia without coma), which, according to the applicant, is the most appropriate code for patients that may receive Lantidra™ based on the

labeled indication. The applicant identified 2,851 discharges and removed 100 percent of all drug charges for the reasons described previously. The applicant stated that using the CMS new technology add-on payment template for evaluating the cost criterion, this analysis resulted in a final average inflated standardized charge per case of \$1,714,333, which is greater than the average case-weighted threshold amount of \$51,535. The applicant conducted a sensitivity analysis by applying an estimated CAR-T CCR (0.2669) to the cost of Lantidra™, and stated that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount (\$1,171,683 and \$51,535, respectively).

The applicant stated that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all additional analyses. The applicant clarified that administration of Lantidra™ is a minimally invasive procedure with moderate sedation and one night hospital stay, and asserted use of the CCR to approximate hospital charges may result in a large overestimation. The applicant stated that in the application, it added actual hospital charges from two cases in 2022 which resulted in an average standardized charge per case of \$67,770 (excluding the cost of Lantidra™), and applied a 3-year rate of inflation factor of 1.18. Per the applicant, adding the cost of Lantidra™ results in a final average inflated standardized charge per case of \$374,547, which exceeds the average case-weighted threshold amounts in all the additional cost analyses provided by the applicant.

Response: We thank the applicant for its comments and appreciate the updated cost analyses. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in the scenarios provided. Therefore, Lantidra™ meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that Lantidra™ represents a substantial clinical improvement over existing technologies. The applicant asserted that patients with the indication of T1D characterized by hypoglycemic unawareness are at risk of severe hypoglycemia, complications, and death, if untreated.

According to the applicant, when intensive insulin therapy is not sufficient for addressing symptoms of severe hypoglycemia, Lantidra™ infusion into the hepatic portal vein offers a safe and effective minimally invasive alternative with proven clinical outcomes, fewer complications, and similar overall costs to that of whole pancreas transplantation. The applicant also asserted that Lantidra™ provides a treatment option for patients unresponsive to, or ineligible for, currently available treatments because whole pancreas transplant, a currently available treatment, is associated with greater surgical and post-procedural risk than pancreatic islet transplantation. Additionally, the applicant asserted that due to procedural risks, some patients may not be appropriate surgical candidates for whole pancreas transplantation.⁸⁸ The applicant provided two patient testimonials, one study combining results of a Phase 1/2 and a Phase 3 clinical study to support these claims, as well as one background article.⁸⁹ The following table summarizes the applicant’s assertions regarding the substantial clinical improvement criterion. Please see the online posting for Lantidra™ for the applicant’s complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments

⁸⁹ Background articles are not included in the following table but can be accessed via the online posting for the technology.

transplantation significantly reduces CIMT	
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available	
Applicant statements in support	Supporting evidence provided by the applicant
Lantidra™ patients achieved insulin independence, improved HbA1c endpoints, had a reduction in hypoglycemia episodes and showed improved quality of life.	CellTrans Inc., 2021, <i>op.cit.</i>

As stated in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36069), after review of the information provided by the applicant, we had the following concerns regarding whether Lantidra™ meets the substantial clinical improvement criterion. We noted that we were interested in evidence on clinical outcomes based on a comparison of Lantidra™ with currently available treatments, including whole pancreatic transplant or recent advances in glucose monitoring and insulin delivery systems that are FDA-approved. We also noted that according to the summary of the long-term 6-year follow-up of patients from the Lantidra™ clinical trials,⁹⁰ the number of evaluable patients was reduced from 30 at the baseline to 12 at year 6. We questioned whether the small number would impact the reliability of the conclusions about insulin independence and reduction in severe hypoglycemic events. Regarding the applicant's claim that Lantidra™ patients achieved insulin independence, improved HbA1c endpoints, had fewer hypoglycemia episodes, and experienced improved quality of life, the applicant stated that the Phase 1/2 and 3 trials had over 10 years of extended follow-up, but specific results on long-term efficacy appear to be provided only up to six years post- the last transplant.⁹¹ We noted we were interested in learning about available results from any longer-term follow-up. In addition, we stated that we were interested in data demonstrating that Lantidra™ results in improved clinical outcomes, like reduced mortality, to support an assessment of whether Lantidra™ represents a substantial clinical improvement.

We invited public comments on whether Lantidra™ meets the substantial clinical improvement criterion.

⁹⁰ CellTrans, Inc. 2021, Table 20, p. 60.

⁹¹ *Ibid.*

Comment: The applicant submitted a public comment responding to CMS's concerns regarding the substantial clinical improvement criterion. With regard to the request for comparison of Lantidra™ to currently available treatments, the applicant stated that patients with hard-to-control T1D are, by definition, unable to achieve adequate glycemic control despite currently available diabetes management technologies, such as continuous glucose monitors, insulin pumps, or closed-loop systems, also referred to as artificial pancreas (AP) systems. The applicant included references to studies in which patients were not able to control glucose levels using closed-loop systems. For example, according to the applicant, a clinical trial by Anderson et al. (2019)⁹² demonstrated that the subcutaneous infusion of insulin with these AP systems is suboptimal, resulting in inferior insulin action and a hindrance of the ability of AP systems to cope with meals, exercise, and illness. The applicant stated that in subsequent studies by the Anderson team, in patients with T1D and with hypoglycemia unawareness and a history of severe hypoglycemia followed over 1 month, the AP reduced the time that blood glucose was below 70 mg/dL by over three-fold, but did not completely normalize glycemic control, and did not restore hypoglycemia awareness or epinephrine response to hypoglycemia induced in a hospital setting. The applicant also cited a case study of sudden death associated with severe hypoglycemia in a patient with an advanced sensor-pump device.⁹³ In addition, the applicant discussed a randomized controlled trial with an 18-month follow-up that tested a closed loop system where a subgroup (55 of 168) of patients in this iDCL Trial Protocol 3⁹⁴ (the largest AP study performed to date) who were at high risk for hypoglycemia at baseline (defined as >4% continuous glucose monitoring time below 70 mg/dL) showed improved overall glycemic

⁹² Anderson, S.M., et al., Hybrid Closed-Loop Control Is Safe and Effective for People with Type 1 Diabetes Who Are at Moderate to High Risk for Hypoglycemia. *Diabetes Technol Ther*, 2019. 21(6): p. 356-363.

⁹³ Nishihama, K., et al., Sudden Death Associated with Severe Hypoglycemia in a Diabetic Patient During Sensor Augmented Pump Therapy with the Predictive Low Glucose Management System. *Am J Case Rep*, 2021. 22: p. e928090.

⁹⁴ Kovatchev, B., et al., Randomized Controlled Trial of Mobile Closed-Loop Control. *Diabetes Care*, 2020. 43(3): p. 607-615.

control and time-in range (70-180 mg/dL), but still had residual hypoglycemia and their hypoglycemia awareness did not improve.⁹⁵

The applicant reiterated that the hard-to-control T1D subgroup of patients does not adequately benefit from current diabetes management technologies, including AP systems. The applicant also cited studies that islet transplantation impacted health-related quality of life of patients by reducing fear of hypoglycemia, changing behaviors adopted to avoid hypoglycemia, reducing depression and confusion, or allowing patients to better engage in vacationing and vigorous physical activities such as hiking, sprinting, etc. For example, the applicant cited a study by Häggström et al. (2011), in which 11 patients who had received islet transplants at Uppsala University Hospital were surveyed about their fear of hypoglycemia, health-related quality of life, and social life situation in relation to their fear of hypoglycemia. The applicant asserted that while the results for health-related quality of life were lower than in the normal population, changes in fear of hypoglycemia suggested an improvement for the patients who had undergone islet transplantation. The applicant stated that the patients felt they experienced improved control over their social situations.⁹⁶ The applicant mentioned a study by Radosevich et al. (2013)⁹⁷, in which 27 patients with T1D had undergone an islet transplant alone (ITA) procedure at the University of Minnesota. According to the applicant, ITA was found to be related to reductions in behaviors adopted to avoid hypoglycemia ($P < 0.001$) and attenuation in concerns about hypoglycemic episodes ($P < 0.001$). Further, the applicant stated that health status among the patients who had undergone ITA was also found to have improved, according to scores on the Euro Quality of Life scale ($P = 0.002$) and the Beck Depression Inventory scale ($P = 0.003$).

⁹⁵ Levy, C.J., et al., 100-LB: Closed-Loop Control Reduces Hypoglycemia without Increased Hyperglycemia in Subjects with Increased Prestudy Hypoglycemia: Results from the iDCL DCLP3 *Randomized Trial*. *Diabetes*, 2020. 69(Supplement 1): p. 100-LB.

⁹⁶ Häggström, E., M. Rehnman, and L. Gunningberg, Quality of life and social life situation in islet transplanted patients: time for a change in outcome measures? *Int J Organ Transplant Med*, 2011. 2(3): p. 117-25

⁹⁷ Radosevich, D.M., et al., Comprehensive health assessment and five-yr follow-up of allogeneic islet transplant recipients. *Clin Transplant*, 2013. 27(6): p. E715-24.

With regards to the concern about long term follow up and the small number of evaluable patients in the studies provided as evidence in the original application, the applicant explained that the number of evaluable patients decreases in each subsequent year after the last islet transplant in part because some of the patients had not yet reached yearly milestones at the time of data cutoff⁹⁸ and because the follow up year resets for patients that receive an additional transplant. Per the applicant, this also accounts for the difference in the number of years of extended follow up referenced. The applicant stated that the statement in the application describing more than 10 years of extended follow-up for patients in Phase 1/2 and 3 clinical trials referred to their overall experience. The applicant further stated that although the number of patients in the clinical trials supporting Lantidra™ is necessarily small, given the carefully limited subset of patients treated with this therapy, the efficacy outcomes are representative of larger studies and clinical data.

The applicant stated that long term studies of more than 10 years have provided direct evidence that islet transplantation in patients with T1D can markedly improve metabolic control and suppress severe hypoglycemic events.^{99 100} According to the applicant, a Marfil-Garza et al. (2022) study published 20-year findings of pancreatic islet cell transplantation from the University of Alberta in Edmonton, Canada. The applicant stated that the cohort study included 255 patients and illustrated the long-term safety of islet cell transplantation. The applicant stated that over the median follow-up of 7.4 years, 90 percent of patients survived with a median islet transplant survival time of 5.9 years. The applicant asserted that patients with sustained graft survival demonstrated significantly higher rates of insulin independence as well as better

⁹⁸ Per the applicant, the data cutoff date was May 20, 2020, which is the date of BLA submission

⁹⁹ Vantyghem, Marie-Christine et al. "Ten-Year Outcome of Islet Alone or Islet After Kidney Transplantation in Type 1 Diabetes: A Prospective Parallel-Arm Cohort Study." *Diabetes Care* vol. 42,11 (2019): 2042-2049. doi:10.2337/dc19-0401

¹⁰⁰ Czarnecka, Zofia et al. "The Current Status of Allogenic Islet Cell Transplantation." *Cells* vol. 12,20 2423. 10 Oct. 2023, doi:10.3390/cells12202423

sustained glycemic control compared with patients with non-sustained graft survival.¹⁰¹ The applicant stated that these outcomes were consistent with those of Hering et al (2022)¹⁰², who reported the outcomes of islet transplantation in 398 recipients with T1D complicated by severe hypoglycemic episodes reported to the Collaborative Islet Transplant Registry. Per the applicant, the Hering team identified age, islet dose, and concomitant immunosuppression protocols as factors associated with favorable outcomes, and demonstrated that when these factors were met, 53 percent of the patients were insulin independent at 5 years following transplant, 76% had an HbA1c under seven percent, and 95 percent were free of severe hypoglycemic events.

The applicant concluded in its public comments that the clinical data supports the safety and efficacy of FDA-approved Lantidra™ to address an unmet medical need for a small subset of patients with hard-to-control T1D complicated by severe hypoglycemic episodes.

A commenter also submitted a public comment in support of Lantidra™. The commenter stated the benefits of Lantidra™ include being available for patients with hard-to-control diabetes. The commenter cited the unpublished results from a NIH-funded Phase 3 safety and efficacy study for islet cell transplantation as evidence to support the use of islet transplantation to improve the clinical outcomes of this subgroup of patients. According to the commenter, 87.5 percent of patients in the NIH-funded study achieved glucose control and freedom from severe hypoglycemic events at 1 year and 71 percent at 2 years, while 52 percent of patients achieved insulin independence a year after transplant. The commenter stated that Lantidra™ uniquely fills an unmet need and provides an important therapy option for T1D patients who are at an increased risk for severe morbidity and mortality.

Response: We thank the applicant and the commenter for their comments regarding the substantial clinical improvement criterion. Based on the additional information received, we

¹⁰¹ Marfil-Garza BA, Imes S, Verhoeff K, et al. Pancreatic islet transplantation in type 1 diabetes: 20-year experience from a single-centre cohort in Canada. *Lancet Diabetes Endocrinol.* 2022;10(7):519-532. doi:10.1016/S2213-8587(22)00114-0

¹⁰² Hering, Bernhard J et al. "Factors associated with favourable 5 year outcomes in islet transplant alone recipients with type 1 diabetes complicated by severe hypoglycaemia in the Collaborative Islet Transplant Registry." *Diabetologia* vol. 66,1 (2023): 163-173. doi:10.1007/s00125-022-05804-4

continue to have concerns as to whether Lantidra™ meets the substantial clinical improvement criterion to be approved for new technology add-on payments. Regarding the applicant's assertion that patients with hard to control T1D are, by definition, unable to achieve glycemic control despite currently available diabetes management technologies such as continuous glucose monitors, insulin pumps, or closed-loop systems, we disagree that the data presented adequately supports this assertion. Specifically, we note the many technological advancements in glucose level detection and insulin delivery that have evolved since the beginning of islet cell transplantation. Continuous glucose monitoring systems with real time readings and alert systems can identify episodes of hyper- and hypoglycemia. Trend and pattern data can inform insulin dosing, and we note that severe hypoglycemic episodes and high glycemic variability can be prevented or significantly reduced by setting threshold alarms and having pumps that suspend and control insulin infusion with automated insulin delivery systems.^{103,104,105,106} It is not clear from the additional evidence presented by the applicant that patients eligible for treatment with Lantidra™ could not be appropriately managed with the most recent diabetes management systems that are available.

In addition, while the applicant provided studies to demonstrate that current therapies are inadequate, we note that the Anderson et al. (2019)¹⁰⁷ study cited by the applicant compared sensor-augmented pump (SAP) therapy to hybrid closed-loop control (HCLC), and per the study, HCLC reduced the risk and frequency of hypoglycemia while improving time in target range. We further note that with regard to the studies provided by the applicant to demonstrate that

¹⁰³ FDA Clears New Insulin Pump and Algorithm-Based Software to Support Enhanced Automatic Insulin Delivery <https://www.fda.gov/news-events/press-announcements/fda-clears-new-insulin-pump-and-algorithm-based-software-support-enhanced-automatic-insulin-delivery>

¹⁰⁶ FDA authorizes first interoperable, automated insulin dosing controller designed to allow more choices for patients looking to customize their individual diabetes management device system <https://www.fda.gov/news-events/press-announcements/fda-authorizes-first-interoperable-automated-insulin-dosing-controller-designed-allow-more-choices>

¹⁰⁷ Anderson, S.M., et al., Hybrid Closed-Loop Control Is Safe and Effective for People with Type 1 Diabetes Who Are at Moderate to High Risk for Hypoglycemia. *Diabetes Technol Ther*, 2019. 21(6): p. 356-363.

current therapies do not improve hypoglycemia unawareness, we are unclear how these studies demonstrate a patient population unresponsive to current therapies, particularly since the studies concluded that the therapies used improved hypoglycemia. We further note that the applicant did not assert or otherwise demonstrate that Lantidra™ improves hypoglycemia unawareness.

Additionally, the applicant provided a case study of a patient with an advanced sensor pump, and stated that the patient had sudden death due to severe hypoglycemia. However, we note that the study stated that it remained unclear whether hypoglycemia caused the sudden death, as the accuracy of glucose levels on these pumps during cardiopulmonary resuscitation was doubtful.¹⁰⁸

With regard to the studies cited by the applicant that islet transplantation impacted health-related quality of life, and the study provided by the commenter regarding safety and efficacy of islet cell transplantation, we note that the additional data provided did not assess Lantidra™, but instead included data from other formulations of islet cells for transplantation. As a result, we are unclear how these formulations may compare to that of Lantidra™. We further note that the Hering et al. (2023) study¹⁰⁹ cited by the applicant identified islet dose and concomitant immunosuppression protocols as factors that could affect outcomes; however we are unclear that data using other formulations of islet cells or transplant protocols, which may vary by clinical site, is relevant to the assessment of Lantidra™ specifically.

We also remain concerned with regard to the generalizability of the outcomes given the small number of evaluable patients. We note the applicant stated that the number of evaluable patients decreased in each subsequent year after the last islet transplant in part because some of the patients had not yet reached yearly milestones at the time of data cutoff, and because the follow up year resets for patients that receive an additional transplant, and also the number of patients in the clinical trials supporting Lantidra™ were necessarily small, given the carefully

¹⁰⁹ Hering, Bernhard J et al. “*Factors associated with favourable 5 year outcomes in islet transplant alone recipients with type 1 diabetes complicated by severe hypoglycaemia in the Collaborative Islet Transplant Registry.*” *Diabetologia* vol. 66,1 (2023): 163-173. doi:10.1007/s00125-022-05804-4

limited subset of patients treated with this therapy and the efficacy outcomes are representative of larger studies and clinical data. Regardless, we question whether the patients included in the UIH-001 and UIH-002 studies met the criteria for this specific subset of patients, defined as hard to control T1D complicated by severe hypoglycemia, given that at baseline, 37 percent of transplant recipients had a HbA1c at target, and 83 percent of patients in the trial did not have a documented severe hypoglycemic event in the year prior to transplant, according to the FDA panel review. According to the FDA BLA Clinical Review Memorandum,¹¹⁰ in the discussion of HbA1c: Of the thirty subjects, 11 (37 percent) had an HbA1c of $\leq 7\%$ prior to transplant, and 6 (20 percent) had an HbA1c $\leq 6.5\%$, with 6.5% and 7% being accepted targets for good glycemic control in diabetic patients. Therefore, it is unclear that these patients would represent the narrower subset of patients, as described by the applicant.

In addition, in response to our question about the availability of evidence that Lantidra™ improved clinical outcomes, like reduced mortality, to inform our assessment of whether Lantidra™ represents a substantial clinical improvement, the applicant cited long-term studies of more than 10 years. According to the applicant, these studies provided direct evidence that islet transplantation in patients with T1D can markedly improve metabolic control and suppress severe hypoglycemic events. The applicant further cited a Marfil-Garza et al. (2022)¹¹¹ study which published 20-year findings of pancreatic islet cell transplantation from the University of Alberta in Edmonton, Canada. The applicant stated that the cohort study included 255 patients and illustrated the long-term safety of islet cell transplantation. The applicant further stated that over the median follow-up of 7.4 years, 90 percent of patients survived with a median islet transplant survival time of 5.9 years. The applicant asserted that patients with sustained graft survival demonstrated significantly higher rates of insulin independence as well as better

¹¹⁰ BLA Clinical Review Memorandum <https://www.fda.gov/media/170827/download>

¹¹¹ Marfil-Garza BA, Imes S, Verhoeff K, et al. *Pancreatic islet transplantation in type 1 diabetes: 20-year experience from a single-centre cohort in Canada*. *Lancet Diabetes Endocrinol*. 2022;10(7):519-532. doi:10.1016/S2213-8587(22)00114-0

sustained glycemic control compared with patients with non-sustained graft survival. The applicant also stated that these outcomes were consistent with those of the Hering et al. (2023) study, who reported the outcomes of islet transplantation in 398 recipients with T1D complicated by severe hypoglycemic episodes reported to the Collaborative Islet Transplant Registry. Per the applicant, the Hering team identified age, islet dose, and concomitant immunosuppression protocols as factors associated with favorable outcomes, and demonstrated that when these factors were met, 53 percent of patients were insulin independent at 5 years following transplant, 76 percent had an HbA1c under seven percent, and 95 percent were free of severe hypoglycemic events. With regards to the studies cited by the applicant, we note that the additional data provided did not assess the use of Lantidra™, and given the potential differences in the islet cell formulation used at different transfusion facilities and the potential differences in the various transplant protocols, we question whether the reported results are replicable or comparable to Lantidra™.

After consideration of all the information received from the applicant, as well as the public comments we received, we are unable to determine that Lantidra™ represents a substantial clinical improvement over existing technologies for the reasons discussed in the proposed rule and in this final rule, and therefore, we are not approving new technology add-on payments for Lantidra™ for FY 2025.

h. AMTAGVI™ (lifileucel)

Iovance Biotherapeutics, Inc. submitted an application for new technology add-on payments for AMTAGVI™ for FY 2025. According to the applicant, AMTAGVI™ is a one-time, single-dose autologous tumor-infiltrating lymphocyte (TIL) immunotherapy for the treatment of advanced (unresectable or metastatic) melanoma comprised of a suspension of TIL for intravenous infusion. We note that Iovance Biotherapeutics submitted an application for new technology add-on payments for AMTAGVI™ for FY 2022 under the name lifileucel, as summarized in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25272 through 25282) but

withdrew the application prior to the issuance of the FY 2022 IPPS/LTCH PPS final rule (86 FR 44979). We also note that the applicant submitted an application for AMTAGVI™ for FY 2023 under the name lifileucel, as summarized in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28244 through 28257), that it withdrew prior to the issuance of the FY 2023 IPPS/LTCH PPS final rule (87 FR 48920).

Please refer to the online application posting for AMTAGVI™, available at <https://mearis.cms.gov/public/publications/ntap/NTP231012V8Y9J>, for additional detail describing the technology and the treatment of unresectable or metastatic melanoma.

With respect to the newness criterion, according to the applicant, AMTAGVI™ was granted Biologics License Application (BLA) approval from FDA on February 16, 2024, for treatment of adult patients with unresectable or metastatic melanoma previously treated with a programmed cell death protein 1 (PD-1) blocking antibody, and if B-raf proto-oncogene (BRAF) V600 mutation positive, a BRAF inhibitor with or without a mitogen-activated extracellular signal-regulated kinase (MEK) inhibitor. The applicant stated that AMTAGVI™ has received Regenerative Medicine Advanced Therapy (RMAT), Orphan Drug, and Fast Track designations from FDA for the treatment of advanced melanoma. According to the applicant, AMTAGVI™ was expected to be commercially available within 30-40 days post-FDA approval due to the need for the physician to prescribe AMTAGVI™, the treatment center to receive approval from the patient's insurer and to schedule and surgically resect the patient's tumor tissue, the 22-day TIL manufacturing process, and shipment/invoicing of AMTAGVI™ to the treatment center for patient administration. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36069), we stated we were interested in additional information regarding the delay in the technology's market availability, as it seems that the technology would need to be available for sale before a physician would be able to prescribe AMTAGVI™.

According to the applicant, AMTAGVI™ is provided as a single dose for infusion containing a suspension of TIL in up to four patient-specific intravenous (IV) infusion bag(s),

with each dose containing 7.5×10^9 to 72×10^9 viable cells. The applicant further noted that there is a lymphodepleting regimen administered before infusion of AMTAGVI™, and post-AMTAGVI™ infusion, an interleukin 2 (IL-2) infusion at 600,000 IU/kg is administered every 8 to 12 hours, for up to a maximum of 6 doses, to support cell expansion in vivo.

The applicant stated that effective October 1, 2022, the following ICD-10-PCS codes may be used to uniquely describe procedures involving the use of AMTAGVI™: XW033L7 (Introduction of lifileucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7), and XW043L7 (Introduction of lifileucel immunotherapy into central vein, percutaneous approach, new technology group 7). The applicant stated that all diagnosis codes under the category C43 (Malignant melanoma of skin) may be used to currently identify the indication for AMTAGVI™ under the ICD-10-CM coding system.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered “new” for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that AMTAGVI™ is not substantially similar to other currently available technologies because TIL immunotherapy with AMTAGVI™ has a novel and unique mechanism of action that delivers a highly customized, personalized, and targeted, single-infusion treatment for advanced melanoma, and AMTAGVI™ is the first and only TIL immunotherapy approved for the treatment of advanced (unresectable or metastatic) melanoma, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant’s assertions regarding the substantial similarity criteria. Please see the online application posting for AMTAGVI™ for the applicant’s complete statements in support of its assertion that AMTAGVI™ is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
---------------------------------	--------------------	---

<p>Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?</p>	<p>No</p>	<p>AMTAGVI™ does not use the same or a similar mechanism of action as any other existing technology, including currently available products used as earlier treatment of advanced melanoma and included in the 2022 100% Medicare Provider Analysis and Review (MedPAR) Limited Data Set. The currently available first- and second-line treatments for advanced melanoma include kinase inhibitors (BRAF and MEK inhibitors), immune checkpoint inhibitors (ICIs) (anti-CTLA-4 antibody and anti-PD-1 antibody), and the recently approved ICI and anti-LAG-3 combination. There are no approved treatment options for patients with advanced melanoma previously treated with ICI therapy. Some patients with disease progression after receiving an anti-PD-1 antibody and a targeted therapy may receive high-dose IL-2 or cytotoxic agents.¹¹² TIL immunotherapy with AMTAGVI™ has a novel and unique mechanism of action which delivers a highly customized, personalized, and targeted single infusion treatment for advanced melanoma. AMTAGVI™ TIL immunotherapy involves autologous T-cells directly isolated from the patient’s tumor tissue and expanded ex vivo. Following the infusion of AMTAGVI™, the TIL migrates back into the patient’s tumor, including metastases, where they trigger specific tumor cell killing upon recognition of tumor antigens. TIL have clear differentiation and advantage in treatment of solid tumors (for example, unresectable or metastatic melanoma) including tumor recognition, personalized, polyclonal and neoantigen-specific.^{113,114,115,116} TIL immunotherapy with one-time treatment of AMTAGVI™ is also highly differentiated from currently approved chimeric antigen receptor (CAR) T-cell therapies that treat liquid tumors. While other types of adoptive cell therapy, including CAR T-cell therapies, utilize circulating T-cells from the blood, TIL therapy harvests neoantigen-directed T-cells that are isolated from a tumor biopsy. Thus, the unique mechanism of action of AMTAGVI™ TIL immunotherapy and the distinguishing criteria demonstrate that AMTAGVI™ is not substantially similar to other currently available therapies and/or technologies.</p>
<p>Is the technology assigned to the same MS-DRG as existing technologies?</p>	<p>No</p>	<p>There are no cases assigned to any MS-DRG in the 2022 MedPAR data representing advanced melanoma cases treated with a TIL immunotherapy. CMS has finalized the assignment of AMTAGVI™ ICD-10-PCS procedure codes to Pre-MDC MS-DRG 018 where CAR T-cell, non-CAR T-cell and other immunotherapies map. Cases where AMTAGVI™ is administered will be distinctly identified by lifileucel-specific ICD-10-PCS administration codes, XW033L7 and XW043L7. In the FY 2022 IPPS/LTCH PPS final rule, CMS finalized its proposal to assign existing procedure codes describing CAR T-cell, non-CAR T-cell and other immunotherapies to Pre-MDC MS-DRG 018 and to modify the title to “Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies” to better reflect the cases reporting the administration of non-CAR T-cell therapies that would be assigned to this MS-DRG (for example, introduction of lifileucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7) in addition to CAR T-cell therapies. The applicant stated that in its final decision, CMS noted the clinical similarities with respect to the administration of CAR T-cell therapies and AMTAGVI™, the complexity of the conditions in which they are treating, and resource utilization. The applicant stated that CMS specifically included the AMTAGVI™ ICD-10-PCS codes in the FY 2022 IPPS/LTCH PPS final rule table of</p>

¹¹⁵ Raskov H, et al. *British Journal of Cancer* (2021) 124:359–367; <https://doi.org/10.1038/s41416-020-01048-4>.

¹¹⁶ Fardis M, et al. Current and future directions for tumor infiltrating lymphocyte therapy for the treatment of solid tumors. *Cell and Gene Therapy Insights*, 2020; 6(6), 855-863.

		codes mapped to Pre-MDC MS-DRG 018, effective with the beginning of FY 2022. The AMTAGVI™ ICD-10-PCS codes were also published in Table 6B – New Procedure Codes and reflect mapping to Pre-MDC MS-DRG 018. Importantly, patient cases where AMTAGVI™ is administered will be uniquely identified by the ICD-10-PCS codes XW033L7 and XW043L7 and will be mapped to Pre-MDC MS-DRG-018.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	AMTAGVI™ involves the treatment of patients with advanced (unresectable or metastatic) melanoma previously treated with systemic therapy and, AMTAGVI™ is the first and only FDA-approved post-ICI and post-BRAF/MEK therapy for this challenging-to-treat patient population across all classes of medicines, including small molecules, protein biologics, cellular therapy, etc. Advanced melanoma is identified by ICD-10-CM codes that are distinct from diagnosis codes used for the patient populations with hematologic malignancies treated by currently available CAR T-cell therapies, that is, large B-cell lymphoma, relapsed/refractory mantle cell lymphoma, and relapsed/ refractory multiple myeloma. For clarification, Stage III melanoma that cannot be completely surgically resected is considered as advanced unresectable melanoma. Although it is not metastatic, advanced unresectable stage III melanoma is treated similarly to metastatic or Stage IV melanoma.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36071), we invited public comments on whether AMTAGVI™ is substantially similar to existing technologies and whether AMTAGVI™ meets the newness criterion.

Comment: The applicant submitted a public comment regarding the newness criterion. The applicant reiterated that AMTAGVI™ is the first and only one-time, individualized T-cell therapy to receive FDA approval as a treatment for a solid tumor cancer. The applicant stated that the proposed mechanism for AMTAGVI™ offers a new cell therapy approach that deploys patient-specific T-cells called TIL cells. The applicant stated that when cancer is detected, the immune system creates TIL cells to locate, attack, and destroy cancer and that TIL cells recognize distinctive tumor markers on the cell surface of each person’s cancer. The applicant stated that when cancer develops and prevails, the body’s natural TIL cells can no longer perform their intended function to fight cancer. The applicant asserted that TIL cell therapy with AMTAGVI™ uses autologous T-cells isolated from the tumor tissue and expanded ex vivo using a centralized manufacturing process, maintaining the heterogeneous repertoire of T-cells without any prior selection or genetic modification. The applicant stated that by isolating autologous TIL from the tumor microenvironment and expanding them ex vivo in the presence of growth factors, the AMTAGVI™ manufacturing process produces large numbers of reinvigorated T-cells.

Further, the applicant asserted that following a one-time infusion of the personalized AMTAGVI™ immunotherapy, the TIL migrates back into primary and metastatic tumors, where they amplify and rejuvenate the patient's own immune system, triggering specific tumor cell killing upon recognition of tumor antigens.

The applicant also responded to CMS's request for additional information regarding the delay in the technology's market availability, stating that AMTAGVI™ was granted FDA approval on February 16, 2024, and became immediately available for providers to order for patients. The applicant further stated that as a tumor-derived autologous T-cell immunotherapy that is individualized for each patient, there is a several-week process for each patient to receive AMTAGVI™. The applicant stated that AMTAGVI™ is manufactured from resected patient tumor tissue processed from one or more tumor lesions.¹¹⁷ The applicant stated that initially, it had targeted a 34-day turnaround time from the receipt of starting material at their centralized GMP facility to return shipment to the treatment center, which includes the AMTAGVI™ manufacturing and testing/release processes. However, the applicant stated it expected this time to decrease as the product becomes more widely available. In addition, the applicant stated there is a 7-day preconditioning regimen prior to AMTAGVI™ infusion, and as a result, the first AMTAGVI™ shipment to a treatment center was on March 28, 2024, and the first patient was infused on April 4, 2024. The applicant requested April 4, 2024, as the start of the AMTAGVI™ newness period for the new technology add-on payment.

Response: Based on our review of comments received and information submitted by the applicant as part of its FY 2025 new technology add-on payment application for AMTAGVI™, we agree with the applicant that AMTAGVI™ is the first TIL therapy in the treatment of advanced melanoma and, therefore, has a new mechanism of action compared to existing technologies. We also believe that the use of AMTAGVI™ would be assigned to a different MS-DRG than existing technologies to treat patients with advanced melanoma since AMTAGVI™

¹¹⁷ FDA. <https://www.fda.gov/media/176417/download?attachment> – AMTAGVI prescribing information.

maps to Pre-MDC MS-DRG 018 (Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies). Therefore, we agree with the applicant that AMTAGVI™ is not substantially similar to existing treatment options and meets the newness criterion.

With respect to the applicant's request to start the AMTAGVI™ newness period for the new technology add-on payment on April 4, 2024, we note that the timeframe that a new technology can be eligible to receive new technology add-on payments begins when data become available (69 FR 49003, 85 FR 58610). Consistent with the statute, a technology no longer qualifies as "new" once it is more than 2 to 3 years old, irrespective of how frequently it has been used in the Medicare population. Therefore, if a product is more than 2 to 3 years old, we consider its costs to be included in the MS-DRG relative weights whether its use in the Medicare population has been frequent or infrequent. While our policy is generally to begin the newness period on the date of FDA approval or clearance, we may consider a documented delay in a technology's market availability in our determination of newness (87 FR 48977). However, we do not consider the date of first sale of a product, or first shipment of a product, as an indicator of the entry of a product onto the U.S. market; none of these dates indicate when a technology became available for sale (88 FR 58802). Similarly, the date of first infusion of a product does not indicate when a technology became available for sale. As the applicant noted, AMTAGVI™ was granted FDA approval on February 16, 2024, and became immediately available for providers to order for patients. Therefore, it appears that AMTAGVI™ was available for sale starting February 16, 2024. We consider the beginning of the newness period to commence on February 16, 2024, when AMTAGVI™ was granted BLA approval from FDA for treatment of adult patients with unresectable or metastatic melanoma previously treated with a PD-1 blocking antibody, and if BRAF V600 mutation positive, a BRAF inhibitor with or without a MEK inhibitor.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that it meets the cost criterion. For each analysis, the applicant searched the FY 2022 MedPAR

file using different combinations of ICD-10-CM codes, ICD-10-PCS codes, and/or inpatient length-of-stay (LOS) of 10 or more days. The applicant explained that it used different combinations to demonstrate four different cohorts that may be eligible for the technology. According to the applicant, eligible cases for AMTAGVI™ will be mapped to Pre-MDC MS-DRG 018 (Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies). For each analysis, the applicant used the FY 2025 new technology add-on payments threshold for Pre-MDC MS-DRG 018 for all identified cases. Each analysis followed the order of operations described in the table later in this section.

For the first analysis, the applicant searched for potential cases for the following combination of ICD-10-CM diagnosis/procedure codes: any melanoma and metastasis diagnosis codes and any IL-2 or chemotherapy procedure codes. Please see the online posting for AMTAGVI™ for the complete list of codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 176 claims mapping to 16 MS-DRGs, with each MS-DRG representing 6.3 percent of identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$2,150,682, which exceeded the average case-weighted threshold amount of \$1,374,450.

For the second analysis, the applicant searched for potential cases for the following ICD-10-CM diagnosis/procedure codes in combination with an inpatient LOS of 10 or more days: any melanoma and metastasis diagnosis codes and any IL-2 or chemotherapy procedure codes. Please see the online posting for AMTAGVI™ for the complete list of codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 77 claims mapping to seven MS-DRGs, with each MS-DRG representing 14.3 percent of identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$2,207,367, which exceeded the average case-weighted threshold amount of \$1,374,450.

For the third analysis, the applicant searched for potential cases for the following combination of ICD-10-CM diagnosis/procedure codes: a code describing primary or admitting diagnosis of melanoma and a metastasis diagnosis code. Please see the online posting for AMTAGVI™ for the complete list of codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 735 claims mapping to 64 MS-DRGs, with each MS-DRG representing 3.4 percent to 1.5 percent of identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$2,017,903, which exceeded the average case-weighted threshold amount of \$1,374,450.

For the fourth analysis, the applicant searched for potential cases for the following combination of ICD-10-CM diagnosis/procedure codes: a code describing any diagnosis of melanoma and a metastasis diagnosis code. Please see the online posting for AMTAGVI™ for the complete list of codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 6,648 claims mapping to 358 MS-DRGs, each MS-DRG representing 0.2 percent to 6.7 percent of identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$2,018,905, which exceeded the average case-weighted threshold amount of \$1,374,450.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that AMTAGVI™ meets the cost criterion.

AMTAGVI™ COST ANALYSIS¹¹⁸	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	Analyses 1,2,3, and 4—All diagnosis codes under the categories: C43 (Malignant melanoma of skin) D03 (Melanoma in situ) C78 (Secondary malignant neoplasm of respiratory and digestive organs) C79 (Secondary malignant neoplasm of other and unspecified sites)
List of ICD-10-PCS codes	Analyses 1 and 2: 3E03002 (Introduction of high-dose interleukin-2 into peripheral vein, open approach) 3E03003 (Introduction of low-dose interleukin-2 into peripheral vein, open approach)

¹¹⁸ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

AMTAGVI™ COST ANALYSIS¹⁸	
	<p>3E03005 (Introduction of other antineoplastic into peripheral vein, open approach) 3E03302 (Introduction of high-dose interleukin-2 into peripheral vein, percutaneous approach) 3E03303 (Introduction of low-dose interleukin-2 into peripheral vein, percutaneous approach) 3E03305 (Introduction of other antineoplastic into peripheral vein, percutaneous approach) 3E04002 (Introduction of high-dose interleukin-2 into central vein, open approach) 3E04003 (Introduction of low-dose interleukin-2 into central vein, open approach) 3E04005 (Introduction of other antineoplastic into central vein, open approach) 3E04302 (Introduction of high-dose interleukin-2 into central vein, percutaneous approach) 3E04303 (Introduction of low-dose interleukin-2 into central vein, percutaneous approach) 3E04305 (Introduction of other antineoplastic into central vein, percutaneous approach)</p> <p>Analyses 3 and 4: N/A</p>
List of MS-DRGs	<p>Analyses 1, 3, and 4: For the list of MS-DRGs, see the online posting for AMTAGVI™.</p> <p>Analysis 2: 193 (Simple Pneumonia and Pleurisy with MCC) 389 (G.I. Obstruction with CC) 054 (Nervous System Neoplasms with MCC) 542 (Pathological Fractures and Musculoskeletal and Connective Tissue Malignancy with MCC) 802 (Other O.R. Procedures of The Blood and Blood Forming Organs with MCC) 840 (Lymphoma and Non-Acute Leukemia with MCC) 844 (Other Myeloproliferative Disorders or Poorly Differentiated Neoplastic Diagnoses with CC)</p>
Inclusion/exclusion criteria	<p>Analysis 1: The applicant selected claims based on the codes listed previously as it believes this list represents patients with a principal or secondary ICD-10-CM diagnosis code representing cases with primary or secondary diagnosis of melanoma with metastasis and treatment using either IL-2 or chemotherapy. The applicant stated this analysis represents a patient population that is eligible for treatment with AMTAGVI™ based on the indication.</p> <p>Analysis 2: The applicant selected claims based on the codes listed previously as it believes this list represents patients with a principal or secondary ICD-10-CM diagnosis code representing cases with primary or secondary diagnosis of melanoma with metastasis and treatment using either IL-2 or chemotherapy, in combination with an inpatient length of stay (LOS) of 10 or more days. The applicant stated this analysis represents a patient population that is eligible for treatment with AMTAGVI™ based on the indication, and patients who stay 10 or more days in the hospital more closely approximate the expected resource intensity for the AMTAGVI™ regimen.</p> <p>Analysis 3: The applicant selected claims based on the codes listed previously as it believes this list represents patients with a primary or admitting diagnosis of melanoma with secondary diagnosis of metastasis, but with no IL-2 or chemotherapy treatment requirement. The applicant stated this analysis illustrates a likely patient population that will be treated with AMTAGVI™ by focusing on a narrow set of melanoma cases and removing the requirement that the patient be receiving IL-2 or chemotherapy.</p> <p>Analysis 4: The applicant selected claims based on the codes listed previously as it believes this list represents patients with any diagnosis of melanoma with secondary diagnosis of metastasis, but with no treatment requirement. The applicant stated this analysis illustrates a likely patient population that will be treated with AMTAGVI™ by focusing on a full set of melanoma cases and removing the requirement that the patient be receiving IL-2 or chemotherapy.</p>
Charges removed for prior technology	The applicant did not remove charges or indirect charges related to the prior technology. The applicant indicated that no technology is being replaced.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2022 IPPS/LTCH PPS final rule and correction notice.
Inflation factor	The applicant applied an inflation factor of 11.90% to the standardized charges, based on the two-year inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the Wholesale Acquisition Cost (WAC) of the new technology by an estimated cost-to-charge ratio of 0.2669 for CAR-T therapies. The applicant stated that this cost-to-charge ratio is greater than the national average cost-to-charge ratio of 0.18 for drugs from the FY 2024 IPPS/LTCH PPS final rule, resulting in a lower estimated charges for the cost criterion analysis. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36074), we invited public comments on whether AMTAGVI™ meets the cost criterion.

We did not receive any comments on whether AMTAGVI™ meets cost criterion. Based on the information submitted by the applicant as part of its FY 2025 new technology add-on payment application, as previously summarized, the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount. Therefore, AMTAGVI™ meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that AMTAGVI™ represents a substantial clinical improvement over existing technologies because the efficacy and safety profile of the single infusion of AMTAGVI™ TIL immunotherapy addresses an important unmet need in the advanced (unresectable or metastatic) melanoma population who lack effective or approved treatment options after being previously treated with ICI therapy. The applicant asserted that the clinically meaningful and durable activity of AMTAGVI™ represents a substantial clinical improvement over published outcomes for chemotherapy. The applicant provided four studies to support these claims, as well as 22 background articles about treatments for advanced melanoma.¹¹⁹

The following table summarizes the applicant’s assertions regarding the substantial clinical improvement criterion. Please see the online posting for AMTAGVI™ for the applicant’s complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	Supporting evidence provided by the applicant
AMTAGVI™ will be the first and only FDA-approved therapy for patients with advanced melanoma who relapse on or do not tolerate current therapies	Chesney J, et al. J Immunother Cancer 2022; 10:e005755. doi:10.1136/jitc-2022-005755 The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available	
Applicant statements in support	Supporting evidence provided by the applicant

¹¹⁹ Background articles are not included in the following table but can be accessed via the online posting for the technology.

<p>A single infusion of AMTAGVI™ has produced clinically meaningful and durable responses in patients with advanced melanoma who progress after ICI or targeted therapy</p>	<p>Chesney J, et al. J Immunother Cancer 2022; 10:e005755. doi:10.1136/jitc-2022-005755</p> <p>Sarnaik A, et al. Oral presentation. 37th Annual Meeting and Pre-Conference Programs. November 10, 2022.</p> <p>The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.</p>
<p>AMTAGVI™ is a viable therapeutic option for patients with advanced melanoma with a safety profile consistent with the underlying advanced disease and the known profiles of nonmyeloablative lymphodepleting (NMA-LD) and IL-2</p>	<p>Chesney J, et al. J Immunother Cancer 2022; 10:e005755. doi:10.1136/jitc-2022-005755</p> <p>Sarnaik A, et al. Lifileucel, a tumor-infiltrating lymphocyte therapy, in metastatic melanoma. J Clin Oncol. 2021;39(24):2656-66. doi:10.1200/JCO.21.00612. (Published online first: 2021/05/13).</p> <p>The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.</p>

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36075 through 36076), after reviewing the information provided by the applicant, we stated we had the following concerns regarding whether AMTAGVI™ meets the substantial clinical improvement criterion.

In support of its application, the applicant provided data from the C-144-01 study, an ongoing phase two multicenter study (NCT02360579) to assess the efficacy and safety of autologous TIL in patients with stage IIIc-IV metastatic melanoma, which consisted of: Cohort 1 (n = 30 generation 1 no-cryopreserved TIL product); Cohort 2 (n = 66 generation 2 cryopreserved TIL product); Cohort 3 (a sub-sample of n = 10 from Cohorts 1, 2, and 4); and Cohort 4 (n = 75 generation 2 cryopreserved TIL product). Regarding the sample studied (Cohorts 2 & 4 combined) by Chesney, et al. (2022),¹²⁰ similar to concerns raised in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25281), we stated that we continued to question the appropriateness of combining Cohorts 2 and 4 together. Furthermore, similar to concerns raised in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28256 through 28257), we noted that in the study of Chesney, et al. (2022), 54 percent of the sample size included males with a median

¹²⁰ Chesney J, et al. J Immunother Cancer 2022;10:3005755.Doi :10.1136/jitc-2022-005755

age of 56; data on race, ethnicity, and other demographics are not presented. Given that the average age of Medicare beneficiaries is substantially older, and that Medicare beneficiaries often have multiple comorbidities, we questioned whether the sample evaluated is appropriately representative of the Medicare population and whether this sample has a disease burden similar to that seen in Medicare beneficiaries.^{121,122,123} Thus, similar to concerns raised in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28256 through 28257), we stated we were concerned that the findings may not be generalizable to Medicare beneficiaries. Furthermore, as discussed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28256), we noted that we continued to question whether the patient sample evaluated in the Sarnaik et al. (2021)¹²⁴ study is appropriately representative of the Medicare population and whether this sample has a disease burden similar to that seen in Medicare beneficiaries.

Second, similar to concerns raised in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25279 through 25282) and the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28256 through 28257), we stated that we continued to note that while multiple background studies were provided in support of the applicant's claims for substantial clinical improvement, those that evaluate AMTAGVI™ were based solely on the C-144-01 trial. The background studies focus primarily on describing the limitations of other therapies rather than supporting the role of AMTAGVI™, and no direct comparisons to other existing therapies, such as targeted therapies with combination BRAF plus MEK inhibitors or nivolumab plus ipilimumab, were provided. Therefore, we stated that we would be interested in additional information comparing AMTAGVI™ to existing treatments (for example, evidence comparing AMTAGVI™ phase two

¹²³ Cher, B., Ryan, A. M., Hoffman, G. J., & Sheetz, K. H. (2020). Association of Medicaid Eligibility With Surgical Readmission Among Medicare Beneficiaries. *JAMA network open*, 3(6), e207426. <https://doi.org/10.1001/jamanetworkopen.2020.7426>

¹²⁴ Sarnaik A, et al. leucel, a tumor-infiltrating lymphocyte therapy, in metastatic melanoma. *J Clin Oncol*. 2021;39(24):2656-66. doi:10.1200/JCO.21.00612 (Published online first: 2021/05/13).

studies to the phase two studies of existing or approved treatments by using meta-analysis after systematic review, or evidence based on retrospective cohort studies of the relevant patients to assess whether AMTAGVI™ had significantly different impact on any outcomes compared to existing or approved treatments).

Third, similar to concerns raised in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25279 through 25282), and the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28256 through 28257), we noted that the Chesney et al. (2022)¹²⁵ study uses a surrogate endpoint, ORR, which combines the results of complete and partial responders; we questioned whether this correlated to improvement in clinical outcomes such as overall survival (OS).

Finally, similar to concerns raised in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28256 through 28257), we noted that according to the applicant, high-dose IL-2 has been used to treat metastatic melanoma in the past and is given as a post-treatment to AMTAGVI™.

According to the applicant, the occurrence of grade 3 and 4 treatment-emergent adverse events (TEAEs) was early and consistent with the lymphodepletion regimen (NMA-LD) and known profile of IL-2. If AMTAGVI™ is always given in conjunction with the pre- and post-treatments, we questioned how it is possible to determine the cause of the TEAEs which are categorized as severe based on the Common Terminology Criteria for Adverse Events v4.03. We noted that we continued to question whether the effect seen in C-144-01 is due to AMTAGVI™ itself or due to other factors such as the use of IL-2, general changes in medical practice over time, and the specific sample identified for the trial at hand.

We invited public comments on whether AMTAGVI™ meets the substantial clinical improvement criterion.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns in the proposed rule. With regards to the appropriateness of combining cohorts in the C-144-01 study, the applicant stated

¹²⁵ Chesney J, et al. J Immunother Cancer 2022 ;10 :3005755.Doi :10.1136/jitc-2022-005755

that the findings for Cohorts 2 and 4 were presented separately as well as combined (pooled results), and that in both cases AMTAGVI™ demonstrated a substantial clinical improvement in ORR over chemotherapy, which the applicant asserted offers poor ORR (4 – 10%). Specifically, the applicant stated that Cohorts 2 and 4 provided ORRs of 34.8 percent and 28.7 percent, respectively, when assessed separately, and an ORR of 31.4 percent when combined.¹²⁶ The applicant asserted that pooling efficacy and safety from Cohort 2 and 4 increased the sample size and therefore supported confidence in the point estimates of efficacy (ORR and DOR) and better characterized the AMTAGVI™ safety profile. Additionally, the applicant clarified that both cohorts used the same eligibility criteria and enrolled similar patient populations as demonstrated by the baseline disease characteristics, patient demographics and prior therapies received; and both cohorts had the same primary and secondary objectives. The applicant stated that to minimize investigator bias, both Cohort 2 and 4 evaluated the efficacy of AMTAGVI™ in patients with unresectable or metastatic melanoma using the ORR. Lastly, the applicant stated that the investigational product used in Cohort 2 and 4 was manufactured using the same manufacturing process and was released using the same product specification. The applicant also provided the pooled efficacy results that were assessed by FDA that included 153 patients (from Cohorts 2 and 4). Therefore, the applicant concluded that pooling Cohorts 2 and 4 from Study C-144-01 provided the most comprehensive dataset supporting the safety and efficacy of AMTAGVI™.

In addition, in response to CMS's concerns regarding whether the C-144-01 study population age, demographics, and disease burden were representative of the Medicare population, the applicant provided information about the inclusion criteria for Cohorts 2 and 4. The applicant noted that Medicare beneficiaries with advanced melanoma qualify for Medicare coverage by age (65 or greater) or disability (any age insured by Social Security Disability

¹²⁶ C-144-01 Sources: Chesney J, et al. JITC 2022; Sarnaik A, et al, J Clin Oncol 2021; Sarnaik A, et al. SITC 2022. Chemotherapy Sources: Ribas A, et al. Lancet Oncol 2015; Larkin J, et al. J Clin Oncol 2018; Weichenthal M, et al. J Clin Oncol 2018.

Insurance, SSDI) as well as noting that the study C-144-01 population is extrapolatable across the advanced melanoma Medicare-age population, with 24 percent of enrollees in Cohorts 2 and 4 aged 66 years or older.^{127,128} The applicant stated that between Cohorts 2, 4 and the pooled cohorts, all patients had a high disease burden (median target lesion sum of diameters [SOD] was 98 mm) at baseline, and patients had received a median of 3 lines of prior therapies (range, 1 to 9). The applicant stated that all patients had a confirmed progressive disease on their prior therapy before study entry. The applicant stated that as reported by Chesney et al, 2022, response to AMTAGVI™ was observed across all subgroups analyzed including by age group (<65 years and greater than or equal to 65 years), where ORR was similar, and that this data is most representative of the real-life population with advanced melanoma. The applicant stated that moreover, when creating its Category of Evidence 2A recommendation for AMTAGVI™, the National Comprehensive Cancer Network (NCCN) Guidelines did not distinguish its recommendation by age. The applicant asserted that accessibility to AMTAGVI™ treatment is highly important to all Medicare beneficiaries whether eligible by age or disability status; specifically, increasing age is associated with a higher incidence of melanoma death. The applicant also provided the study C-144-01 inclusion requirements for additional context.

Regarding CMS's interest in additional information comparing AMTAGVI™ to existing treatment, the applicant stated that there are no approved therapies for the line of treatment for which AMTAGVI™ was approved, and that chemotherapy is the most commonly used therapy for patients with advanced melanoma post-progression. The applicant stated that most patients with advanced melanoma relapse on, or do not tolerate, treatment with ICIs and BRAF-targeted therapies and respond poorly to subsequent rounds of therapy with these agents. The applicant stated that primary resistance to immune checkpoint blockade occurs in approximately 40 to 65 percent of patients with melanoma treated with anti-PD-1 based therapy, depending on whether

¹²⁷ Chesney J, et al. *J Immunother Cancer* 2022; 10 e005755. Doi:101136/jitc-2022-005755.

¹²⁸ Sarnaik A, et al. Oral presentation. 37th Annual Meeting and Pre-Conference Programs, Society for Immunotherapy of Cancer (SITC). November 10, 2022.

anti-PD-1 therapy is given upfront or after progression on other therapies, and in >70 percent of those treated with anti-CTLA-4 therapy. The applicant stated that of those with initial disease control, 30 to 40 percent develop acquired resistance. The applicant stated that approximately 15 to 20 percent of BRAF V600 mutation-positive patients fail to respond to targeted therapy initially, and only 22 percent remain progression-free at 3 years. The applicant noted that although primary resistance is lower in patients treated with anti-PD-1 therapy plus anti-CTLA-4 therapy, 38 percent of patients discontinue therapy because of treatment-emergent adverse events (TEAEs), with 88 percent developing immune-related adverse events (irAEs), many of these being persistent. The applicant further stated that before AMTAGVI™'s approval, there were no FDA-approved treatment options for patients with advanced melanoma whose disease progressed following initial treatment with an immune checkpoint inhibitor and, if appropriate, targeted therapy. The applicant stated that in its FY 2025 new technology add-on payment application, ORR and OS results for C-144-01 were compared to chemotherapy and asserted that only 4 percent to 10 percent of advanced melanoma patients who progress after retreatment have objective responses to chemotherapy, with a median OS of 7 months. The applicant stated that in contrast, a single infusion of AMTAGVI™ provides clinically meaningful and durable responses in patients with advanced melanoma previously treated with ICI therapy. The applicant stated that in a four-year analysis of C-144-01 submitted to CMS in February 2024 as supplemental information for its new technology add-on payment application, the longest duration of independent review committee (IRC)-assessed response was ongoing at 55.8 months. The applicant stated that the median DOR was not reached; median OS was 13.9 months, with 1-, 2-, 3-, and 4-year OS rates of 54.0%, 33.9%, 28.4%, and 21.9%, respectively. The applicant stated that no new late-onset AMTAGVI™-related serious AE was reported. The applicant stated that based on its estimation of ORR, the planned sample size of Cohort 2 was 66 patients, and the planned sample size for Cohort 4 was 75 patients to demonstrate statistical significance to the historical ORR. The applicant provided additional methodology for its hypothesis testing for the

primary endpoint of Cohort 4 as assessed by the IRC. The applicant also stated that AMTAGVI™ recently became the first and the only Category of Evidence 2A designated agent approved on-label for second line therapy in advanced melanoma in an April 2024 update to the NCCN Guidelines, as a preferred high-dose therapy as second-line or subsequent systemic therapy, as a component of TIL therapy unresectable disease, and after progression on anti-PD-1-based therapy and BRAF/MEK inhibitor therapy (if BRAF V600 mutation positive). The applicant asserted that the clinically meaningful and durable responses following the single infusion of AMTAGVI™ address the high unmet medical need in patients with advanced melanoma and high tumor burden, who are heavily pre-treated and difficult-to-treat and have a poor prognosis with no treatment options available after progression on immunotherapy and targeted agents or who are primary refractory to anti-PD-1/PD-L1 therapy.

In response to CMS's concern about using a surrogate endpoint, ORR, and whether it correlated to clinical outcomes such as OS, the applicant cited an analysis of C-144-01 in patients who achieved response at first assessment (6 weeks or approximately 1.5 months) and provided a Kaplan-Meier curve showing a statistically significant difference in overall survival between patients who achieved an early response versus non-responders.¹²⁹ The applicant also referred to a public comment letter to CMS on June 17, 2021 from the principal investigator for the C-144-01 trial that directed CMS to FDA guidance to industry describing the significance of ORR as assessed by its magnitude and duration of effect. In addition, the applicant stated that the guidance states use of ORR can represent direct clinical benefit based on the specific disease, context of use, magnitude of effect, the number of complete responses, the durability of response, and other factors.¹³⁰ The applicant stated that in addition to the association between early response and OS in the C-144-01 landmark analysis, further evidence was presented from a

¹²⁹ Sarnaik A, et al. SITC 2022; Buysse M, Piedbois P. On the relationship between response to treatment and survival. *Stat Med.* 1996;15:2797-2812.

¹³⁰ FDA. Clinical trial endpoints for the approval of cancer drugs and biologics. December 2018. <https://www.fda.gov/media/71195/download>

multicenter, randomized Phase 3 trial evaluating treatment with locally-produced TIL therapy versus ipilimumab (n=84 per arm) for advanced melanoma.^{131,132} The applicant indicated that in this study, the overall survival of responders compared to non-responders had a hazard ratio of 0.14 (95% CI: 0.06, 0.33, p<.001), favoring TIL responders, and provided additional results for the TIL study population. The applicant also stated that AMTAGVI™ was approved under FDA's accelerated approval program, which allows for earlier approval of drugs that treat serious conditions and fill an unmet medical need, and can also be based on the effect on a "surrogate endpoint," such as ORR that is reasonably likely to predict clinical benefit. Finally, the applicant noted that CMS has a well-established history of granting new technology add-on payment status to drugs and biologics that receive FDA approval under the accelerated approval pathway. The applicant stated that based on a review of past IPPS/LTCH PPS final rules, effective in FY 2016 and extending through FY 2024, CMS had 10 approvals for new technology add-on payments for new therapies approved under FDA's accelerated approval pathway for oncology and hematology uses, and the majority of these therapies were granted FDA accelerated approvals based on surrogate efficacy endpoints, including the same ORR and DOR endpoints used for accelerated approval of AMTAGVI™. Another commenter emphasized the importance of the use of surrogate/intermediary endpoints within clinical trials for immunotherapy and that it is a critically important tool that emphasizes both patient access and scientific rigor.

Regarding CMS's concerns related to the cause of grade 3 and 4 TEAEs and questions about being able to distinguish the effect of AMTAGVI™ from other factors that are part of the treatment process, the applicant asserted that the C-144-01 study and other publications have had consistent findings about the safety profile of the TIL regimen. The applicant stated that TEAEs associated with TIL treatment have been found to be largely due to the lymphodepleting preparative regimen or IL-2 components of the TIL regimen.¹³³ The applicant stated that in C-

¹³¹ Haanen JBAG, et al. ESMO Congress 2022. September 2022.

¹³² Rohaan MW, et al. N Engl J Med 2022;387:2113-25.

¹³³ Seitter SJ, et al. *Clin Cancer Res.* 2021;27(19):5289-5298.

144-01, the safety profile of the AMTAGVI™ regimen is consistent with the underlying advanced disease and the known safety profiles of NMA-LD and IL-2, with no new safety signal identified during long-term follow-up, and that the safety profile was similar between cohorts 2 and 4. The applicant stated that most TEAEs were transient, expected, and manageable; the incidence decreased rapidly over the first two weeks after AMTAGVI™ infusion. Furthermore, the applicant stated that the autologous nature of AMTAGVI™ was associated with a low risk for off-target effects and no long-term toxicities related to the AMTAGVI™ regimen have been noted. The applicant asserted that AMTAGVI™ produced durable response and a favorable safety profile across subgroups of heavily pretreated patients with high tumor burden, regardless of age, BRAF mutation status, PD-L1 status, baseline ECOG PS status, and presence of liver and/or brain lesions at baseline. With respect to the role of IL-2 in the AMTAGVI™ regimen, the applicant stated IL-2 is not used for its antineoplastic effect but is intended to support the activation, proliferation, and cytolytic activity of AMTAGVI™. The applicant cited two post-hoc analyses of study C-144-01 by Hassel, et al. (2022)¹³⁴ and Larkin, et al. (2023)¹³⁵ which concluded that the abbreviated course of high-dose IL-2 (600,000 IU/kg, ≤6 doses) used as part of the AMTAGVI™ regimen to promote T-cell activity does not independently contribute to anti-neoplastic activity. Another commenter asserted that experiments in the commenter's lab were clear in demonstrating that the impact of IL-2 alone depends on the stimulation of endogenous T-cells with antitumor activity and stated that the AMTAGVI™ therapy protocol involves giving cells with antitumor activity and then IL-2, so that IL-2 solely acts on the administered cells to mediate antitumor effects. This commenter further claimed that the efficacy and durability of TIL has been shown in patients who progressed after previous IL-2

¹³⁴ Hassel JC, et al. European Society for Medical Oncology (ESMO) Immunology Annual Congress. Oral presentation, December 2022.

¹³⁵ Larkin J, et al. European Society for Blood and Marrow Transplantation (EBMT) 49th Annual Meeting. Poster P223 supplement, April 2023.

monotherapy, and also asserted that the toxicities of TIL therapy have been extensively reported and are largely due to the lymphodepleting preparative regimen or IL-2.

We also received several additional comments in support of the application for AMTAGVI™ that addressed points related to the substantial clinical improvement criterion. Several commenters indicated general support for AMTAGVI™ as a therapy that can provide a new treatment option for individuals with advanced melanoma who have not responded to standard of care treatments. A commenter stated that FDA approval of AMTAGVI™ reflects a significant advancement in TIL cell therapy, while another commenter stated its appreciation of CMS's efforts to improve patient access to novel cell therapies like AMTAGVI™. One commenter also encouraged CMS to assign new technology add-on payment status for new treatments and technologies supporting personalized medicine that meet the required criteria, including the application for AMTAGVI™ as an example.

Response: We thank the applicant and commenters for their comments regarding the substantial clinical improvement criterion. Based on the additional information received, we continue to have concerns as to whether AMTAGVI™ meets the substantial clinical improvement criterion to be approved for new technology add-on payments. Specifically, it remains unclear if the use of AMTAGVI™ significantly improves clinical outcomes over existing technologies and whether AMTAGVI™ TIL immunotherapy offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments for patients with advanced (unresectable or metastatic) melanoma who relapse on or do not tolerate current therapies. Although the applicant asserts that the clinically meaningful and durable responses following treatment with AMTAGVI™ address an unmet medical need in patients with advanced melanoma and high tumor burden, who are heavily pre-treated and difficult-to-treat and have a poor prognosis with no treatment options available after progression on immunotherapy and targeted agents or who are primary refractory to anti-PD-1/PD-L1 therapy, we remain concerned that the evidence provided by the applicant did not sufficiently address our

concern regarding the lack of comparison to other standard of care therapies used in the treatment of metastatic melanoma, to allow us to assess whether AMTAGVI™ substantially improved outcomes compared to existing treatments for this heavily pre-treated and difficult-to-treat patient population. In addition, while the applicant stated that there are no treatment options available for this patient population, it appears there are a number of therapies that are FDA approved for unresectable or malignant melanoma that can be used in any line of therapy such as pembrolizumab¹³⁶, ipilimumab¹³⁷, and immunotherapy combinations such as nivolumab plus ipilimumab¹³⁸ and nivolumab-relatlimab¹³⁹. Further, as these other treatments, as well as chemotherapy, are available therapies for patients with advanced melanoma, we remain unclear if there is a patient population that is eligible for AMTAGVI™ that would be ineligible for other currently available treatments. In addition, although the applicant presented results from a multicenter, randomized Phase 3 trial from the Netherlands and Denmark that evaluated treatment with a locally-produced TIL therapy versus ipilimumab for advanced melanoma, we note that the applicant did not address how the conditions of the study differed from that of the C-144-01 trial nor how the locally-produced TIL regimen used differed from AMTAGVI™.

With respect to the applicant's assertion that CMS had previously approved new technology add-on payments for therapies approved under FDA's accelerated approval pathway for oncology and hematology uses, and the majority of these therapies were granted FDA accelerated approvals based on surrogate efficacy endpoints, including the same ORR and DOR endpoints used for accelerated approval of AMTAGVI™, we note that, as previously stated, consistent with the discussion in the FY 2003 IPPS/LTCH PPS final rule (67 FR 50015), we do not rely on FDA criteria in our evaluation of substantial clinical improvement for purposes of determining what drugs, devices, or technologies qualify for new technology add-on payments

¹³⁷ https://www.accessdata.fda.gov/drugsatfda_docs/label/2020/125377s1151bl.pdf

¹³⁸ https://www.accessdata.fda.gov/drugsatfda_docs/label/2020/125554s0781bl.pdf

¹³⁹ <https://www.fda.gov/drugs/resources-information-approved-drugs/fda-approves-opdualag-unresectable-or-metastatic-melanoma>

under Medicare. This criterion does not depend on the standard of safety and efficacy on which FDA relies but on a demonstration of substantial clinical improvement in the Medicare population. Therefore, we do not believe that the FDA approvals for these other technologies relate to an assessment of substantial clinical improvement for AMTAGVI™. We also note that we are unsure which technologies are being referenced by the applicant, and whether those technologies were determined to be a substantial clinical improvement because they improved the ORR, or whether the technologies demonstrated substantial clinical improvement under § 412.87(b)(1)(ii) through other claims that would not correlate with outcomes for AMTAGVI™.

In addition, as described in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36075 through 36076), we continue to have concerns that the patient population evaluated in the C-144-01, Chesney, et al. (2022), and Sarnaik, et al. (2021) studies are not appropriately representative of the Medicare population and the disease burden seen in Medicare beneficiaries. While the applicant provided clarifying information about the inclusion and exclusion criteria for the C-144-01 study, the applicant did not provide additional information about the race, ethnicity, or other demographics of these individuals to demonstrate general applicability to the Medicare population. In addition, while the applicant stated that all patients had a high disease burden, it did not comment on whether the study population had a disease burden inclusive of the comorbidities generally found in the Medicare population. Thus, we remain concerned that the findings may not be generalizable to Medicare beneficiaries and their disease burden.

After consideration of all the information from the applicant, as well as the comments we received, we are unable to determine that AMTAGVI™ represents a substantial clinical improvement over existing technologies for the reasons discussed in the proposed rule and in this final rule, and therefore we are not approving new technology add-on payments for AMTAGVI™ for FY 2025.

i. Lyfgenia™ (lovotibeglogene autotemcel)

Bluebird bio, Inc. submitted an application for new technology add-on payments for Lyfgenia™ (lovotibeglogene autotemcel) for FY 2025. According to the applicant, Lyfgenia™ is an autologous hematopoietic stem cell-based gene therapy indicated for the treatment of patients 12 years of age or older with sickle cell disease (SCD) and a history of vaso-occlusive events (VOE). Lyfgenia™, administered as a single-dose intravenous infusion, consists of an autologous cluster of differentiation 34+ (CD34+) cell-enriched population from patients with SCD that contains hematopoietic stem cells (HSCs) transduced with BB305 lentiviral vector (LVV) encoding the $\beta^{\text{A-T87Q}}$ -globin gene, suspended in a cryopreservation solution. The applicant explained that Lyfgenia™ is designed to add functional copies of a modified form of the $\beta^{\text{A-T87Q}}$ -globin gene into a patient's own HSCs, which allows their red blood cells to produce an anti-sickling adult hemoglobin (HbA^{T87Q}), to reduce or eliminate downstream complications of SCD.

Please refer to the online application posting for Lyfgenia™, available at <https://mearis.cms.gov/public/publications/ntap/NTP231013X3AK8>, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, Lyfgenia™ was granted BLA approval from FDA on December 8, 2023, for the treatment of patients 12 years of age or older with SCD and a history of VOEs. The applicant stated that it anticipated that Lyfgenia™ would have become available for sale on April 16, 2024, and that the first commercial claim for Lyfgenia™ would occur within approximately 130 days post-FDA approval to allow for the one-time activity to commercially qualify the contract manufacturer organization (CMO), followed by apheresis of the first patient at the qualified treatment center (QTC), where the personalized starting material will be shipped to the CMO for drug product manufacturing, release testing, and shipment of final product to the QTC for the one-time infusion. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36076), we stated that we were interested in additional information

regarding the delay in the technology's market availability, as it appears that the technology would need to be available for sale prior to the enrollment of the first patient at the QTC. According to the applicant, Lyfgenia™ is provided in infusion bags containing 1.7 to 20×10⁶ cells/mL (1.4 to 20 x 10⁶ CD34+ cells/mL) in approximately 20 mL of solution and is supplied in one to four infusion bags. Per the applicant, the minimum dose is 3.0 × 10⁶ CD34+ cells/kg patient weight.

According to the applicant, as of October 1, 2023, there are currently two ICD–10–PCS procedure codes to distinctly identify the intravenous administration of Lyfgenia™: XW133H9 (Transfusion of lovetibeglogene autotemcel into central vein, percutaneous approach, new technology group 9) and XW143H9 (Transfusion of lovetibeglogene autotemcel into peripheral vein, percutaneous approach, new technology group 9). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for Lyfgenia™ under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered “new” for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that Lyfgenia™ is not substantially similar to other currently available technologies, because Lyfgenia™ has a distinct mechanism of action, which converts SCD at the genetic, cellular, and physiologic level to a non-sickling phenotype through the expression of the gene therapy-derived anti-sickling β^{A-T87Q}-globin gene, and that therefore, the technology meets the newness criterion. Additionally, the applicant stated Lyfgenia™ is not substantially similar to other currently available therapeutic approaches indicated for SCD or to any drug therapy assigned to any MS-DRG in the 2022 MedPAR file data.

The following table summarizes the applicant’s assertions regarding the substantial similarity criteria. Please see the online application posting for Lyfgenia™ for the applicant’s complete statements in support of its assertion that Lyfgenia™ is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	Lyfgenia™’s distinct mechanism of action and distinguishing criteria demonstrate that it is not substantially similar to other currently available therapeutic approaches for the treatment of SCD or any drug therapy assigned to any MS-DRG in the 2022 MedPAR file data. With its unique mechanism of action, Lyfgenia™ seeks to convert SCD at the genetic, cellular, and physiologic level to a non-sickling phenotype through the expression of the gene therapy-derived anti-sickling β ^{A-T87Q} -globin; thus, reducing or eliminating downstream complications. Treatment with Lyfgenia™ involves isolation of CD34+ HSC, ex vivo transduction of the cells with BB305 LVV to introduce the β ^{A-T87Q} -globin gene, and then intravenous infusion of the genetically-modified autologous cells into the patient. Lyfgenia™ is substantially differentiated from allo-HSCT, where the broad utility is significantly limited in the SCD population by age of patient, limited availability of HLA-matched sibling donors, as well as transplant risks. Lyfgenia™’s gene addition technology, described previously, is distinct from the investigational gene-edited technology of exagamglogene autotemcel (Casgevy™), which identifies the erythroid-specific enhancer region of BCL11A in CD34+ cells and cuts the gene using Cas9 and guide RNA to reduce the expression of BCL11A. And, finally, Lyfgenia™ is a distinct drug product with a discrete clinical development program from bluebird bio’s Zynteglo™ (betibeglogene autotemcel, or beticel), a gene therapy approved by FDA on August 17, 2022, for the treatment of adult and pediatric patients with β-thalassemia who require regular RBC transfusions.
Is the technology assigned to the same MS-DRG as existing technologies?	No	There are no patient cases assigned to any MS-DRG in the 2022 MedPAR file data representing SCD cases treated with a gene therapy. Effective October 1, 2023, there are two unique ICD-10-PCS codes to identify administration of Lyfgenia™ in the inpatient setting: XW133H9 and XW143H9. These two Lyfgenia™-specific ICD-10-PCS codes map to Pre-MDC DRGs 016 (Autologous Bone Marrow Transplant with MCC/CC) and 017 (Autologous Bone Marrow Transplant without MCC/CC). Thus, all patient claims where Lyfgenia™ is administered will be distinguishable from other therapies that may be assigned to Pre-MDC MS-DRGs 016 and 017.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	Yes	Patients with SCD treated with currently approved therapies are identified by existing ICD-10-CM diagnosis codes. Upon FDA approval, Lyfgenia™ has the potential to offer these same patients transformative clinical benefits to improve the hemolytic anemia and VOs that characterize SCD, without the current limitations of allogenic hematopoietic stem cell transplantation (allo-HSCT) and addresses red blood cell sickling at the genetic level while abrogating the need for a well-matched donor. Currently disease-modifying therapies address acute manifestation of disease but do not address the underlying genetic cause of the disease and may require lifelong use and potential for in adherence. While allo-HSCT is a potentially curative option, outcomes worsen with age, and broad utility is limited by a paucity of matched sibling donors, as well as transplant risks. Cases for patients treated with Lyfgenia™, a personalized, one-time, potentially transformative gene therapy, will be identified by the SCD ICD-10-CM diagnosis codes and the unique ICD-10-PCS procedure codes approved by CMS for identification of Lyfgenia™ administration: XW133H9 and XW143H9.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36077 through 36078), we noted that Lyfgenia™ may have the same or similar mechanism of action to Casgevy™, for which we

also received an application for new technology add-on payments for FY 2025. We stated that Lyfgenia™ and Casgevy™ are both gene therapies using modified autologous CD34+ hematopoietic stem and progenitor cell (HSPC) therapies administered via stem cell transplantation for the treatment of SCD. Both technologies are autologous, ex-vivo modified hematopoietic stem-cell biological products. As previously discussed, Casgevy™ was approved by FDA for this indication on December 8, 2023. For these technologies, patients are required to undergo CD34+ HSPC mobilization followed by apheresis to extract CD34+ HSPCs for manufacturing and then myeloablative conditioning using busulfan to deplete the patient's bone marrow in preparation for the technologies' modified stem cells to engraft to the bone marrow. Once engraftment occurs for both technologies, the patient's cells start to produce a different form of hemoglobin to reduce the amount of sickling hemoglobin. Further, we noted that both technologies appear to map to the same MS-DRGs, MS-DRG 016 (Autologous Bone Marrow Transplant with CC/MCC) and 017 (Autologous Bone Marrow Transplant without CC/MCC), and to treat the same or similar disease (SCD) in the same or similar patient population (patients 12 years of age and older who have a history of VOs). Accordingly, as it appeared that Lyfgenia™ and Casgevy™ may use the same or similar mechanism of action to achieve a therapeutic outcome (that is, to reduce the amount of sickling hemoglobin to reduce and prevent VOs associated with SCD), would be assigned to the same MS-DRG, and treat the same or similar patient population and disease, we stated we believed that these technologies may be substantially similar to each other such that they should be considered as a single application for purposes of new technology add-on payments. We noted that if we determined that this technology is substantially similar to Casgevy™, we believed the newness period would begin on December 8, 2023, the date both Lyfgenia™ and Casgevy™ received FDA approval for SCD. We stated we were interested in information on how these two technologies may differ from each other with respect to the substantial similarity criteria and newness criterion, to inform our analysis of whether Lyfgenia™ and Casgevy™ are substantially similar to each other and

therefore should be considered as a single application for purposes of new technology add-on payments.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36078), we invited public comment on whether Lyfgenia™ meets the newness criterion, including whether Lyfgenia™ is substantially similar to Casgevy™ and whether these technologies should be evaluated as a single technology for purposes of new technology add-on payments.

Comment: The applicant for Casgevy™ submitted a public comment regarding substantial similarity for Lyfgenia™ and Casgevy™. The commenter asserted Casgevy™ represents the first therapy approved to use CRISPR/Cas9 gene editing technology and stated that no other approved technologies use this mechanism of action, and CRISPR/Cas9 technology has never previously been used in humans outside of clinical trials. The commenter stated that Casgevy™ is a one-time treatment that uses ex vivo non-viral CRISPR/Cas9 to precisely edit the erythroid-specific enhancer region of BCL11A in CD34+ HSPCs. The commenter stated that, while other non-gene therapy-based therapeutic approaches impact production of fetal hemoglobin (HbF), no other approved technology has been able to reactivate production of endogenous HbF to levels known to eliminate disease complications (for example, VOC), consistent with individuals with a clinically benign condition called hereditary persistence of fetal hemoglobin (HPFH) who experience no or minimal disease complications from SCD when they co-inherit both HPFH and SCD. The commenter stated that CMS focused on perceived similarities in treatment journey and categorical product characteristics between Casgevy™ and certain other technologies, but did not acknowledge material differences in the underlying technology which impact the safety and efficacy profile of these products. The commenter further explained that after Casgevy™ infusion, the edited CD34+ cells engraft in the bone marrow and differentiate to erythroid lineage cells with reduced BCL11A expression, and that this reduced BCL11A expression results in an increase in γ -globin expression and HbF protein production in erythroid cells. The commenter stated that in patients with severe SCD, HbF

expression reduces intracellular hemoglobin S (HbS) concentration, preventing the red blood cells from sickling and addressing the underlying cause of disease, thereby eliminating VOCs. The commenter stated that, as such, Casgevy™ is not similar to the current standard of care (bone marrow transplant), nor to other technologies used in the treatment of SCD, and that none of these treatments use a mechanism of action that rely on CRISPR gene editing to reduce intracellular HbS concentration in SCD patients. The commenter explained how Lyfgenia™ uses a separate technology, gene replacement therapy, that utilizes a viral-based mechanism to introduce exogenous genetic material into patients' HSPCs, to add functional copies of a modified β^A -globin gene into patients' HSCs through transduction of autologous CD34+ cells with B8305 lentiviral vector (LVV). The commenter stated that due to the LVV-based mechanism of action and the semi-random nature of viral integration, there is a potential risk of LVV-mediated insertional oncogenesis after treatment with Lyfgenia™ used in the treatment of SCD, as documented in FDA-approved labeling. The commenter stated that Casgevy™, with its non-viral mechanism of action using CRISPR/Cas9 gene editing, does not employ a viral vector and does not insert a transgene; therefore, insertional oncogenesis cannot occur as a matter of scientific principle. The commenter further stated that Casgevy™ uses a unique underlying technology and manufacturing process and has distinct product characteristics that differentiate it from other technologies used to treat SCD. The commenter asserted in its comments that if CMS were to consider gene replacement therapy and gene editing technologies to be substantially similar, it could set a precedent based on overgeneralization which could deter further innovation.

The applicant also submitted a public comment regarding the newness criterion. With respect to mechanism of action, the applicant stated that Lyfgenia™ has a unique mechanism of action that differs from Casgevy™'s because it is a one-time gene therapy that adds functional copies of the β^{A-T87Q} -globin gene into a patient's own HSCs ex-vivo through the transduction of autologous CD34+ cells with a BB305 LVV to durably produce HbA^{T87Q}. The applicant added

that HbA^{T87Q} is a modified adult hemoglobin (HbA) specifically designed to be anti-sickling while maintaining the same structure and function as naturally occurring HbA. According to the applicant, Lyfgenia™ consists of an autologous CD34+ cell-enriched population from patients with SCD that contains HSCs transduced with BB305 LVV encoding the β^{A-T87Q} -globin gene, suspended in a cryopreservation solution. The applicant stated the BB305 LVV encodes a single amino acid variant of β -globin gene, β^{A-T87Q} -globin: a human β -globin with a genetically engineered single amino acid change (threonine [Thr; T] to glutamine [Gln; Q] at position 87 (T87Q)). The applicant asserted HbA^{T87Q} is nearly identical to wildtype (or “innate”) HbA, which is not prone to sickling. The applicant stated the T87Q substitution introduced in β^{A-T87Q} -globin is designed to physically block or sterically inhibit polymerization of hemoglobin, thus rendering further “anti-sickling” properties to β^{A-T87Q} -globin. According to the applicant, this results in a transgenic, non-immunogenic protein that can be measured in blood allowing for monitoring of the therapeutic protein in vivo and quantification relative to other globin species used to treat SCD. The applicant stated that Lyfgenia™ is not substantially similar to the CRISPR-Cas9 gene editing technique of Casgevy™. The applicant also stated that, as described previously, Lyfgenia™ adds functional copies of a modified β -globin (HBB) gene, β^{A-T87Q} globin gene, into patients’ own HSCs to durably produce HbA^{T87Q}, a modified adult HbA specifically designed to be anti-sickling while maintaining the same morphology and function as naturally occurring HbA. According to the applicant, the CRISPR/Cas9 gene editing technique mechanism of action described for Casgevy™ in the proposed rule differs substantially from Lyfgenia™, as is evident by Casgevy™’s unique editing approach in which GATA1 binding is irreversibly disrupted, and BCL11A expression is reduced, resulting in an increased production of HbF, and recapitulating a naturally occurring, clinically benign condition called HPFH that reduces or eliminates SCD symptoms.

According to the applicant, increasing HbA^{T87Q} versus increasing HbF are fundamentally distinct mechanistic approaches. For individuals without SCD, HbF production is decreased

shortly after birth, coinciding with an increase in HbA, and Lyfgenia™ is designed to replicate this natural state by introducing the production of HbA^{T87Q}. The applicant stated HbA^{T87Q} is nearly identical to HbA in several ways: sequence homology, protein structure, oxygen affinity and oxygen dissociation curves. The applicant stated that HbF has ~50 percent homology to HbA (two β globin chains are replaced with two γ-chains) and has a higher observed oxygen affinity and different oxygen unloading properties than HbA. According to the applicant, from a clinical perspective, current standard of care approaches (for example, the use of hydroxyurea) are available to increase levels of HbF with variable effectiveness, while the mechanism of action Lyfgenia™ affords is unique in increasing a modified HbA. The applicant commented that while both gene therapies are indicated for the treatment of SCD, the mechanistic approach of each is fundamentally and significantly different from the other, and therefore Lyfgenia™ and Casgevy™ are not substantially similar and should not be considered as a single application for the purposes of new technology add-on consideration.

The applicant also described potential risks associated with consideration of the two technologies as a single application. Specifically, the applicant commented that if Lyfgenia™ and Casgevy™ were treated as a single application and paid under a single maximum new technology add-on payment amount, this could potentially undermine CMS's aim to improve timely, meaningful access to SCD gene therapies for Medicare patients. Per the applicant, not only do the two therapies have distinct mechanisms of action but they also differ in the length of follow-up and the features of the population in which they were studied (for example, the commenter stated that the Lyfgenia™ clinical trials did not exclude patients with a history of chronic pain and included some patients with a history of stroke), and patients should have a choice to work with physicians to decide which therapy is most appropriate for them, based solely on their specific individual clinical circumstances. The applicant further asserted that given these differences, the finalization of a single new technology add-on payment amount for both therapies could hamper patient access to the most appropriate gene therapy for them, and

potentially create a fiscally problematic and financial loss for IPPS hospitals, given the difference in the wholesale acquisition costs of both therapies, and CMS could potentially over-reimburse for one product, while under-reimbursing for the other through the use of the historical blended weighted average cost utilizing volume estimates. It is for these reasons, the applicant further stated, that Lyfgenia™ is not substantially similar to Casgevy™, and therefore should not be considered as a single application with Casgevy™ for the purposes of new technology add-on payments.

The applicant also stated that provided that CMS finalize its policy to change the newness cutoff date from April 1 to October 1 to determine whether a new technology is within its 2- to 3-year newness period (as further described in section II.E.8 of the preamble of this final rule), the applicant would agree that it was reasonable to consider the start of Lyfgenia™'s newness period to be on the date of FDA approval, December 8, 2023. However, the applicant requested that should CMS not finalize its proposal and the cutoff date remains April 1, that CMS should establish the beginning of the newness period on the date of Lyfgenia™'s first commercial availability, as described in its new technology add-on payment application.

Response: We thank the applicant and the commenter for their comments. Based on our review of comments received and information submitted by the applicant as part of its FY 2025 new technology add-on payment application for Lyfgenia™, we agree that Lyfgenia™, which modifies a patients' own HSCs to increase HbA^{T87Q} (modified adult hemoglobin), has a distinct mechanism of action compared to that of Casgevy™, which uses a different mechanism of action of modifying a patients' HSPCs to increase expression of HbF to subsequently reduce the expression of intracellular sickled hemoglobin concentration. Therefore, we agree with the applicant that Lyfgenia™ utilizes a unique mechanism of action and is not substantially similar to existing treatment options and meets the newness criterion.

With regards to the market availability of Lyfgenia™, as we have discussed in prior rulemaking (86 FR 45132; 77 FR 53348), generally, our policy is to begin the newness period on

the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. Although the applicant stated in its application that Lyfgenia™ would become available for sale on April 16, 2024, we noted that we were interested in additional information regarding any delay in the technology's market availability, as it appears that the technology would need to be available for sale prior to the enrollment of the first patient at the QTC, and we did not receive additional information regarding the delay. Therefore, at this time, there is not sufficient information to determine a newness date based on a documented delay in the technology's availability on the U.S. market. Absent additional information, we consider the beginning of the newness period to commence on December 8, 2023, when Lyfgenia™ was granted BLA approval from FDA for the treatment of patients 12 years of age or older with SCD and a history of VOs.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that it meets the cost criterion. For each analysis, the applicant searched the FY 2022 MedPAR file using different ICD-10-CM codes to identify potential cases representing patients who may be eligible for Lyfgenia™. Per the applicant, Lyfgenia™ is intended for patients who have not already undergone allogeneic bone marrow transplant or autologous bone marrow transplant. The applicant explained that it used different ICD-10-CM codes to demonstrate different cohorts of SCD patients that may be eligible for the technology.

According to the applicant, eligible cases for Lyfgenia™ will be mapped to either Pre-MDC MS-DRG 016 (Autologous Bone Marrow Transplant with CC/MCC) or 017 (Autologous Bone Marrow Transplant without CC/MCC). For each cohort, the applicant performed two sets of analyses using either the FY 2025 new technology add-on payments threshold for Pre-MDC MS-DRG 016 or Pre-MDC MS-DRG 017 for all identified cases. We noted that the FY 2025 new technology add-on payments thresholds for both Pre-MDC MS-DRG 016 and Pre-MDC MS-DRG 017 are \$182,491. Each analysis followed the order of operations described in the table later in this section.

For the primary cohort, the applicant searched for an appropriate group of patients with any ICD-10-CM diagnosis code for SCD with crisis. Please see the online posting for Lyfgenia™ for the complete list of ICD-10-CM codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 12,357 claims mapping to 167 MS-DRGs, including MS-DRGs 811 and 812 (Red Blood Cell Disorders with MCC and without MCC, respectively) representing 76.0 percent of total identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$11,677,887, which exceeded the average case-weighted threshold amount of \$182,491.

For the sensitivity 1 cohort, the applicant searched for a narrower cohort of patients with the admitting or primary ICD-10-CM diagnosis codes of Hemoglobin-SS (Hb-SS) SCD with crisis for the most common genotype of SCD. Please see the online posting for Lyfgenia™ for a complete list of ICD-10-CM codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 10,987 claims mapping to 160 MS-DRGs, including MS-DRGs 811 and 812 (Red Blood Cell Disorders with and without MCC, respectively) representing 75.1 percent of total identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$11,680,025, which exceeded the average case-weighted threshold amount of \$182,491.

For the sensitivity 2 cohort, the applicant searched for a broader cohort of patients with the primary or secondary ICD-10-CM diagnosis codes for SCD with or without crisis. Please see the online posting for Lyfgenia™ for a complete list of ICD-10-CM codes provided by the applicant. The applicant used the inclusion/exclusion criteria described in the following table. Under this analysis, the applicant identified 17,120 claims mapping to 453 MS-DRGs, including MS-DRGs 811 and 812 (Red Blood Cell Disorders with and without MCC, respectively) representing 56.3 percent of total identified cases. The applicant calculated a final inflated

average case-weighted standardized charge per case of \$11,681,718, which exceeded the average case-weighted threshold amount of \$182,491.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant maintained that Lyfgenia™ meets the cost criterion.

LYFGENIA™ COST ANALYSIS¹⁴⁰	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	Please see the online posting for Lyfgenia™ for a complete list of ICD-10-CM codes provided by the applicant.
List of MS-DRGs	Please see the online posting for Lyfgenia™ for a list of included MS-DRGs provided by the applicant.
Inclusion/exclusion criteria	<p>Primary cohort: The applicant selected claims based on the codes provided by the applicant in the online posting as it believes this list represents patients with any ICD-10-CM diagnosis code representing SCD with crisis.</p> <p>Sensitivity 1 cohort: The applicant selected claims based on the codes provided by the applicant in the online posting as it believes this list represents patients with an admitting or primary ICD-10-CM diagnosis code of Hb-SS disease with crisis, the most common genotype of SCD.</p> <p>Sensitivity 2 cohort: The applicant selected claims based on the codes provided by the applicant in the online posting as it believes this list represents patients with a primary or secondary ICD-10-CM diagnosis code of SCD with or without crisis.</p> <p>The applicant made the same exclusions for all three scenarios. The applicant excluded claims assigned to MS-DRG 014 (Allogenic Bone Marrow Transplant), 016 (Autologous Bone Marrow Transplant with CC/MCC), or 017 (Autologous Bone Marrow Transplant without CC/MCC) as the technology is intended for patients who have not already undergone allogeneic or autologous bone marrow transplant.</p>
Charges removed for prior technology	The applicant did not remove any charges for the prior technology. The applicant stated that in the case of Lyfgenia™, the inpatient hospital charges for myeloablative conditioning and Lyfgenia™ infusion will exceed any current charges for drugs and ancillary services.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2022 IPPS/LTCH PPS final rule and correction notice.
Inflation factor	The applicant applied an inflation factor of 11.90% to the standardized charges, based on the two-year inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by an estimated cost-to-charge ratio of 0.2669 for CAR T-cell therapies. The applicant stated that this cost-to-charge ratio is greater than the national average cost-to-charge ratio of 0.18 for drugs from the FY 2024 IPPS/LTCH PPS final rule, resulting in a lower estimated charges for the cost criterion analysis. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36079), we invited public comments on whether Lyfgenia™ meets the cost criterion.

Comment: The applicant commented that the cost criterion for Lyfgenia™ was met for the primary cohort and two sensitivity cohorts of cases.

Response: We thank the applicant for its comments. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted

¹⁴⁰ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

threshold amount under all scenarios. Therefore, Lyfgenia™ meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that Lyfgenia™ represents a substantial clinical improvement over existing technologies, because Lyfgenia™ is a one-time administration gene therapy that uniquely impacts the pathophysiology of SCD at the genetic level and offers the potential for stable, durable production of anti-sickling hemoglobin HbA^{T87Q}, with approximately 85 percent of RBCs producing HbA^{T87Q}, leading to complete resolution of severe VOEs in patients with SCD through 5.5 years of follow-up. The applicant asserted that for these reasons Lyfgenia™ is a much-needed treatment option for a patient population ineligible for allo-HSCT or without a matched related donor and significantly improves health-related quality of life. The applicant provided seven studies on Lyfgenia™ to support these claims, as well as 22 background articles about SCD and its current treatments.¹⁴¹ The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for Lyfgenia™ for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

¹⁴¹ Background articles are not included in the following table but can be accessed via the online posting for the technology.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments.	
Applicant statements in support	Supporting evidence provided by the applicant
Lyfgenia™ will provide a much-needed SCD treatment option, including for patients ineligible for allo-HSCT and for patients without a matched related donor.	<p>Kanter J, et al. Abstract #11; presentation.</p> <p>The applicant also provided a supplementary attachment and background information to support this claim, which can be accessed via the online posting for the technology.</p>

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36081), after reviewing the information provided by the applicant, we stated we had the following concerns regarding whether Lyfgenia™ meets the substantial clinical improvement criterion. With respect to the claim that Lyfgenia™ presents an acceptable risk-benefit profile in terms of efficacy and safety for patients with SCD while allowing clinically meaningful improvements in HRQoL, the applicant stated the safety profile remains generally consistent with risk of autologous stem cell transplant, myeloablative conditioning, and underlying SCD. Additionally, the applicant mentioned that serious treatment-emergent adverse events (TEAEs) of grade 3 or higher TEAEs were reported, but no cases of veno-occlusive liver disease, graft failure, or vector-mediated replication competent lentivirus were reported. Per the applicant, three patients had adverse events attributed to Lyfgenia™, including 2 events deemed possibly related and 1 event deemed definitely related, with all 3 resolving within 1 week of onset. We noted that the applicant submitted one published article about Group C results, an interim analysis by Kanter, et al. (2022)¹⁴² in which Lyfgenia™'s safety and efficacy were evaluated in a nonrandomized, open-label, single-dose phase 1-2 clinical trial (HGB-206) where 35 Group C patients had received Lyfgenia™ infusion. Group C was established after optimizing the treatment process in the initial cohorts, Groups A (7 patients) and B (2 patients). There was also a more stringent inclusion criterion for severe vaso-occlusive events before enrollment for Group C. The median follow-up was 17.3 months (range, 3.7-37.6) and 25 patients met both the inclusion criteria for vaso-occlusive events before enrollment and a minimum 6-month follow-up required for assessment of vaso-occlusive events. After receiving Lyfgenia™, 12 patients (34 percent) had at least one serious adverse event; the most frequently reported were abdominal pain, drug withdrawal syndrome (opiate), nausea, and vomiting (6 percent each). The two events that were

¹⁴²Kanter, J., Walters, M.C., Krishnamurti, L., Mapara, M.Y., Kwiatkowski, J.L, Rifkin-Zenenberg, S., Aygun, B., Kasow, K.A., Pierciey, Jr., F.J., Bonner, M., Miller, A., Zhang, X., Lynch, J., Kim, D., Ribeil, J.A., Asmal, M., Goyal, S., Thompson, A.A., & Tisdale, J.F. (2022). Biologic and Clinical Efficacy of LentiGlobin for Sickle Cell Disease. *The New England Journal of Medicine*, 386, 617-628. <https://doi.org/10.1056/nejmoa2117175>

deemed to be possibly related to Lyfgenia™ were grade 2 leukopenia and grade 1 decreased diastolic blood pressure and the one event that was deemed to be definitely related was grade 2 febrile neutropenia. Although this evidence was provided to assert Lyfgenia™ improves clinical outcomes relative to previously available therapies, we noted that the risk-benefit profile and HRQoL for Lyfgenia™ was not compared to existing therapies. We stated we were interested in additional information regarding the risk-benefit profile of Lyfgenia™ compared to existing therapies, including clarification regarding an acceptable risk-benefit profile for patients with SCD and whether Lyfgenia™ fits this profile. We also questioned if the length of patient follow-up (median: 17.3 months, range: 3.7 to 37.6) would be sufficient to assess long-term safety outcomes.

Finally, with respect to the applicant's assertion that Lyfgenia™ improves clinical outcomes by halting SCD progression, presenting an acceptable risk-benefit profile with clinically meaningful improvement in HRQoL, and results in complete resolution of sVOEs, we noted that the applicant provided multiple sources of evidence that analyze the same phase 1-2 clinical study for Lyfgenia™, HGB-206. We received an additional unpublished source¹⁴³ that provided some data on the phase 3 HGB-210 trial and combined this with data from HGB-206 with a total of 34 patients being evaluable for efficacy and 47 for safety. The median age of these 47 patients was 23 years. Due to the small study population and the median age of participants in the studies, we questioned if the safety and efficacy data from these studies would be generalizable to the Medicare population.

We invited public comments on whether Lyfgenia™ meets the substantial clinical improvement criterion.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion. In response to our concerns regarding the risk-benefit profile of

¹⁴³ Kanter J, et al. 65th ASH Annual Meeting and Exposition. December 9-12, 2023. Abstract 1051. Oral presentation (December 11th).

Lyfgenia™ compared to existing therapies and whether the length of patient follow-up was sufficient to assess long-term safety outcomes, the applicant stated that within the efficacy and safety pools, among the 47 patients who received Lyfgenia™, the median follow-up time was 35.5 months; overall exposure was 126.2 patient years. The applicant stated the longest patient follow up was 61.0 months (5.1 years). Per the applicant, efficacy was sustained across the duration of follow up (up to 61 months); 30 of 34 evaluable patients (88.2 percent; 95 percent CI, 72.5-96.7) achieved complete resolution of VOEs (VOE-CR), the primary endpoint (evaluated at 6-18 months post infusion). The key secondary endpoint, complete resolution of severe VOE (sVOE-CR), was achieved by 32 of 34 evaluable patients (94.1 percent; 95 percent CI, 80.3-99.3) in the same evaluation time period. The applicant reported that, at 36 months (N=20), clinically meaningful improvements occurred early and were sustained in pain intensity (57 percent), pain interference (64 percent), and fatigue (64 percent). The applicant further stated that the safety profile of Lyfgenia™ was consistent with underlying SCD and known effects of myeloablative conditioning, and there were no reports of graft failure or graft-versus-host disease. The applicant stated that SCD is associated with progressive and significant morbidity and mortality, with the burden of disease increasing with age. Per the applicant, current therapies do not target the underlying cause of disease and significant unmet need persists. The applicant also emphasized that while allo-HSCT is a potentially curative option, only a small percentage of patients are eligible for this treatment option due to lack of a matched donor and other reasons, such as age.

In response to our concern that the safety and efficacy data for Lyfgenia™ may not be generalizable to the Medicare population, the applicant explained that the overwhelming majority of Medicare beneficiaries with SCD were eligible because of disability (97.3 percent), not age. According to the applicant, Wilson-Frederick, et al. (2019)¹⁴⁴ found that 85.8 percent of

¹⁴⁴ Wilson-Frederick SM, et al. Prevalence of sickle cell disease among Medicare Fee-for-Service beneficiaries, age 18-75 years, in 2016. CMS Data Highlight, No 15, June 2019.

the Medicare SCD population were non-elderly (ages 18-64), and 14.2 percent were ages 65-75 years, with ages 31- 45 years (36.4 percent) representing the largest Medicare-covered age category.

A few commenters commented in support of approving Lyfgenia™. A commenter disagreed with CMS's concerns on substantial clinical improvement and discussed the barriers to access hematopoietic stem cell transplantation.

Response: We thank the applicant and other commenters for their comments regarding the substantial clinical improvement criterion. Based on a review of all the clinical studies and information submitted, we agree with the applicant that Lyfgenia™ represents a substantial clinical improvement over existing technologies because the technology offers a treatment option for certain patients with SCD who experience recurrent VOs and who have not been able to achieve adequate control of the condition with existing treatments such as hydroxyurea and are ineligible for allo-HSCT due to the lack of a matched donor or other reasons (for example, age of the patients).

After consideration of the public comments received, and the information included in the applicant's new technology add-on payment application, we have determined that Lyfgenia™ meets the criteria for approval for new technology add-on payment. Therefore, we are approving new technology add-on payments for this technology for FY 2025. Cases involving the use of Lyfgenia™ that are eligible for new technology add-on payments will be identified by ICD-10-PCS codes: XW133H9 (Transfusion of lovotibeglogene autotemcel into central vein, percutaneous approach, new technology group 9) or XW143H9 (Transfusion of lovotibeglogene autotemcel into peripheral vein, percutaneous approach, new technology group 9).

In its application, the applicant estimated that the cost of Lyfgenia™ is \$3,100,000 per patient. As discussed in section II.E.10. of the preamble of this final rule, we are revising the maximum new technology add-on payment percentage to 75 percent, for a medical product that is a gene therapy that is indicated and used specifically for the treatment of SCD and approved

for new technology add-on payments for the treatment of SCD in the FY 2025 IPPS/LTCH PPS final rule. Accordingly, under § 412.88(a)(2) as revised in this final rule, we limit new technology add-on payments to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of Lyfgenia™ for the treatment of SCD is \$2,325,000 for FY 2025.

j. Quicktome Software Suite (Quicktome Neurological Visualization and Planning Tool)

Omniscient Neurotechnology submitted an application for new technology add-on payments for Quicktome Software Suite for FY 2025. According to the applicant, Quicktome Software Suite is a cloud-based software that uses artificial intelligence (AI) tools and the scientific field of connectomics to analyze millions of data points derived from a patient’s magnetic resonance imaging (MRI). Per the applicant, Quicktome Software Suite’s proprietary Structural Connectivity Atlas (SCA) uses machine learning and tractographic techniques to create highly specific and personalized maps of a patient’s brain or connectome from a standard MRI scan, regardless of brain shape, size, or physical distortion. The applicant asserted that the SCA is combined with a key refinement algorithm that identifies the location of parcels based on the specific structural characteristics of an individual’s brain. The applicant asserted that Quicktome Software Suite uses resting-state functional MRI (rs-fMRI) to unveil the brain’s network architecture or functional connectome by mapping blood oxygen level dependent (BOLD) signal correlations across brain parcels. Per the applicant, using data from a structural or a functional MRI (fMRI) scan, Quicktome Software Suite’s proprietary AI allows clinicians to quickly and accurately assess the structural layout (that is, the locations and integrity) or the functional connectivity (that is, how different brain regions are working together) of a patient’s brain.

Please refer to the online application posting for Quicktome Software Suite, available at <https://mearis.cms.gov/public/publications/ntap/NTP23101722NQE>, for additional detail describing the technology and the disease for which the technology is used.

With respect to the newness criterion, according to the applicant, Quicktome Software Suite received FDA 510(k) clearance on May 30, 2023. Per the FDA-cleared indication, Quicktome Software Suite is composed of a set of modules intended for the display of medical images and other healthcare data. It includes functions for image review, image manipulation, basic measurements, planning, three-dimensional (3D) visualization (multiplanar reconstructions (MPR) and 3D volume rendering), and the display of BOLD rs-MRI scan studies. The FDA clearance for Quicktome Software Suite was based on substantial equivalence to the legally marketed predicate device, StealthViz Advanced Planning Application with Stealth Diffusion Tensor Imaging (DTI)TM Package (hereafter referred to as StealthVizTM), as both of these devices allow the import and export of Digital Imaging and Communications in Medicine (DICOM) images to a hospital picture archiving and communication system (PACS); contain a graphical user interface to conduct planning and visualization; display MRI anatomical images, as well as tractography constructed from Diffusion Weighted Images, in two-dimensional (2D) and 3D views; register tractography and an atlas to the underlying anatomical images; allow adding, removing, and editing of objects (including automatically segmented and manually defined regions of interest); and are delivered as software on an off-the-shelf hardware platform.¹⁴⁵ Prior to the FDA 510(k) clearance of Quicktome Software Suite in 2023, the technology, under the trade name Quicktome, received FDA 510(k) clearance on March 9, 2021, based on substantial equivalence to StealthVizTM.¹⁴⁶ StealthVizTM received FDA 510(k) clearance on May 16, 2008, for use in 2D and 3D surgical planning and image review and analysis. According to the FDA 510(k) summary for StealthVizTM, it enables digital diagnostic and functional imaging datasets,

¹⁴⁵ Food and Drug Administration (FDA). 510(k) Premarket notification for Medtronic Navigation, Inc.'s StealthViz Advanced Planning Application with StealthDTI Package. K081512. May 16, 2008.

¹⁴⁶ FDA. K203518. 2021.

reviewing and analyzing the data in various 2D and 3D presentation formats, performing image fusion of datasets, segmenting structures in the images with manual and automatic tools and converting them into 3D objects for display, and exporting results to other Medtronic Navigation planning applications, to a PACS or to Medtronic Navigation surgical navigation systems such as StealthStation System. According to the applicant, Quicktome Software Suite was commercially available immediately after FDA clearance.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for Quicktome Software Suite and was granted approval to use the following procedure code effective October 1, 2024: 00K0XZ1 (Map brain using connectomic analysis, external approach). The applicant provided a list of diagnosis codes that it stated may currently be used to identify the indication for Quicktome Software Suite under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered new for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that Quicktome Software Suite is not substantially similar to other currently available technologies because it is the first and only FDA-cleared platform to enable connectomic analysis at an individual level using machine learning and tractographic techniques to create personalized maps of the human brain. In addition, the applicant asserted that Quicktome Software Suite is the first cleared neurological planning tool to offer rs-fMRI capabilities. Per the applicant, Quicktome Software Suite eliminates the need for highly trained personnel, who may not be available at most institutions, and therefore, the technology meets the newness criterion. The applicant further asserted that current technologies that rely on task-based fMRI (tb-fMRI) can be problematic in

brain tumor patients who may be cognitively impaired because they may be unable to perform required tasks. The following table summarizes the applicant’s assertions regarding the substantial similarity criteria. Please see the online application posting for Quicktome Software Suite for the applicant’s complete statements in support of its assertion that Quicktome Software Suite is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	The applicant noted that while Quicktome Software Suite is not therapeutic in nature, it is unique in its mechanism of action. Per the applicant, Quicktome Software Suite is the first and only FDA-cleared platform to enable connectomic analysis at an individual level. The applicant stated that the technology’s proprietary SCA, a newly developed brain mapping technique, uses machine learning and tractographic techniques to create personalized maps of the human brain, providing clinicians with unprecedented information about the location and function of a patient’s brain networks, which was previously only available in research settings.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	The applicant maintained that the technology provides critical supplementary information for patients admitted under existing DRGs for procedures and conditions such as craniotomy.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	Per the applicant, Quicktome Software Suite does not treat a new disease type or patient population but does provide new information for the treatment of existing patient populations.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36083), we noted the following concerns regarding whether Quicktome Software Suite meets the newness criterion. With respect to the applicant’s claim that Quicktome Software Suite does not use the same or similar mechanism of action as existing technologies to achieve a therapeutic outcome, we noted that, according to the 510(k) application, it appears that Quicktome Software Suite is equivalent to StealthViz™, its predicate device. We stated it was unclear how Quicktome Software Suite’s mechanism of action, which enables patient-specific connectomic analysis for neurological planning, is different from that of StealthViz™. We noted that StealthViz™ received FDA 510(k) clearance on May 16, 2008, for use in 2D/3D surgical planning and image review and analysis, and therefore is no longer considered new for purposes of new technology add-on payments. According to the applicant, Quicktome Software Suite is the first and only FDA-cleared platform to enable brain network mapping and analysis at an individual level and

provides clinicians with information that was previously only available in a research setting. We noted that we were interested in further information to support that Quicktome Software Suite does not use the same or similar mechanism of action as StealthViz™ to achieve a therapeutic outcome, including information regarding capabilities of Quicktome Software Suite not found in StealthViz™, and whether and how those capabilities are the result of a new mechanism of action.

In addition, we noted that there are several existing FDA-approved or cleared technologies (for example, StealthViz™, Brainlab's Elements and iPlan products) that analyze fMRI and other medical imaging data to create 3D maps of a patient's brain, including white matter tracts. Furthermore, while the applicant asserted that Quicktome Software Suite is the only FDA-cleared device that uses a rs-fMRI, we questioned whether other FDA-cleared neurosurgical planning and visualization technologies integrate rs-fMRI, or if the analysis of rs-fMRI for neurosurgical planning is a mechanism of action unique to Quicktome Software Suite. We noted that we were interested in more information on the relevant current standard of care and technologies utilized for neurosurgical planning and how the mechanism of action of Quicktome Software Suite compares to the mechanism of action of existing technologies and connectomics software.

With respect to the third criterion, whether Quicktome Software Suite involves the treatment of the same or similar disease and patient population compared to existing technologies, we noted that according to the applicant, Quicktome Software Suite does not treat a new disease type or patient population but does provide new information for the treatment of existing patient populations. However, the provision of new information for the treatment of existing patient populations does not mean that the technology treats a new disease type or patient population, and therefore, we noted that it was unclear what the basis is for the applicant's statement that the third criterion is not met. We stated we were interested in

additional information to support whether and how Quicktome Software Suite may involve the treatment of a different type of disease or patient population.

We stated that, as discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44981), we also continued to be interested in public comments regarding issues related to determining newness for technologies that use AI, an algorithm, or software. Specifically, we stated that we were interested in public comment on how these technologies may be considered for the purpose of identifying a unique mechanism of action; how updates to AI, an algorithm, or software would affect an already approved technology or a competing technology; whether software changes for an already approved technology could be considered a new mechanism of action; and whether an improved algorithm by competing technologies would represent a unique mechanism of action if the outcome is the same as an already approved AI new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36083), we invited public comments on whether Quicktome Software Suite is substantially similar to existing technologies and whether Quicktome Software Suite meets the newness criterion.

Comment: We received a few comments in support of new technology add-on payments for Quicktome Software Suite. The commenters stated that Quicktome Software Suite has a new mechanism of action because it distinguishes itself from existing technologies such as StealthViz™ by harnessing the power of AI, the structural connectivity atlas, and connectomics. The commenters further stated that unlike conventional methods, Quicktome Software Suite leverages AI algorithms to analyze complex structural and functional brain data, enabling the creation of comprehensive brain network maps that go beyond tractography. The commenters also stated that this approach, discussed in studies by Hendricks et al. (unpublished)¹⁴⁷ and Morell et al. (2022)¹⁴⁸, offers a more nuanced understanding of brain connectivity which

¹⁴⁷ Hendricks B, Scherschinski L, Jubran J, et al. Supratentorial Cavernous Malformation Surgery: The Seven Hotspots of Novel Cerebral Risk. Unpublished manuscript.

¹⁴⁸ Morell AA, Eichberg DG, Shah AH, et al. Using machine learning to evaluate large-scale brain networks in patients with brain tumors: Traditional and non-traditional eloquent areas. *Neurooncol Adv.* 2022 Sep 19;4(1):vdac142. Doi: 10.1093/noajnl/vdac142. PMID: 36299797; PMCID: PMC9586213

includes higher order brain networks responsible for cognitive functions and emotion to which only Quicktome Software Suite can map. The commenters stated that existing technologies like StealthViz™ only go as far as tractography, which is able to map the white matter connections of the brain but does not delineate a patient's unique brain networks. The commenters stated that another of Quicktome Software Suite's hallmark features is its utilization of rs-fMRI for functional connectomic analysis, which is a mechanism of action that sets it apart from existing technologies. The commenters stated that studies such as the ones by Shimony et al. (2009)¹⁴⁹, Hacker et al. (2019)¹⁵⁰, and Lee et al. (2013)¹⁵¹ have demonstrated the unique efficacy of rs-fMRI in delineating functional brain networks, enabling surgeons to tailor their approaches to minimize damage to critical neural circuits. The commenters stated that Quicktome Software Suite is also set apart from existing technology because Quicktome Software Suite offers fully automated post-processing of rs-fMRI, eliminating the need for specialized radiology personnel who are typically only available at the most advanced academic centers.

The commenters also stated, with regard to whether Quicktome Software Suite treats the same or similar type of disease and patient population as existing technologies that analyze fMRI and other medical imaging data for neurologic planning, such as StealthViz™, that the unique processing of rs-fMRI underscores Quicktome Software Suite's potential to revolutionize neurosurgical planning and improve patient outcomes for all Medicare patients, not just the ones at the most elite academic institutions. Per the commenters, this is a critical consideration for Medicare patients who suffer from cognitive or motor impairments and cannot fully cooperate with task-based protocols (which are the only pre-surgical functional imaging paradigms currently available outside of Quicktome Software Suite).

¹⁴⁹ Shimony J, Zhang D, Johnston JM, et al. Resting-state spontaneous fluctuations in brain activity: A new paradigm for presurgical planning using fMRI. *Academic Radiology* 16:578-583.

¹⁵⁰ Hacker CD, Roland JL, Kim AH, et al. Resting-state network mapping in neurosurgical practice: a review. *Neurosurgical Focus* December 2019. Volume 47.

¹⁵¹ Lee MH, Smyser CD, and Shimony JS. Resting-state fMRI: A review of methods and clinical applications. *American Journal of Neuroradiology* Oct 2013. 34:1866-72

A commenter stated that it is important to note that receiving clearance through a 510(k) should not be a definitive determination that a technology is substantially similar, particularly for one that has received FDA Breakthrough Device designation. The commenter further stated that over the last few years, CMS has approved a number of technologies for new technology add-on payments (thus having demonstrated newness) that received 510(k) clearance by demonstrating substantial equivalence to a previously approved or cleared technology.

Response: We appreciate the additional information from the commenters with respect to whether Quicktome Software Suite is substantially similar to existing technologies. We note that the studies presented by commenters (Shimony et al. (2009)¹⁵², Hacker et al. (2019)¹⁵³, and Lee et al. (2013)¹⁵⁴) do not appear to discuss the specific mechanism of action of Quicktome Software Suite and how it represents a new mechanism of action compared to existing technologies, but rather more generally describe the potential uses of rs-fMRIs. We note that Quicktome was not mentioned in any of the three articles. We are unclear if the technology discussed in the articles was identical to Quicktome Software Suite, or rather, if it is an existing technology that would have a similar mechanism of action as Quicktome Software Suite. Absent additional information, we are unable to determine if Quicktome Software Suite's mechanism of action, which utilizes AI-based patient-specific analysis for neurological planning, is different from the mechanism(s) of action of existing technologies that analyze medical imaging data to create 3D maps of a patient's brain, including white matter tracts. While the commenters asserted Quicktome Software Suite distinguishes itself from existing technologies such as StealthViz™ by harnessing the power of AI, the structural connectivity atlas, and connectomics, it remains unclear specifically how this use of AI constitutes a unique mechanism of action when compared to non-AI technologies used in the same way for neurosurgical planning and visualization. We

¹⁵² Shimony J, Zhang D, Johnston JM, et al. Resting-state spontaneous fluctuations in brain activity: A new paradigm for presurgical planning using fMRI. *Academic Radiology* 16:578-583.

¹⁵³ Hacker CD, Roland JL, Kim AH, et al. Resting-state network mapping in neurosurgical practice: a review. *Neurosurgical Focus* December 2019. Volume 47.

¹⁵⁴ Lee MH, Smyser CD, and Shimony JS. Resting-state fMRI: A review of methods and clinical applications. *American Journal of Neuroradiology* Oct 2013. 34:1866-72

also disagree with commenters that the fully automated post-processing of rs-MRIs offered by Quicktome Software Suites represents a new mechanism of action, as it appears to describe an ease-of-use feature that may instead relate to an assessment of substantial clinical improvement. As a result, we believe that Quicktome Software Suite uses the same or similar mechanism of action as existing technologies like StealthViz™.

However, with regard to whether a technology treats the same or similar type of disease and patient population, we agree with the commenters that Medicare patients who suffer from cognitive or motor impairments and cannot cooperate with task-based protocols would represent a patient population that could not utilize existing technologies for patient-specific connectomic analysis for neurological planning. Therefore, based on our review of the comments received, we agree that Quicktome Software Suite is not substantially similar to existing technologies and meets the newness criterion. We consider the beginning of the newness period to commence on May 30, 2023, when Quicktome Software Suite received FDA market authorization.

Comment: A few commenters responded to our request for comments regarding issues related to determining newness for technologies that use AI, an algorithm, or software. A commenter stated that FDA defines mechanism of action (referred to as mode of action) as “the means by which a product achieves its intended therapeutic effect or action.”¹⁵⁵ Per the commenter, in reviewing Quicktome Software Suite and similar technologies that involved the use of AI, it is important to note that the AI, algorithm, or software do not represent the mechanism of action per se. The commenter stated that AI, algorithm, or software plays an important role, such as analyzing images and creating brain mapping, but that piece alone is not sufficient to achieve the clinical effect. It stated that the AI, algorithm, or software is a component of the technology, not the entirety of the technology itself. The commenter stated that technologies that incorporate AI, an algorithm or software should be evaluated for newness in the same way as CMS evaluates any other medical device applying for a new technology add-on

¹⁵⁵ 21 CFR § 3.2(k)

payment. The commenter stated that CMS should not take a broad policy position on the newness of these types of technologies, but should use its existing criteria and existing framework in evaluating these technologies individually on a case-by-case basis.

Another commenter recommended that CMS consider revisions to the regulations for new technology add-on payments under 42 CFR 412.87 to establish an alternative pathway for high-value AI technologies. The commenter suggested that newness should be determined by whether the technology enables a clinically valuable task for the Medicare patient population not previously achievable without the technology. The commenter continued by stating that “uniqueness” should be determined by whether the technology addresses a high-value clinical use case not previously addressed by other available technologies or medical procedures. The commenter also stated CMS’s understanding of “value” of the Medicare population should be guided primarily by input from physician-experts and/or specialists in the related fields as well as product performance data.

Response: We thank the commenters for their input. We will continue to consider these comments as we gain more experience in this area and continue to welcome comments on determining newness and assessing mechanism of action for technologies that use AI, an algorithm or software.

With respect to the cost criterion, to identify potential cases representing patients who may be eligible for Quicktome Software Suite, the applicant searched 2020 Medicare Inpatient Hospitals - by Provider and Service data.¹⁵⁶ The applicant included all cases from the following MS-DRGs: 025 (Craniotomy and Endovascular Intracranial Procedures with MCC), 026 (Craniotomy and Endovascular Intracranial Procedures with CC), and 027 (Craniotomy and Endovascular Intracranial Procedures without CC/MCC). Using the inclusion/exclusion criteria

¹⁵⁶ The Medicare Inpatient Hospitals by Provider and Service dataset provides information on inpatient discharges for Original Medicare Part A beneficiaries by IPPS hospitals. It includes information on the use, payment, and hospital charges for more than 3,000 U.S. hospitals that received IPPS payments. The data are organized by hospital and Medicare Severity Diagnosis Related Group (DRG): <https://data.cms.gov/provider-summary-by-type-of-service/medicare-inpatient-hospitals/medicare-inpatient-hospitals-by-provider-and-service>.

described in the following table, the applicant identified 28,401 cases mapping to these three craniotomy MS-DRGs, with 64 percent of the identified cases mapping to MS-DRG 025. The applicant followed the order of operations described in the following table and calculated a final inflated average case-weighted standardized charge per case of \$179,317, which exceeded the average case-weighted threshold amount of \$134,802. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that Quicktome Software Suite meets the cost criterion.

QUICKTOME SOFTWARE SUITE COST ANALYSIS	
Data Source and Time Period	2020 Medicare Inpatient Hospitals – by Provider and Service data
List of MS-DRGs	DRG 025 (Craniotomy and Endovascular Intracranial Procedures with MCC) DRG 026 (Craniotomy and Endovascular Intracranial Procedures with CC) DRG 027 (Craniotomy and Endovascular Intracranial Procedures without CC/MCC)
Inclusion/exclusion criteria	The applicant asserted that Quicktome Software Suite is relevant to all procedure and diagnosis codes which may lead to a craniotomy procedure, therefore it included all cases assigned to the listed MS-DRGs and applied no restrictions regarding ICD-10-CM/PCS codes as it indicated that all stays related to the MS-DRGs listed previously are relevant.
Charges removed for prior technology	The applicant stated that it did not remove indirect charges related to the prior technology because Quicktome Software Suite would not replace prior technologies. Per the applicant, Quicktome Software Suite would supplement existing MRIs to provide detail regarding brain structural and functional analysis to improve patient outcomes.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2020 IPPS/LTCH PPS final rule and correction notice.
Inflation factor	The applicant applied an inflation factor of 32% to the standardized charges, as a five-year inflation factor calculated based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added the cost for Quicktome Software Suite but did not convert the previously noted costs to charges for the new technology. In addition, the applicant estimated indirect costs related to the technology. Per the applicant, it took into account the operating costs related to an additional 18-minute scan time compared to the typical MRI scan. The applicant also added costs of additional capital MRI equipment needed to produce the MRI scans for Quicktome Software Suite. Specifically, per the applicant, MRI hardware and infrastructure must, at minimum, include scanners equipped with DTI capabilities. The applicant noted that while it assumed only DTI capabilities as a baseline additional expense, the actual hardware and infrastructure costs for most hospitals are likely much higher. The applicant did not convert the indirect costs to charges for the new technology.

We noted the following concerns regarding the cost criterion. We noted that the applicant limited its cost analysis to MS-DRGs 025, 026, and 027 because those three MS-DRGs represent brain tumor resection procedures, which are the first and most clearly established procedures for which the technology offers clinical utility. We stated that we were interested in information as to whether the technology would map to other MS-DRGs, such as 023 and 024 (Craniotomy with Major Device Implant or Acute Complex CNS PDX with MCC or Chemotherapy, or without

MCC, respectively), or 054 and 055 (Nervous System Neoplasms with and without MCC, respectively), and if these MS-DRGs should also be included in the cost analysis. In addition, we questioned whether every case within MS-DRGs 025, 026, and 027 would be eligible for the technology and whether there would be any appropriate inclusion/exclusion criteria by ICD-10-CM/PCS codes within these MS-DRGs to identify potential cases representing patients who may be eligible for Quicktome Software Suite.

We invited public comments on whether Quicktome Software Suite meets the cost criterion.

We did not receive any comments on whether the Quicktome Software Suite cost analysis should include other MS-DRGs, such as 023 and 024 (Craniotomy with Major Device Implant or Acute Complex CNS PDX with MCC or Chemotherapy, or without MCC, respectively), or 054 and 055 (Nervous System Neoplasms with and without MCC, respectively), or if any additional inclusion/exclusion criteria should be applied to the MS-DRGs the applicant included in its cost analysis, specifically MS-DRGs 025, 026, and 027. As previously discussed, based on the information submitted by the applicant as part of its new technology add-on payment application, the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount for MS-DRGs 025, 026, and 027, which represent brain tumor resection procedures. Therefore, Quicktome Software Suite meets the cost criterion for use with brain tumor resection procedures mapping to MS-DRGs 025, 026, and 027.

With regard to the substantial clinical improvement criterion, the applicant asserted that Quicktome Software Suite represents a substantial clinical improvement over existing technologies because Quicktome Software Suite supports the visualization and brain mapping that improve clinical outcomes such as reducing the risk of an extended length of stay (LOS) and unplanned readmissions for craniotomy patients by reducing new postoperative neurological deficits that are caused by damage to brain networks or a patient's connectome. The applicant further asserted that Quicktome Software Suite is the first and only FDA-cleared platform to

enable connectomic analysis at an individual level, enabling surgeons to visualize and avoid damaging these brain networks during surgery, thereby significantly improving clinical outcomes relative to services or technologies previously available. The applicant submitted three published studies and one unpublished study evaluating Quicktome Software Suite to support these claims, as well as four background articles about complications leading to unplanned readmissions after cranial surgery, factors associated with extended LOS in patients undergoing craniotomy for tumor resection, the association of incorporating fMRI in presurgical planning with mortality and morbidity in brain tumor patients, and the clinical importance of non-traditional, large-scale brain networks with respect to the potential adverse effects on patients when these networks are disrupted during surgery.¹⁵⁷ We noted in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36085) that one of the articles submitted as a study using the technology, the Dadario and Sughrue (2022)¹⁵⁸ study, should more appropriately be characterized as a background article because it does not directly assess the use of Quicktome Software Suite.

The following table summarizes the applicant’s assertions regarding the substantial clinical improvement criterion. Please see the online posting for Quicktome Software Suite for the applicant’s complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

Substantial Clinical Improvement Assertion #1: The technology significantly improves clinical outcomes relative to services or technologies previously available

Damaging brain networks during surgery leads to neurologic complications, which are a leading contributor to increased length of stay, ICU admission, and readmissions	The applicant provided background information to support this claim, which can be accessed via the online posting for the technology.
Damaging brain networks during surgery has adverse effects for patients, including decreased quality of life and loss of function	The applicant provided background information to support this claim, which can be accessed via the online posting for the technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36085 through 36087), after our review of the information provided by the applicant, we stated that we had the following concerns regarding whether Quicktome Software Suite meets the substantial clinical improvement criterion. With respect to the applicant’s claim that Quicktome Software Suite supports the visualization of brain networks and surgical planning to avoid damaging them during surgery, we stated we were concerned that the evidence does not appear to demonstrate that the Quicktome Software Suite’s visualization and brain mapping techniques improve clinical outcomes relative to services or technologies already available by avoiding or reducing damage to the brain networks during surgery. For example, the Shah et al. (2023)¹⁵⁹ study describes the use of connectomics in planning and guiding an awake craniotomy for a tumor impinging on the language area in a 31-year-old bilingual woman. The authors stated that Quicktome Software Suite was used to generate preoperative connectome imaging for the patient, which helped in assessing the risk of functional deficits, guiding surgical planning, directing intraoperative mapping stimulation, and providing insights into postoperative function. The authors further described how preoperative imaging demonstrated proximity of the tumor to parcellations of the language area, and how intraoperative awake language mapping was performed, revealing

¹⁵⁹ Shah HA, Ablyazova F, Alrez A, et al. Intraoperative awake language mapping correlates to preoperative connectomics imaging: An instructive case. *Clin Neurol Neurosurg*. 2023 Jun;229:107751. Doi: 10.1016/j.clineuro.2023.107751. Epub 2023 Apr 29. PMID: 3714997. 2.

speech arrest and paraphasic errors at areas of the tumor boundary correlating to functional regions that explained these findings. However, we noted that we were concerned that the report is based on a single case, and we questioned whether these findings would be generalizable to the broader Medicare population. In addition, we noted that the applicant did not provide evidence based on comparison of the use of Quicktome Software Suite technology with currently available cranial mapping software or tractography tools, and we noted that we would be interested in comparisons that assess the use of Quicktome Software Suite technology to improve these clinical outcomes relative to currently available technologies, such as StealthViz™ or Brainlab's Elements and iPlan products.

In addition, we questioned whether the findings related to Quicktome Software Suite's efficacy were generalizable to the Medicare population. Specifically, the Wu et al. (2023)¹⁶⁰ study examined the involvement of non-traditional brain networks in insulo-Sylvian gliomas and evaluated the potential of Quicktome Software Suite in optimizing surgical approaches to preserve cognitive function. The study included three parts. The first part involved a retrospective analysis of the location of insulo-Sylvian gliomas in 45 adult patients who underwent glioma surgery centered in the insular lobe. According to the research team, Quicktome Software Suite showed that 98 percent of the tumors involved a non-traditional eloquent brain network, which is associated with cognitive or neurological function. In part two, the research team prospectively collected neuropsychological data on seven patients to assess tumor-network involvement with change in cognition. Using Quicktome Software Suite, the research team found that all seven patients had a tumor involving a non-traditional eloquent brain network. Part three described how the research team used Quicktome Software Suite's network mapping capabilities to inform surgical decision-making and predict the preservation of

¹⁶⁰ Wu Z, Hu G, Cao B, Liu X, et al. Non-traditional cognitive brain network involvement in insulo-Sylvian gliomas: a case series study and clinical experience using Quicktome. *Chin Neurosurg J.* 2023 May 26;9(1):16. Doi: 10.1186/s41016-023-00325-4 PMID: 37231522; PMCID: PMC10214670.

cognitive function post-surgery for two prospective patients. We noted that while Quicktome Software Suite was used to assist surgical decision-making in two patients, as previously discussed, we questioned whether these limited findings would be generalizable to the broader Medicare population, and we stated that we would be interested in comparisons between Quicktome Software Suite and other currently available technologies to improve these clinical outcomes.

We also questioned whether the use of Quicktome Software Suite had a direct impact on significantly reducing neurological or cognitive deficits post-surgery. The applicant cited Morell et al. (2022)¹⁶¹, a retrospective, single-center study of 100 patients who underwent surgery for brain tumor resection. The research team used Quicktome Software Suite to map and evaluate the integrity of nine large-scale brain networks in these patients. According to the research team, Quicktome Software Suite's analysis showed that for more than half of these patients, at least one of their brain networks were either affected during brain surgery or at risk of postsurgical deficits. Among those at risk of postsurgical deficits, their cortical regions or white matter fibers were either displaced by the mass effect of the tumor or damaged during surgery due to proximity to the tumor and/or planned transcortical trajectory. We noted that the primary focus of the study was to retrospectively map large-scale brain networks in brain tumor patients using Quicktome Software Suite platform, and therefore we stated that it did not appear to demonstrate that use of Quicktome Software Suite avoided damaging these networks during surgery.

Similarly, we noted that the applicant cited Hendricks et al. (n.d.),¹⁶² which retrospectively analyzed the outcomes of 346 adult patients who underwent resection of superficial cerebral cavernous malformations from November 2008 through June 2021. We noted that the focus of the study was the use of Quicktome Software Suite to support the

¹⁶¹ Morell AA, Eichberg DG, Shah AH, et al. Using machine learning to evaluate large-scale brain networks in patients with brain tumors: Traditional and non-traditional eloquent areas. *Neurooncol Adv.* 2022 Sep 19;4(1):vdac142. Doi: 10.1093/oaajnl/vdac142 PMID: 36299797; PMCID: PMC9586213.

¹⁶² Hendricks B, Scherschinkski L, Jubran J, et al. Supratentorial Cavernous Malformation Surgery: The Seven Hotspots of Novel Cerebral Risk (SUBMITTED MANUSCRIPT).

identification of areas of eloquent noneloquence, or cortex injured or transgressed that causes unexpected deficits. Therefore, we stated we remained interested in evidence that incorporating Quicktome Software Suite's analytics into surgical strategies and navigational tools during craniotomy surgery is associated with improved post-surgical outcomes.

With respect to the applicant's claim that damaging brain networks during surgery leads to neurologic complications, which are a leading contributor to increased length of stay (LOS), ICU admission, and readmissions, the applicant asserted that Quicktome Software Suite enables surgeons to visualize these brain networks and change their surgical approach as needed to avoid damages. We noted that the applicant submitted two documents in support of this claim, both of which are background documents rather than studies that evaluate clinical outcomes associated with the use of Quicktome Software Suite. In particular, the Elsamadicy et al. (2018)¹⁶³ study showed that altered mental status and sensory or motor deficits were the primary complications of craniotomies. The Phillips et al. (2023)¹⁶⁴ study demonstrated that post-operative neurological deficits, caused by damage to brain networks or a patient's connectome were responsible for extended LOS. Although these studies supported the applicant's claim that damage to brain networks resulted in neurological complications, increasing LOS and inpatient service use, we noted that the evidence provided for this claim did not assess the use of Quicktome Software Suite to improve these clinical outcomes, nor did the evidence appear to demonstrate that use of the technology substantially improves these clinical outcomes relative to existing technologies, such as StealthViz™ or Brainlab's Elements and iPlan products. We stated that we would be interested in evidence demonstrating that utilization of Quicktome Software Suite improves clinical outcomes related to LOS, ICU admissions, and readmissions relative to existing technologies.

¹⁶³ Elsamadicy, AA, Sergesketter, A, Adogwa, O, et al. Complications and 30-Day readmission rates after craniotomy/craniectomy: A single Institutional study of 243 consecutive patients, *Journal of Clinical Neuroscience*, Volume 47, 2018, Pages 178-182, ISSN 0967-5868, <https://doi.org/10.1016/>

¹⁶⁴ Phillips KR, Enriquez-Marulanda A, Mackel C, et al. Predictors of extended length of stay related to craniotomy for tumor resection. *World Neurosurg* X. 2023 Mar 31;19:100176. doi:10.1016/j.wnsx.2023.100176 PMID: 37123627; PMCID: PMC10139985.

With respect to the applicant’s claim that damaging brain networks during surgery has adverse effects for patients, including decreased quality of life and loss of function, the applicant asserted that Quicktome Software Suite enables surgeons to visualize brain networks and change their surgical approach as needed to avoid damaging these networks. The applicant further asserted that while other techniques have enabled the visualization of tractography or of parts of eloquent networks, this is not an adequate substitute for the ability to review the entirety of a patient’s connectome (networks such as motor, language, and vision). Per the applicant, Quicktome Software Suite is the first of its kind to show the location and function of these networks and that damage to these networks is associated with poor outcomes. The applicant cited Vysotski et al. (2019),¹⁶⁵ who demonstrated that brain tumor patients who underwent a preoperative fMRI experienced significantly lower risks for mortality than those who did not. The applicant also cited Dadario and Sughrue (2022),¹⁶⁶ who discussed the clinical importance of preserving non-traditional brain networks for neurosurgical patients. Similar to our previous concern, we noted that the evidence provided for this claim did not assess the use of Quicktome Software Suite to improve quality of life and loss of function, nor did the evidence appear to demonstrate that use of the technology substantially improves these clinical outcomes relative to existing technologies. Therefore, we stated that we continued to question whether there was evidence to assess the effectiveness of Quicktome Software Suite to reduce damage to brain networks during surgery.

We stated in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36087) that we were also interested in public comments related to how we should evaluate issues related to determining substantial clinical improvement for technologies that use AI, an algorithm or software, including issues related to algorithm transparency, and how CMS should consider these

¹⁶⁵ Vysotski S, Madura C, Swan B, et al. Preoperative fMRI Associated with Decreased Mortality and Morbidity in Brain Tumor Patients. *Interdiscip Neurosurg.* 2018 Sep;13:40-45. doi: 10.1016/j.inat.2018.02.001 Epub 2018 Feb 14. PMID: 31341789; PMCID: PMC6653633.

¹⁶⁶ Dadario NB, Sughrue ME. Should Neurosurgeons Try to Preserve Non-Traditional Brain Networks? A Systematic Review of the Neuroscientific Evidence. *Journal of Personalized Medicine.* 2022; 12(4):587. <https://doi.org/10.3390/jpm12040587>.

issues in our assessment of substantial clinical improvement, as we continue to gain experience in this area. We noted that algorithm transparency refers to whether, and the extent to which, clinical users are able to access a consistent, baseline set of information about the algorithms they use to support their decision making and to assess such algorithms for fairness, appropriateness, validity, effectiveness, and safety.¹⁶⁷

We invited public comments on whether Quicktome Software Suite meets the substantial clinical improvement criterion.

Comment: We received a few comments in support of new technology add-on payments for Quicktome Software Suite. The commenters stated that they believe Quicktome Software Suite provides a substantial clinical improvement over existing technologies. The commenters stated that out of the box, StealthViz™ does not allow a surgeon to visualize the patient's Default Mode Network (DMN) or the Dorsal Attention Network (DAN). Per the commenters, damage to the DMN can lead to memory loss and psychiatric disorders, and dysfunction of the DAN has been shown to be related to declines in cognitive abilities including attention and executive function. The commenters also stated if these higher order networks are damaged during surgery, deficits occur which can be just as debilitating to the patient as damage to the networks previously deemed eloquent - language, motor, and vision. In addition, the commenters stated that their own experiences support the assertion that Quicktome Software Suite's visualization and brain mapping techniques lead to tangible improvements in clinical outcomes by mitigating the risk of damage to vital brain networks during surgery. The commenters further stated that by providing surgeons with personalized insights into a patient's brain's structural and functional architecture, Quicktome Software Suite empowers them to navigate complex surgeries with greater confidence. A commenter additionally stated that it currently uses Quicktome Software Suite to improve outcomes from its brain tumor practice and would not go back to

¹⁶⁷ Department of Health and Human Services (December 13, 2023). HHS Finalizes Rule to Advance Health IT Interoperability and Algorithm Transparency | HHS.gov, accessed 2/20/2024.

standard methodology. The commenters stated that they acknowledge the lack of randomized controlled trials evaluating the efficacy of Quicktome Software Suite technology, with a commenter stating that results from studies supporting the importance of preserving brain networks, such as the study by Hendricks, et al., can be conferred to Quicktome Software Suite, as it is the only technology that allows for the visualization of those brain networks. The commenters also wanted to point out the challenges associated with effectively studying a technology such as Quicktome Software Suite in large scale, randomized, long-term studies. The commenters further stated that aside from the difficulty getting patients to agree to be randomized to a control group (that is, not being treated using the latest tools and best information possible), it is challenging to distinguish the specific impact of tools from factors such as patient selection, case complexity, brain shift, and the myriad decisions made by a surgeon throughout a procedure. The commenters stated that in summary, the technology's integration of AI, the structural connectivity atlas, and connectomics, coupled with its unique utilization of rs-fMRI, positions it as a groundbreaking tool for improving patient outcomes and enhancing surgical precision.

Response: We thank the commenters for their input. After further review, we continue to have concerns as to whether Quicktome Software Suite meets the substantial clinical improvement criterion as noted in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36085 through 36087). Specifically, we continue to question whether Quicktome Software Suite's visualization and brain mapping techniques improve clinical outcomes by avoiding or reducing damage to the brain networks during surgery, thereby reducing neurological or cognitive deficits post-surgery, as compared to services or technologies already available. We do not have information about the difference in outcomes, such as reduction in neurological complications, LOS, or inpatient service use, and other clinical outcomes, such as quality of life and loss of function, when Quicktome Software Suite versus similar technologies, such as StealthViz™, earlier versions of Quicktome Software Suite, or other currently available cranial mapping

software or tractography tools, are used. We further note that while the commenters have stated they have noted improved clinical outcomes with use of the technology, they did not describe the improved outcomes or provide evidence for CMS to evaluate regarding these improvements. In addition, we continue to question whether the findings related to the efficacy of Quicktome Software Suite are generalizable to the Medicare population due to the very limited number of patients in which Quicktome Software Suite was used to assist in surgical decision-making, as previously stated. Further, while we appreciate the challenges in designing trials that effectively study technologies such as Quicktome Software Suite, as noted by the commenters, we note that without evidence to support a demonstration of improved clinical outcomes as compared to existing technologies, we are unable to make a determination regarding substantial clinical improvement.

We did not receive comments relating to how we should evaluate issues related to determining substantial clinical improvement for technologies that use AI, an algorithm or software, including issues related to algorithm transparency, and how CMS should consider these issues in our assessment of substantial clinical improvement. We will continue to consider these questions as we gain more experience, and we continue to welcome comments in this area.

After consideration of all the information submitted by the applicant as well as the comments we received, we are unable to determine that Quicktome Software Suite meets the substantial clinical improvement criterion for the reasons discussed in the proposed rule and in this final rule, and therefore, we are not approving new technology add-on payments for Quicktome Software Suite for FY 2025.

6. FY 2025 Applications for New Technology Add-On Payments (Alternative Pathways)

As discussed previously, beginning with applications for FY 2021, a medical device designated under FDA's Breakthrough Devices Program that has received marketing authorization as a Breakthrough Device, for the indication covered by the Breakthrough Device designation, may qualify for the new technology add-on payment under an alternative pathway. Additionally, beginning with FY 2021, a medical product that is designated by the FDA as a Qualified Infectious Disease Product (QIDP) and has received marketing authorization for the indication covered by the QIDP designation, and, beginning with FY 2022, a medical product that is a new medical product approved under FDA's Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD) and used for the indication approved under the LPAD pathway, may also qualify for the new technology add-on payment under an alternative pathway. Under an alternative pathway, a technology will be considered not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS and will not need to meet the requirement that it represents an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. These technologies must still be within the 2-to-3-year newness period to be considered "new," and must also still meet the cost criterion.

As discussed previously, in the FY 2023 IPPS/LTCH PPS final rule, we finalized our proposal to publicly post online applications for new technology add-on payment beginning with FY 2024 applications (87 FR 48986 through 48990). As noted in the FY 2023 IPPS/LTCH PPS final rule, we are continuing to summarize each application in this final rule. However, while we are continuing to provide discussion of the concerns or issues, we identified with respect to applications submitted under the alternative pathway, we are providing more succinct information as part of the summaries in the proposed and final rules regarding the applicant's assertions as to how the medical service or technology meets the applicable new technology add-on payment criteria. We refer readers to <https://mearis.cms.gov/public/publications/ntap> for the

publicly posted FY 2025 new technology add-on payment applications and supporting information (with the exception of certain cost and volume information, and information or materials identified by the applicant as confidential or copyrighted), including tables listing the ICD-10-CM codes, ICD-10-PCS codes, and/or MS-DRGs related to the analyses of the cost criterion for certain technologies for the FY 2025 new technology add-on payment applications.

We received 23 applications for new technology add-on payments for FY 2025 under the new technology add-on payment alternative pathway. As discussed previously, in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958), we finalized that beginning with the new technology add-on payment applications for FY 2025, for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application, applicants must have a complete and active FDA market authorization request at the time of new technology add-on payment application submission and must provide documentation of FDA acceptance or filing to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. See § 412.87(e) and further discussion in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958). Of the 23 applications received under the alternative pathway, seven applications were not eligible for consideration for new technology add-on payment because they did not meet these requirements; and two applicants withdrew their applications prior to the issuance of the proposed rule, including the withdrawal of the application for DefenCath™ (taurolidine/heparin), which received conditional approval for new technology add-on payments for FY 2024, subsequently received FDA approval in November 2023, and therefore was eligible to receive new technology add-on payments beginning with discharges on or after January 1, 2024. As discussed in section II.E.4. of this final rule, we proposed and are finalizing to continue making new technology add-on payments for DefenCath® (taurolidine/heparin) for FY 2025. Subsequently, prior to the issuance of this final rule, three additional applicants withdrew their respective applications for restor3d TIDAL™ Fusion Cage, Transdermal GFR Measurement

System utilizing Lumitrace, and cefepime-taniborbactam. For the remaining 11 applications, we are approving 12 new technology add-on payments for FY 2025 (including ZEVTERA™ (ceftobiprole medocaryl) for which the applicant submitted a single application for multiple indications, and for which we are approving two separate new technology add-on payments). A discussion of these 11 applications is presented in this final rule, including 10 technologies that have received a Breakthrough Device designation from FDA and 1 that was designated as a QIDP by FDA. We did not receive any applications for technologies approved through the LPAD pathway.

In accordance with the regulations under § 412.87(f)(2), applicants for new technology add-on payments for FY 2025 for Breakthrough Devices must have FDA marketing authorization by May 1 of the year prior to the beginning of the fiscal year for which the application is being considered. Under § 412.87(f)(3), applicants for new technology add-on payments for FY 2025 for QIDPs and technologies approved under the LPAD pathway must have FDA marketing authorization by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. The policy finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58742) provides for conditional approval for a technology for which an application is submitted under the alternative pathway for certain antimicrobial products (QIDPs and LPADs) at § 412.87(d) that does not receive FDA marketing authorization by July 1 prior to the particular fiscal year for which the applicant applied for new technology add-on payments, provided that the technology receives FDA marketing authorization before July 1 of the fiscal year for which the applicant applied for new technology add-on payments. We refer the reader to the FY 2021 IPPS/LTCH final rule for a complete discussion of this policy (85 FR 58737 through 58742).

As we did in the FY 2024 IPPS/LTCH PPS proposed rule, for applications under the alternative new technology add-on payment pathway, in the FY 2025 IPPS/LTCH PPS proposed rule we proposed to approve or disapprove each of these 11 applications for FY 2025 new

technology add-on payments. Therefore, in this section of the preamble of this final rule, we provide background information on each of the remaining alternative pathway applications and our determination on whether or not each technology is eligible for the new technology add-on payment for FY 2025. We are not including in this final rule the description and discussion of applications that were withdrawn or that are ineligible for consideration for FY 2025.

We refer readers to section II.H.8. of the preamble of the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and section II.F.6 of preamble of the FY 2021 IPPS/LTCH PPS final rule (85 FR 58715 through 58733) for further discussion of the alternative new technology add-on payment pathways for these technologies.

a. Annalise Enterprise Computed Tomography Brain (CTB) Triage - Obstructive Hydrocephalus (OH)

Annalise-Ai Pty Ltd submitted an application for new technology add-on payments for the Annalise Enterprise CTB Triage - OH for FY 2025. According to the applicant, the Annalise Enterprise CTB Triage - OH is a medical device software application used to aid in the triage and prioritization of studies with features suggestive of obstructive hydrocephalus (OH). Per the applicant, the device analyzes studies using an artificial intelligence (AI) algorithm to identify suspected OH findings in non-contrast computed tomography (NCCT) brain scans and makes study-level output available to an order and imaging management system for worklist prioritization or triage.

Please refer to the online application posting for the Annalise Enterprise CTB Triage - OH available at <https://mearis.cms.gov/public/publications/ntap/NTP231017D5AA7>, for additional detail describing the technology and how it is used.

According to the applicant, the Annalise Enterprise CTB Triage - OH received Breakthrough Device designation from FDA on February 17, 2023, for use in the medical care environment to aid in triage and prioritization of studies with features suggestive of OH. The device analyzes studies using an AI algorithm to identify findings. It makes study-level output

available to an order and imaging management system for worklist prioritization or triage. The applicant stated that the technology received 510(k) clearance from FDA on August 15, 2023, for the same indication consistent with the Breakthrough Device designation. Per the applicant, the Annalise Enterprise CTB Triage - OH was not immediately available for sale because there were additional steps to be completed following 510(k) clearance prior to the product becoming commercially available. According to the applicant, these additional steps involved generating a new unique device identifier (UDI) to incorporate the recently cleared finding for OH, integrating this UDI into the device, and releasing it. Per the applicant, the Annalise Enterprise CTB Triage - OH became commercially available on October 10, 2023.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for the Annalise Enterprise CTB Triage - OH beginning in FY 2025 and was granted approval for the following procedure code effective October 1, 2024: XXE0X1A (Measurement of intracranial cerebrospinal fluid flow, computer-aided triage and notification, new technology group 10). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for the Annalise Enterprise CTB Triage - OH under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

With respect to the cost criterion, the applicant provided three analyses to demonstrate that the technology meets the cost criterion. The applicant stated that for all three analyses, it used the 2021 Standard Analytic Files (SAF) Limited Data Set (LDS) to identify the top admitting diagnosis codes for inpatient stays that were admitted from the emergency room (ER) and included a non-contrast CT head scan. Next, it searched the FY 2022 MedPAR data to identify applicable inpatient stays based on different sets of admitting diagnosis codes for each of the three analyses. The applicant explained that it used admitting diagnosis codes from the inpatient stays, rather than discharge diagnosis codes, because the Annalise Enterprise CTB Triage - OH is an AI-based technology used to identify and prioritize patients suspected of OH.

As a result, it will commonly be used in the ER before the doctor and/or the hospital has assigned the primary or secondary diagnosis for the inpatient stay. The applicant stated that admitting diagnosis codes may be better predictors for whether the Annalise Enterprise CTB Triage - OH service will be used, rather than primary or secondary diagnosis at discharge, which will likely represent information known after the procedure is performed. Per the applicant, for identifying the top admitting diagnosis codes, the inpatient stays were further narrowed down to only those where the patient had a physician claim during the inpatient stay or one day before for a non-contrast CT head scan (defined as CPT codes 70450, 70480, 70486), or had an outpatient claim for a non-contrast CT head scan the day of admission or one day before. Each analysis followed the order of operations described in the table that follows later in this section.

For the primary analysis, the applicant stated that it searched the FY 2022 MedPAR file for cases with emergency room charges (that is, emergency room charge amount greater than \$0) and/or an inpatient admission type code (IP_ADMSN_TYPE_CD) equal to 1 for emergency, and reporting one of the top 25 diagnosis codes associated with 50 percent of all identified inpatient stays in the 2021 SAF. According to the applicant, it identified 2,206,036 claims mapping to 714 MS-DRGs, including MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC), which represented 16 percent of identified cases. The applicant stated that it calculated a final inflated average case-weighted standardized charge per case of \$80,407, which exceeded the average case-weighted threshold amount of \$69,892.

For the second analysis, the applicant stated that it conducted a sensitivity analysis using cases with emergency room charges (that is, emergency room charge amount greater than \$0) and/or an inpatient admission type code (IP_ADMSN_TYPE_CD) equal to 1 for emergency, and reporting one of the top 186 admitting diagnosis codes associated with 80 percent of all identified inpatient stays in the 2021 SAF LDS. The applicant noted that it identified 3,991,354 claims mapping to 739 MS-DRGs, including MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC), which represented 11 percent of identified cases. The

applicant noted that it calculated a final inflated average case-weighted standardized charge per case of \$78,356, which exceeded the average case-weighted threshold amount of \$68,660.

For the third analysis, the applicant stated that it conducted a sensitivity analysis that identified cases using the same criteria as the primary analysis, and further limited it to cases that also incurred CT charges. Per the applicant, it performed this sensitivity analysis because although doctors are likely to order the Annalise AI technology when a NCCT head scan is performed and the patient is admitted through the emergency room, the MedPAR file variable for CT charges does not differentiate between contrast and NCCTs, or the area of the body where the CT is performed, and does not capture CT charges billed by physicians during the inpatient stay. As a result, it further limited the cases to those with charges for CT to assess if this would impact whether the technology would meet the cost criterion. Per the applicant, it identified 1,546,504 claims mapping to 702 MS-DRGs, including MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC), which represented 17 percent of identified cases. The applicant stated that it calculated a final inflated average case-weighted standardized charge per case of \$89,176, which exceeded the average case-weighted threshold amount of \$71,344.

The applicant asserted that because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the Annalise Enterprise CTB Triage - OH meets the cost criterion.

Annalise Enterprise CTB Triage - OH COST ANALYSIS¹⁶⁸	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	For the lists of ICD-10-CM codes, see the online posting for the Annalise Enterprise CTB Triage - OH.
List of MS-DRGs	For the lists of MS-DRGs and titles, see the online posting for the Annalise Enterprise CTB Triage - OH.
Inclusion/exclusion criteria	<p>Primary Analysis: The applicant selected claims based on the inclusion of ICD-10-CM codes provided in the online posting that included an ER visit defined as the Emergency Room Charge Amount greater than 0 and/or the inpatient admission type code equal to "1," as it believed this analysis best represented patients for whom the doctor is likely to order the Annalise AI technology to be run to determine if there is any evidence for OH.</p> <p>Analysis 2: The applicant selected claims based on the inclusion of a larger set of ICD-10-CM codes provided in the online posting that included an ER visit defined as the Emergency Room Charge Amount greater than 0 and/or the inpatient admission type code equal to "1".</p>

¹⁶⁸ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

	<p>Analysis 3: The applicant applied the inclusion/exclusion criteria used in the primary analysis and identified cases that included charges for a CT scan. Specifically, the applicant only included cases where radiology CT charges were greater than 0 or the Radiology CT Scan Indicator Switch was equal to "1".</p> <p>All case counts for MS-DRGs with less than 11 cases were imputed a value of 11 cases. The applicant calculated the average unstandardized charge per case for each MS-DRG.</p>
Charges removed for prior technology	The applicant stated that it did not remove charges for a prior technology because the technology is not expected to remove the need for prior technologies or remove the costs associated with prior technologies. The applicant maintained that the Annalise AI technology works in collaboration with NCCT scans to identify patients that are likely to have OH. The applicant did not remove indirect charges related to a prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Standardizing File posted with the FY 2024 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant calculated an average cost per case by taking the average cost per case across all hospitals studied. The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.128 for radiology from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36108), we noted the following concern regarding the cost criterion. According to the applicant, the technology is used to aid in the triage and prioritization of studies with features suggestive of OH. However, the diagnosis codes that the applicant used to identify eligible cases included non-neurologic diagnosis codes (for example, U071, R0602, J189). We questioned whether these diagnosis codes were applicable, and whether using neurologic diagnosis codes for diagnoses that exhibit symptoms similar to OH would more accurately identify eligible cases.

Subject to the applicant adequately addressing this concern, we agreed with the applicant that the technology meets the cost criterion and proposed to approve the Annalise Enterprise CTB Triage - OH for new technology add-on payments for FY 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the Annalise Enterprise CTB Triage - OH to the hospital to be \$371.37 per patient. According to the applicant, hospitals acquire the Annalise Enterprise CTB Triage - OH system on a subscription-based model, with an annual cost of \$180,000 per hospital. The applicant stated that the average cost per patient per hospital will vary by the volume of the NCCT cases for which the software is used. To determine the cost per case, the applicant used the following methodology:

First, the applicant conducted market research to estimate the percent of NCCT cases where this software would likely be ordered, which was estimated at 50 percent of NCCT head scans for older patients (>65 years of age) and 30 percent of NCCT head scans for younger patients (<65 years of age).

Second, the applicant used the 2021 SAF LDS to identify total NCCT scans by hospital. To represent the full Medicare fee-for-service population, the applicant multiplied total NCCT head scans at each hospital from the data by 20.

Third, to calculate the total number of NCCT head scans for each hospital, the applicant assumed that 56.5 percent of all NCCT scans are for Medicare beneficiaries, based on literature on trends in the utilization of head CT scans in the United States.¹⁶⁹

Fourth, to calculate the cost per case for each hospital, the applicant divided \$180,000 by the estimated number of NCCT head scans analyzed by the technology for each hospital. Per the applicant, the average cost per case across all IPPS hospitals was then calculated at \$371.37.

The applicant asserted that calculating the cost per case across all IPPS hospitals was reasonable. The applicant noted that given its limited time on the market and low number of subscribers, it used all IPPS hospitals to calculate cost per case rather than limiting the analysis to current subscribers. The applicant mentioned that for technologies that are commercially available for a longer period of time and with more subscribers, it may make sense to limit the cost per case analysis to hospitals that are current subscribers rather than using all IPPS hospitals in the calculation.

As we noted in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58630) and in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44983), we understand that there are unique circumstances with respect to determining a cost per case for a technology that utilizes a subscription for its cost and we will continue to consider the issues relating to calculation of the

¹⁶⁹ Selfi, A, Jafari, S, and Mirmoenei, S et al. (June 16, 2022) Trends in inpatient utilization of head computerized tomography scans in the United States: A brief cross-sectional study. *Cureus* 14(6): e26018. DOI 10.7759/cureus.26018

cost per unit of technologies sold on a subscription basis as we gain more experience in this area. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36109), we stated that we continued to welcome comments from the public as to the appropriate method to determine a cost per case for such technologies, including comments on whether the cost analysis should be updated based on the most recent subscriber data for each year for which the technology may be eligible for add-on payment.

We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the Annalise Enterprise CTB Triage - OH would be \$241.39 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the Annalise Enterprise CTB Triage - OH meets the cost criterion and our proposal to approve new technology add-on payments for the Annalise Enterprise CTB Triage - OH for FY 2025 for use in the medical care environment to aid in triage and prioritization of studies with features suggestive of OH.

Comment: The applicant submitted a public comment in response to our concern regarding the use of non-neurologic diagnosis codes to identify eligible cases of OH. The applicant stated that it intentionally included cases with non-neurological diagnosis codes to reflect patients who may have received the test based on the presenting symptoms in the Emergency Department because only a subset of those patients have an admitting diagnosis of OH or other neurological condition. The applicant explained that removing the inpatient stays with a non-neurological admitting diagnosis would undercount the inpatient stays and underestimate potential volume. However, in response to the request from CMS, the applicant stated that it conducted an additional sensitivity analysis by removing the non-neurological

diagnoses (for example, A41.9, R53.1, N39.9, N17.9, U07.1, R06.02, J18.9, E87.1, R07.9, R50.9, I21.4, J96.01, E86.0, I46.9) from the list of top 25 admitting diagnoses and re-ran analyses 1 and 3. The applicant stated that the remaining 11 admitting diagnoses mapped to 651 and 640 MS-DRGs respectively, with the top 10 MS-DRGs representing about 43 percent of the total volume in both analyses. The applicant asserted that using the same methodology for the previously run analyses, it determined the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, and the Annalise Enterprise CTB Triage - OH meets the cost criterion.

Response: We thank the applicant for its comment. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount. Therefore, Annalise Enterprise CTB Triage – OH meets the cost criterion.

Comment: The applicant submitted a comment in response to the discussion in the proposed rule on the appropriate method to determine a cost per case for the technologies sold on a subscription basis. The applicant stated that calculating the cost per case across all IPPS hospitals was reasonable since there were not enough subscribers for Annalise Enterprise CTB Triage – OH at the time of the cost analysis. The applicant stated that Annalise Enterprise CTB Triage – OH had only been commercially available for less than 30 days prior to the new technology add-on payment application submission deadline.

Response: We thank the applicant for its comment. We agree with the applicant's rationale in calculating the cost of the technology given the limited time that the technology has been on the market and small number of subscribers. We will continue to consider the issues relating to calculation of the cost per unit of technologies sold on a subscription basis as we gain more experience in this area. We also continue to welcome comments from the public as to the appropriate method to determine a cost per case for such technologies, including comments on whether the cost analysis should be updated based on the most recent subscriber data for each year for which the technology may be eligible for add-on payment.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the Annalise Enterprise CTB Triage - OH meets the cost criterion. The technology received 510(k) clearance on August 15, 2023 as a Breakthrough Device, with an indication for use in the medical care environment to aid in triage and prioritization of studies with features suggestive of OH, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the Annalise Enterprise CTB Triage - OH for FY 2025. We consider the beginning of the newness period to commence on October 10, 2023, the date on which the technology became commercially available for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the Annalise Enterprise CTB Triage - OH is \$371.37. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the Annalise Enterprise CTB Triage - OH is \$241.39 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of the Annalise Enterprise CTB Triage - OH that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code: XXE0X1A (Measurement of intracranial cerebrospinal fluid flow, computer-aided triage and notification, new technology group 10).

b. ASTar® System

Q-linea submitted an application for new technology add-on payments for the ASTar® System for FY 2025. According to the applicant, the ASTar® System is a fully automated system for rapid antimicrobial susceptibility testing (AST). The applicant stated that the proprietary AST technology is based on broth microdilution (BMD), optimized for high

sensitivity and short time-to-result, delivering phenotypic AST with true minimum inhibitory concentration (MIC) results in approximately six hours.

Please refer to the online application posting for the ASTar® System, available at <https://mearis.cms.gov/public/publications/ntap/NTP231013T7Y5F>, for additional detail describing the technology and how it is used.

According to the applicant, the ASTar® System consists of the ASTar® Instrument and the ASTar® BC G- Kit. According to the applicant, the ASTar® Instrument and ASTar® BC G-Kit, which includes the ASTar® BC G- Consumable Kit and the ASTar BC G- Frozen Insert, received Breakthrough Device designation from FDA on April 7, 2022. The ASTar® BC G- Kit is a multiplexed, *in vitro*, diagnostic test utilizing AST methods and is intended for use with the ASTar® Instrument. The ASTar® BC G- Kit is performed directly on positive blood cultures confirmed positive for Gram-negative bacilli only by Gram stain, and tests antimicrobial agents with nonfastidious and fastidious bacterial species. The technology received FDA 510(k) clearance on April 26, 2024 with the following indication for use: the ASTar® System, comprised of the ASTar® Instrument with the ASTar® BC G-Kit (ASTar® BC G-Consumable kit, ASTar® BC G-Frozen insert, and ASTar® BC G-Kit software), utilizes high-speed, time-lapse microscopy imaging of bacteria for the *in vitro*, quantitative determination of antimicrobial susceptibility of on-panel gram-negative bacteria. The test is performed directly on positive blood culture samples signaled as positive by a continuous monitoring blood culture system and confirmed to contain gram-negative bacilli by Gram stain. Since the indication for which the technology received FDA 510(k) clearance is included within the scope of the Breakthrough Device designation, we believe that the FDA 510(k) indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria. The applicant stated that it anticipates the technology will be available on the market immediately after 510(k) clearance from FDA.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for the ASTar® System beginning in FY 2025 and was granted approval for the following procedure code effective October 1, 2024: XXE5X2A (Measurement of infection, phenotypic fully automated rapid susceptibility technology with controlled inoculum, new technology group 10). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for the ASTar® System under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that it meets the cost criterion. Each analysis used different ICD-10-CM codes to identify potential cases in the FY 2022 MedPAR file representing patients who may be eligible for the ASTar® System. According to the applicant, Cohort 1 comprised patients with non-sepsis infections and Cohort 2 consisted of patients with sepsis resulting from bacteria identifiable by the ASTar® System. The applicant explained that these scenarios were separated as the applicant believed that charges and MS-DRG assignments may differ due to the resources required to treat sepsis patients compared to those required for less severe infections. Finally, Cohort 3 included all ICD-10-CM codes from Cohorts 1 and 2 because the applicant stated that the ASTar® System may be used to identify any infection caused by the bacteria listed in Cohorts 1 and 2. The applicant stated that in all three cohorts, the patients mapped to a large number of MS-DRGs based on the listed ICD-10-CM codes. Therefore, in the analyses, the applicant only included the most common MS-DRGs, that is, the MS-DRGs containing at least 1 percent of the potential case volume within each of the three cohorts, as these are the MS-DRGs to which potential ASTar® System cases would most closely map. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section to identify claims for each cohort. Each analysis followed the order of operations described in the table that follows later in this section.

For Cohort 1, the applicant identified 440,838 claims mapping to 14 MS-DRGs, including MS-DRG 871 (Septicemia or Severe Sepsis with MV >96 Hours with MCC) representing 25 percent of identified cases, and calculated a final inflated average case-weighted standardized charge per case of \$85,525, which exceeded the average case-weighted threshold amount of \$70,398.

For Cohort 2, the applicant identified 224,825 claims mapping to 7 MS-DRGs, including MS-DRG 871 (Septicemia or Severe Sepsis with MV >96 Hours with MCC) representing 54 percent of identified cases, and calculated a final inflated average case-weighted standardized charge per case of \$99,508, which exceeded the average case-weighted threshold amount of \$82,171.

For Cohort 3, the applicant identified 603,877 claims mapping to 13 MS-DRGs, including MS-DRG 871 (Septicemia or Severe Sepsis with MV >96 Hours with MCC) representing 34 percent of identified cases, and calculated a final inflated average case-weighted standardized charge per case of \$88,395 which exceeded the average case-weighted threshold amount of \$73,727.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all the three cohorts, the applicant asserted that the ASTar® System meets the cost criterion.

ASTar® System COST ANALYSIS¹⁷⁰	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	For the lists of ICD-10-CM codes, see the online posting for the ASTar® System.
List of MS-DRGs	For the lists of MS-DRGs and titles, see the online posting for the ASTar® System.
Inclusion/exclusion criteria	<p>The applicant only included the MS-DRGs containing at least 1 percent of the potential case volume within each of the three cohorts as these are the MS-DRGs to which potential ASTar® System cases would most closely map.</p> <p>Cohort 1: The applicant identified claims using the ICD-10-CM codes provided in the online posting, which it stated represents patients with non-sepsis infections.</p> <p>Cohort 2: The applicant identified claims using the ICD-10-CM codes provided in the online posting, which it stated represents patients with sepsis resulting from the bacteria that can be identified by the ASTar® System.</p>

¹⁷⁰ Codes referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

	Cohort 3: The applicant included all ICD-10-CM codes from Cohorts 1 and 2 because the applicant stated that the ASTar® System may be used to identify any infection caused by the bacteria listed in Cohorts 1 and 2.
Charges removed for prior technology	The applicant stated that the ASTar® System is expected to replace existing antimicrobial testing for this patient sample. Per the applicant, CPT code 87186 (Susceptibility studies, antimicrobial agent; microdilution or agar dilution (minimum inhibitory concentration [MIC] or breakpoint), each multi-antimicrobial, per plate) is currently used to bill for antimicrobial testing. To understand the charges associated with CPT code 87186, the applicant used the CMS Public Use File “Medicare Physician & Other Practitioners - by Geography and Service” dataset, filtered to 2021 and the national level and noted that Medicare reported charges for CPT code 87186 as \$51. The applicant removed this prior technology charge in each analysis. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Standardizing and Impact Files posted with the FY 2022 IPPS/LTCH PPS final rule correction notice.
Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.102 for laboratory from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36110), we agreed with the applicant that the ASTar® System meets the cost criterion and therefore proposed to approve the ASTar® System for new technology add-on payments for FY 2025, subject to the technology receiving FDA marketing authorization as a Breakthrough Device for the indication corresponding to the Breakthrough Device designation by May 1, 2024.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the operating cost of the ASTar® System to the hospital to be \$150 per patient, based on the operating component ASTar® BC G- Kit (composed of the ASTar® BC G- Consumable Kit (\$141) and ASTar BC G- Frozen Insert (\$9)). The applicant also noted a capital cost of \$200,000 for the ASTar® Instrument. Because section 1886(d)(5)(K)(i) of the Act requires that the Secretary establish a mechanism to recognize the costs of new medical services or technologies under the payment system established under that subsection, which establishes the system for payment of the operating costs of inpatient hospital services, we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs (86 FR 45145). As noted, the applicant stated that the cost of the ASTar® Instrument is a capital cost. Therefore, we stated that it appeared that this component was not eligible for new technology add-on payment because, as discussed in prior rulemaking and as noted, we only make new technology add-on

payments for operating costs (72 FR 47307 through 47308). We noted that any new technology add-on payment for the ASTar® System would include only the cost of ASTar® BC G- Kit (\$150). We also noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the ASTar® System would be \$97.50 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the ASTar® System meets the cost criterion and our proposal to approve new technology add-on payments for the ASTar® System for FY 2025, subject to the technology receiving FDA marketing authorization as a Breakthrough Device for the indication corresponding to the Breakthrough Device designation by May 1, 2024.

Comment: The applicant submitted a public comment expressing support for our proposal to approve new technology add-on payments for FY 2025 for the ASTar® System. The applicant reiterated that the ASTar® System meets the cost criterion and confirmed the maximum new technology add-on payment for the ASTar® System to cover the ASTar® BC G- Kit.

Response: We thank the applicant for its support to approve the new technology add-on payments for the ASTar® System.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the ASTar® System meets the cost criterion. The technology received 510(k) clearance on April 26, 2024, as a Breakthrough Device, with the following indication for use: the ASTar® System, comprised of the ASTar® Instrument with the ASTar® BC G-Kit (ASTar® BC G-Consumable kit, ASTar® BC G-Frozen insert, and ASTar® BC G-Kit software), utilizes high-speed, time-lapse microscopy imaging of bacteria for the in vitro, quantitative determination of antimicrobial

susceptibility of on-panel gram-negative bacteria. The test is performed directly on positive blood culture samples signaled as positive by a continuous monitoring blood culture system and confirmed to contain gram-negative bacilli by Gram stain. Since the indication for which the applicant received FDA 510(k) clearance is included within the scope of the Breakthrough Device designation, we are finalizing our proposal to approve new technology add-on payments for the ASTar® System for FY 2025. We consider the beginning of the newness period to commence on April 26, 2024, the date on which technology received FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the ASTar® System is \$150, based on the operating component ASTar® BC G-Kit (composed of the ASTar® BC G-Consumable Kit (\$141) and ASTar BC G-Frozen Insert (\$9)). Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the ASTar® System is \$97.50 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of the ASTar® System that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code XXE5X2A (Measurement of infection, phenotypic fully automated rapid susceptibility technology with controlled inoculum, new technology group 10).

c. Edwards EVOQUE™ Tricuspid Valve Replacement System (Transcatheter Tricuspid Valve Replacement System)

Edwards Lifesciences LLC submitted an application for new technology add-on payments for the Edwards EVOQUE™ Tricuspid Valve Replacement System (“EVOQUE™ System”) for FY 2025. According to the applicant, the EVOQUE™ System is a new, transcatheter treatment option for patients with at least severe tricuspid regurgitation. Per the applicant, the EVOQUE™ System is designed to replace the native tricuspid valve and consists

of a transcatheter bioprosthetic valve, a catheter-based delivery system, and supporting accessories.

Please refer to the online application posting for the Edwards EVOQUE™ Tricuspid Valve Replacement System, available at <https://mearis.cms.gov/public/publications/ntap/NTP231013MRRBG>, for additional detail describing the technology and the condition treated by the technology.

According to the applicant, the EVOQUE™ System received Breakthrough Device designation from FDA on December 18, 2019, for the treatment of patients with symptomatic moderate or above tricuspid regurgitation. The applicant stated that the technology received premarket approval from FDA on February 1, 2024 for a narrower indication for use, for the improvement of health status in patients with symptomatic severe tricuspid regurgitation despite optimal medical therapy, for whom tricuspid valve replacement is deemed appropriate by a heart team. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36113), we noted that since the indication for which the applicant received premarket approval is included within the scope of the Breakthrough Device designation, it appears that the PMA indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria. According to the applicant, the EVOQUE™ System was commercially available immediately after FDA approval.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for the EVOQUE™ System beginning in FY 2025 and was granted approval for the following procedure code effective October 1, 2024: X2RJ3RA (Replacement of tricuspid valve with multi-plane flex technology bioprosthetic valve, percutaneous approach, new technology group 10). The applicant stated that ICD-10-CM diagnosis codes I07.1 (Rheumatic tricuspid insufficiency), I07.2 (Rheumatic tricuspid stenosis and insufficiency), I36.1 (Nonrheumatic tricuspid (valve) insufficiency), and I36.2 (Nonrheumatic tricuspid (valve) stenosis with

insufficiency) may be used to currently identify the indication for the EVOQUE™ System under the ICD-10-CM coding system.

With respect to the cost criterion, the applicant provided two analyses to demonstrate that the technology meets the cost criterion. To identify potential cases representing patients who may be eligible for the EVOQUE™ System, each analysis used the same ICD-10-CM diagnosis codes in different positions, with and without selected ICD-10-PCS procedure codes, to identify relevant cases in the FY 2022 MedPAR file. Each analysis followed the order of operations described in the table that follows later in this section.

For the first analysis, the applicant searched for cases assigned to MS-DRGs 266 (Endovascular Cardiac Valve Replacement and Supplement Procedures with MCC) and 267 (Endovascular Cardiac Valve Replacement and Supplement Procedures without MCC) that included one of the four ICD-10-CM diagnosis codes in any position, as listed in the table that follows later in this section. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 2,728 claims mapping to the two MS-DRGs and calculated a final inflated average case-weighted standardized charge per case of \$267,720, which exceeded the average case-weighted threshold amount of \$194,848.

For the second analysis, the applicant searched for the cases that included any of the ICD-10-PCS codes for percutaneous repair or replacement of the tricuspid valve in any position, in combination with one of the four ICD-10-CM codes for tricuspid valve insufficiency as the primary diagnosis, as listed in the table that follows later in this section. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 198 claims mapping to 6 MS-DRGs and calculated a final inflated average case-weighted standardized charge per case of \$327,236, which exceeded the average case-weighted threshold amount of \$219,225.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that the EVOQUE™ System meets the cost criterion.

EVOQUE™ TRICUSPID VALVE REPLACEMENT SYSTEM COST ANALYSIS	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-PCS codes	<p>Analysis 1: None</p> <p>Analysis 2: 02QJ3ZG (Repair tricuspid valve created from right atrioventricular valve, percutaneous approach) 02QJ3ZZ (Repair tricuspid valve, percutaneous approach) 02RJ37H (Replacement of tricuspid valve with autologous tissue substitute, transapical, percutaneous approach) 02RJ37Z (Replacement of tricuspid valve with autologous tissue substitute, percutaneous approach) 02RJ38H (Replacement of tricuspid valve with zooplastic tissue, transapical, percutaneous approach) 02RJ38Z (Replacement of tricuspid valve with zooplastic tissue, percutaneous approach) 02RJ3JH (Replacement of tricuspid valve with synthetic substitute, transapical, percutaneous approach) 02RJ3JZ (Replacement of tricuspid valve with synthetic substitute, percutaneous approach) 02RJ3KH (Replacement of tricuspid valve with nonautologous tissue substitute, transapical, percutaneous approach) 02RJ3KZ (Replacement of tricuspid valve with nonautologous tissue substitute, percutaneous approach)</p>
List of ICD-10-CM codes	<p>For both analyses: I07.1 (Rheumatic tricuspid insufficiency) I07.2 (Rheumatic tricuspid stenosis and insufficiency) I36.1 (Nonrheumatic tricuspid (valve) insufficiency) I36.2 (Nonrheumatic tricuspid (valve) stenosis with insufficiency)</p>
List of MS-DRGs	<p>Analysis 1: 266 (Endovascular Cardiac Valve Replacement and Supplement Procedures with MCC) 267 (Endovascular Cardiac Valve Replacement and Supplement Procedures without MCC)</p> <p>Analysis 2: 266 (Endovascular Cardiac Valve Replacement and Supplement Procedures with MCC) 267 (Endovascular Cardiac Valve Replacement and Supplement Procedures without MCC) 319 (Other Endovascular Cardiac Valve Procedures with MCC) 320 (Other Endovascular Cardiac Valve Procedure without MCC) 003 (ECMO or Tracheostomy with MV >96 Hours or Principal Diagnosis Except Face, Mouth, and Neck with Major O.R. Procedures) 216 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC)</p>
Inclusion/exclusion criteria	<p>Analysis 1: The applicant searched cases assigned to the two MS-DRGs listed earlier in this table for selected claims reporting one of the ICD-10-CM codes listed earlier in this table in any position.</p> <p>Analysis 2: The applicant selected claims reporting one of the ICD-10-CM codes listed earlier in this table in the primary position in combination with any of the ICD-10-PCS codes listed earlier in this table.</p>
Charges removed for prior technology	The applicant removed 100% of charges associated with Medical/Surgical Supplies and Devices (revenue centers 027x, and 0624). The applicant noted that use of the EVOQUE™ system is expected to replace a portion of devices included in these claims, although it would not replace all devices, nor any medical supplies required to perform the procedure. However, the applicant could not determine an estimate of the percentage of these total charges for devices that would be replaced. To be as conservative as possible, the applicant removed 100% of these charges.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported with the FY 2022 IPPS/LTCH PPS final rule correction notice.
Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the preliminary per-patient cost of the technology by the national cost to charge (CCR) ratio of 0.269 for implantable devices from the FY2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology as it stated that no other hospital charges were assumed to be required for implanting the EVOQUE™ System.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36114), we agreed with the applicant that the EVOQUE™ System meets the cost criterion and therefore proposed to approve the EVOQUE™ System for new technology add-on payments for FY 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the EVOQUE™ System to the hospital to be \$49,000 per patient, which includes the following components: the EVOQUE™ Tricuspid Delivery System, the EVOQUE™ Dilator Kit, the EVOQUE™ Loading System, the Stabilizer, Base, and Plate, and the EVOQUE™ Valve. The applicant noted that the listed components of the EVOQUE™ System are sold together as one unit because they are all needed to perform the procedure, are all single patient use, and are not sold separately. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the EVOQUE™ System would be \$31,850 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the EVOQUE™ System meets the cost criterion and our proposal to approve new technology add-on payments for the EVOQUE™ System for FY 2025 for the improvement of health status in patients with symptomatic severe tricuspid regurgitation despite optimal medical therapy, for whom tricuspid valve replacement is deemed appropriate by a heart team.

Comment: The applicant and other commenters submitted public comments expressing support for the approval of the EVOQUE™ System for new technology add-on payment for FY 2025.

Response: We thank the commenters for their support.

Based on the information provided in the application for new technology add-on

payments, and after consideration of the public comments we received, we believe the EVOQUE™ System meets the cost criterion. The technology received FDA premarket approval on February 1, 2024 as a Breakthrough Device, with an indication for use for the improvement of health status in patients with symptomatic severe tricuspid regurgitation despite optimal medical therapy, for whom tricuspid valve replacement is deemed appropriate by a heart team, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the EVOQUE™ System for FY 2025. We consider the beginning of the newness period to commence on February 1, 2024, the date on which the technology received its FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the EVOQUE™ System is \$49,000 per patient. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the EVOQUE™ System is \$31,850 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of the EVOQUE™ System that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code: X2RJ3RA (Replacement of tricuspid valve with multi-plane flex technology bioprosthetic valve, percutaneous approach, new technology group 10).

d. GORE® EXCLUDER® Thoracoabdominal Branch Endoprosthesis (TAMBE Device)

W.L. Gore & Associates, Inc. submitted an application for new technology add-on payments for the TAMBE Device for FY 2025. According to the applicant, the TAMBE Device is used for endovascular repair in patients with thoracoabdominal aortic aneurysms (TAAA) and high-surgical risk patients with pararenal abdominal aortic aneurysms (PAAA) who have appropriate anatomy. Per the applicant, the TAMBE Device is comprised of multiple required

components, including: 1) an Aortic Component, 2) Branch Components, 3) a Distal Bifurcated Component, and 4) Contralateral Leg Component. According to the applicant, these components together comprise the TAMBE Device.

Please refer to the online application posting for the GORE® EXCLUDER® Thoracoabdominal Branch Endoprosthesis (TAMBE Device), available at <https://mearis.cms.gov/public/publications/ntap/NTP231016DYQQX>, for additional detail describing the technology and the condition treated by the technology.

According to the applicant, the TAMBE Device received Breakthrough Device designation from FDA on October 1, 2021, for endovascular repair of thoracoabdominal and pararenal aneurysms in the aorta in patients who have appropriate anatomy. According to the applicant, the TAMBE Device received premarket approval (PMA) from FDA on January 12, 2024, for a slightly narrower indication for use, namely, TAAA and high-surgical risk patients with PAAA who have appropriate anatomy. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36115), we noted that since the indication for which the applicant received premarket approval is included within the scope of the Breakthrough Device designation, it appears that the PMA indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria. According to the applicant, the TAMBE Device is not yet available for sale due to the required lead time to train physicians on the TAMBE Device, and the first commercial device will only be implanted May 1, 2024 or later. We stated in the proposed rule that we were interested in additional information regarding the delay in the technology's market availability, as we questioned whether the date the device first became available for sale would be the same as the date the first commercial device is implanted.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for the TAMBE Device beginning in FY 2025 and was granted approval for the following procedure code effective October 1, 2024: X2VE3SA (Restriction of descending thoracic aorta and abdominal aorta using branched intraluminal device, manufactured integrated system, four

or more arteries, percutaneous approach, new technology group 10). The applicant provided a list of diagnosis codes that may be used to currently identify the proposed indication for the TAMBE Device under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

With respect to the cost criterion, to identify potential cases representing patients who may be eligible for the TAMBE Device, the applicant searched the FY 2022 MedPAR file for claims that had at least one of the ICD-10-CM codes and at least one of the ICD-10-PCS codes as listed in the following table. Using the inclusion/exclusion criteria described in the following table, the applicant identified 1,005 claims mapping to 19 MS-DRGs, including MS-DRG 269 (Aortic and Heart Assist Procedures except Pulsation Balloon without MCC), which represented 54.5 percent of the identified cases. The applicant followed the order of operations described in the following table and calculated a final inflated average case-weighted standardized charge per case of \$448,347, which exceeded the average case-weighted threshold amount of \$185,799. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the TAMBE Device meets the cost criterion.

TAMBE Device COST ANALYSIS¹⁷¹	
Data Source and Time Period	FY 2022 MedPAR file
List ICD-10-PCS codes	04V03FZ (Restriction of abdominal aorta with branched or fenestrated intraluminal device, three or more arteries, percutaneous approach) 04V04FZ (Restriction of abdominal aorta with branched or fenestrated intraluminal device, three or more arteries, percutaneous endoscopic approach)
List of ICD-10-CM codes	I71.4 (Abdominal aortic aneurysm, without rupture) I71.6 (Thoracoabdominal aortic aneurysm, without rupture)
List of MS-DRGs	For the list of MS-DRGs, see the online posting for the GORE® EXCLUDER® Thoracoabdominal Branch Endoprosthesis (TAMBE Device).

¹⁷¹ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

Inclusion/exclusion criteria	The applicant stated that it identified cases using the ICD-10-CM codes listed in this table in conjunction with the presence of one of the ICD-10-PCS codes specified in this table. Per the applicant, this combination was considered indicative of the off-label TAAA and PAAA physician-modified endograft (PMEG) cases, which, according to the applicant, reasonably approximated the cost of the TAMBE Device once all the current implantable device charges are removed and replaced with charges for the TAMBE Device. The applicant noted that it calculated the average unstandardized charge per case for each MS-DRG using only covered departmental charges used by CMS for rate-setting. Per the applicant, charges for organ acquisition, managed care cases, claims submitted only for graduate medical education payments, claims with ancillary costs of zero, and claims that were statistical outliers within the MS-DRG were excluded.
Charges removed for prior technology	Per the applicant, the use of the TAMBE Device would replace any ad hoc, off-label PMEGs for which charges are assigned to the implant category. The applicant stated that it used a conservative approach and removed all implant charges. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2024 IPPS/LTCH PPS final rule and the GAF from the Impact File in the FY 2022 final rule.
Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant determined the number and types of components that were used for an average patient based on the pivotal clinical trial and calculated the case cost per component. The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.269 for implantable devices from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36116), we agreed with the applicant that the TAMBE Device meets the cost criterion and therefore proposed to approve the TAMBE Device for new technology add-on payments for FY 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the TAMBE Device to the hospital to be \$72,675 per patient. Per the applicant, the TAMBE Device has a number of required components, including the aortic component (\$29,000), branch components (\$3,355), distal bifurcated component (DBC) (\$10,758), DBC extender component (\$3,037), contralateral leg endoprosthesis (\$4,390), and iliac extender endoprosthesis (\$3,037). The applicant stated that the actual type and number of components used varies by patient depending on their anatomy and the extent of the patient's aneurysm. The applicant determined the number and types of components that were used in an average patient based on a multicenter pivotal clinical trial conducted predominantly in the U.S. and calculated the case cost per component. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in

excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the TAMBE Device would be \$47,238.75 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the TAMBE Device meets the cost criterion and our proposal to approve new technology add-on payments for the TAMBE Device for FY 2025, for endovascular repair in patients with thoracoabdominal aortic aneurysms and high-surgical risk patients with pararenal aortic aneurysms who have appropriate anatomy.

Comment: The applicant submitted a public comment in response to CMS's request for additional information regarding the delay in the technology's market availability. The applicant reiterated that it anticipated the device would become available for sale in early May 2024, and the first implanted case would occur May 1, 2024 or later, as discussed in the proposed rule. The applicant stated that the first implant was conducted by the leading clinical investigator on May 10, 2024, and the TAMBE Device became commercially available on May 10, 2024, to U.S. physicians who have completed the necessary training. The applicant further stated that the FDA-approved Instructions for Use (IFU) requires that the TAMBE device should only be used by physicians who have successfully completed the appropriate physician training program. The applicant stated that to ensure high standards of care with this device, it had instituted a comprehensive clinical training program for physicians prior to implanting the device.

The applicant and another commenter expressed support for our proposal to approve new technology add-on payments for FY 2025 for the TAMBE Device. The applicant also agreed with the proposed maximum new technology add-on payment amount for the TAMBE Device.

Response: We thank the commenters for their comments. As discussed in prior rulemaking, we note that the timeframe that a new technology can be eligible to receive new technology add-on payments begins when data become available ([69 FR 49003](#), [85 FR 58610](#)). Specifically, § 412.87(c)(2) states that a new medical device that is part of FDA's Breakthrough Devices Program and has received marketing authorization for the indication covered by the

Breakthrough Device designation may be considered new for not less than 2 years and not more than 3 years after the point at which data begin to become available reflecting the inpatient hospital code assigned to the new service or technology (depending on when a new code is assigned and data on the new service or technology become available for DRG recalibration). We do not consider the date of first sale of a product as an indicator of the entry of a product onto the U.S. market (87 FR 48911). Similarly, although the applicant states that the date of first implantation of the TAMBE device was May 10, 2024, and that the TAMBE Device became commercially available on May 10, 2024 to U.S. physicians who have completed the necessary training, it is unclear from the information provided when the technology first became *available* for sale. We note that the information provided by the applicant indicating that the FDA-approved IFU requires that the TAMBE device should only be used by physicians who have successfully completed the appropriate physician training and that there was a comprehensive clinical training program for physicians prior to implanting the device, does not appear to address the delay in the technology's market availability, because the information provided identifies when the device was first able to be used by a physician, rather than when the device first became available for sale. Absent additional information from the applicant regarding when the technology first became available for sale, we cannot determine a newness date based on a documented delay in the technology's availability on the U.S. market.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the TAMBE Device meets the cost criterion. The technology received FDA premarket approval on January 12, 2024 as a Breakthrough Device, with an indication for endovascular repair in patients with TAAA and high-surgical risk patients with PAAA who have appropriate anatomy, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the TAMBE Device for FY 2025. As previously discussed, absent additional information from the applicant, we consider the beginning of the

newness period to commence on January 12, 2024, the date on which the technology received FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the TAMBE Device is \$72,675, based on the average case cost per component for the: aortic component, branch components, distal bifurcated component (DBC), DBC extender component, contralateral leg endoprosthesis, and iliac extender endoprosthesis. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the TAMBE Device is \$47,238.75 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of the TAMBE Device that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code X2VE3SA (Restriction of descending thoracic aorta and abdominal aorta using branched intraluminal device, manufactured integrated system, four or more arteries, percutaneous approach, new technology group 10).

e. LimFlow™ System

LimFlow Inc. submitted an application for new technology add-on payments for the LimFlow™ System for FY 2025. According to the applicant, the LimFlow™ System is a single-use, medical device system designed to treat patients who have chronic limb-threatening ischemia with no suitable endovascular or surgical revascularization options and are at risk of major amputation. Per the applicant, the LimFlow™ System consists of LimFlow's Cylindrical and Conical Stent Grafts that are used in conjunction with a LimFlow™ Arterial Catheter, a LimFlow™ Venous Catheter, and a LimFlow™ Valvulotome. According to the applicant, the LimFlow™ System is used for transcatheter arterialization of the deep veins, a minimally invasive procedure that aims to restore blood flow to the ischemic foot by diverting a stream of oxygenated blood through tibial veins in order to permanently bypass heavily calcified and

severely stenotic arteries defined as unreconstructable. We note that LimFlow Inc. submitted an application for new technology add-on payments for the LimFlow™ System for FY 2024 as summarized in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26938 through 26940), but the technology did not meet the applicable deadline of July 1, 2023 for FDA approval or clearance of the technology and, therefore, was not eligible for consideration for new technology add-on payments for FY 2024 (88 FR 58919).

Please refer to the online application posting for the LimFlow™ System, available at <https://mearis.cms.gov/public/publications/ntap/NTP23101627LXC>, for additional detail describing the technology and the condition treated by the technology.

According to the applicant, the LimFlow™ System received Breakthrough Device designation from FDA on October 3, 2017, for the treatment of critical limb ischemia by minimally invasively creating an arterio-venous bypass graft to produce the venous arterialization procedure in the below-the-knee vasculature. The applicant stated that the technology was granted premarket approval from FDA on September 11, 2023, for patients who have chronic limb-threatening ischemia with no suitable endovascular or surgical revascularization options and are at risk of major amputation. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36117), we noted that since the indication for which the applicant received premarket approval is considered equivalent to the Breakthrough Device designation, it appears that the premarket approval indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria. Per the applicant, the LimFlow™ System was not immediately available for sale because inventory build and ramp for commercial sales was set to commence following FDA approval to allow time for the conduct of surgeon training and medical education on patient selection, indications, and surgical technique. The applicant stated that the technology became commercially available on November 1, 2023.

The applicant provided a list of ICD-10-PCS codes that, effective October 1, 2018, can be used to uniquely describe procedures involving the use of the LimFlow™ System under the

ICD-10-PCS coding system. Please see the online posting for the LimFlow™ System for the complete list of ICD-10-PCS codes provided by the applicant. The applicant provided a list of diagnosis codes that may be used to currently identify the indication for the LimFlow™ System under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

With respect to the cost criterion, the applicant provided three analyses to demonstrate that it meets the cost criterion. Each analysis used the same ICD-10-PCS codes to identify potential cases representing patients who may be eligible for the LimFlow™ System. The applicant stated that the selected claims represent the exact situations in which the LimFlow™ System would be used and represent the cost of care associated with the use of the LimFlow™ System. The applicant utilized a different year of MedPAR data in each analysis. According to the applicant, it used multiple years of data because the case count in each individual year was low. The applicant imputed a value of 11 cases for MS-DRGs with less than 11 cases. Each analysis followed the order of operations described in the table that follows later in this section.

For the first analysis, the applicant searched FY 2022 MedPAR data for claims reporting at least one of the ICD-10-PCS codes listed in the table that follows later in this section to identify cases that may be eligible for the LimFlow™ System. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 88 claims mapping to 8 MS-DRGs, with none exceeding more than 13 percent of the total identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$307,461 which exceeded the average case-weighted threshold amount of \$124,971.

For the second analysis, the applicant searched FY 2021 MedPAR data for claims reporting at least one of the ICD-10-PCS codes listed in the table that follows later in this section to identify cases that may be eligible for the LimFlow™ System. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this

analysis, the applicant identified 111 claims mapping to 10 MS-DRGs, with none exceeding more than 11 percent of the total identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$277,454, which exceeded the average case-weighted threshold amount of \$116,278.

For the third analysis, the applicant searched FY 2020 MedPAR data for claims reporting at least one of the ICD-10-PCS codes listed in the table that follows later in this section to identify cases that may be eligible for the LimFlow™ System. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 99 claims mapping to 9 MS-DRGs, with none exceeding more than 12 percent of the total identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$273,638 which exceeded the average case-weighted threshold amount of \$125,153.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that the LimFlow™ System meets the cost criterion.

LimFlow™ System COST ANALYSIS¹⁷²	
Data Source and Time Period	Analysis 1: FY 2022 MedPAR file Analysis 2: FY 2021 MedPAR file Analysis 3: FY 2020 MedPAR file
List of ICD-10-PCS codes	041M3JS (Bypass right popliteal artery to lower extremity vein with synthetic substitute, percutaneous approach) 041N3JS (Bypass left popliteal artery to lower extremity vein with synthetic substitute, percutaneous approach) 041P3JS (Bypass right anterior tibial artery to lower extremity vein with synthetic substitute, percutaneous approach) 041Q3JS (Bypass left anterior tibial artery to lower extremity vein with synthetic substitute, percutaneous approach) 041R3JS (Bypass right posterior tibial artery to lower extremity vein with synthetic substitute, percutaneous approach) 041S3JS (Bypass left posterior tibial artery to lower extremity vein with synthetic substitute, percutaneous approach) 041T3JS (Bypass right peroneal artery to lower extremity vein with synthetic substitute, percutaneous approach) 041U3JS (Bypass left peroneal artery to lower extremity vein with synthetic substitute, percutaneous approach)
List of MS-DRGs	For the lists of MS-DRGs for the three analyses, see the online posting for the LimFlow™ System
Inclusion/exclusion criteria	For all three analyses, the applicant selected claims using the ICD-10-PCS codes listed in this table. Each scenario utilized a different year of MedPAR data. The resulting MS-DRGs associated with identified cases are provided in the online posting. The applicant included only claims that would be used for rate

¹⁷² Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

	setting (fee-for-service IPPS discharges, plus Maryland hospital discharges). The applicant imputed 11 cases for all DRGs where the case count was fewer than 11.
Charges removed for prior technology	The applicant used a conservative approach and removed all implantable device charges. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2024 IPPS/LTCH PPS final rule.
Inflation factor	For Analysis 1 with FY 2022 MedPAR data, the applicant applied an inflation factor of 11.9% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule. For Analysis 2 with FY 2021 MedPAR data, the applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule. For Analysis 3 with FY 2020 MedPAR data, the applicant applied an inflation factor of 25.2% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.269 for implantable devices from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36118), we agreed with the applicant that the LimFlow™ System meets the cost criterion and therefore proposed to approve the LimFlow™ System for new technology add-on payments for FY 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the LimFlow™ System to the hospital to be \$25,000 per patient. According to the applicant, the LimFlow™ System is sold as a system, as such, the components of the LimFlow™ System are not priced or sold to hospitals independently. The applicant stated that all components of the LimFlow™ System are single-use and the entire system is an operating cost. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the LimFlow™ System would be \$16,250 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the LimFlow™ System meets the cost criterion and our proposal to approve new technology add-on payments for the LimFlow™ System for FY

2025 for patients who have chronic limb-threatening ischemia with no suitable endovascular or surgical revascularization options and are at risk of major amputation.

Comment: Commenters, including the applicant, submitted public comments expressing support for the approval of the LimFlow™ System for new technology add-on payment for FY 2025.

The applicant stated that the LimFlow™ System addresses an unmet need in late-stage chronic limb-threatening ischemia patients, who are no longer candidates for conventional endovascular or open bypass surgery to resolve their artery blockage and face major amputation as their only therapeutic option. The applicant stated that the LimFlow™ System is the first and only FDA approved device for transcatheter arterialization of the deep veins. The applicant restated that the LimFlow™ System received Breakthrough Device designation from FDA on October 3, 2017, and the LimFlow™ System received FDA premarket approval on September 11, 2023. The applicant stated that the LimFlow™ System was not immediately available for sale after FDA approval because it had to modify its commercial manufacturing strategy at the end of the PMA review process. The applicant asserted that this manufacturing delay prevented the first commercial product from being available for sale until November 1, 2023. The applicant also included a letter from the treating physician who performed the first U.S. commercial case on November 2, 2023. The applicant reiterated that the LimFlow™ System meets the cost criterion and confirmed the proposed cost of the LimFlow™ System to the hospital of \$25,000 per patient. The applicant agreed that the proposed maximum new technology add-on payment amount for a case involving the use of the LimFlow™ System would be \$16,250 for FY 2025 (that is, 65 percent of the average cost of the technology).

Response: We thank the commenters for their support. Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the LimFlow™ System meets the cost criterion. The technology received FDA premarket approval on September 11, 2023, as a Breakthrough

Device, with an indication for patients who have chronic limb-threatening ischemia with no suitable endovascular or surgical revascularization options and are at risk of major amputation, which is considered equivalent to the Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the LimFlow™ System for FY 2025. We consider the beginning of the newness period to commence on November 1, 2023, the date on which the technology became commercially available for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the LimFlow™ System is \$25,000. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the LimFlow™ System is \$16,250 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of the LimFlow™ System that are eligible for new technology add-on payments will be identified by one of the following ICD-10-PCS procedure codes:

ICD-10-PCS Code	Description
041M3JS	Bypass right popliteal artery to lower extremity vein with synthetic substitute, percutaneous approach
041N3JS	Bypass left popliteal artery to lower extremity vein with synthetic substitute, percutaneous approach
041P3JS	Bypass right anterior tibial artery to lower extremity vein with synthetic substitute, percutaneous approach
041Q3JS	Bypass left anterior tibial artery to lower extremity vein with synthetic substitute, percutaneous approach
041R3JS	Bypass right posterior tibial artery to lower extremity vein with synthetic substitute, percutaneous approach
041S3JS	Bypass left posterior tibial artery to lower extremity vein with synthetic substitute, percutaneous approach
041T3JS	Bypass right peroneal artery to lower extremity vein with synthetic substitute, percutaneous approach
041U3JS	Bypass left peroneal artery to lower extremity vein with synthetic substitute, percutaneous approach

f. Paradise™ Ultrasound Renal Denervation System

ReCor Medical submitted an application for new technology add-on payments for the Paradise™ Ultrasound Renal Denervation System for FY 2025. According to the applicant, the Paradise™ Ultrasound Renal Denervation System is an endovascular catheter-based system that

delivers SonoWave360™ ultrasound energy circumferentially, thermally ablating and disrupting overactive renal sympathetic nerves to lower blood pressure in adult (≥ 22 years of age) patients with uncontrolled hypertension who may be inadequately responsive to or who are intolerant to anti-hypertensive medications.

Please refer to the online application posting for the Paradise™ Ultrasound Renal Denervation System, available at <https://www.access.gpo.gov/publications/ntap/NTP23101772HBQ>, for additional detail describing the technology and the condition treated by the technology.

According to the applicant, the Paradise™ Ultrasound Renal Denervation System received Breakthrough Device designation from FDA on December 4, 2020, for reducing blood pressure in adult (≥ 22 years of age) patients with uncontrolled hypertension, who may be inadequately responsive to, or who are intolerant to anti-hypertensive medications. The applicant received FDA premarket approval for the technology on November 7, 2023, for reducing blood pressure as an adjunctive treatment in hypertension patients in whom lifestyle modifications and antihypertensive medications do not adequately control blood pressure. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36119), we noted that because we consider the indication for which the applicant received premarket approval to be within the scope of the Breakthrough Device designation, and FDA considers this marketing authorization to be for the Breakthrough Device designation,¹⁷³ it appears that the premarket approval indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria. According to the applicant, the technology was commercially available immediately after FDA approval.

The applicant stated that effective October 1, 2023, the following ICD-10-PCS code may be used to uniquely describe procedures involving the use of the Paradise™ Ultrasound Renal

¹⁷³ List of Breakthrough Devices with Marketing Authorization: <https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program>.

Denervation System: X051329 (Destruction of renal sympathetic nerve(s) using ultrasound ablation, percutaneous approach, new technology group 9). The applicant stated that ICD-10-CM codes I10 (Essential (primary) hypertension), I15.1 (Hypertension secondary to other renal disorders), I15.8 (Other secondary hypertension), I15.9 (Secondary hypertension, unspecified), and I1A.0 (Resistant hypertension) may be used to currently identify the indication for the Paradise™ Ultrasound Renal Denervation System under the ICD-10-CM coding system.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that it meets the cost criterion. Each analysis used different MS-DRGs and/or ICD-10-CM codes to identify potential cases representing patients who may be eligible for the Paradise™ Ultrasound Renal Denervation System. The applicant explained that it used different codes to demonstrate different cohorts that may be eligible for the technology. Each analysis followed the order of operations described in the table that follows later in this section.

For the first analysis, the applicant searched the FY 2022 MedPAR file for all cases that map to MS-DRG 264 (Other Circulatory System O.R. Procedures). The applicant stated that medical MS-DRGs 304 and 305 (Hypertension with MCC and without MCC) are specific to hypertension. However, given the nature of the procedure, the applicant's expectation is that the DRG Grouper logic would assign potential cases representing patients who may be eligible for the Paradise™ Ultrasound Renal Denervation System to a surgical MS-DRG. To identify the surgical MS-DRG, the applicant identified ICD-10-PCS code 015M3ZZ (Destruction of abdominal sympathetic nerve, percutaneous approach) as the procedure most similar to the procedure performed using the Paradise™ Ultrasound Renal Denervation System, and determined the specific MS-DRG to which that ICD-10-PCS code maps. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 7,064 claims mapping to MS-DRG 264 (Other Circulatory System O.R. Procedures) and calculated a final inflated average case-weighted standardized

charge per case of \$357,807, which exceeded the average case-weighted threshold amount of \$98,708.

For the second analysis, as a sensitivity analysis the applicant searched the FY 2022 MedPAR file for all cases that map to MS-DRGs 304 or 305 (Hypertension with MCC and without MCC), which are specific to hypertension. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 32,433 claims mapping to MS-DRG 304 (Hypertension with MCC) or 305 (Hypertension without MCC) and calculated a final inflated average case-weighted standardized charge per case of \$268,298, which exceeded the average case-weighted threshold amount of \$46,986.

For the third analysis, the applicant provided a sensitivity analysis that combined the first and second scenario together for a broader list of MS-DRGs. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 39,497 claims mapping to MS-DRGs 264 (Other Circulatory System O.R. Procedures), 304 (Hypertension with MCC), or 305 (Hypertension without MCC) and calculated a final inflated average case-weighted standardized charge per case of \$284,306, which exceeded the average case-weighted threshold amount of \$56,237.

For the fourth analysis, the applicant performed a sensitivity analysis to subset the cases assigned to MS-DRG 264 (Other Circulatory System O.R. Procedures) to those reporting the following ICD-10-CM codes: I10 (Essential (primary) hypertension), I15.1 (Hypertension secondary to other renal disorders), I15.8 (Other secondary hypertension), or I15.9 (Secondary hypertension, unspecified) in any position. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 1,477 claims mapping to MS-DRG 264 (Other Circulatory System O.R. Procedures) and calculated a final inflated average case-weighted standardized charge per case of \$325,810, which exceeded the average case-weighted threshold amount of \$98,708.

For the fifth analysis, the applicant performed a sensitivity analysis to subset the cases assigned to MS-DRGs 264 (Other Circulatory System O.R. Procedures), 304 (Hypertension with MCC), or 305 (Hypertension without MCC) to those reporting the following ICD-10-CM codes: I10 (Essential (primary) hypertension), I15.1 (Hypertension secondary to other renal disorders), I15.8 (Other secondary hypertension), or I15.9 (Secondary hypertension, unspecified) in any position. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 14,415 claims mapping to MS-DRGs 264 (Other Circulatory System O.R. Procedures), 304 (Hypertension with MCC), or 305 (Hypertension without MCC) and calculated a final inflated average case-weighted standardized charge per case of \$272,701, which exceeded the average case-weighted threshold amount of \$50,817.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all analyses, the applicant asserted that the Paradise™ Ultrasound Renal Denervation System meets the cost criterion.

Paradise™ Ultrasound Renal Denervation System COST ANALYSIS¹⁷⁴	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	Analysis 1-3: Not applicable. Analysis 4-5: I10 Essential (primary) hypertension I15.1 Hypertension secondary to other renal disorders I15.8 Other secondary hypertension I15.9 Secondary hypertension, unspecified
List of ICD-10-PCS codes	Analysis 1: The applicant used 015M3ZZ (Destruction of abdominal sympathetic nerve, percutaneous approach) to identify the MS-DRG upon which the analysis was based. Analysis 2, 3, and 4: Not applicable
List of MS-DRGs	Analyses 1 and 4: 264 Other Circulatory System O.R. Procedures Analysis 2: 304 Hypertension with MCC 305 Hypertension without MCC Analyses 3 and 5: 264 Other Circulatory System O.R. Procedures 304 Hypertension with MCC 305 Hypertension without MCC
Inclusion/exclusion criteria	Analysis 1: The applicant identified all cases within MS-DRG 264.

¹⁷⁴ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

	<p>Analysis 2: The applicant identified all cases within MS-DRGs 304 and 305 as a sensitivity analysis.</p> <p>Analysis 3: The applicant identified all cases within MS-DRGs 264, 304, and 305 as a sensitivity analysis.</p> <p>Analysis 4: The applicant subset cases from analysis 1 to include cases reporting at least one ICD-10-CM code listed in this table in any position as a sensitivity analysis.</p> <p>Analysis 5: The applicant subset cases from analysis 3 to include cases reporting at least one ICD-10-CM code listed in this table in any position as a sensitivity analysis.</p>
Charges removed for prior technology	According to the applicant, the Paradise™ Ultrasound Renal Denervation System is not expected to replace prior technologies. Therefore, no direct or indirect charges associated with prior technologies were removed.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2024 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	According to the applicant, the cost of the new technology was determined based on the inputs for furnishing the service for the single-use components. The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.102 for cardiac catheterization from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36121), we agreed with the applicant that the Paradise™ Ultrasound Renal Denervation System meets the cost criterion and therefore proposed to approve the Paradise™ Ultrasound Renal Denervation System for new technology add-on payments for FY 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the Paradise™ Ultrasound Renal Denervation System to the hospital to be \$23,000 per patient, based on single-use components including the operating costs of the catheter kit (\$22,000), cable (\$250), and cartridge (\$750). We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the Paradise™ Ultrasound Renal Denervation System would be \$14,950 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the Paradise™ Ultrasound Renal Denervation System meets the cost criterion and our proposal to approve new technology add-on payments

for the Paradise™ Ultrasound Renal Denervation System for FY 2025 for reducing blood pressure as an adjunctive treatment in hypertension patients in whom lifestyle modifications and antihypertensive medications do not adequately control blood pressure, which corresponds to the Breakthrough Device designation.

Comment: Multiple commenters including the applicant expressed support for approval of the Paradise™ Ultrasound Renal Denervation System for new technology add-on payments for FY 2025. The applicant restated that the Paradise™ Ultrasound Renal Denervation System received Breakthrough Device designation from FDA on December 4, 2020, and the Paradise™ Ultrasound Renal Denervation System received FDA premarket approval on November 7, 2023, for the same indication as the Breakthrough Device designation. The applicant reaffirmed that the Paradise™ Ultrasound Renal Denervation System is new for FY 2025, and acknowledged our proposed newness date as the date of FDA approval, when the technology became commercially available. The applicant reiterated that the Paradise™ Ultrasound Renal Denervation System meets the cost criterion and agreed with the proposed maximum new technology add-on payment amount for the Paradise™ Ultrasound Renal Denervation System. The applicant requested that CMS finalize as proposed.

Response: We thank the commenters for their support to approve new technology add-on payments for the Paradise™ Ultrasound Renal Denervation System.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the Paradise™ Ultrasound Renal Denervation System meets the cost criterion. The technology received FDA premarket approval on November 7, 2023, as a Breakthrough Device, with an indication for reducing blood pressure as an adjunctive treatment in hypertension patients in whom lifestyle modifications and antihypertensive medications do not adequately control blood pressure, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the Paradise™ Ultrasound Renal

Denervation System for FY 2025. We consider the beginning of the newness period to commence on November 7, 2023, the date on which technology received FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the Paradise™ Ultrasound Renal Denervation System is \$23,000, based on single-use components including the operating costs of the catheter kit (\$22,000), cable (\$250), and cartridge (\$750). Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the Paradise™ Ultrasound Renal Denervation System is \$14,950 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of the Paradise™ Ultrasound Renal Denervation System that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code X051329 (Destruction of renal sympathetic nerve(s) using ultrasound ablation, percutaneous approach, new technology group 9).

g. PulseSelect™ Pulsed Field Ablation (PFA) Loop Catheter

Medtronic, Inc. submitted an application for new technology add-on payments for the PulseSelect™ PFA Loop Catheter for FY 2025. According to the applicant, the PulseSelect™ PFA Loop Catheter is used to perform pulmonary vein isolation in cardiac catheter ablation to treat atrial fibrillation. Per the applicant, unlike existing methods that rely on thermal energy (either radiofrequency or cryoablation), PulseSelect™ employs non-thermal irreversible electroporation to induce cell death in cardiac tissue at the target site. According to the applicant, PulseSelect™ technology's non-thermal approach can avoid risks associated with existing thermal cardiac catheter ablation technologies.

Please refer to the online application posting for the PulseSelect™ PFA Loop Catheter, available at <https://mearis.cms.gov/public/publications/ntap/NTP231017BMQKQ>, for additional detail describing the technology and the disease treated by the technology.

According to the applicant, the PulseSelect™ PFA System, which includes a compatible Medtronic multi-electrode cardiac ablation catheter (the PulseSelect™ PFA Loop Catheter), received Breakthrough Device designation from FDA on September 27, 2018, for the treatment of drug refractory recurrent symptomatic atrial fibrillation. The Medtronic multi-electrode cardiac ablation catheter is also intended to be used for cardiac electrophysiological (EP) mapping and measuring of intracardiac electrograms, delivery of diagnostic pacing stimuli and verifying electrical isolation post-treatment. According to the applicant, the PulseSelect™ PFA System received premarket approval on December 13, 2023 for the following indication that reflects a slightly narrower patient population compared to the Breakthrough Device designation: for cardiac electrophysiological mapping (stimulation and recording) and for treatment of drug refractory, recurrent, symptomatic paroxysmal atrial fibrillation or persistent atrial fibrillation (episode duration less than 1 year). The applicant noted that the PulseSelect™ PFA System consists of two primary elements: the PulseSelect™ PFA Loop Catheter and the PulseSelect™ PFA Generator system, but that as capital equipment, the PulseSelect™ PFA Generator system is not the subject of this new technology add-on payment application. According to the applicant, the technology was commercially available immediately after FDA approval.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for the PulseSelect™ PFA System and was granted approval for the following procedure code effective April 1, 2024: 02583ZF (Destruction of conduction mechanism using irreversible electroporation, percutaneous approach). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for the PulseSelect™ PFA Loop Catheter under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that it meets the cost criterion. The applicant stated that there is an expectation the PulseSelect™ PFA Loop Catheter will predominantly be used when both indicated uses are employed in a single patient case. Each analysis used different ICD-10-CM codes to identify potential cases representing patients who may be eligible for the PulseSelect™ PFA Loop Catheter. The applicant explained that it used different codes to demonstrate different cohorts that may be eligible for the technology. Each analysis followed the order of operations described in the table that follows later in this section.

For the first analysis, the applicant searched the FY 2022 MedPAR file for claims that had the ICD-10-PCS code 02583ZZ (Destruction of conduction mechanism, percutaneous approach) in any procedure code position on the claim and identified 98 MS-DRGs. The applicant limited the cost analysis to the top six MS-DRGs that had over 2 percent of cases in each MS-DRG (see the table that follows later in this section for a complete list of MS-DRGs provided by the applicant). According to the applicant, these six MS-DRGs represented 86 percent of all cardiac catheter ablation cases. Using the inclusion/exclusion criteria described in the table that follows later in this section, the applicant identified 14,695 claims mapping to these 6 MS-DRGs. The applicant followed the order of operations described in the table that follows later in this section and calculated a final inflated average case-weighted standardized charge per case of \$176,942, which exceeded the average case-weighted threshold amount of \$136,813.

For the second analysis, the applicant searched the FY 2022 MedPAR file for claims that had the ICD-10-PCS code 02583ZZ (Destruction of conduction mechanism, percutaneous approach) in any procedure code position on the claim, and had one of the ICD-10-CM codes for atrial fibrillation listed in the table that follows later in this section. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 12,088 claims mapping to the top six MS-DRGs (representing 82.3 percent of all cases) and calculated a final inflated average case-weighted standardized

charge per case of \$179,931, which exceeded the average case-weighted threshold amount of \$136,782.

For the third analysis, the applicant searched the FY 2022 MedPAR file for claims that had the ICD-10-PCS code 02583ZZ (Destruction of conduction mechanism, percutaneous approach) in any procedure code position on the claim and had one of the ICD-10-CM codes for paroxysmal or persistent atrial fibrillation listed in the table that follows later in this section. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 9,446 claims mapping to the top six MS-DRGs (representing 64.3 percent of all cases) and calculated a final inflated average case-weighted standardized charge per case of \$180,114, which exceeded the average case-weighted threshold amount of \$136,193.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that the PulseSelect™ PFA Loop Catheter meets the cost criterion.

PULSESELECT™ PFA LOOP CATHETER COST ANALYSIS¹⁷⁵	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	Analysis 1: not applicable Analysis 2: I48.0 (Paroxysmal atrial fibrillation) I48.11 (Longstanding persistent atrial fibrillation) I48.19 (Other persistent atrial fibrillation) I48.20 (Chronic atrial fibrillation, unspecified) I48.21 (Permanent atrial fibrillation) I48.91 (Unspecified atrial fibrillation) Analysis 3: I48.0 (Paroxysmal atrial fibrillation) I48.11 (Longstanding persistent atrial fibrillation) I48.19 (Other persistent atrial fibrillation)
List of ICD-10-PCS codes	02583ZZ (Destruction of conduction mechanism, percutaneous approach) in any position
List of MS-DRGs	For all analyses: 274 (Percutaneous and Other Intracardiac Procedures without MCC) 273 (Percutaneous and Other Intracardiac Procedures with MCC) 242 (Permanent Cardiac Pacemaker Implant with MCC) 243 (Permanent Cardiac Pacemaker Implant with CC) 229 (Other Cardiothoracic Procedures without MCC) 228 (Other Cardiothoracic Procedures with MCC)

¹⁷⁵ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

Inclusion/exclusion criteria	<p>Analysis 1: The applicant identified cases by using the ICD-10-PCS code in this table in any procedure code position on the claim. The applicant then limited the analysis to cases that were mapped to the top six MS-DRGs (representing 86% of all cardiac catheter ablation cases).</p> <p>Analysis 2: The applicant identified cases by using the ICD-10-PCS code in this table in any procedure code position on the claim and the ICD-10-CM codes in this table. The applicant limited the analysis to only atrial fibrillation ICD-10-CM diagnosis codes as described in the Breakthrough Device designation indication. The applicant limited the analysis to the top six MS-DRGs (representing 82.3% of all cases).</p> <p>Analysis 3: The applicant identified cases by using the ICD-10-PCS code in this table in any procedure code position on the claim and the ICD-10-CM codes in this table. The applicant limited the analysis to paroxysmal and persistent atrial fibrillation ICD-10-CM diagnosis codes as aligned with the slightly narrower patient population reflected in the final Premarket Approval Application indication. The applicant limited the analysis to the top six MS-DRGs (representing 64.3% of all cases).</p> <p>For each analysis, cases with outlier payments were excluded.</p>
Charges removed for prior technology	<p>Per the applicant, PulseSelect™ will replace currently approved cardiac catheter ablation technologies. The applicant removed 100% of medical surgical supply charges from the identified cases. The applicant stated that this was likely an overestimate of replaced charges as other catheters, sheaths, and supplies will still be used in the PulseSelect™ procedure. While some of the charges associated with these catheters may also be present in the implantable device cost center, depending on individual hospital charging practices, the applicant noted that based on the MS-DRGs identified, other technology charges that are not replaced (for example, pacemakers) would also be reflected in the implantable device cost center. Therefore, the applicant removed the charges associated with supplies but did not remove the charges associated with implantable devices. The applicant stated that this was a conservative, balanced approach intended to not overstate the charges associated with the technology being replaced. The applicant did not remove indirect charges related to the prior technology as it stated that the encounters would only differ in terms of the type of catheter used.</p>
Standardized charges	<p>The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Standardizing File posted with the FY 2024 IPPS/LTCH PPS final rule.</p>
Inflation factor	<p>The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.</p>
Charges added for the new technology	<p>The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.303 for supplies and equipment from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.</p>

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36123), we agreed with the applicant that the PulseSelect™ PFA Loop Catheter meets the cost criterion and therefore proposed to approve the PulseSelect™ PFA Loop Catheter for new technology add-on payments for FY 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the cost of the PulseSelect™ PFA Loop Catheter to the hospital to be \$9,750 per patient, and for the PulseSelect™ PFA Catheter Interface Cable to be \$800 per patient, totaling \$10,550 per inpatient stay. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. We noted that the applicant stated that the PulseSelect™ Pulsed Field Ablation (PFA) Interface Cable is listed as a component of the PulseSelect™ Pulsed Field Ablation (PFA) Generator Reusable Accessories. However, we noted the submitted new

technology add-on payment application is for the PulseSelect™ PFA Loop Catheter, and that the applicant had specified in its application that the PulseSelect™ PFA Generator System is not the subject of this new technology add-on payment application. Therefore, we believed the total cost per inpatient stay should be based only on the cost of the PulseSelect™ PFA Loop Catheter, which is \$9,750 per the applicant. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the PulseSelect™ PFA Loop Catheter would be \$6,337.50 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the PulseSelect™ PFA Loop Catheter meets the cost criterion and our proposal to approve new technology add-on payments for the PulseSelect™ PFA Loop Catheter for FY 2025 for cardiac electrophysiological mapping (stimulation and recording) and for treatment of drug refractory, recurrent, symptomatic paroxysmal atrial fibrillation or persistent atrial fibrillation (episode duration less than 1 year).

Comment: The applicant submitted a public comment requesting that the cost of the PulseSelect™ PFA Catheter Interface Cable (\$800) be included as an operating cost rather than a capital cost, since it is a sterilized, one-time use connector between the PulseSelect™ PFA Loop Catheter and the PulseSelect™ PFA Generator System.

Response: We thank the commenter for its comments. As we had noted in the proposed rule, the submitted new technology add-on payment application is for the PulseSelect™ PFA Loop Catheter, and not for the PulseSelect™ PFA System. As noted by the applicant, and in the FDA Summary of Safety and Effectiveness Data for the PulseSelect™ PFA System,¹⁷⁶ the PulseSelect™ PFA Interface Cable is not a component of the PulseSelect™ PFA Loop Catheter. Therefore, we do not consider the cost of the PulseSelect™ PFA Catheter Interface Cable as an

¹⁷⁶ https://www.accessdata.fda.gov/cdrh_docs/pdf23/P230017B.pdf

operating cost for the PulseSelect™ PFA Loop Catheter, and the PulseSelect™ PFA Catheter Interface Cable is not eligible to be included in new technology add-on payments.

Comment: The applicant submitted a public comment requesting that the PulseSelect™ PFA technology be the only product eligible for the new technology add-on payment designation and requested clarity on how eligibility for the new technology add-on payment would be properly determined on hospital claims. The applicant stated that CMS has established that a technology that is substantially similar to an existing technology approved for new technology add-on payment under the traditional pathway also qualifies for new technology add-on payment within the eligibility period, even if a specific application for that technology was not submitted and considered through rulemaking (82 FR 38110). The applicant also stated that CMS wrote in the FY 2023 IPPS/LTCH PPS final rule that "...applications received for new technology add-on payments for FY 2021 and subsequent fiscal years for medical devices that are part of FDA's Breakthrough Devices Program and received FDA marketing authorization will be considered not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS" (87 FR 48915). The applicant stated this language establishes that Breakthrough Devices approved for new technology add-on payment under the alternative pathway cannot be considered substantially similar to any other technologies, by definition. The applicant further stated that it was not evident how this distinction between new technology add-on payments approved under the traditional pathway and new technology add-on payments for Breakthrough Devices approved under the alternative pathway would be effectuated on a claim-by-claim basis, in instances when the same code may be used to describe procedures involving the new technology add-on payment-approved Breakthrough Device as well as other devices (which may or may not have Breakthrough Device status). The applicant stated it obtained a new ICD-10-PCS code for the PulseSelect™ PFA System, and that the code could be used to describe procedures involving at least one other irreversible electroporation device. The applicant requested that CMS clarify in the final rule that the PulseSelect™ PFA technology, as a

Breakthrough device, is not substantially similar to any other technologies for purposes of new technology add-on payments under the alternative pathway, and provide guidance on how this policy will be effectuated in terms of claims processing to ensure the new technology add-on payment is triggered only in cases where the PulseSelect™ PFA System is used.

Response: We thank the commenter for its comments. As we previously noted, under the alternative pathway, in evaluating eligibility for the new technology add-on payment, a medical device designated under FDA's Breakthrough Devices Program that has received FDA marketing authorization will be considered not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS, and will not need to meet the requirement under § 412.87(b)(1) that it represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries.

In addition, we note that procedure codes under the ICD-10-PCS are not manufacturer specific; rather, they are used to describe the hospital service that was performed. If, after consulting current official coding guidelines a hospital determines that an ICD-10-PCS procedure code associated with a new technology add-on payment describes the technology that it used in the performance of a procedure, the hospital may report the code and may be eligible to receive the associated new technology add-on payment. We note that similar procedures using the same device or technology may also be appropriately coded differently under the ICD-10-PCS classification. An entity that is seeking coding guidance may contact the American Hospital Association's Central Office on ICD-10-CM/PCS systems for such advice.¹⁷⁷ Hospitals are responsible for ensuring that they are correctly billing for the services they render.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the PulseSelect™ PFA Loop Catheter meets the cost criterion. The technology received FDA

¹⁷⁷ <https://www.aha.org/websites/2017-12-17-aha-central-office>

premarket approval on December 13, 2023 as a Breakthrough Device, with an indication for use for cardiac electrophysiological mapping (stimulation and recording) and for treatment of drug refractory, recurrent, symptomatic paroxysmal atrial fibrillation or persistent atrial fibrillation (episode duration less than 1 year), which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the PulseSelect™ PFA Loop Catheter for FY 2025. We consider the beginning of the newness period to commence on December 13, 2023, the date on which the technology received its FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the PulseSelect™ PFA Loop Catheter is \$9,750 per inpatient stay. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the PulseSelect™ PFA Loop Catheter is \$6,337.50 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of the PulseSelect™ PFA Loop Catheter that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code: 02583ZF (Destruction of conduction mechanism using irreversible electroporation, percutaneous approach).

h. Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter

Medtronic submitted an application for new technology add-on payments for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter for FY 2025. According to the applicant, the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter provides a treatment option for patients with uncontrolled hypertension, when used with the Symplicity G3™ Generator, by delivering targeted radiofrequency energy to the renal nerves, safely disrupting overactive sympathetic signaling between the kidneys and brain, as a treatment for uncontrolled hypertension.

Please refer to the online application posting for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter, available at <https://mearis.cms.gov/public/publications/ntap/NTP2310161U617>, for additional detail describing the technology and the condition treated by the technology.

According to the applicant, the Symplicity Spyral™ Multi-Electrode Renal Denervation System received Breakthrough Device designation from FDA on March 27, 2020, for the reduction of blood pressure in patients with uncontrolled hypertension despite the use of anti-hypertensive medications or in patients who may have documented intolerance to anti-hypertensive medications. The applicant received premarket approval for the technology on November 17, 2023, for reducing blood pressure as an adjunctive treatment in patients with hypertension in whom lifestyle modifications and antihypertensive medications do not adequately control blood pressure. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36126), we noted that because we consider the indication for which the applicant received premarket approval to be within the scope of the Breakthrough Device designation, and FDA considers this marketing authorization to be for the Breakthrough Device,¹⁷⁸ it appears that the premarket approval indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria. According to the applicant, the technology was commercially available immediately after FDA approval.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter beginning in FY 2025 and was granted approval for the following procedure code effective October 1, 2024: X05133A (Destruction of renal sympathetic nerve(s) using radiofrequency ablation, percutaneous approach, new technology group 10). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for the Symplicity Spyral™ Multi-Electrode Renal

¹⁷⁸ List of Breakthrough Devices with Marketing Authorization: <https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program>.

Denervation Catheter under the ICD-10-CM coding system. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant.

With respect to the cost criterion, the applicant provided two analyses and two sensitivity analyses to demonstrate that it meets the cost criterion. Each analysis used a common set of ICD-10-CM codes but different criteria for the inclusion/exclusion of MS-DRGs and outlier cases to identify potential cases representing patients who may be eligible for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter. The applicant explained that it used different codes to demonstrate different cohorts that may be eligible for the technology. Each analysis followed the order of operations described in the table that follows later in this section.

For the first scenario (Cost Analysis #1), the applicant searched the FY 2022 MedPAR file for cases where essential (primary) hypertension was the reason for the admission, using at least one of the ICD-10-CM diagnosis codes in the table that follows later in this section. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 490,387 claims mapping to 99 MS-DRGs, including MS-DRG 291 (Heart Failure and Shock With MCC) representing 67 percent of identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$136,450, which exceeded the average case-weighted threshold amount of \$62,312.

The second scenario (Cost Analysis #1 with Outliers) was a sensitivity analysis that mirrored the first scenario, except that cases with outlier payments were included. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 501,760 claims mapping to 101 MS-DRGs, including MS-DRG 291 (Heart Failure and Shock With MCC) representing 66.7 percent of identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$145,001, which exceeded the average case-weighted threshold amount of \$63,789.

For the third scenario (Cost Analysis #2), the applicant searched the FY 2022 MedPAR file for claims reporting any of the ICD-10-CM diagnosis codes listed in the table that follows later in this section but limited the case selection to MS-DRGs where the principal diagnosis was essential hypertension, and no procedures were performed. Per the applicant, this list represents a subset of cases that were most likely to benefit from the new procedural treatment option for primary hypertension. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 390,384 claims mapping to 8 MS-DRGs, including MS-DRG 291 (Heart Failure and Shock With MCC) representing 84.4 percent of identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$124,525, which exceeded the average case-weighted threshold amount of \$52,861.

The fourth scenario (Cost Analysis #2 with Outliers) mirrored the third scenario, except that cases with outlier payments were included. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 395,634 claims mapping to 8 MS-DRGs, including MS-DRG 291 (Heart Failure and Shock With MCC) representing 84.5 percent of identified cases. The applicant calculated a final inflated average case-weighted standardized charge per case of \$128,356, which exceeded the average case-weighted threshold amount of \$52,873.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter meets the cost criterion.

Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter COST ANALYSIS¹⁷⁹	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	For all scenarios: I10 Essential (primary) hypertension I11.0 Hypertensive heart disease with heart failure I11.9 Hypertensive heart disease without heart failure I12.0 Hypertensive chronic kidney disease with stage 5 chronic kidney disease or end stage renal disease

¹⁷⁹ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

	<p>I12.9 Hypertensive chronic kidney disease with stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease</p> <p>I13.0 Hypertensive heart and chronic kidney disease with heart failure and stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease</p> <p>I13.10 Hypertensive heart and chronic kidney disease without heart failure, with stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease</p> <p>I13.11 Hypertensive heart and chronic kidney disease without heart failure, with stage 5 chronic kidney disease, or end stage renal disease</p> <p>I13.2 Hypertensive heart and chronic kidney disease with heart failure and with stage 5 chronic kidney disease, or end stage renal disease</p> <p>I16.0 Hypertensive urgency</p> <p>I16.1 Hypertensive emergency</p> <p>I16.9 Hypertensive crisis, unspecified</p>
List of MS-DRGs	<p>Scenarios 1-2: For the list of MS-DRGs, see the online posting for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter.</p> <p>Scenarios 3-4:</p> <p>291 Heart Failure and Shock With MCC</p> <p>292 Heart Failure and Shock with CC</p> <p>293 Heart Failure and Shock without CC/MCC</p> <p>304 Hypertension with MCC</p> <p>305 Hypertension without MCC</p> <p>682 Renal Failure with MCC</p> <p>683 Renal Failure with CC</p> <p>684 Renal Failure without CC/MCC</p>
Inclusion/exclusion criteria	<p>Scenario 1: The applicant selected claims with a principal diagnosis of the ICD-10-CM codes listed in the table, as it believes this list represents the entire population of patients with essential (primary) hypertension as the reason for an inpatient admission. Any MS-DRG with a total discharge count of less than 11 was imputed with a count of 11. Cases with outlier payments were excluded.</p> <p>Scenario 2: The applicant used the same inclusion/exclusion criteria from Scenario 1, except that cases with outlier payments were included.</p> <p>Scenario 3: The applicant selected claims with a principal diagnosis of the ICD-10-CM codes listed in the table, but limited the case selection to MS-DRGs where the principal diagnosis was essential hypertension and no procedures were performed, as it believes this list represents a subset of cases that were most likely to benefit from the new procedural treatment option for essential (primary) hypertension. Cases with outlier payments were excluded.</p> <p>Scenario 4: The applicant used the same inclusion/exclusion criteria from Scenario 3, except that cases with outlier payments were included.</p>
Charges removed for prior technology	<p>The applicant stated that currently, there are no procedures or devices used to treat essential hypertension. Per the applicant, patients admitted inpatient for hypertension would still require stabilization on medications prior to undergoing renal denervation. Therefore, the applicant did not remove any direct or indirect charges for prior technologies being replaced.</p>
Standardized charges	<p>The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Standardizing File posted with the FY 2024 IPPS/LTCH PPS final rule.</p>
Inflation factor	<p>The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.</p>
Charges added for the new technology	<p>The applicant added charges for the new technology by dividing the expected cost of the new technology by the national average cost-to-charge ratio of 0.303 for supplies and equipment from the FY 2024 IPPS/LTCH PPS final rule.</p> <p>The applicant stated that the estimated indirect procedural costs for hospital costs associated with the renal denervation procedure were approximated from sample hospital claims from participating clinical trial hospitals. The applicant added indirect charges related to the new technology by dividing the indirect procedure costs related to the new technology by the corresponding national average cost-to-charge ratio from the FY 2024 IPPS/LTCH PPS final rule.</p>

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36128), we agreed with the applicant that the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter meets the

cost criterion and therefore proposed to approve the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter for new technology add-on payments for FY 2025.

We noted in the proposed rule that an estimate for the cost of the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter was not available for publication at the time of the proposed rule. We stated that we expected the applicant to release cost information prior to the final rule, and we would provide an update regarding the new technology add-on payment amount for the technology, if approved, in the final rule. The applicant stated that there would be two components for the cost of the technology, including operating costs for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter and capital costs for the Symplicity G3™ Generator. Because section 1886(d)(5)(K)(i) of the Act requires that the Secretary establish a mechanism to recognize the costs of new medical services or technologies under the payment system established under that subsection, which establishes the system for payment of the operating costs of inpatient hospital services, we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs (86 FR 45145). Based on the information from the applicant, it appeared that the Symplicity G3™ Generator is a capital cost. Therefore, it appeared that this component is not eligible for new technology add-on payment because, as discussed in prior rulemaking and as noted, we only make new technology add-on payments for operating costs (72 FR 47307 through 47308). Any new technology add-on payment for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter would be subject to our policy under § 412.88(a)(2) where we limit new technology add-on payment to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case.

We invited public comments on whether the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter meets the cost criterion and our proposal to approve new technology add-on payments for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter for FY

2025 for reducing blood pressure as an adjunctive treatment in patients with hypertension in whom lifestyle modifications and antihypertensive medications do not adequately control blood pressure, which corresponds to the Breakthrough Device designation.

Comment: Multiple commenters including the applicant submitted public comments in support of our proposal to approve new technology add-on payments for FY 2025 for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter. The applicant provided the cost of the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter to the hospital of \$16,000 per patient and requested that we finalize the proposed maximum new technology add-on payment amount of \$10,400 for FY 2025 (that is, 65 percent of the average cost of the technology).

Response: We thank the commenters for their support to approve new technology add-on payments for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter.

Comment: A commenter expressed concerns regarding not disclosing cost information for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter at the time of the proposed rule. The commenter acknowledged that there was precedent to not disclose cost information where the technology has not received FDA marketing authorization at the time of the proposed rule. However, the commenter stated that given the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter received FDA marketing authorization on November 17, 2023 and was immediately available for sale after FDA approval, they believed that the applicant could have estimated the cost of the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter prior to December 18, 2023, which is the deadline for submitting additional information for its application for new technology add-on payment. The commenter stated that not disclosing the technology's cost prevents stakeholders from submitting fully informed comments given the lack of information. The commenter stated that it is critically important that going forward, CMS consistently apply its requirements and processes across all applicants to ensure a level playing field.

Response: We appreciate the commenter sharing its concern regarding not disclosing cost information for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter at the time of the proposed rule. As stated by the commenter, we frequently do not have cost information from some applicants at the time of the proposed rule, and therefore do not include cost information on those applications in the proposed rule. As discussed in previous rulemaking (87 FR 48981), where cost information is not yet available at the time of the proposed rule, we note (in the proposed rule) our expectation that the applicant will submit cost information prior to the final rule, and we indicate that we will provide an update regarding the new technology add-on payment amount for the technology, if approved, in the final rule. We further note that in assessing the cost criterion for new technology add-on payments, consistent with the formula specified in section 1886(d)(5)(K)(ii)(I) of the Act, we assess the adequacy of the MS-DRG prospective payment rate otherwise applicable to discharges involving the new medical service or technology by evaluating whether the charges for cases involving the new technology exceed certain threshold amounts. As discussed in the proposed rule, we agreed that based on the applicant's cost analysis, the final inflated case-weighted average standardized charge per case for the technology exceeded the applicable average case-weighted threshold amount. We also note that we include descriptions of the cost analyses provided for all applications in the proposed rule to allow for public comments on how the applications meet the cost criterion. Nevertheless, we will continue to consider the commenter's concerns with respect to those applications for which information about the technology's cost is not included in the proposed rule.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter meets the cost criterion. The technology received FDA premarket approval on November 17, 2023, as a Breakthrough Device, with an indication for reducing blood pressure as an adjunctive treatment in patients with

hypertension in whom lifestyle modifications and antihypertensive medications do not adequately control blood pressure, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter for FY 2025. We consider the beginning of the newness period to commence on November 17, 2023, the date on which technology received FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the single-use Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter is \$16,000.00. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter is \$10,400.00 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of the Symplicity Spyral™ Multi-Electrode Renal Denervation Catheter that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code X05133A (Destruction of renal sympathetic nerve(s) using radiofrequency ablation, percutaneous approach, new technology group 10).

i. TriClip™ G4

Abbott submitted an application for new technology add-on payments for TriClip™ G4 for FY 2025. According to the applicant, TriClip™ G4 is intended for reconstruction of the insufficient tricuspid valve through tissue approximation via a transcatheter approach. The TriClip™ G4 System consists of the TriClip™ G4 Implant, Clip Delivery System and Steerable Guide. The applicant explained that the TriClip™ G4 Implant is a percutaneously delivered mechanical implant that helps close the tricuspid valve leaflets resulting in fixed tricuspid leaflet approximation throughout the cardiac cycle. According to the applicant, TriClip™ G4 is

intended for the treatment of patients with symptomatic, severe tricuspid valve regurgitation, whose symptoms and tricuspid regurgitation (TR) severity persist despite being treated optimally with medical therapy.

Please refer to the online application posting for TriClip™ G4, available at <https://mearis.cms.gov/public/publications/ntap/NTP231016N52MH>, for additional detail describing the technology and the disease treated by the technology.

According to the applicant, the TriClip™ G4 System received Breakthrough Device designation from FDA on November 19, 2020, for the treatment of patients with symptomatic, severe tricuspid valve regurgitation, whose symptoms and TR severity persist despite being treated optimally with medical therapy. The technology received FDA premarket approval on April 1, 2024 as a Breakthrough Device, with an indication for improving the quality of life and functional status in patients with symptomatic severe tricuspid regurgitation despite optimal medical therapy, who are at intermediate or greater risk for surgery and in whom transcatheter edge-to-edge valve repair is clinically appropriate and is expected to reduce tricuspid regurgitation severity to moderate or less, as determined by a multidisciplinary heart team, which is covered by its Breakthrough Device designation.

According to the applicant, the following ICD-10-PCS code may be used to describe procedures involving the use of TriClip™ G4: 02UJ3JZ (Supplement tricuspid valve with synthetic substitute, percutaneous approach). The applicant noted at the time of its application that there were no FDA-approved technologies using this procedure code. The applicant stated that ICD-10-CM diagnosis codes I07.1 (Rheumatic tricuspid insufficiency) and I36.1 (Nonrheumatic tricuspid (valve) insufficiency) may be used to currently identify the indication for TriClip™ G4 under the ICD-10-CM coding system.

With respect to the cost criterion, to identify potential cases representing patients who may be eligible for TriClip™ G4, the applicant searched the 2022 Medicare Inpatient Hospital Standard Analytical File (100%) for claims that had one of the following ICD-10-CM codes,

I07.1 (Rheumatic tricuspid insufficiency) or I36.1 (Nonrheumatic tricuspid (valve) insufficiency) in the primary position, in combination with ICD-10-PCS code 02UJ3JZ (Supplement tricuspid valve with synthetic substitute, percutaneous approach). Using the inclusion/exclusion criteria described in the following table, the applicant identified 235 claims mapping to two MS-DRGs, MS-DRG 266 (Endovascular Cardiac Valve Replacement and Supplement Procedures, with MCC), and 267 (Endovascular Cardiac Valve Replacement and Supplement Procedures, without MCC). The applicant followed the order of operations described in the following table and calculated a final inflated average case-weighted standardized charge per case of \$313,389 which exceeded the average case-weighted threshold amount of \$192,861.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that TriClip™ G4 meets the cost criterion.

TRICLIP™ G4 COST ANALYSIS	
Data Source and Time Period	2022 Medicare Inpatient Hospital Standard Analytical File (100%)
List of ICD-10-CM codes	I07.1 (Rheumatic tricuspid insufficiency) I36.1 (Nonrheumatic tricuspid (valve) insufficiency)
List of ICD-10-PCS codes	02UJ3JZ (Supplement tricuspid valve with synthetic substitute, percutaneous approach)
List of MS-DRGs	MS-DRG 266 Endovascular Cardiac Valve Replacement and Supplement Procedures, with MCC MS-DRG 267 Endovascular Cardiac Valve Replacement and Supplement Procedures, without MCC
Inclusion/exclusion criteria	The applicant identified cases reporting a primary diagnosis of one of the ICD-10-CM codes in this table, in combination with the ICD-10-PCS code in this table. The applicant excluded cases in MS-DRGs 216 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC), 219 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC), and 500 (Soft Tissue Procedures with MCC) because those cases included more extensive or unrelated intervention than is typically involved for TriClip™ G4 procedures. Per the applicant, these cases comprised 1.07% of the total cases in 2022. The applicant also excluded cases with denied payment.
Charges removed for prior technology	The applicant estimated replaced technology device charges using the afore-mentioned criteria and the following criteria: 1) claims with primary ICD-10-CM diagnosis code of I07.1 or I36.1, which were by far the most common codes and would help to estimate the charges in revenue center 0278 (Other Implants); 2) claims with ICD-10 procedure code 02UJ3JZ in the first position and no additional surgery codes (codes beginning with 0), which would help to ensure the correct device was charged in revenue center 0278; 3) claims listing charges under revenue center 0278; and 4) claims indicating the number of revenue units was one. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2022 IPPS/LTCH PPS final rule correcting amendment.
Inflation factor	The applicant applied an inflation factor of 11.2% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.269 for implantable devices from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36132), we agreed with the applicant that TriClip™ G4 meets the cost criterion and therefore proposed to approve TriClip™

G4 for new technology add-on payments for FY 2025, subject to the technology receiving FDA marketing authorization as a Breakthrough Device for the indication corresponding to the Breakthrough Device designation by May 1, 2024.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of TriClip™ G4 to the hospital to be \$40,000 per procedure. According to the applicant, the TriClip™ System is composed of multiple components: the TriClip™ G4 Implant, Clip Delivery System, and Steerable Guide Catheter. The applicant stated that all the components typically required for a single procedure are sold together for a single operating cost (for example, it is the same cost per procedure whether the patient requires one or two implants). We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of TriClip™ G4 would be \$26,000 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether TriClip™ G4 meets the cost criterion and our proposal to approve new technology add-on payments for TriClip™ G4 for FY 2025, subject to the technology receiving FDA marketing authorization as a Breakthrough Device for the indication corresponding to the Breakthrough Device designation by May 1, 2024.

Comment: We received multiple public comments in support of our proposal to approve new technology add-on payments for the TriClip™ G4 System. The commenters stated the technology meets FDA marketing authorization and cost criterion requirements for approval and also supported CMS's proposed maximum new technology add-on payment.

Response: We thank the commenters for their comments. Based on the information provided in the application for new technology add-on payments, and after consideration of the

public comments we received, we believe TriClip™ G4 meets the cost criterion. The technology received FDA premarket approval on April 1, 2024 as a Breakthrough Device, with an indication for improving the quality of life and functional status in patients with symptomatic severe tricuspid regurgitation despite optimal medical therapy, who are at intermediate or greater risk for surgery and in whom transcatheter edge-to-edge valve repair is clinically appropriate and is expected to reduce tricuspid regurgitation severity to moderate or less, as determined by a multidisciplinary heart team, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for TriClip™ G4 for FY 2025. We consider the beginning of the newness period to commence on April 1, 2024, the date on which the technology received its market authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of TriClip™ G4 (composed of the TriClip™ G4 Implant, Clip Delivery System, and Steerable Guide Catheter) is \$40,000 per procedure. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of TriClip™ G4 is \$26,000 for FY 2025 (that is, 65 percent of the average cost of the technology). Cases involving the use of TriClip™ G4 that are eligible for new technology add-on payments will be identified by ICD-10-PCS procedure code 02UJ3JZ (Supplement tricuspid valve with synthetic substitute, percutaneous approach).

j. VADER® Pedicle System

Icotec Medical, Inc. submitted an application for new technology add-on payments for the VADER® Pedicle System for FY 2025. According to the applicant, the VADER® Pedicle System is a pedicle screw system for standard posterior fixation of the spinal column used to provide stabilization of infected spinal segments after debridement of infectious tissues.

According to the applicant, the VADER® Pedicle System is made from high strength carbon fiber reinforced polyether ether ketone, which provides low artifact imaging to allow for post-operative surveillance of the healing of the infected spinal segment.

Please refer to the online application posting for the VADER® Pedicle System, available at <https://mearis.cms.gov/public/publications/ntap/NTP231016CMGH3>, for additional detail describing the technology and the condition treated by the technology.

According to the applicant, the VADER® Pedicle System received Breakthrough Device designation from FDA on July 31, 2023 for stabilizing the thoracic and/or lumbar spinal column as an adjunct to fusion in patients diagnosed with an active spinal infection (for example, spondylodiscitis, osteomyelitis) who are at risk of spinal instability, progressive spinal deformity, or neurologic compromise, following surgical debridement. The applicant stated that the technology received 510(k) clearance from FDA on February 26, 2024, for the following indication, which is the subject of the new technology add-on payment application, and is consistent with the Breakthrough Device designation: to stabilize the thoracic and/or lumbar spinal column in patients who are or will be receiving concurrent medical treatment for an active spinal infection (for example, spondylodiscitis, osteomyelitis) that, without stabilization, could lead to deterioration of bony structures and misalignment with neurological compromise. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36132), we noted that the VADER® Pedicle System has received FDA 510(k) clearance for multiple indications since 2019.¹⁸⁰ We also noted that, under the eligibility criteria for approval under the alternative pathway for certain transformative new devices, only the use of the VADER® Pedicle System to stabilize the thoracic and/or lumbar spine as an adjunct to fusion in patients with spinal infection, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2025. According to the applicant, the technology was commercially available immediately after 510(k) clearance from FDA.

¹⁸⁰ K222789, January 9, 2023; K200596, October 13, 2020; K193423, May 22, 2020; and K190545, June 20, 2019.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for the VADER® Pedicle System beginning in FY 2025 and was granted approval for the following procedure codes effective October 1, 2024:

ICD-10-PCS Code	Description
XRH60FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracic vertebral joint, open approach, new technology group 10
XRH63FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracic vertebral joint, percutaneous approach, new technology group 10
XRH64FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracic vertebral joint, percutaneous endoscopic approach, new technology group 10
XRH70FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 to 7 thoracic vertebral joints, open approach, new technology group 10
XRH73FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 to 7 thoracic vertebral joints, percutaneous approach, new technology group 10
XRH74FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 to 7 thoracic vertebral joints, percutaneous endoscopic approach, new technology group 10
XRH80FA	Insertion of pedicle based carbon/peek spinal stabilization device into 8 or more thoracic vertebral joints, open approach, new technology group 10
XRH83FA	Insertion of pedicle based carbon/peek spinal stabilization device into 8 or more thoracic vertebral joints, percutaneous approach, new technology group 10
XRH84FA	Insertion of pedicle based carbon/peek spinal stabilization device into 8 or more thoracic vertebral joints, percutaneous endoscopic approach, new technology group 10
XRHA0FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracolumbar vertebral joint, open approach, new technology group 10
XRHA3FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracolumbar vertebral joint, percutaneous approach, new technology group 10
XRHA4FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracolumbar vertebral joint, percutaneous endoscopic approach, new technology group 10
XRHB0FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbar vertebral joint, open approach, new technology group 10
XRHB3FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbar vertebral joint, percutaneous approach, new technology group 10
XRHB4FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbar vertebral joint, percutaneous endoscopic approach, new technology group 10
XRHC0FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 or more lumbar vertebral joints, open approach, new technology group 10
XRHC3FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 or more lumbar vertebral joints, percutaneous approach, new technology group 10
XRHC4FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 or more lumbar vertebral joints, percutaneous endoscopic approach, new technology group 10
XRHD0FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbosacral joint, open approach, new technology group 10
XRHD3FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbosacral joint, percutaneous approach, new technology group 10
XRHD4FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbosacral joint, percutaneous endoscopic approach, new technology group 10

The applicant provided a list of diagnosis codes that may be used to currently identify the indication for the VADER® Pedicle System under the ICD-10-CM coding system, describing spinal infections including osteomyelitis, discitis, and spondylopathies of various vertebral spine body parts including the cervical, thoracic, and lumbar regions. Please refer to the online application posting for the complete list of ICD-10-CM codes provided by the applicant. As previously noted, only use of the technology for the indications corresponding to the

Breakthrough Device designation would be relevant for new technology add-on payment purposes. Therefore, in the proposed rule (89 FR 36132) we stated that we believed that the relevant ICD-10-CM codes to identify the Breakthrough Device-designated indication would be the codes included in category M46 (Other inflammatory spondylopathies) under the ICD-10-CM classification in subcategories: M46.2- (Osteomyelitis of vertebra), M46.3- (Infection of intervertebral disc (pyogenic)), M46.4- (Discitis, unspecified), M46.5- (Other infective spondylopathies), M46.8- (Other specified inflammatory spondylopathies), and M46.9- (Unspecified inflammatory spondylopathy). We invited public comment on the use of these ICD-10-CM diagnosis codes to identify the Breakthrough Device-designated indication for purposes of the new technology add-on payment, if approved.

With respect to the cost criterion, to identify potential cases representing patients who may be eligible for the VADER® Pedicle System, the applicant searched the FY 2022 MedPAR file for claims reporting a combination of ICD-10-CM/PCS codes as listed in the online posting for the VADER® Pedicle System. The applicant believes these cases represent patients who have undergone fusion procedures and have been diagnosed with an active spinal infection (such as spondylodiscitis or osteomyelitis), and these patients are at risk of spinal instability, progressive spinal deformity, or neurologic compromise following surgical debridement, making them suitable candidates for the use of the technology. Using the inclusion/exclusion criteria described in the following table, the applicant identified 2,116 claims mapping to 22 MS-DRGs, with none exceeding more than 15 percent of the total identified cases. The applicant followed the order of operations described in the following table and calculated a final inflated average case-weighted standardized charge per case of \$473,636, which exceeded the average case-weighted threshold amount of \$197,922. Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the VADER® Pedicle System meets the cost criterion.

VADER® Pedicle System COST ANALYSIS¹⁸¹	
Data Source and Time Period	FY 2022 MedPAR proposed rule file
List ICD-10-PCS codes	For the list of ICD-10-PCS codes, see the online posting for the VADER® Pedicle System.
List of ICD-10-CM codes	For the list of ICD-10-CM codes, see the online posting for the VADER® Pedicle System.
List of MS-DRGs	For the list of MS-DRGs, see the online posting for the VADER® Pedicle System.
Inclusion/exclusion criteria	<p>The applicant identified cases that had an ICD-10-CM code and an ICD-10-PCS code from the tables of codes listed in the online posting for the VADER® Pedicle System, as it believes these cases represent patients who have undergone fusion procedures and have been diagnosed with an active spinal infection (such as spondylodiscitis or osteomyelitis), and these patients are at risk of spinal instability, progressive spinal deformity, or neurologic compromise following surgical debridement, making them suitable candidates for the use of this technology.</p> <p>The applicant only included MS-DRGs with case frequencies greater than 11. Per the applicant, it also included MS-DRGs 458 and 854 with fewer than 11 cases in the analysis, because the applicant considered these MS-DRGs highly relevant to the technology. The MS-DRGs with a total discharge count of less than 11 were imputed with a count of 11. Only approved charges were used in the calculation of charges. Hospitals were removed from the calculation of charges if they were identified within the MedPAR data but not present within the FY 2024 Standardizing File provided by CMS.</p>
Charges removed for prior technology	According to the applicant, the VADER® Pedicle System would replace the screws, set screws, and rods used in the spinal procedure. The applicant stated that it determined the unit prices for competitor screws, rods, and set screws using an analysis of literature and competitor cost sources. The applicant computed the total cost for an average procedure involving five screws, five set screws, and two rods. The applicant then converted the cost for an average procedure to a charge using the national cost-to-charge ratio of 0.269 for the implantable devices from the FY 2024 IPPS/LTCH PPS final rule to calculate an average charge amount. The applicant did not remove any indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the FY 2022 MedPAR preliminary rule file (fee for service claims only) and standardizing and impact files posted with the FY 2024 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant determined the cost per patient based on the average number of spinal segments from the VADER® Pedicle System. The applicant stated that an average of five pedicle screws, five set screws, and two rods would be used for a spinal fusion procedure. The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.269 for Implantable Devices from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36133), we agreed with the applicant that the VADER® Pedicle System meets the cost criterion and therefore proposed to approve the VADER® Pedicle System for new technology add-on payments for FY 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the VADER® Pedicle System to the hospital to be \$43,450 per patient. According to the applicant, the unit prices are \$6,500 for a pedicle screw, \$4,600 for a rod, and \$350 for a set screw. The applicant stated that an average of five pedicle screws, two rods, and five set screws would be used for a spinal fusion procedure. The applicant calculated

¹⁸¹ Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

the total cost of the technology by multiplying the unit price of each component by the average number of that component used in the procedure. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the VADER® Pedicle System would be \$28,242.50 for FY 2025 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the VADER® Pedicle System meets the cost criterion and our proposal to approve new technology add-on payments for the VADER® Pedicle System for FY 2025, when used to stabilize the thoracic and/or lumbar spinal column in patients who are or will be receiving concurrent medical treatment for an active spinal infection (for example, spondylodiscitis, osteomyelitis) that, without stabilization, could lead to deterioration of bony structures and misalignment with neurological compromise.

Comment: We received comments supporting our proposal to approve new technology add-on payments for FY 2025 for the VADER® Pedicle System.

Response: We thank the commenters for their support to approve new technology add-on payments for the VADER® Pedicle System.

We note that we did not receive any public comments on the ICD-10-CM diagnosis codes we provided in the proposed rule to identify the Breakthrough Device-designated indication for purposes of the new technology add-on payment.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the VADER® Pedicle System meets the cost criterion. The technology received 510(k) clearance from FDA on February 26, 2024 as a Breakthrough Device, with an indication for use to stabilize the thoracic and/or lumbar spinal column in patients who are or will be receiving concurrent medical

treatment for an active spinal infection (for example, spondylodiscitis, osteomyelitis) that, without stabilization, could lead to deterioration of bony structures and misalignment with neurological compromise, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the VADER® Pedicle System for FY 2025. We consider the beginning of the newness period to commence on February 26, 2024, the date on which technology received FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the VADER® Pedicle System is \$43,450 per patient. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the VADER® Pedicle System is \$28,242.50 for FY 2025 (that is, 65 percent of the average cost of the technology). As noted earlier in this section, the VADER® Pedicle System has received FDA 510(k) clearance for multiple indications since 2019, and only the use of the VADER® Pedicle System to stabilize the thoracic and/or lumbar spine as an adjunct to fusion in patients with spinal infection, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2025. Therefore, cases involving the use of the VADER® Pedicle System that are eligible for new technology add-on payments will be identified by any of the ICD-10-PCS procedure codes listed in the following table, in combination with any one of the ICD-10-CM diagnosis codes listed in a following table.

ICD-10-PCS Codes used in the Identification of the VADER® Pedicle System	
ICD-10-PCS Code	Description
XRH60FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracic vertebral joint, open approach, new technology group 10
XRH63FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracic vertebral joint, percutaneous approach, new technology group 10
XRH64FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracic vertebral joint, percutaneous endoscopic approach, new technology group 10
XRH70FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 to 7 thoracic vertebral joints, open approach, new technology group 10
XRH73FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 to 7 thoracic vertebral joints, percutaneous approach, new technology group 10
XRH74FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 to 7 thoracic vertebral

	joints, percutaneous endoscopic approach, new technology group 10
XRH80FA	Insertion of pedicle based carbon/peek spinal stabilization device into 8 or more thoracic vertebral joints, open approach, new technology group 10
XRH83FA	Insertion of pedicle based carbon/peek spinal stabilization device into 8 or more thoracic vertebral joints, percutaneous approach, new technology group 10
XRH84FA	Insertion of pedicle based carbon/peek spinal stabilization device into 8 or more thoracic vertebral joints, percutaneous endoscopic approach, new technology group 10
XRHA0FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracolumbar vertebral joint, open approach, new technology group 10
XRHA3FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracolumbar vertebral joint, percutaneous approach, new technology group 10
XRHA4FA	Insertion of pedicle based carbon/peek spinal stabilization device into thoracolumbar vertebral joint, percutaneous endoscopic approach, new technology group 10
XRHB0FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbar vertebral joint, open approach, new technology group 10
XRHB3FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbar vertebral joint, percutaneous approach, new technology group 10
XRHB4FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbar vertebral joint, percutaneous endoscopic approach, new technology group 10
XRHC0FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 or more lumbar vertebral joints, open approach, new technology group 10
XRHC3FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 or more lumbar vertebral joints, percutaneous approach, new technology group 10
XRHC4FA	Insertion of pedicle based carbon/peek spinal stabilization device into 2 or more lumbar vertebral joints, percutaneous endoscopic approach, new technology group 10
XRHD0FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbosacral joint, open approach, new technology group 10
XRHD3FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbosacral joint, percutaneous approach, new technology group 10
XRHD4FA	Insertion of pedicle based carbon/peek spinal stabilization device into lumbosacral joint, percutaneous endoscopic approach, new technology group 10

M46.20	Osteomyelitis of vertebra, site unspecified
M46.22	Osteomyelitis of vertebra, cervical region
M46.23	Osteomyelitis of vertebra, cervicothoracic region
M46.24	Osteomyelitis of vertebra, thoracic region
M46.25	Osteomyelitis of vertebra, thoracolumbar region
M46.26	Osteomyelitis of vertebra, lumbar region
M46.27	Osteomyelitis of vertebra, lumbosacral region
M46.30	Infection of intervertebral disc (pyogenic), site unspecified
M46.32	Infection of intervertebral disc (pyogenic), cervical region
M46.33	Infection of intervertebral disc (pyogenic), cervicothoracic region
M46.34	Infection of intervertebral disc (pyogenic), thoracic region
M46.35	Infection of intervertebral disc (pyogenic), thoracolumbar region
M46.36	Infection of intervertebral disc (pyogenic), lumbar region
M46.37	Infection of intervertebral disc (pyogenic), lumbosacral region
M46.39	Infection of intervertebral disc (pyogenic), multiple sites in spine
M46.40	Discitis, unspecified, site unspecified
M46.42	Discitis, unspecified, cervical region
M46.43	Discitis, unspecified, cervicothoracic region
M46.44	Discitis, unspecified, thoracic region
M46.45	Discitis, unspecified, thoracolumbar region
M46.46	Discitis, unspecified, lumbar region
M46.47	Discitis, unspecified, lumbosacral region

M46.49	Discitis, unspecified, multiple sites in spine
M46.50	Other infective spondylopathies, site unspecified
M46.51	Other infective spondylopathies, occipito-atlanto-axial region
M46.52	Other infective spondylopathies, cervical region
M46.53	Other infective spondylopathies, cervicothoracic region
M46.54	Other infective spondylopathies, thoracic region
M46.55	Other infective spondylopathies, thoracolumbar region
M46.56	Other infective spondylopathies, lumbar region
M46.57	Other infective spondylopathies, lumbosacral region
M46.59	Other infective spondylopathies, multiple sites in spine
M46.80	Other specified inflammatory spondylopathies, site unspecified
M46.82	Other specified inflammatory spondylopathies, cervical region
M46.83	Other specified inflammatory spondylopathies, cervicothoracic region
M46.84	Other specified inflammatory spondylopathies, thoracic region
M46.85	Other specified inflammatory spondylopathies, thoracolumbar region
M46.86	Other specified inflammatory spondylopathies, lumbar region
M46.87	Other specified inflammatory spondylopathies, lumbosacral region
M46.89	Other specified inflammatory spondylopathies, multiple sites in spine
M46.90	Unspecified inflammatory spondylopathy, site unspecified
M46.92	Unspecified inflammatory spondylopathy, cervical region
M46.93	Unspecified inflammatory spondylopathy, cervicothoracic region
M46.94	Unspecified inflammatory spondylopathy, thoracic region
M46.95	Unspecified inflammatory spondylopathy, thoracolumbar region
M46.96	Unspecified inflammatory spondylopathy, lumbar region
M46.97	Unspecified inflammatory spondylopathy, lumbosacral region
M46.99	Unspecified inflammatory spondylopathy, multiple sites in spine

k. ZEVTERA™ (ceftobiprole medocartil)

Basilea Pharmaceutica International Ltd, Allschwil submitted an application for new technology add-on payments for ZEVTERA™ (ceftobiprole medocartil) for FY 2025. According to the applicant, ZEVTERA™ is an advanced intravenous cephalosporin antibiotic designed to combat infections caused by antibiotic resistant pathogens. The applicant stated that ZEVTERA™ targets a wide range of Gram-positive and Gram-negative bacteria, including methicillin-resistant *Staphylococcus aureus* (MRSA), *Streptococcus pneumoniae*, including penicillin-non-susceptible pneumococci (PNSP) and *Enterococcus faecalis*, as well as non-Extended Spectrum Beta-Lactamase (non-ESBL) producing Enterobacterales. The applicant noted that ZEVTERA™'s bactericidal activity is achieved by binding to essential penicillin-binding proteins, disrupting the synthesis of the bacterial cell wall's peptidoglycan layer and leading to bacterial cell death, which differentiates it from other beta-lactams by effectively

addressing MRSA. Per the applicant, ZEVTERA™ is stable against certain beta-lactamases in both gram-positive and gram-negative bacteria. The applicant stated that Phase 3 studies submitted to the FDA demonstrate its non-inferiority compared to standard treatments in various infections, including Staphylococcus aureus bacteremia (SAB), acute bacterial skin and skin structure infections (ABSSSI), and community-acquired bacterial pneumonia (CABP).

Please refer to the online application posting for ZEVTERA™, available at <https://mearis.cms.gov/public/publications/ntap/NTP2310161DBB8>, for additional detail describing the technology and the disease treated by the technology.

According to the applicant, ZEVTERA™ received QIDP designations for CABP on July 20, 2015, for ABSSI on August 7, 2015, and for SAB on December 8, 2017. According to the applicant, ZEVTERA™ would be commercially available immediately after FDA approval. In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36134), we noted that, as an application submitted under the alternative pathway for certain antimicrobial products at § 412.87(d), ZEVTERA™ is eligible for conditional approval for new technology add-on payments if it does not receive FDA marketing authorization by July 1, 2024, provided that the technology receives FDA marketing authorization before July 1 of the fiscal year for which the applicant applied for new technology add-on payments (that is, July 1, 2025), as provided in § 412.87(f)(3). The technology was granted NDA approval from FDA on April 3, 2024, with indications for the treatment of: adults with SAB, including those with right-sided infective endocarditis; adults with ABSSSI; and adult and pediatric patients three months to less than 18 years old with CABP. According to the applicant, for CABP and ABSSSI, ZEVTERA™ is dosed at 500mg and administered three times daily (Q8h) as a 2-hour intravenous infusion for 5-14 days. For SAB, it is administered four times daily (Q6h) for the first 8 days, followed by Q8h daily infusion for the subsequent days, up to a total of 42 days.

The applicant submitted a request for approval for a unique ICD-10-PCS procedure code for ZEVTERA™ beginning in FY 2025 and was granted approval for the following procedure

codes effective October 1, 2024: XW0335A (Introduction of ceftobiprole medocaryl anti-infective into peripheral vein, percutaneous approach) and XW0435A (Introduction of ceftobiprole medocaryl anti-infective into central vein, percutaneous approach, new technology group 10). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for ZEVTERA™ under the ICD-10-CM coding system, describing SAB, ABSSSI, and CABP. Please refer to the online application posting for the complete list of ICD-10-CM (and PCS) codes provided by the applicant. In the proposed rule (89 FR 36134), we stated our belief that the relevant combination of ICD-10-CM codes to identify the indication of SAB would be: R78.81 (Bacteremia) in combination with B95.61 (Methicillin susceptible Staphylococcus aureus infection as the cause of diseases classified elsewhere) or B95.62 (Methicillin resistant Staphylococcus aureus infection as the cause of diseases classified elsewhere). We invited public comments on the use of these ICD-10-CM diagnosis codes to identify the indication of SAB for purposes of the new technology add-on payment, if approved.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that it meets the cost criterion. For each analysis, the applicant searched the FY 2022 MedPAR file using different sets of ICD-10-CM codes in the first five diagnosis positions to identify potential cases representing different cohorts of patients who may be eligible for ZEVTERA™. The applicant performed the same analysis on ABSSSI, CABP, and SAB cases individually and for all indications combined.

For the first analysis, the applicant searched for claims with a diagnosis code for ABSSSI using the ICD-10-CM codes listed in the online posting for ZEVTERA™. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 261,397 claims mapping to 663 MS-DRGs and calculated a final inflated average case-weighted standardized charge per case of \$114,279, which exceeded the average case-weighted threshold amount of \$63,767.

For the second analysis, the applicant searched for claims with a diagnosis code for CABP using the ICD-10-CM codes listed in the online posting for ZEVTERA™. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 635,628 claims mapping to 611 MS-DRGs and calculated a final inflated average case-weighted standardized charge per case of \$143,456, which exceeded the average case-weighted threshold amount of \$78,778.

For the third analysis, the applicant searched for claims with a diagnosis code for SAB using the ICD-10-CM codes listed in the online posting for ZEVTERA™. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 105,068 claims mapping to 626 MS-DRGs and calculated a final inflated average case-weighted standardized charge per case of \$165,809, which exceeded the average case-weighted threshold amount of \$82,238.

For the fourth analysis, the applicant searched for claims with diagnosis codes for ABSSSI, CABP, or SAB in the first five positions on a claim, using the ICD-10-CM codes listed in the online posting for ZEVTERA™. The applicant used the inclusion/exclusion criteria described in the table that follows later in this section. Under this analysis, the applicant identified 958,104 claims mapping to 680 MS-DRGs and calculated a final inflated average case-weighted standardized charge per case of \$137,861, which exceeded the average case-weighted threshold amount of \$75,097.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that ZEVTERA™ meets the cost criterion.

ZEVTERA™ COST ANALYSIS¹⁸²	
Data Source and Time Period	FY 2022 MedPAR file
List of ICD-10-CM codes	For the lists of ICD-10-CM codes, see the online posting for ZEVTERA™

¹⁸² Lists referenced here may be found in the cost criterion codes and MS-DRGs attachment included in the online posting for the technology.

List of MS-DRGs	For the lists of MS-DRGs, see the online posting for ZEVTERA™
Inclusion/exclusion criteria	<p>Analysis 1: The applicant selected claims based on the ICD-10-CM codes provided in the online posting, as it believes this list represents cases of ABSSSI diagnosis.</p> <p>Analysis 2: The applicant selected claims based on the ICD-10-CM codes provided in the online posting, as it believes this list represents cases of CABP diagnosis.</p> <p>Analysis 3: The applicant selected claims based on the ICD-10-CM codes provided in the online posting, as it believes this list represents cases of SAB diagnosis.</p> <p>Analysis 4: The applicant selected claims based on the ICD-10-CM codes provided in the online posting, as it believes this list represents diagnosis codes for ABSSSI, CABP, and SAB.</p> <p>For each analysis, the applicant included 100% of the cases identified which is inclusive of the imputed claims that occurred when an MS-DRG had fewer than 11 claims. The applicant calculated the average unstandardized charge per case for each MS-DRG.</p>
Charges removed for prior technology	The applicant did not remove any of charges as it believes ZEVTERA™ will be used in addition to other therapies. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the Impact File posted with the FY 2024 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 18.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2024 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.184 for drugs from the FY 2024 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36135), we agreed with the applicant that ZEVTERA™ meets the cost criterion and therefore proposed to approve ZEVTERA™ for new technology add-on payments for FY 2025, subject to the technology receiving FDA marketing authorization for the indication corresponding to the QIDP designation by July 1, 2024. We noted as an application submitted under the alternative pathway for certain antimicrobial products at § 412.87(d), ZEVTERA™ is eligible for conditional approval for new technology add-on payments if it does not receive FDA marketing authorization by July 1, 2024, provided that the technology receives FDA marketing authorization before July 1 of the fiscal year for which the applicant applied for new technology add-on payments (that is, July 1, 2025), as provided in § 412.87(f)(3). We stated that if ZEVTERA™ receives FDA marketing authorization before July 1, 2025, the new technology add-on payment for cases involving the use of this technology would be made effective for discharges beginning in the first quarter after FDA marketing authorization is granted. We noted if FDA marketing authorization is received on or after July 1, 2025, no new technology add-on payments would be made for cases involving the use of ZEVTERA™ for FY 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the pricing for this treatment is set at \$125 per vial, and the recommended dosage varies depending on the condition being treated. The applicant stated that for ABSSSI and CABP, the suggested daily dose is 3 vials per day for a duration of 5-14 days, resulting in an estimated average cost of \$3,750 for a 10-day therapy. The applicant noted that for SAB, the recommended dose is every 6 hours for the first 8 days, followed by every 8 hours for up to 42 days. The applicant made the assumption that patients would be inpatient for 28 days and then continue the therapy as an outpatient for up to 42 days, which resulted in an average inpatient cost of \$11,500. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments for technologies designated as QIDPs to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS-DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of ZEVTERA™ for FY 2025 would be \$8,625.00 for the indication of SAB and \$2,812.50 for the indications of ABSSSI and CABP (that is, 75 percent of the average cost of the technology).

We invited public comments on whether ZEVTERA™ meets the cost criterion and our proposal to approve new technology add-on payments for ZEVTERA™ for FY 2025 for SAB, ABSSSI, and CABP, subject to the technology receiving FDA marketing authorization consistent with its QIDP designations by July 1, 2024.

We did not receive any comments related to ZEVTERA™.

Based on the information provided in the application for new technology add-on payments, we believe ZEVTERA™ meets the cost criterion. The technology received NDA approval from FDA on April 3, 2024, with indications for the treatment of: adults with SAB, including those with right-sided infective endocarditis; adults with ABSSSI; and adult and pediatric patients three months to less than 18 years old with CABP. Therefore, we are finalizing

our proposal to approve ZEVTERA™ for new technology add-on payments for FY 2025. We consider the beginning of the newness period to commence on April 3, 2024, the date on which the technology received its FDA marketing authorization for the indications covered by its QIDP designations.

Based on the information available at the time of this final rule, the average inpatient cost per case of ZEVTERA™ is \$11,500 for the indication of SAB and \$3,750 for the indication of ABSSSI and CABP. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS-DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of ZEVTERA™ is \$8,625.00 for the indication of SAB and \$2,812.50 for the indications of ABSSSI and CABP for FY 2025 (that is, 75 percent of the average cost of the technology).

Cases involving the use of ZEVTERA™ for the indications of ABSSSI and CABP that are eligible for new technology add-on payments will be identified by the following ICD-10-PCS procedure codes: XW0335A (Introduction of ceftobiprole medocaril anti-infective into peripheral vein, percutaneous approach) or XW0435A (Introduction of ceftobiprole medocaril anti-infective into central vein, percutaneous approach).

Cases involving the use of ZEVTERA™ for the indication of SAB that are eligible for new technology add-on payments will be identified by the following ICD-10-PCS procedure codes: XW0435A (Introduction of ceftobiprole medocaril anti-infective into central vein, percutaneous approach) or XW0435A (Introduction of ceftobiprole medocaril anti-infective into central vein, percutaneous approach), in combination with ICD-10-CM codes R78.81 (Bacteremia), in combination with B95.61 (Methicillin susceptible *Staphylococcus aureus* infection as the cause of diseases classified elsewhere) or B95.62 (Methicillin resistant *Staphylococcus aureus* infection as the cause of diseases classified elsewhere).

7. Other Comments

We received several public comments requesting changes to the new technology add-on payment policies such as creating new alternative pathway categories for different FDA designations or types of treatments, expanding the conditional approval process to additional types of technologies or designations, moving to a biannual process that would set two annual deadlines for manufacturers to apply for new technology add-on payment, and requiring Medicare Advantage (MA) to provide new technology add-on payment. These comments were outside the scope of the proposals included in the FY 2025 IPPS/LTCH PPS proposed rule and we are therefore not addressing them in this final rule.

8. Change to the Method for Determining whether a Technology Would be Within its 2- to 3-Year Newness Period when Considering Eligibility for New Technology Add-on Payments

As discussed previously in this rule, section 1886(d)(5)(K)(i) of the Act requires the Secretary to establish (after notice and opportunity for public comment) a mechanism to recognize the costs of new medical services and technologies under the IPPS. Section 1886(d)(5)(K)(vi) of the Act specifies that a medical service or technology will be considered new if it meets criteria established by the Secretary after notice and opportunity for public comment. The regulations at 42 CFR 412.87 implement these provisions. As further discussed in FY 2005 IPPS final rule (69 FR 49002), the intent of section 1886(d)(5)(K) of the Act and regulations under § 412.87(b)(2) is to pay for new medical services and technologies for the first 2 to 3 years that a product comes on the market, during the period when the costs of the new technology are not yet fully reflected in the DRG weights. Generally, we use the FDA marketing authorization date as the indicator of the time when a technology begins to become available on the market and data reflecting the costs of the technology begin to become available for recalibration of the DRG weights. In specific circumstances, we have recognized a date later than the FDA marketing authorization date as the appropriate starting point for the 2- to 3-year newness period. For example, we have recognized a later date where an applicant could prove a

delay in actual availability of a product after FDA approval or clearance. The costs of the new medical service or technology, once paid for by Medicare for this 2- to 3-year period, are accounted for in the MedPAR data that are used to recalibrate the DRG weights on an annual basis. Therefore, we stated it is appropriate to limit the add-on payment window for technologies that have passed this 2- to 3-year timeframe.

As discussed previously in this rule, our policy is that a medical service or technology may continue to be considered “new” for purposes of new technology add-on payments within 2 or 3 years after the point at which data begin to become available reflecting the inpatient hospital code assigned to the new service or technology. Our practice has been to begin and end new technology add-on payments on the basis of a fiscal year, and we have generally followed a guideline that uses a 6-month window before and after the start of the fiscal year to determine whether to extend the new technology add-on payment for an additional fiscal year. In general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry onto the U.S. market occurs in the latter half of the fiscal year, that is, after April 1 (70 FR 47362).

We have not implemented a policy to stop new technology add-on payment in the middle of the fiscal year (for example, during the month that a technology reaches its three-year anniversary date of entry onto the U.S. market) because, as we discussed in the FY 2005 IPPS final rule, we believe that predictability is an important aspect of the prospective payment system methodology. Accordingly, we believe that it is appropriate to apply a consistent payment methodology for new technologies throughout the fiscal year (69 FR 49016).

As previously discussed, in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958), we finalized that beginning with the new technology add-on payment applications for FY 2025, for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application, applicants must have a complete and active FDA marketing authorization request at the time of new technology

add-on payment application submission and must provide documentation of FDA acceptance or filing to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. We also finalized that, beginning with FY 2025 applications, in order to be eligible for consideration for new technology add-on payment for the upcoming fiscal year, an applicant for new technology add-on payments must have received FDA approval or clearance by May 1 (rather than July 1) of the year prior to the beginning of the fiscal year for which the application is being considered (except for an application that is submitted under the alternative pathway for certain antimicrobial products).

As we summarized in the FY 2024 IPPS/LTCH PPS final rule, commenters raised concerns that this policy would adversely impact their ability to receive maximum flexibility with respect to when to apply to FDA and when they apply for new technology add-on payment (88 FR 58953). Many commenters expressed specific concerns regarding moving the FDA marketing authorization deadline to May 1 and the impact it would have on how long technologies may be eligible for new technology add-on payment. Several of the commenters asserted that this policy change would prevent a 3-year new technology add-on payment duration for almost all applicants, as only those technologies that receive FDA marketing authorization in April would be eligible for 3 years of new technology add-on payments, shortening the window from 3 months under the former policy (April 1 until July 1) to just 1 month (April 1 until May 1) (88 FR 58954). In response, we noted in that even under the former policy, not all applicants receive the full 3 years of new technology add on payments, and that there are many factors (including timing of interactions with the FDA and manufacturing readiness) that can delay a technology's approval by the FDA that would disrupt a technology's ability to receive the full 3 years of payment. However, we also noted the commenters' concerns regarding the shortened time period between April 1 and May 1 under the new policy and stated that we would consider for future rulemaking how we assess new technology add-on payment eligibility in the third year of newness, such as consideration of adjusting the April 1 cutoff to allow for a longer window of

eligibility (88 FR 58955).

In the proposed rule (89 FR 36136 through 36137), after further consideration of commenters' concerns that the policy we finalized in the FY 2024 IPPS/LTCH PPS final rule may limit the ability of new technology add-on payment applicants to be eligible for a third year of new technology add-on payments due to the shortened timeframe between April 1 and May 1, we stated that we agreed that there may be merit to modifying our current 6-month guideline to provide additional flexibility for applications submitted in accordance with this new policy.

While technologies that are FDA approved or cleared in April, and technologies with a documented delay in availability on the U.S. market such that the product's entry onto the U.S. market falls within the second half of the fiscal year, would still be eligible for a third year of new technology add-on payments under current policy, we agreed that the change in the FDA marketing authorization deadline from July 1 to May 1 may limit the ability of new technology add-on payment applicants to be eligible for 3 years of new technology add-on payments.

Therefore, we proposed to change the April 1 cutoff for determining whether a technology would be within its 2- to 3-year newness period when considering eligibility for new technology add-on payments. We stated that we believed this proposed change would continue the flexibility applicants had with respect to when they apply to FDA and when they apply for new technology add-on payment, while preserving a predictable and consistent payment methodology for new technologies throughout the fiscal year.

Specifically, we proposed that beginning with new technology add-on payments for FY 2026, in assessing whether to continue the new technology add-on payments for those technologies that are first approved for new technology add-on payments in FY 2025 or a subsequent year, we would extend new technology add-on payments for an additional fiscal year when the 3-year anniversary date of the product's entry onto the U.S. market occurs on or after October 1 of that fiscal year. We proposed that this policy change would become effective beginning with those technologies that are initially approved for new technology add-on

payments in FY 2025 or a subsequent year to allow additional flexibility for those applications for new technologies which were first subject to the change in the deadline for FDA marketing authorization from July 1 to May 1. Therefore, for technologies that were first approved for new technology add-on payments prior to FY 2025, including for technologies we determine to be substantially similar to those technologies, we stated we would continue to use the midpoint of the upcoming fiscal year (April 1) when determining whether a technology would still be considered “new” for purposes of new technology add-on payments. Similarly, we also proposed that beginning with applications for new technology add-on payments for FY 2026, we would use the start of the fiscal year (October 1) instead of April 1 to determine whether to approve new technology add-on payment for that fiscal year.

We sought public comment on our proposal to change the April 1 cutoff to October 1 for determining whether a technology would be within its 2- to 3-year newness period when considering eligibility for new technology add-on payments, beginning in FY 2026, effective for those technologies that are approved for new technology add-on payments starting in FY 2025 or a subsequent year.

Comment: Commenters were supportive of our proposal to use the start of the fiscal year, October 1, instead of April 1, to determine whether a product is within its 2-to-3-year newness period for new technology add-on payment, and requested that CMS finalize this proposal. Commenters stated that they appreciated CMS’s acknowledgement that the FY 2024 policy change in the FDA marketing authorization deadline may limit the ability of new technology add-on payment applicants to be eligible for 3 years of new technology add-on payments, and stated that the proposal would improve the flexibility for applicants with respect to FDA timing. Commenters stated that this proposal provided a more balanced and appropriate evaluation of whether a technology qualifies for a 2-year or 3-year period of new technology add-on payment. Another commenter agreed that predictability is an important aspect of the prospective payment system methodology and appreciated CMS’s application of consistent payment methodology for

new technologies throughout the fiscal year.

Commenters stated that the policy would allow more innovative technologies to receive new technology add-on payment for a third year. Commenters further stated that this would help to incentivize new treatment options and ensure continued access to breakthrough and life-saving technologies for Medicare beneficiaries and their providers during the first years of product availability and with substantially reduced payment disincentives inherent in how IPPS payment rates are established. Commenters stated this would help more hospitals offer these technologies, which would improve the claims data for MS-DRG assignments and ensure appropriate MS-DRG recalibration following the new technology add-on payment period. Commenters were also supportive of the increased time for cost data collection, stating that it would be particularly helpful in accruing data for low-volume technologies and/or those with a significant delay between their newness date and the timeframe when claims began accumulating in the data.

Response: We thank commenters for their support of our proposal, and agree that this proposal would provide additional flexibility for new technology add-on payment applications submitted in accordance with the change in the FDA marketing authorization deadline.

Comment: Commenters also requested that CMS provide additional flexibility to guarantee a third year of new technology add-on payment for all technologies regardless of when they receive FDA marketing authorization. A commenter further stated that this would maximize patient access to future CAR T-cell therapies and other important technologies advancing personalized medicine. Other commenters requested that CMS guarantee a third year of new technology add-on payment for specific technologies, such as CAR-T cell therapies or cell and gene therapies. A commenter further explained that new cell and gene therapies technologies might take several months to gain market availability, post-FDA approval. The commenter stated that personalized medical technologies like cell and gene therapies are uniquely developed for each patient and, therefore, often have a delay in actual availability of a product after FDA approval or clearance, due to the time needed for development and administration. The

commenter stated that ensuring a third year of add-on payment for using cell and gene therapies would accommodate the time required for patient-specific development while advancing patient access to innovative technologies. A commenter also requested that CMS create a five-year add-on payment period for autologous gene and cell therapy products that qualify for new technology add-on payment.

Some commenters stated that this proposed policy would leave CMS with unreliable claims data for rate-setting at the expiration of new technology add-on payment because CMS uses MedPAR data from two years prior to the applicable fiscal year for ratesetting, and for services that use new technology with only 2 years of new technology add-on payment status, CMS is effectively relying on the first year of data to set rates for the first fiscal year following the end of new technology add-on payment status. Commenters stated that the first year of new technology add-on payment is typically when a technology is first coming to market and there are typically fewer claims reflecting use of the technology, especially for technologies that may not have received new technology add-on payment until a year or more after their FDA approval date, resulting in a small number of claims that may not be stable or reliable. Commenters stated that by granting all new technologies 3 years of new technology add-on payment status, CMS can ensure sufficient reliable claims data for ratesetting at the end of new technology add-on payment status, and that the applicable statute and regulations discuss newness in relation to the availability of claims data.

Some commenters believed that this and other proposals did not adequately address what they described as the consistent and severe underfunding of gene therapies and breakthrough drugs. A commenter stated that although this change would enable more products to qualify for add-on payments during the third year, it did not guarantee that these products would benefit from a full three years of new technology add-on payment. The commenter stated that the proposal narrowly addresses the issue of timing but fails to expand the overall eligibility window in a meaningful way that would support a greater number of innovative products.

A few commenters further stated that the proposal did not actually help the technologies impacted by the July 1 to May 1 FDA marketing authorization deadline change, as the only products for which this proposal would allow for an additional third year of new technology add-on payment are those products approved between October 1 and March 31. The commenters stated that products approved April 1 to May 1 were not affected by the change in the FDA approval deadline and would not be impacted by this proposal. The commenters stated that products approved May 2 to July 1 lost a third year of new technology add-on payment status when the July 1 to May 1 rule was finalized and would not gain back the third year of new technology add-on payment status under CMS's proposal because their FDA approval date occurs before October 1 of what would be the third fiscal year. The commenters also stated that products approved July 1 to October 1 would continue to remain ineligible for the third year of new technology add-on payment. Therefore, commenters stated that granting all new technologies three years of payment would rectify the problem for technologies approved between May 1 and July 1.

Some commenters also stated that the statute did not mention the FDA approval date, nor was there a statutory preclusion from granting all products a third year of payment. Another commenter asserted that CMS could statutorily grant three full years of new technology add-on payment status to new technologies based on the effective date of the ICD-10-PCS code that describes the service/technology, which could be set at October 1, the date that new technology add-on payment status begins, and that this approach was in line with how CMS makes pass-through payment under the OPPS. The commenter explained that FDA approvals can arbitrarily occur in the second half of the fiscal year, rather than in the first half of the following fiscal year, and that it is challenging to time FDA application submissions to try to get approval in the first half of the fiscal year, and that new therapeutic products approved between April 2 and September 30 face potentially slow uptake given the up to 17 months before new technology add-on payment adjustments would be effective.

Response: We thank commenters for their feedback. However, we do not agree that we should guarantee a third year of new technology add-on payment for all technologies regardless of when they receive FDA marketing authorization. The intent of our policy was not to ensure that more technologies would receive three years of new technology add-on payments, but rather to address how the change in the FDA marketing authorization deadline, effective beginning with new technology add-on payment applications for FY 2025, may limit the ability of new technology add-on payment applicants to be eligible for a third year of new technology add-on payments under our general practice for determining whether to extend the payment for an additional fiscal year, as described previously in this rule. We recognize that there may be a small subset of technologies that would not benefit from this proposal.

As we stated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58955), section 1886(d)(5)(K)(ii) of the Act establishes a period of not less than 2 years and not more than 3 years for the collection of data with respect to the costs of new services or technologies; a full 3 years is not required. As we had stated, consistent with the statute and our implementing regulations, a technology is no longer considered “new” once it is more than 2 to 3 years old, irrespective of how frequently the medical service or technology has been used in the Medicare population (70 FR 47349). As such, once a technology has been available on the U.S. market for more than 2 to 3 years, we consider the costs to be included in the MS-DRG relative weights regardless of whether the technology's use in the Medicare population has been frequent or infrequent. Therefore, we do not believe that 2 years' worth of data would be insufficient to inform rate-setting for the inpatient setting.

We also disagree that this proposed policy would leave CMS with unreliable claims data for ratesetting for technologies that would be on the market for a year or more before they could begin receiving new technology add-on payment and receive payment for at most two years based on their FDA marketing authorization dates. As described in the FY 2005 IPPS final rule (69 FR 49003), even if a technology does not receive new technology add-on payments, CMS

continues to pay for new technologies through the regular payment mechanism established by the DRG payment methodology. In addition, the costs incurred by the hospital for a case are evaluated to determine whether the hospital is eligible for an additional payment as an outlier case. This additional payment is designed to protect the hospital from large financial losses due to unusually expensive cases. Any eligible outlier payment is added to the DRG-adjusted base payment rate (88 FR 58648). We further note that whether a technology receives new technology add-on payments or not does not affect coverage of the technology or the ability for hospitals to provide a technology to patients where appropriate. Therefore, data reflecting the costs of a new technology begin to become available for recalibration of the DRG weights starting from when the technology became available on the U.S. market. As we previously stated, the newness period does not necessarily start with the approval date for the medical service or technology and does not necessarily start with the issuance of a distinct code. Instead, it begins with availability of the product on the market, which is when data become available (69 FR 49003).

Comment: Some commenters also requested that CMS make the proposal effective immediately. Commenters recommended that CMS apply the proposal to other technologies that are currently receiving new technology add-on payment, such as to those for which the new technology add-on payment is set to expire in FY 2024, to those that first received new technology add-on payment for FY 2024, and to new technology add-on payment applications for FY 2025 that are determined to be substantially similar to technologies first approved for new technology add-on payments prior to FY 2025. A commenter stated that applying the proposal to technologies that are currently receiving new technology add-on payment that would qualify for a third year under the change would apply to only three technologies that CMS proposed to discontinue in FY 2025, and stated this would better serve Medicare beneficiaries, improve the quality of data, and capture more mature usage patterns for LIVTENCITY™ and other affected products to ensure more robust claims data for ratesetting.

Another commenter further stated that CMS should finalize this proposal such that

technologies that received a second year of new technology add-on payment status in FY 2024, receive a third year of new technology add-on payment status in FY 2025; technologies that received their first year of new technology add-on payment status in FY 2024 would receive new technology add-on payment through FY 2026; and technologies first approved for new technology add-on payment in FY 2025 and future years are automatically eligible for three full years of new technology add-on payment. The commenter suggested that if CMS were to move forward with its current proposal, it should be effective for applicants that first receive new technology add-on payment starting in FY 2024, rather than FY 2025, as otherwise CMS would be relying on the FY 2024 claims data for rate-setting in FY 2026, and there may be a low number of claims with significant variability in reported charges resulting in less reliable ratesetting.

Response: We thank the commenters for their comments. As we previously noted, the intent of our proposal was not to ensure that more technologies would receive three years of new technology add-on payments. We had stated that, after further consideration of commenters' concerns that the policy we finalized in the FY 2024 IPPS/LTCH PPS final rule may limit the ability of new technology add-on payment applicants to be eligible for a third year of new technology add-on payments due to the shortened timeframe between April 1 and May 1, we agreed that there may be merit to modifying our current 6-month guideline to provide additional flexibility for applications submitted in accordance with this new policy (89 FR 36136).

Applications submitted for new technology add-on payment prior to FY 2025 were not subject to the change in the deadline for FDA marketing authorization from July 1 to May 1 as finalized in the FY 2024 IPPS/LTCH PPS final rule. Similarly, for technologies that we determine to be substantially similar to technologies first approved for new technology add-on payments prior to FY 2025, under our longstanding policy, if substantially similar technologies are submitted for review in different (and subsequent) years, we evaluate and make a determination on the first application and apply that same determination to the second application (85 FR 58679), and we

use the earliest market availability date submitted as the beginning of the newness period for both technologies (87 FR 48925). Therefore, we disagree with commenters that this proposal should be effective immediately or applied to other technologies outside of our proposal.

Comment: Commenters offered additional suggestions as to how CMS could establish the newness period. A commenter stated that the period of “newness” for a technology or medical service to receive add-on payments is based generally on the date of FDA approval/clearance, which is not necessarily the date of commercial availability. Commenters suggested that CMS consider the date of assignment of a new ICD-10 code when determining a technology’s date of commercial availability, with a commenter stating that it would be consistent with CMS's stated policy that a technology may continue to be considered "new" for new technology add-on payment purposes "within 2 or 3 years after the point at which data begin to become available reflecting the inpatient hospital code assigned to the new service or technology." A commenter believed there was merit in considering the newness period to start on the date of first sale or upon issuance of an ICD-10-PCS code, as otherwise, a technology may not be commercially available or without an ICD-10-PCS code that allows the collection of accurate cost data as the new technology is not identifiable in any claims data. A commenter also requested that CMS start the newness period at the date of first administration of the technology for autologous gene and cell therapy products that qualify for new technology add-on payment.

Response: As we have stated in prior rulemaking, the newness period does not necessarily start with the approval date for the medical service or technology and does not necessarily start with the issuance of a distinct code. Instead, it begins with availability of the product on the market, which is when data become available. We have consistently applied this standard, and believe that it is most consistent with the purpose of new technology add-on payments (69 FR 49003).

We have also stated that for technologies that do not have a unique ICD-10 code, while it may be impossible to identify when a particular product was used because there is no unique

code to identify it amongst other products in the category, the product is nonetheless used and paid for. In addition, hospital charges reflect the services provided to patients receiving the new service or device whether or not a specific code is assigned. Therefore, data containing payments for these new technologies are already in our MedPAR database and when DRG recalibration occurs these costs are accounted for. Furthermore, assignment of new codes can occur for many reasons other than the introduction of new procedures and technologies. For example, new codes can simply reflect more refined and discriminating descriptions of existing procedures and technologies (69 FR 49003).

We also disagree that the newness period should start on the date of the first sale or at the first administration of a technology. As we previously noted, while CMS may consider a documented delay in a technology's availability on the U.S. market in determining when the newness period begins, under our historical policy, we do not consider how frequently the medical service or technology has been used in our determination of newness (70 FR 47349). Consistent with the statute, a technology no longer qualifies as new once it is more than 2 to 3 years old irrespective of how frequently it has been used in the Medicare population.

Therefore, after consideration of the comments received, and for the reasons discussed previously and in the FY 2025 IPPS/LTCH PPS proposed rule, we are finalizing our proposal that, beginning with new technology add-on payments for FY 2026, in assessing whether to continue the new technology add-on payments for those technologies that are first approved for new technology add-on payments in FY 2025 or a subsequent year, we will extend new technology add-on payments for an additional fiscal year when the 3-year anniversary date of the product's entry onto the U.S. market occurs on or after October 1 of that fiscal year. This policy change will become effective beginning with those technologies that are initially approved for new technology add-on payments in FY 2025 or a subsequent year. For technologies that were first approved for new technology add-on payments prior to FY 2025, including for technologies we determine to be substantially similar to those technologies, we will continue to use the

midpoint of the upcoming fiscal year (April 1) when determining whether a technology would still be considered “new” for purposes of new technology add-on payments. Similarly, we are also finalizing that beginning with applications for new technology add-on payments for FY 2026, we will use the start of the fiscal year (October 1) instead of April 1 to determine whether to approve new technology add-on payment for that fiscal year.

9. Change to the Requirements Defining an Active FDA Marketing Application for the Purpose of New Technology Add-On Payment Application Eligibility

As previously discussed, in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958), we finalized that beginning with the new technology add-on payment applications for FY 2025, for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application, applicants must have a complete and active FDA market authorization request at the time of new technology add-on payment application submission, and must provide documentation of FDA acceptance or filing to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. See § 412.87(e) and further discussion in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958).

As we discussed further in the FY 2024 IPPS/LTCH PPS final rule, the documentation of FDA acceptance or filing of a marketing authorization request must be provided at the time of new technology add-on payment application, and be consistent with the type of FDA marketing authorization the applicant has submitted to FDA. We stated that we only accept new technology add-on payment applications once FDA has received all of the information necessary to determine whether it will accept (such as in the case of a 510(k) premarket submission or De Novo Classification request) or file (such as in the case of a PMA, NDA, or BLA) the application as demonstrated by documentation of the acceptance/filing that is provided by FDA. The applicant is required to submit documentation with its new technology add-on payment

application to demonstrate that FDA has determined that the application is sufficiently complete to allow for substantive review by the FDA (88 FR 58955).

We also explained that, for the purposes of new technology add-on payment applications, we consider an FDA marketing authorization application to be in an active status when it has not been withdrawn, is not the subject of a Complete Response Letter or final decision from FDA to refuse to approve the application, and is not on hold (88 FR 58955 through 58956).

We stated in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36137) that, as noted in the FY 2024 IPPS/LTCH PPS final rule, we collaborated with FDA in developing the terminology used for purposes of this policy, and the intent behind using the terms we did was to ensure that the requirement could apply to and be inclusive of the various FDA applications and approval pathways for different types of drugs and devices. We stated in the proposed rule that, as such, we did not use terms defined in statute or existing regulations or terms defined by FDA (88 FR 58955). We stated that while FDA may consider an application for an FDA marketing authorization to be under active review despite a hold status, under our current policy we do not consider marketing authorization applications in a hold with FDA to be in an active status for the purposes of new technology add-on payment application eligibility. As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58956) our intent with respect to considering applications that are on hold at the time of new technology add-on payment application submission to be inactive was to ensure that applicants are far enough along in the FDA review process that applicants would be able to reasonably provide sufficient information at the time of new technology add-on payment application submission for CMS to identify critical questions regarding the technology's eligibility for add-on payments and to allow the public to assess the relevant new technology evaluation criteria in the proposed rule. We stated that, as noted in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58956), we have received applications over the years for technologies that are in a hold status with up to 360 days allowed for submission of additional information.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36137 through 36138), we stated that we also recognized that applications for FDA marketing authorization may go in and out of a hold status at various stages during the FDA application process and for various reasons. The maximum length of a hold status can vary based on the FDA approval pathway, such that the time remaining for an applicant to resolve the hold may vary from days to several months after the start of the new technology add-on payment application cycle, depending on the FDA pathway, reason(s) for the hold status, and how the timing of the hold coincides with the annual new technology add-on payment application submission date. Additionally, FDA may need to issue secondary letters of request for additional information, often depending on the quality of initial response from the applicant. Accordingly, we stated that while we continued to believe that an application that is in a hold status with FDA pending additional information may lack critical information that is needed to evaluate whether the technology meets the eligibility criteria, we also recognized the variability in the reasons for a hold and the varying lengths of time for which an application can be on hold with FDA, such that some applicants may be farther along in the process to obtain FDA marketing authorization at the time of the hold.

Further, we stated that after further consideration, based on the variability in the timing of and reasons underlying hold statuses with FDA, we believed it was appropriate to propose to update our policy. Specifically, we proposed, beginning with new technology add-on payment applications for FY 2026, to no longer consider a hold status to be an inactive status for the purposes of eligibility for the new technology add-on payment. We stated we would continue to consider an application to be in an inactive status where it is withdrawn, the subject of a Complete Response Letter, or the subject of a final decision from FDA to refuse to approve the application. Because of the variety of circumstances for which a technology may be in a hold, as previously discussed, we noted that we may reassess this policy for future years, if finalized, based on ongoing experience.

We invited public comments on our proposal to no longer consider a hold status to be an inactive status for the purposes of eligibility for new technology add-on payment, beginning with new technology add-on payment applications for FY 2026.

Comment: Commenters overwhelmingly supported CMS's proposal to no longer consider a hold to be an inactive status for the purposes of new technology add-on payment eligibility. Commenters stated that the FDA application review process is dynamic and that applications may go in and out of a hold at various stages during the FDA application process and for various reasons including administrative reasons that might not necessarily be due to lack of critical information in the FDA application, such as user fee holds, incorrect eCopy, outdated submission templates, or omission of an administrative element, and that these holds may be resolved within days or months after the start of the new technology add-on payment application cycle. Commenters further stated that being on hold does not materially affect the ability for the technology to receive FDA authorization by the May 1 new technology add-on payment deadline as some applicants may be farther along in the process to obtain FDA marketing authorization at the time of the hold. Commenters also stated that they believe that this proposed change would enhance the predictability of the new technology add-on payment process and ensure that new technology add-on payment applications are not inadvertently pushed back to a later new technology add-on payment application cycle, even though FDA may have continued reviewing the product's marketing application, despite a hold at the time the product's new technology add-on payment application is submitted to CMS. Commenters concluded that finalizing this proposal would remove a significant barrier for applications that may be placed on a brief hold status and would be rendered ineligible for new technology add-on payments for a full year.

Response: We thank commenters for their support of our proposal to no longer consider a hold with FDA to be an inactive status for the purposes of eligibility for new technology add-on payment, beginning with new technology add-on payment applications for FY 2026.

Comment: Many commenters also requested that CMS reverse other aspects of the policy

finalized in the FY 2024 IPPS/LTCH PPS final rule including the requirement for a complete and active FDA marketing authorization application request at the time of new technology add-on payment application, the FDA documentation requirement, and moving the FDA marketing deadline from May 1 back to July 1. The commenters stated that these requirements are already disqualifying applicants and therefore delaying beneficiary access to innovative technologies in contradiction of the new technology add-on payment program goals. The commenters further stated that reversing the policy completely would give new technology add-on payment applicants the most flexibility. A few commenters specified that it is especially critical that CMS reverse the FDA market authorization requirement for particular application types such as Breakthrough Devices or those undergoing rolling review or real-time oncology review (RTOR) to prevent financial barriers to adoption of these new technologies and other access delays, and because these applications could become complete shortly after the application deadline. Some commenters further stated that applications with rolling review or RTOR are reserved for therapies with Breakthrough Therapy or Fast Track designations, or for therapies likely to demonstrate substantial clinical improvement and CMS should therefore reverse its policy for these therapies. A commenter also stated concerns specifically with the exact type of FDA documentation required at the time of new technology add-on payment submission because they said it has limited forecasting of final FDA approval by May 1 for the new technology add-on payment applicant, and recommended CMS rescind the FDA documentation requirement.

Several commenters suggested that CMS should instead provide an alternate deadline to provide the necessary information regarding FDA marketing authorization, such as within 60 days after application submission, the December supplemental information deadline, or no earlier than March 1, and that CMS should make these changes via notice and comment rulemaking.

Several commenters made additional requests from CMS, if CMS were to decide not to reverse the policy. A commenter requested that CMS provide an analysis of the impact of the

FDA submission/authorization requirements on new technology add-on payment application volume, CMS workload, and the average time between marketing authorization and new technology add-on payment availability for medical devices.

Response: We thank the commenters for sharing their concerns, as well as their suggestions and recommendations. CMS shares the goal of ensuring Medicare beneficiaries and their providers have access to new technologies. However, as described in the FY 2005 IPPS final rule (69 FR 49003 and 49009), patient access to these technologies should not be adversely affected if a technology does not qualify to receive new technology add-on payments, as CMS continues to pay for new technologies through the regular payment mechanism established by the MS-DRG methodology. In addition, the costs incurred by the hospital for a case are evaluated to determine whether the hospital is eligible for an additional payment as an outlier case. This additional payment is designed to protect the hospital from large financial losses due to unusually expensive cases. Any eligible outlier payment is added to the DRG-adjusted base payment rate (88 FR 58648). As noted in an earlier section, whether a technology receives new technology add-on payments or not does not affect coverage of the technology or the ability for hospitals to provide a technology to patients where appropriate. As stated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58953), the new technology add-on payment application eligibility requirements related to FDA application status did not eliminate flexibilities built into the new technology add-on payment process, as FDA marketing authorization is not required at the time of application, and eligible applicants can continue to provide some information as it becomes available according to our standard processes (such as the December supplemental deadline and the public comment period). Although we continue to believe in providing maximum flexibility to applicants where feasible, the policy was put in place due to the increasing complexity and volume of applications lacking critical information that is needed to evaluate whether the technology meets the eligibility criteria at § 412.87(b), (c), or (d). As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58949), in prior years, a significant

number of applicants had submitted new technology add-on payment applications that resulted in information not being available for the proposed rule and during the comment period.

Specifically, many applicants submitted new technology add-on payment applications prior to submitting a request to FDA for the necessary marketing authorization, and applicants have stated that information missing from their applications, which is needed to evaluate the technology for the add-on payment, will not become available until after submission to FDA.

With regard to the alternative pathways, such applications may also be missing information that would help inform understanding of the details and interrelationship between the intended indication and FDA Breakthrough Device or QIDP designation, which is the basis for a product's eligibility for the alternative pathway. Ultimately, it is difficult for CMS to review and for interested parties to comment on a product that has not yet been submitted to FDA and for which FDA has not determined that the marketing authorization request is sufficiently complete to allow for substantive review by FDA (regardless of FDA Breakthrough Device designation, Breakthrough Therapy designation, Fast Track designation, or RTOR participation), as multiple sections of the new technology add-on payment applications lack preliminary information that is more likely to be available after an FDA submission. Public input is an important part of our assessment of whether a technology meets the new technology add-on payment criteria, particularly as technology becomes more complex and specialized. Thus, we believe that requiring applicants to have already submitted a marketing authorization request to FDA that FDA has determined is sufficiently complete to allow for substantive review by FDA at the time of submission of the new technology add-on payment application further increases transparency and improves the evaluation process, including the identification of critical questions in the proposed rule, particularly as the number and complexity of the applications have been increasing over time. We will therefore continue to require documentation of FDA acceptance (for a 510(k) premarket submission or De Novo Classification request) or FDA filing (for a PMA, NDA, or BLA) at the time of new technology add-on payment application submission,

consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. We still believe this approach provides the clearest and most effective means of documenting that the applicant has submitted a complete request to FDA (88 FR 58950). We continue to believe these policies facilitate a more transparent process that will improve public engagement and help improve and streamline our review processes. Many of these products are novel and complex, and CMS has a responsibility to appropriately and thoroughly review applications for eligibility for new technology add-on payments against our established eligibility criteria. As noted in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58958), CMS will require documentation demonstrating that FDA has determined that the marketing authorization request is sufficiently complete to allow for substantive review by FDA (e.g., documentation of FDA acceptance or FDA filing, depending on the type of FDA marketing authorization application the applicant has submitted to FDA) at the time of submission of the new technology add-on payment application. We have not accepted and will not accept documentation in which the date that FDA made the determination to accept (for a 510(k) premarket submission or De Novo Classification request) or file (for a PMA, NDA, or BLA) the request occurred after new technology add-on payment application submission; such documentation could not have been provided at the time of new technology add-on payment application submission and therefore does not meet the requirement. Further, we note that while documentation of FDA acceptance/filing may also include the date of submission of the FDA marketing authorization request, for new technology add-on payment purposes this is not the date on which FDA determined the request is sufficiently complete for substantive review, and therefore, this does not meet the new technology add-on payment application FDA status requirement at § 412.87(e)(2). For these reasons, we are not reversing other aspects of the policy finalized in the FY 2024 IPPS/LTCH PPS final rule.

Comment: A few commenters expressed concern about applications for technologies that were determined to be ineligible for consideration for new technology add-on payments for

FY 2025 at the time of application for new technology add-on payments. The commenters were concerned about the impact that the ineligibility determination would have on Medicare beneficiaries' access to these innovative technologies in the upcoming year, as well as the financial viability of these technologies. Some of the commenters suggested that CMS provide mitigating intervention for technologies that were found ineligible for new technology add-on payment consideration in FY 2025, such as reversing the ineligibility and making an interim decision determination subject to public comment regarding overall qualification in this final rule using the "good cause" exception as provided in the APA¹⁸³; extended eligibility to three years of new technology add-on payments; or extension of an additional year of new technology add-on payments following review in FY 2026.

Response: We thank the commenters for their comments and recommendations. We note that, as described previously, patient access to these technologies should not be adversely affected if a technology does not qualify to receive new technology add-on payments, as CMS continues to pay for new technologies through the regular payment mechanism established by the MS-DRG methodology. In addition, and as previously noted, a hospital may be eligible for additional payment for outlier cases. As also previously noted, whether a technology is approved for new technology add-on payments does not affect coverage of the technology or the ability for hospitals to provide a technology to patients where appropriate. We evaluated all applications for FY 2025 that were submitted by the new technology add-on payment deadline under the applicable eligibility requirements, and we will continue to do so for applications that are submitted or resubmitted for FY 2026. We further note that submission of a new technology add-on payment application does not guarantee that a technology will be approved for a new technology add-on payment.

Comment: A commenter stated that while this flexibility is an improvement, it applies mainly to devices and does not fully address challenges with CMS's new requirements for a

¹⁸³ Section 5 U.S.C. 553(b).

“complete and active” FDA market authorization request. The commenter encouraged CMS to further clarify this language to ensure the gamut of personalized medicine treatments and technologies remain eligible for new technology add-on payments and reach patients who need them, without creating further delays in the availability of new technology add-on payment status.

Response: We thank the commenter for their comment. As discussed previously, the intent behind using the terminology we did was to ensure that the requirement could apply to and be inclusive of the various FDA applications and approval pathways for different types of drugs and devices. We disagree with the commenter’s assessment that this flexibility applies mainly to devices. We note that our current hold policy applies to all technologies, irrespective of category (drugs, devices) or pathway (alternative, traditional). Regarding the commenter’s request for CMS to further clarify the requirements for a “complete and active” FDA market authorization request, we note that, as discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958), we consider an FDA marketing authorization application to be “complete” when the full application has been submitted to FDA (including all modules or all information following a rolling review or RTOR, where relevant) and FDA has provided documentation of acceptance (for a 510k application or De Novo Classification request) or filing (for a PMA, NDA, or BLA) to the applicant indicating that FDA has determined that the application is sufficiently complete to allow for substantive review by FDA. Applicants are required to provide this documentation of FDA acceptance (for a 510k application or De Novo Classification request) or filing (for a PMA, NDA, or BLA) of the request to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. Additionally, as noted in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58955 through 58956), for the purposes of new technology add-on payment applications, we consider an FDA marketing authorization application to be in an “active” status when the application has been determined by FDA to be sufficiently complete to permit substantive review

by FDA, and when it is not in an “inactive” status at the time of new technology add-on payment application submission. We further note that “active” FDA status for the purposes of new technology add-on payment application eligibility begins once FDA has determined that the application is sufficiently complete to allow for substantive review by FDA, which as described earlier in this section, applicants must demonstrate at the time of new technology add-on payment application submission by providing FDA’s acceptance (for a 510k application or De Novo Classification request) or filing (for a PMA, NDA, or BLA) of the request, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. We continue to consider an application to be in an inactive status where it is withdrawn, the subject of a Complete Response Letter, or the subject of a final decision from FDA to refuse to approve the application.

After consideration of the public comments we received, we are finalizing our proposal that, beginning with new technology add-on payment applications for FY 2026, we will no longer consider an FDA hold to be an inactive status for the purposes of eligibility for the new technology add-on payment for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application. As previously noted, because of the variety of circumstances for which a technology may be on hold, we may reassess this policy for future years based on ongoing experience.

10. Change to the Calculation of the Inpatient New Technology Add-On Payment for Gene Therapies Indicated for Sickle Cell Disease

As discussed previously in this section, section 1886(d)(5)(K)(ii)(I) of the Act specifies that a new medical service or technology may be considered for a new technology add-on payment if, based on the estimated costs incurred with respect to discharges involving such service or technology, the DRG prospective payment rate otherwise applicable to such discharges under this subsection is inadequate. Under our current policy, as set forth in § 412.88(b)(2), unless the discharge qualifies for an outlier payment, the additional Medicare

payment will be limited to the full MS-DRG payment plus 65 percent (or 75 percent for a medical product designated by the FDA as a Qualified Infectious Disease Product [QIDP] or approved under FDA's Limited Population Pathway for Antibacterial and Antifungal Drugs [LPAD]) of the estimated costs of the new technology or medical service.

Since establishing the new technology add-on payment, we have been cautious about increasing the new technology add-on payment percentage. As stated in the May 4, 2001 proposed rule (66 FR 22695), we believe limiting the new technology add-on payment percentage would provide hospitals an incentive for continued cost-effective behavior in relation to the overall costs of the case. In the FY 2020 IPPS/LTCH PPS final rule, in adopting the general increase in the new technology add-on payment percentage from 50 percent to 65 percent, we stated that we believed that 65 percent would be an incremental increase that would reasonably balance the need to maintain the incentives inherent to the prospective payment system while also encouraging the development and use of new technologies. We continue to believe that it is important to balance these incentives in assessing any potential change to the new technology add-on payment calculation.

In the FY 2020 IPPS/LTCH PPS final rule, we also finalized an increase in the new technology add-on payment percentage for QIDPs from 65 percent to 75 percent. We stated that we shared commenters' concerns related to antimicrobial resistance and its serious impact on Medicare beneficiaries and public health overall. We noted that the Centers for Disease Control and Prevention (CDC) described antimicrobial resistance as "one of the biggest public health challenges of our time." We stated that we believe that Medicare beneficiaries may be disproportionately impacted by antimicrobial resistance due in large part to the unique vulnerability to drug-resistant infections (for example, due to age-related and/or disease-related immunosuppression, greater pathogen exposure via catheter use) among individuals aged 65 or older. We further stated that antimicrobial resistance results in a substantial number of additional

hospital days for Medicare beneficiaries, resulting in significant unnecessary health care expenditures.

To address the continued issues related to antimicrobial resistance resulting in a substantial number of increased hospital days and significant unnecessary health care expenditures for Medicare beneficiaries, in the FY 2021 IPPS/LTCH PPS final rule, we finalized a proposal to expand the alternative new technology add-on payment pathway for QIDPs to include products approved under the LPAD pathway and to increase the maximum new technology add-on payment percentage for a product approved under FDA's LPAD pathway, from 65 percent to 75 percent, consistent with the new technology add-on payment percentage for a product that is designated by FDA as a QIDP, beginning with discharges occurring on or after October 1, 2020 (85 FR 58739).

In the proposed rule (89 FR 36138 through 36139), we stated that since finalizing our current policy for QIDPs and LPADs, we continued to receive feedback from interested parties regarding the adequacy of new technology add-on payments for certain categories of technologies, including cell and gene therapies to treat sickle cell disease (SCD). We stated that although we still believe it is prudent to proceed cautiously with increasing the new technology add-on payment percentage, we recognize that SCD, the most common inherited blood disorder, has historically had limited treatment options. In addition, hospitalizations and other health episodes related to SCD cost the health system \$3 billion per year.¹⁸⁴ We further noted that the Administration has identified a need to address SCD and has made a commitment to improving outcomes for patients with SCD by facilitating access to cell and gene therapies that treat SCD.¹⁸⁵

¹⁸⁴ Biden-Harris Administration Announces Action to Increase Access to Sickle Cell Disease Treatments <https://www.hhs.gov/about/news/2024/01/30/biden-harris-administration-announces-action-increase-access-sickle-cell-disease-treatments.html>

¹⁸⁵ Biden-Harris Administration Announces Action to Increase Access to Sickle Cell Disease Treatments <https://www.hhs.gov/about/news/2024/01/30/biden-harris-administration-announces-action-increase-access-sickle-cell-disease-treatments.html>

Accordingly, we stated that we believe that further facilitating access to these gene therapies for Medicare beneficiaries with SCD may have the potential to simultaneously improve the health of impacted Medicare beneficiaries and potentially lead to long-term savings in the Medicare program. We also noted that some gene therapies that treat SCD are among the costliest treatments to date, and we were concerned about a hospital's ability to sustain a potential financial loss to provide access to such treatments. As we discussed when we increased the new technology add-on payment for QIDPs in the FY 2020 IPPS/LTCH PPS final rule and products approved under FDA's LPAD in the FY 2021 IPPS/LTCH PPS final rule from 65 percent to 75 percent, we stated that we believe that it may be appropriate to increase the maximum add-on amount in limited cases where the current new technology add-on payment does not provide a sufficient incentive for the use of a new technology, which we believed may be the case for gene therapies that treat SCD. Accordingly, and consistent with our new technology add-on payment policy for products designated by the FDA as a QIDP or LPAD, we stated that we believe there would be merit in also increasing the new technology add-on payment percentage for gene therapies that are indicated and used for the treatment of SCD to 75 percent.

Therefore, we proposed that, subject to our review of the new technology add-on payment eligibility criteria, for certain gene therapies approved for new technology add-on payments in the FY 2025 IPPS/LTCH PPS final rule for the treatment of SCD, effective with discharges on or after October 1, 2024 and concluding at the end of the 2- to 3-year newness period for such therapy, if the costs of a discharge (determined by applying CCRs as described in § 412.84(h)) involving the use of such therapy for the treatment of SCD exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare would make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. We stated that, if finalized, these payment amounts would

only apply to any gene therapy indicated and used specifically for the treatment of SCD that CMS determines in the FY 2025 IPPS/LTCH PPS final rule meets the criteria for approval for new technology add-on payment. We also proposed to add new § 412.88(a)(2)(ii)(C) and § 412.88(b)(2)(iv) to reflect this proposed change to the calculation of the new technology add-on payment amount, beginning in FY 2025 and concluding at the end of the 2- to 3-year newness period for each such therapy. With this incremental increase, we stated that we believe hospitals would continue to have an incentive to balance the desirability of using the new technology for patients as medically appropriate while also maintaining an incentive for continued cost-effective behavior in relation to the overall costs of the case.

We invited public comments on this proposal to temporarily increase the new technology add-on payment percentage to 75 percent for a gene therapy that is indicated and used for the treatment of SCD as described previously. We also sought comment on whether we should make this proposed 75 percent add-on payment percentage available only to applicants that meet certain additional criteria, such as attesting to offering and/or participating in outcome-based pricing arrangements with purchasers (without regard to whether the specific purchaser availed itself of the outcome-based arrangements), or otherwise engaging in behaviors that promote access to these therapies at lower cost.

Comment: Some commenters were supportive of the proposal. Commenters were pleased that CMS is making efforts to improve access to this rapidly advancing area of medicine, and stated that increasing the add-on percentage to 75 percent for gene therapies for sickle cell disease reflects a targeted approach aligned with the Cell and Gene Therapy Access Model. Commenters stated that they appreciate the Agency's commitment to the SCD patient population which they stated has historically been marginalized, as outlined in the SCD Action Plan. The commenters stated that the proposed payment policy represents a meaningful change for Medicare beneficiaries, as the increased add-on payment will incentivize hospital adoption and expand patient access to these critical technologies. A commenter stated that in addition to

improving the lives of patients, investing in therapies that reduce the need for chronic care and, especially, costly hospitalizations for SCD patients has the potential for significant long-term savings for the Medicare program. Another commenter stated that incentivizing use of SCD gene therapies will reduce associated care costs for patients, providers, and payers by preventing the need for future medical services.

Most of the commenters supporting the policy stated that they believed CMS should finalize as proposed, and also requested that CMS extend the policy further in various ways, while some stated they would support the proposal with varied modifications. Many of the commenters requested that CMS expand or modify the proposal to increase the add-on percentage to other therapies in addition to gene therapies treating SCD, stating that increasing the percentage allows for hospital adoption of groundbreaking therapies and advances the new technology add-on payment program's objective for expanding patient access to innovative new technologies. A commenter stated that while the focus on SCD is commendable, the narrow application of the proposal to specific therapies, and potentially only those engaged in value-based purchasing agreements, indicates a limited scope of financial support.

A few of the commenters recommended that all technologies that meet the new technology add-on payment eligibility criteria should receive 75 percent. A commenter stated that hospitals find the current 65 percent add-on payment insufficient to cover the costs of using new technologies, and that 75 percent would mitigate losses and encourage adoption of new technologies. The commenter further stated that an analysis demonstrated that hospitals receive millions in outlier payments on the same cases that receive new technology add-on payment payments, highlighting how inadequate the new technology add-on payment is. Another commenter stated that a consistent payment percentage for all therapies would eliminate inequity for manufacturers, improve transparency, and reduce payment confusion for hospitals. One of these commenters stated that this piecemeal approach (that is, highlighting one group of technologies for a higher payment percentage) fails to recognize the financial difficulties that

hospitals face in adopting other innovative technologies not yet reflected in Medicare rates. Other commenters believed that by having a higher payment percentage for select groups of technologies (such as SCD therapies or QIDP/LPADs), CMS is making a value judgement that these therapies are more valuable than other qualifying technologies or medical conditions, and that this is beyond the purview of CMS and not the intent of the new technology add-on payment program. The commenters stated that while each technology has varying levels of impact on the Medicare population, once CMS has established that a technology meets the new technology add-on payment criteria, all drugs and devices should be treated equally. A few commenters also requested that CMS provide details regarding any criteria that CMS uses to determine which categories of technologies warrant increased payment levels, as well as the appropriate payment level for each class of technologies via rulemaking to allow for stakeholder input. A commenter further requested that as an alternative to raising the payment percentage to 75 percent for all technologies, CMS should, at a minimum, establish a process and criteria by which manufacturers can request an enhanced new technology add-on payment percentage. The commenter stated that it is difficult to discern a clear and consistent set of criteria that were used to determine which technologies should receive enhanced payment from discussions of these decisions in the Federal Register, and whether the decisions resulted from manufacturer/stakeholder requests or from internal CMS requests. The commenter further stated that it believes that the lack of clear process and criteria for these decisions creates risk that the decisions will be viewed as arbitrary and capricious.

A few commenters requested that CMS extend the 75 percent to therapies with regenerative medicine advanced therapy (RMAT) or Breakthrough Therapy designations; to those targeting rare diseases, unmet needs, or vulnerable groups; or to other transformative therapies that Medicare beneficiaries may have difficulty accessing. Some commenters requested that CMS extend an increased new technology add-on payment percentage to align with other Administration priorities, such as hospital preterm deliveries, very low birth weight babies, other

critically ill pediatric patients, and maternal health technologies. A commenter requested that CMS extend the increased maximum percentage to transformative therapies as opportunities arise, and that CMS monitor when additional increases higher than 75 percent are warranted.

Some of the commenters stated that all cell and gene therapies should receive the increase to 75 percent, stating that CMS's stated reasons for the proposal apply to these therapies as well, and that cell and gene therapies may pose similar beneficiary access challenges based on inadequate payment. Commenters cited as their rationales that these therapies are generally treating small patient populations, rare disease, certain cancers, underserved populations, and/or orphan indications with significant unmet medical need. A commenter explained that cell and gene therapies often require complex manufacturing processes, specialized infrastructure, and intensive monitoring, and that these costs are embedded in the cost of these products, making them more costly. The commenter added that these therapies often have no historical claims data to characterize resource use associated with the inpatient admissions since patients may not even have been admitted previously due to a lack of treatment options (as compared to other types of new technology add-on payment technologies that represent improvements on or alternatives to existing treatments), and that therefore new technology add-on payment is needed to compensate for the absence of any costs from the rate setting methodology. Another commenter added that cell and gene therapies cause a significant strain on hospital financial resources; even with a new technology add-on payment, these therapies are more likely than other inpatient stays to qualify for outlier payments. A commenter stated that there is a need to incentivize newly approved high-cost, high-reward cellular and gene therapies through new technology add-on payment as there continues to be insufficient inpatient reimbursement for autologous cellular therapies, like CAR T-cell therapies. Commenters stated that inpatient stays with cell and gene therapies are inadequately paid, even with new technology add-on payments, which could dissuade hospitals from providing these therapies. A commenter specified further that particularly cell and gene therapies that treat other inherited, debilitating, and under-treated conditions like hemophilia and

Duchenne muscular dystrophy (DMD) should receive this increase, stating that the significant costs and limited therapies to treat these patients justify an increase above other new technology add-on payment applicants. Commenters also requested that therapies that share characteristics with gene therapies for SCD should be included in the proposal, including the significant up-front costs to hospitals and significant reduction in chronic care needs and costs to the Medicare program on an ongoing basis. A commenter stated that reductions in chronic care costs accrue to Medicare rather than providers, and new technology add-on payment is a pathway to bridge the gap by providing support for hospitals that incur the up-front cost of purchasing these therapies. Another commenter also stated that increasing the new technology add-on payment percentage for cell and gene therapies would, in addition to supporting Medicare beneficiary access to these therapies, be beneficial to Medicaid patients as many are dually eligible.

Several commenters requested that CMS expand its proposal to include transfusion-dependent beta thalassemia (TDT). Commenters questioned why this proposal from CMS only applied to gene therapies for SCD and did not include FDA-approved gene therapies for TDT, which have the same public policy, pricing, and access concerns as SCD, and also have no curative alternatives. A commenter further stated that like SCD, historical treatment options for TDT also carry numerous limitations resulting in significantly under-served patient populations. The commenter also stated that extending enhanced new technology add-on payment to gene therapies used for TDT would be likely to have a minimal impact to the IPPS from a budget neutrality perspective because there was only an estimated 1,000 to 1,500 individuals in the U.S. living with TDT, with a far smaller proportion of Medicare-eligible individuals.

Response: We appreciate the commenters' feedback. We thank commenters for their support of the proposal. We continue to believe that the policy aligns with the Administration-identified commitment to improving outcomes for patients with SCD by facilitating access to

gene therapies that treat SCD,¹⁸⁶ and also balances the need to maintain the incentives inherent to the prospective payment system.

With regard to commenters requesting that the proposal include different groups of therapies or those with particular designations, or all therapies approved for new technology add-on payment, we recognize that the goal of facilitating access to new technologies for Medicare beneficiaries could also apply to other types of therapies. However, as discussed in the proposed rule (89 FR 36138), we focused our proposal on gene therapies for Medicare beneficiaries with SCD, as the most common inherited blood disorder, with historically limited treatment options and a significant clinical and financial impact on the healthcare system, and consistent with the Administration's commitment to improving outcomes for patients with SCD by facilitating access to gene therapies that treat SCD. We appreciate commenters' interest in improving access to these and other technologies through the new technology add-on payment program, and will continue to consider the interest areas raised by commenters.

With respect to comments that stated hospitals receive millions in outlier payments on the same cases that receive new technology add-on payment payments, highlighting how inadequate the new technology add-on payment is, and that even with a new technology add-on payment, cell and gene therapies are more likely than other inpatient stays to qualify for outlier payments, we disagree that the existence of outlier payments for some new technology cases is evidence that those payments are necessarily inadequate, as there may be unrelated reasons why a hospital would receive outlier payments. There may also be circumstances where new technology payments and outlier payments work in a complementary manner for related reasons, that do not necessarily mean the appropriate policy is to increase new technology payments.

Comment: Some of the commenters requested that CMS modify its proposal and finalize a maximum payment higher than 75 percent, stating that an increase of 10 percent would not

¹⁸⁶ Biden-Harris Administration Announces Action to Increase Access to Sickle Cell Disease Treatments <https://www.hhs.gov/about/news/2024/01/30/biden-harris-administration-announces-action-increase-access-sickle-cell-disease-treatments.html>

adequately address the underlying problem of insufficient reimbursement. Many of these commenters stated that, considering the transformational potential of these therapies and the fact that these are among the costliest treatments to date, CMS should increase the percentage to 100 percent to provide a better incentive for hospitals to provide these therapies and not impede access for Medicare beneficiaries. Commenters stated that this is important since hospitals already incur losses on treatments that trigger new technology add-on payments, and these SCD therapies are even more costly. A commenter stated that in the absence of any other evaluation or discussion of reimbursement solutions, hospitals will be left to bear enormous losses for an essential therapy where there are no alternatives with similar outcomes, which would directly obstruct Medicare patients' access to gene therapies based on prices that are beyond the control of the provider and hinder future treatment options for this patient population. In addition, a commenter stated that Medicare payment policy sets the standard for other payers, so there would be a downstream effect of limited access if the policy is finalized as proposed at 75 percent. The commenter further stated that if these SCD therapies are not provided due to inadequate new technology add-on payment, there will be no data available to set appropriate rates after the new technology add-on payment period expires that include the costs of the therapies and associated inpatient costs. Another commenter stated that anything less than 100 percent would be inadequate due to significant financial losses that would need to be absorbed on every case, particularly for high DSH hospitals, which many hospitals that treat SCD are likely to be. The commenters stated that a payment rate of 100 percent would allow CMS to most effectively incentivize the development of important new technologies like gene therapies, help ensure patient access, reduce health disparities, positively impact other payer coverage decisions, and appropriately recognize the durable and transformative value that gene therapies offer to patients, their families, and society. A commenter stated that a 100 percent payment rate would demonstrate the same commitment to equity in the Medicare FFS population that the Cell and Gene Therapy (CGT) Access Model demonstrates for the Medicaid population. The commenter

stated that 100 percent is reasonable given that the costs may be lower than anticipated due to the limited number of patients who may be candidates for SCD gene therapy and the limited manufacturing capacity, which is estimated to be less than 200 treatments per year.

A commenter shared data modeling simulating potential payment scenarios to demonstrate the impact of the current methodology to hospitals and the impact of potential new technology add-on payment percentage amounts at 65 percent, 75 percent, 85 percent and 100 percent using claims in MS-DRG 016 from the FY 2023 MedPAR file. The commenter stated that new technology add-on payment amounts at or below 75 percent would still leave hospitals severely under-reimbursed for the product and patient care costs, with a loss of over \$700,000 with each case, which it stated would create vast barriers to utilization, no matter the clinical benefit. The commenter further asserted that even at 100 percent, some hospitals would lose over \$250,000 or much more. The commenter explained that the analysis assumed that hospitals set charges for the gene therapy in line with the national average drug CCR of 0.182, which would be more than five times their cost. However, the commenter stated that in reality, hospitals do not markup higher cost drugs by that ratio, especially for gene therapies. The commenter stated that if SCD therapies had a 50 percent markup (for example, charging \$3.3 million for a \$2.2 million drug, reflecting a CCR of 0.666), but CMS applied a much lower CCR of 0.182 to the \$3.3 million charge, CMS would drastically underestimate the cost of the drug at \$600,600, only 27 percent of the actual cost. The commenter explained that this calculation, combined with new technology add-on payment as the lesser of the 75 percent of cost of the drug or 75 percent of the amount by which costs of the case exceed the standard DRG payment, would mean that hospitals would receive much smaller new technology add-on payments than under its analysis, and urged CMS to consider these dynamics as it implements new technology add-on payment for SCD gene therapy. The commenter suggested that rather than using the “lesser of” methodology, that CMS instead use the actual costs of such therapies, such as a percentage of wholesale acquisition costs (WAC) or the hospital's actual acquisition cost, as reported on the claims using value code

90.

A commenter stated that CMS had the statutory authority to provide for additional payment beyond the proposed 75 percent. The commenter stated that for SCD gene therapy, CMS's new technology add-on payment mechanism fails to "adequately reflect[] the estimated average cost of such service or technology" as required by the applicable statute, and that payment based on a portion of charges reduced to costs under section 412.88 would result in significant financial losses for providers. Therefore, the commenter recommended that CMS temporarily adopt a 100 percent cost-based reimbursement methodology for SCD gene therapy and/or take other measures to ensure that the payment methodology fully recognizes the estimated average cost of the care.

Another commenter stated that anything short of 100 percent reimbursement of acquisition costs would be inadequate for cell and gene therapies while eligible for new technology add-on payment. The commenter stated that increasing the payment to the full cost amount would ensure health equity and access. Another commenter suggested that CMS fully cover the costs of SCD gene therapy either by increasing the payment rate or through another innovative approach such as developing a new DRG with a higher base payment. A commenter also suggested that as an alternative to 100 percent payment, CMS should negotiate drug prices directly with drug manufacturers, or alternative pathways to support coverage and access. Another commenter advocated for a policy solution that would ensure providers recoup at least the invoice cost of high-cost therapies such as Casgevy™ and Lyfgenia™, as the invoice cost of drugs is a factor over which providers have no control.

A few commenters requested that CMS instead increase the marginal payment rate (which we understand to refer to the maximum new technology add-on payment percentage) to at least 80 percent to better account for the high costs of these therapies and to address the lack of significant payment proposals related to these therapies. A commenter who requested a marginal payment rate of 100 percent stated that a marginal cost factor of less than 100 percent

encourages efficient selection of alternative existing treatments for a condition, but for this particular set of patients there is no alternative treatment that is equal to an effective cure. The commenter further stated that an argument for the efficient selection of alternative treatments for these patients is an argument for early adoption of advanced curative services.

A few commenters who requested expansion of the proposal to additional therapies or a further increase in the payment percentage also commented on the short-term nature of the proposal, noting that there is no opportunity for other future new technology add-on payment-approved therapies to receive the increased percentage. The commenters requested that CMS make any changes permanent rather than limiting it to therapies approved for new technology add-on payment for FY 2025.

Response: We appreciate the commenters' feedback.

With regard to the comments requesting an increase to the new technology add-on payment percentage above the proposed rate of 75 percent, we acknowledge that SCD gene therapies are among the costliest therapies to date and there may be significant related costs associated with inpatient stays during which the therapies are provided. We also recognize that new technology add-on payment would not fully cover a hospital's costs, even with a 100 percent payment rate, due to the inherent design of the IPPS. At the same time, we note that we remain concerned about the extremely high cost of these products, and want to ensure we do not create incentives to increase prices. We continue to believe that limiting the new technology add-on payment percentage provides hospitals an incentive for continued cost-effective behavior in relation to the overall costs of the case. In response to commenters requesting a new technology add-on payment percentage of 100 percent, we believe that this would result in very little of the incentive for cost-effective behavior inherent to the prospective payment system. While we continue to believe that our standard add-on payment percentage is generally appropriate, due to the particular concerns related to SCD gene therapies previously discussed and confirmed by comments and consistent with the Administration's commitment to improving outcomes for

patients with SCD by facilitating access to gene therapies that treat SCD, at this time we believe it is appropriate to apply a higher new technology add-on payment of 75 percent for SCD gene therapies approved for new technology add-on payment for FY 2025 during their new technology add-on payment period. We believe that the proposed 75 percent payment rate would reasonably address these concerns while also maintaining the incentives inherent to the prospective payment system, and it is consistent with our new technology add-on payment policy for QIDPs and LPADs. For these reasons, we are finalizing the increase in the new technology add-on payment percentage for cell and gene therapies that treat SCD as proposed.

With respect to commenters' other requested changes to our current payment mechanisms, due to the relative newness of these gene therapies for SCD and our continued consideration of approaches and authorities to encourage value-based care and lower prices of costly therapies, we believe it would be premature to adopt further structural changes to our existing payment mechanism specifically for these therapies. For these reasons, we disagree with the commenters' requested changes to our current payment mechanisms for FY 2025. For these same reasons, we also believe it would be premature to adopt a permanent increase in the new technology add-on payment percentage at this time. We will consider these comments should we develop additional policies and consider longer-term solutions related to SCD gene therapies in the future as we gain more experience with the unique considerations of these therapies. We also note that while Medicare payment policy may set the standard for other payers, payers consider many factors in designing and operating their programs.

Comment: Commenters opposed limiting the increase in the new technology add-on payment percentage to applicants that met certain additional criteria, such as attesting to offering and/or participating in outcomes-based pricing arrangements. A few of the commenters stated that CMS should not require additional criteria beyond the existing criteria of newness, cost, and substantial clinical improvement. Other commenters stated that CMS did not provide sufficient information regarding the feedback it is requesting related to outcomes-based arrangements,

details on how it would operationalize such a requirement, or discuss the potential impact on claims data. They further stated that CMS must describe what arrangements or behaviors it is considering, in addition to the rationale and legal basis for any related proposal, so that stakeholders can appropriately comment on a proposal that has sufficient detail for effective evaluation via notice and comment rulemaking. A commenter stated that CMS should also consider the variability in such arrangements, which could lead to substantial inequities in which therapy patients would be able to access if this was a requirement to receive the new technology add-on payment amount, as well as the competitive disadvantage that may occur. A commenter stated that any such restrictions as described in CMS's proposal would impact patient access to transformative therapies by placing undue burden on providers and payers. The commenter further stated that a variety of factors may inhibit a manufacturer's ability to offer or participate in such arrangements, including lack of clarity in best price reporting, limited resources available within states to establish such agreements, and time needed to measure outcomes for new products. A commenter explained that IPPS hospitals are operating within a "buy-and-bill" environment without access to alternative contracting mechanisms, outcomes-based pricing arrangements, or other opportunities to control these therapies' prices, and that unless CMS links the Center for Medicare & Medicaid Innovation's (CMS Innovation Center) CGT Access Model efforts to Medicare FFS beneficiaries, these considerations would not apply to its member providers and hospitals. Another commenter stated that the arrangements CMS describes are encouraged to take place under the CMS Innovation Center's CGT Access Model and new technology add-on payment should not be tied to participation in the model, which is still under development. A commenter also stated that mandates related to outcomes-based pricing arrangements are not provided in the new technology add-on payment statute, and there is currently no mechanism by which FFS Medicare can engage in value-based payment arrangements. A commenter stated that CMS should work closely with impacted stakeholders before considering developing an alternative pricing requirement in the future to ensure any

proposal would align with the new technology add-on payment program goals. Some commenters further stated that it is not clear how such additional criteria relate to or advance the purpose of the new technology add-on payment program.

Response: We appreciate the feedback from commenters. We note that we were seeking comments regarding other criteria that could demonstrate that applicants were engaging in behaviors that promote access to these therapies at lower cost, in alignment with the Administration's broader effort to further drive down prescription drug costs.¹⁸⁷ Consistent with our concerns about incentives for manufacturers to increase prices, we continue to welcome comments on this topic for future consideration. At this time, we are not making this 75 percent add-on payment percentage available only to applicants that meet certain additional criteria, but we will continue to evaluate this topic and may consider changes in the future.

Comment: A few commenters disagreed with CMS's proposal, stating that a new technology add-on payment of 75 percent will not create access to gene therapies. The commenters stated that a new technology add-on payment rate of 75 percent for these costly therapies would still leave a significant burden of unreimbursed costs on hospitals, while keeping drug manufacturers financially whole. The commenters stated that this would represent an unsustainable model for reimbursement and may disincentivize hospitals from providing these therapies, potentially leading to access issues for patients.

A commenter stated that CMS did not discuss its evaluation of any other solutions for improving the overall MS-DRG payment system, nor propose any other solutions for gene therapies, despite stakeholders having provided many ideas in the past. The commenter stated that CMS risked creating a two-tier system by fostering innovation for Medicaid patients via the CMS Innovation Center's new CGT Access Model, while offering no solutions for traditional Medicare FFS or Medicaid-Medicare dual-eligible patients with SCD or TDT, and did not view

¹⁸⁷ Biden-Harris Administration Announces Action to Increase Access to Sickle Cell Disease Treatments <https://www.hhs.gov/about/news/2024/01/30/biden-harris-administration-announces-action-increase-access-sickle-cell-disease-treatments.html>.

the proposal to be in harmony with the attention and effort being put into the CMS Innovation Center model. The commenter also asserted that the new technology add-on payment increase that CMS proposed does not address the series of compounding losses for hospitals that wish to provide these therapies: a low base MS-DRG payment rate, an inadequate new technology add-on payment percentage, the highest-ever fixed-loss threshold, and recovery of only 80 percent of remaining calculated costs through the outlier formula, which it stated directly obstruct Medicare patients' access to gene therapies. The commenter requested that CMS reimburse hospitals for 100 percent of their product acquisition costs related to gene therapies for SCD and TDT, potentially using CMS's adjustment authority under section 1886(d)(5)(I) of the Act. The commenter stated that this request could be operationalized by requiring hospitals to use value code 90 to report the product acquisition cost, providing payment at 100 percent of the reported product cost, and remove the charges reported in revenue code 0892 when calculating total case payment in determining whether an outlier payment is warranted. The commenter explained that hospitals would still be incentivized to provide cost-effective care, as the MS-DRG payment and outlier calculations would still be applicable to the clinical care portion of the claim. The commenter also expressed concern that charge compression, price transparency, and new technology add-on payment 'lesser of' language combined to create a challenge that is impossible for hospitals to successfully navigate, as it stated that this required hospitals to mark-up multimillion dollar products, and was ineffective at achieving adequate reimbursement. The commenter asserted that if a hospital set charges for these therapies in accordance with its own CCR, it was entirely justifiable that a hospital would list the charges between \$10 to 12 million, but was likely to be perceived as ethically problematic and predatory. In further support of its assertions, the commenter modeled the impact to hospitals using a simplified model of reimbursement for two hospitals, with one using a 10 percent policy and one using a CCR of 0.25 to mark-up the gene therapy product costs, to demonstrate that even hospitals that charged appropriately for these therapies and received the maximum 75 percent new technology add-on

payment amount would face a significant financial loss. The commenter stated that the results showed that the hospitals had very different product charges, with different total claim charges—despite the fact that patient care charges are identical, leading CMS to compute a very different case cost estimate for each hospital. The commenter stated that the ‘lesser of’ language used for new technology add-on payment meant that even when hospitals set their charges appropriately, they would be underpaid even the product acquisition cost, resulting in prohibitive financial choices, and where costs would largely be paid through outlier dollars. The commenter asserted that its proposal would have a limited total fiscal impact to CMS because of the limited number of treatments that will happen in the next few years, and the small percentage of applicable Medicare beneficiaries. The commenter referenced a prior letter from the American Hospital Association to CMS¹⁸⁸, asserting that CMS has not typically fully spent the pool of new technology add-on payment dollars it allocates. The commenter further stated that adopting its proposal would allow for claims data with information on case volume, clinical care costs, and transparent product acquisition costs that could be used at the new technology add-on payment timeframe to create a new MS-DRG and/or an alternate payment mechanism to reflect the resources utilized to administer these therapies. Finally, the commenter noted a variety of suggestions it had previously provided, including Town Hall sessions, evaluating the creation of separate MS-DRGs for clinical care and product acquisition costs, creating a new MS-DRG, proposing new payment mechanism for acquisition of HSC gene therapy products, adding Medicare and dual-eligible beneficiaries in the CMS Innovation Center’s CGT Access Model, and using a temporary CCR, and stated it was not clear as to why the agency chose to propose an increase to the new technology add-on payment percentage instead.

Some commenters stated that, while they were supportive of the proposed increase in payment for SCD gene therapies, they were concerned that the change would not adequately

¹⁸⁸ American Hospital Association. AHA FY 2020 IPPS Proposed Rule Comment Letter; Analysis of data from FY 2013-FY 2018. June 24, 2019. Online: <https://www.aha.org/system/files/media/file/2019/06/aha-comments-cms-inpatient-pps-fy-2020-proposed-rule-6-24-2019.pdf>

address gaps in payment or access issues for these therapies. A commenter stated that the SCD gene therapies map to DRGs that have base rates far below the costs of these products, and that reimbursement only covers a minimal portion of the drug cost and no provider and facility costs for the 30-days of inpatient care.

Multiple commenters also discussed similar concerns generally with new technology add-on payment methodology and in particular for costly therapies. They referenced the practice of “charge compression” due to CCRs and the way that the add-on payment amount is calculated as the “lesser of” two different values, which they stated results in hospitals incurring at least 35 percent of the new technology costs even with the new technology add-on payment (based on a 65 percent maximum add-on payment). Another commenter also suggested that CMS should eliminate the “lesser of” new technology add-on payment methodology for gene therapies targeting SCD and other technologies, which it stated required hospitals to artificially inflate their charges to obtain appropriate reimbursement.

Response: We appreciate the commenters’ feedback. We note that the prospective payment system is an average-based system and it is expected that some cases may demonstrate higher than average costs, while other cases may demonstrate lower than average costs. In deciding which treatment is most appropriate for any particular patient, physicians are expected to balance the clinical needs of patients with the efficacy and costliness of particular treatments. We continue to believe that changing the “lesser of” methodology, using the acquisition costs, or otherwise further increasing the add-on payment percentage would remove consideration of the costs of new technology from treatment decisions, and that it is important to maintain some incentive to weigh the costs of new technology in making clinical decisions. Similar to our discussion in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42299), we believe that paying hospitals for 100 percent of their product acquisition costs related to gene therapies would result in very little of the incentives inherent to the prospective payment system.

We also disagree with the commenter that this proposal, or other suggestions offered by

other commenters, would have a limited total fiscal impact to CMS because of the limited number of treatments that will happen in the next few years and the small percentage of applicable Medicare beneficiaries. With regard to the commenter's statement regarding a pool of new technology add-on payment dollars that are allocated, we note that CMS does not allocate dollars to new technology add-on payments. We note that the citation provided by the commenter indicated that when implementing the new technology add-on payment in the September 7, 2001 final rule (66 FR 46902), CMS set a target limit for these payments at 1 percent of total operating prospective payments. However, the new mechanism was initially required to be implemented in a budget neutral manner, and as we had noted at that time, this limit was set to address CMS's concern that new technology add-on payments should not result in inappropriately large redistributions of payments from hospitals that do not employ new technology to those that do (66 FR 46920). In the FY 2005 IPPS final rule, we provided an update, that as a result of the enactment of section 503(d) of Public Law 108-173, we will no longer include the impact of additional payments for new medical services and technologies in the budget neutrality factor (69 FR 49084). Due to the high cost of these gene therapy technologies, and because the total number of patients that will receive these treatments and the amount of new technology add-on payments associated with care of these patients in the future is unknown, it is unclear to us that the fiscal impact to CMS would be limited. We also note that because new technology add-on payments are not administered in a budget neutral manner, by default, they have the potential to result in increases to Medicare spending that are unpredictable and beyond our control, which is why we have remained cautious when assessing potential changes to the new technology add-on payment program to maintain the incentives inherent to the prospective payment system.

Comment: Many commenters stated that the Agency should work with stakeholders to identify adequate and sustainable reimbursement mechanisms for covering payment of outlier drug acquisition costs for both SCD and for other life-saving cell and gene therapies.

Commenters stated that the current payment system was not designed to address market developments including rapid introduction of therapies with high costs, and was not sufficient to appropriately reimburse hospitals. Some commenters were particularly concerned about Medicare payment for these therapies after the new technology add-on payment expires, stating that the current MS-DRGs assigned have reimbursement rates inadequate to reimburse these high-cost therapies. The commenters urged CMS to consider alternative methods of reimbursement to support appropriate patient access in accordance with the goals of this proposal such as a continued pass-through payment for the gene therapies or some other mechanism, stating that the MS-DRG system was not structured to support therapies as costly as these SCD gene therapies. A commenter further stated the need for CMS to develop longer-term solutions to ensure reimbursement sustainability, and that a CMS-convened Town Hall session may be beneficial to facilitate innovative solutions. Commenters also suggested other potential pathways such as the creation of new MS-DRGs for high-cost treatments, and changes to the role of cost-to-charge ratios (CCRs) in the reimbursement methodology, such as eliminating the role of CCRs or creating a new CCR for more accurate rate-setting. A commenter further stated that these options are already within CMS's statutory authority and implementable through notice and comment rulemaking. The commenter further believed Congress must permanently resolve how to pay for these therapies, preferably through broad-scale reform of national drug development, production, and distribution policies. The commenter recommended that in the meantime, CMS work with Congress on changes specific to coverage and payment, such as by carving payment for these products out of the DRG system, as currently done for solid organ and stem cell transplants, or other policies, including split-DRGs, that would enable hospitals to recoup all their costs for these therapies.

A commenter voiced concerns over the rise of high-cost therapies generally and CMS's ability to appropriately account for their costs when determining payments to hospitals and health systems, urging CMS to examine the adequacy of its payments to hospitals. The

commenter noted that many of these therapies' prices are beyond what would have been predicted when the inpatient PPS system was designed, and they are therefore adding to the existing and rising challenge of paying for a massive increase in high-cost therapies and technologies in health care.

Response: We thank commenters for their feedback and suggestions. As noted by commenters, longer-term solutions are outside of the scope of the new technology add-on payment program and this rulemaking. We will continue to consider these issues.

Therefore, after consideration of the public comments received, for the reasons discussed previously and in the FY 2025 IPPS/LTCH PPS proposed rule, we are finalizing our policy as proposed. We are finalizing that for certain gene therapies approved for new technology add-on payments in the FY 2025 IPPS/LTCH PPS final rule that are indicated and used specifically for the treatment of SCD, effective with discharges on or after October 1, 2024 and concluding at the end of the 2- to 3-year newness period for such therapy, if the costs of a discharge (determined by applying CCRs as described in § 412.84(h)) involving the use of such therapy for the treatment of SCD exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. We note that these payment amounts would only apply to Casgevy™ (exagamglogene autotemcel) and Lyfgenia™ (lovotibeglogene autotemcel), when indicated and used specifically for the treatment of SCD, which CMS has determined in this FY 2025 IPPS/LTCH PPS final rule meet the criteria for approval for new technology add-on payment. We are also adding new § 412.88(a)(2)(ii)(C) and (b)(2)(iv) to reflect this change to the calculation of the new technology add-on payment amount, beginning in FY 2025 and concluding at the end of the 2- to 3-year newness period for each such therapy. As noted earlier, we will continue to assess this policy and may propose changes in the future.

III. Changes to the Hospital Wage Index for Acute Care Hospitals

A. Background

1. Legislative Authority

Section 1886(d)(3)(E) of the Act requires that, as part of the methodology for determining prospective payments to hospitals, the Secretary adjust the standardized amounts for area differences in hospital wage levels by a factor (established by the Secretary) reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. We currently define hospital labor market areas based on the delineations of statistical areas established by the Office of Management and Budget (OMB). A discussion of the FY 2025 hospital wage index based on the statistical areas appears under section III.B. of the preamble of this final rule.

Section 1886(d)(3)(E) of the Act requires the Secretary to update the wage index annually and to base the update on a survey of wages and wage-related costs of short-term, acute care hospitals. CMS collects these data on the Medicare cost report, CMS Form 2552–10, Worksheet S–3, Parts II, III, IV. The OMB control number for this information collection request is 0938–0050, which expires on September 30, 2025. Section 1886(d)(3)(E) of the Act also requires that any updates or adjustments to the wage index be made in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. The adjustment for FY 2025 is discussed in section II.B. of the Addendum to this final rule.

As discussed in section III.I. of the preamble of this final rule, we also take into account the geographic reclassification of hospitals in accordance with sections 1886(d)(8)(B) and 1886(d)(10) of the Act when calculating IPPS payment amounts. Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amounts so as to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B), 1886(d)(8)(C), and 1886(d)(10) of the Act are equal to the aggregate prospective

payments that would have been made absent these provisions. The budget neutrality adjustment for FY 2025 is discussed in section II.A.4.b. of the Addendum to this final rule.

Section 1886(d)(3)(E) of the Act also provides for the collection of data every 3 years on the occupational mix of employees for short-term, acute care hospitals participating in the Medicare program to construct an occupational mix adjustment to the wage index. The OMB control number for approved collection of this information is 0938-0907, which expires on January 31, 2026. A discussion of the occupational mix adjustment that we are applying to the FY 2025 wage index appears under section III.E. of the preamble of this final rule.

2. Core-Based Statistical Areas (CBSAs) for the FY 2025 Hospital Wage Index

The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005 (69 FR 49026 through 49032), we delineate hospital labor market areas based on OMB-established Core-Based Statistical Areas (CBSAs). The current statistical areas (which were implemented beginning with FY 2021) are based on revised OMB delineations issued on Sept 14, 2018, in OMB Bulletin No. 18-04.¹⁸⁹ OMB Bulletin No. 18-04 established revised delineations for Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas in the United States and Puerto Rico based on the 2010 Census and the American Community Survey (ACS) and Census Bureau population estimates for 2015.

Historically, OMB issued major revisions to statistical areas every 10 years, based on the results of the decennial census, and occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses through OMB Bulletins. On February 28, 2013, OMB issued Bulletin No. 13-01. CMS adopted these delineations, based on the results of the 2010 census, effective beginning with the FY 2015 IPPS wage index (79 FR 49951 through 49957). OMB subsequently issued Bulletin No. 15-01 on July 15, 2015, followed by OMB

¹⁸⁹ We note that while OMB Bulletin 20-01 superseded Bulletin No. 18-04, it included no changes that required CMS to formally adopt the revisions.

Bulletin No. 17–01 on August 15, 2017, which provided updates to and superseded OMB Bulletin No. 15–01. The attachments to OMB Bulletin No. 17–01 provided detailed information on the update to statistical areas since July 15, 2015, and were based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2014, and July 1, 2015. In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41362 through 41363), we adopted the updates set forth in OMB Bulletin No. 17–01 effective October 1, 2018, beginning with the FY 2019 wage index. OMB Bulletin No. 17-01 was superseded by the April 10, 2018, OMB Bulletin No. 18-03, and then by the September 14, 2018, OMB Bulletin No. 18–04. These bulletins established revised delineations for Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas, and provided guidance on the use of the delineations of these statistical areas. In FY 2021, we adopted the updates set forth in OMB Bulletin No. 18-04 (85 FR 58743 through 58753). Thus, most recently in the FY 2024 IPPS/LTCH PPS final rule, we continued to use the OMB delineations that were adopted beginning with FY 2015 (based on the revised delineations issued in OMB Bulletin No. 13–01) to calculate the area wage indexes, with updates as reflected in OMB Bulletin Nos. 15–01, 17–01, and 18-04.

In the July 16, 2021, Federal Register (86 FR 37777), OMB finalized a schedule for future updates based on results of the decennial Census updates to commuting patterns from the ACS. In accordance with that schedule, on July 21, 2023, OMB released Bulletin No. 23-01. A copy of OMB Bulletin No. 23–01 may be obtained at <https://www.whitehouse.gov/wp-content/uploads/2023/07/OMB-Bulletin-23-01.pdf>. According to OMB, the delineations reflect the 2020 Standards for Delineating Core Based Statistical Areas (“the 2020 Standards”), which appeared in the Federal Register on July 16, 2021 (86 FR 37770 through 37778), and the application of those standards to Census Bureau population and journey-to-work data (that is, 2020 Decennial Census, American Community Survey, and Census Population Estimates Program data).

B. Implementation of Revised Labor Market Area Delineations

We believe that using the revised delineations based on OMB Bulletin No. 23–01 will increase the integrity of the IPPS wage index by creating a more accurate representation of current geographic variations in wage levels. Therefore, we proposed to implement the revised OMB delineations as described in the July 21, 2023, OMB Bulletin No. 23–01, beginning with the FY 2025 IPPS wage index. We proposed to use these revised delineations to calculate area wage indexes in a manner that is generally consistent with the CMS' implementation of CBSA-based wage index methodologies.

CMS has recognized that hospitals in certain areas may experience a negative impact on their IPPS payment due to the proposed adoption of the revised OMB delineations, and has finalized transition policies to mitigate negative financial impacts and provide stability to year-to-year wage index variations. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 49956 through 49962) for discussion of the transition period finalized the last time CMS adopted revised OMB delineations after a decennial census, and to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018) for discussion of wage index transition policies that we finalized for FYs 2020, 2021, and 2022 to apply a 5 percent cap on any decrease in a hospital's final wage index from the prior fiscal year. Beginning with FY 2023, we finalized and codified at 42 CFR 412.64(h)(7) a permanent policy to apply a 5 percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline (87 FR 49018-49020). This 5 percent cap policy is discussed in further detail in section III.G.6 of the preamble of this final rule. We believe it is important for the IPPS to use the updated labor market area delineations to maintain a more accurate and up-to-date payment system that reflects the reality of current labor market conditions. We believe the 5 percent cap policy will sufficiently mitigate any potential significant disruptive financial impacts on hospitals that are negatively affected by the proposed adoption of the revised OMB delineations and thus, we did not propose a transition period for these hospitals.

For the reasons described in this section, we are finalizing the use of the revised labor market area delineations based on OMB Bulletin No. 23–01 beginning with the FY 2025 IPPS hospital wage index as proposed.

1. Micropolitan Statistical Areas

The OMB “2020 Standards” define a “Micropolitan Statistical Area” as being associated with at least one urban area that has a population of at least 10,000, but less than 50,000. A Micropolitan Statistical Area comprises the central county or counties containing the core, plus adjacent outlying counties having a high degree of social and economic integration with the central county or counties as measured through commuting (86 FR 37778). We refer to these areas as Micropolitan Areas. Since FY 2005, we have treated Micropolitan Areas as rural and included hospitals located in Micropolitan Areas in each State’s rural wage index. We refer readers to the FY 2005 IPPS final rule (69 FR 49029 through 49032) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 49952) for a complete discussion regarding this policy and our rationale for treating Micropolitan Areas as rural. Based upon the new 2020 Decennial Census data, a number of urban counties have switched status and have joined or become Micropolitan Areas, and some counties that once were part of a Micropolitan Area, under current OMB delineations, have become urban. Overall, there are a similar number of Micropolitan Areas (542) under the new OMB delineations based on the 2020 Census as existed under the latest data from the 2010 Census (541). We stated in the proposed rule that we believe that the best course of action would be to continue the policy established in the FY 2005 IPPS final rule and include hospitals located in Micropolitan Areas in each State's rural wage index. These areas continue to be defined as having relatively small urban cores (populations of 10,000-49,999). We do not believe it would be appropriate to calculate a separate wage index for areas that typically may include only a few hospitals for the reasons set forth in the FY 2005 IPPS/LTCH PPS final rule (69 FR 49029 through 49032) and the FY 2015 IPPS final rule (79 FR 49952). Therefore, in conjunction with our proposal to implement the new OMB statistical area

delineations beginning in FY 2025, we proposed to continue to treat Micropolitan Areas as “rural” and to include Micropolitan Areas in the calculation of each state’s rural wage index.

2. Metropolitan Divisions

According to OMB’s “2020 Standards” (86 FR 37776), a metropolitan division is a county or group of counties within a metropolitan statistical area (MSA) with a population of at least 2.5 million. Thus, MSAs may be subdivided into metropolitan divisions. A county qualifies as a “main county” of a metropolitan division if 65 percent or more of workers living in the county also work within the county and the ratio of the number of workers working in the county to the number of workers living in the county is at least 0.75. A county qualifies as a “secondary county” if 50 percent or more, but less than 65 percent, of workers living in the county also work within the county and the ratio of the number of workers working in the county to the number of workers living in the county is at least 0.75. After all the main and secondary counties are identified and grouped, each additional county that already has qualified for inclusion in the MSA falls within the metropolitan division associated with the main/secondary county or counties with which the county at issue has the highest employment interchange measure. Counties in a metropolitan division must be contiguous. In the FY 2005 IPPS final rule (69 FR 49029), CMS finalized our policy to use the metropolitan divisions where applicable under the CBSA definitions. CMS concluded that including the metropolitan divisions in the CBSA definitions most closely approximated the labor market delineation from the “Primary Metropolitan Statistical Areas” delineations in place prior to FY 2005.

Under the current delineations, 11 MSAs are subdivided into a total of 31 metropolitan divisions. The revised OMB delineations have subdivided two additional existing MSAs into metropolitan divisions relative to the previous delineations, resulting in 13 MSAs (the 11 currently subdivided MSAs plus two additional MSAs) that are subdivided into 37 metropolitan divisions. Since the configurations of most subdivided MSAs remain substantially similar in the revised delineations compared to those used for the wage index in FY 2024, to maintain

continuity and predictability in labor market delineations, we proposed to continue our policy to include metropolitan divisions as separate CBSAs for wage index purposes.

3. Change to County-Equivalents in the State of Connecticut

In a June 6, 2022, Notice (87 FR 34235 through 34240), the Census Bureau announced that it was implementing the State of Connecticut’s request to replace the 8 counties in the State with 9 new “Planning Regions.” Planning regions now serve as county-equivalents within the CBSA system. OMB Bulletin No. 23-01 is the first set of revised delineations that referenced the new county-equivalents for Connecticut. We have evaluated the change in hospital assignments for Connecticut hospitals and proposed to adopt the planning regions as county equivalents for wage index purposes. As all forthcoming county-based delineation data will utilize these new county-equivalent definitions for Connecticut, we believe it is necessary to adopt this migration from counties to planning region county-equivalents to maintain consistency with OMB Bulletin No. 23-01 and future OMB updates. We are providing the following crosswalk for each hospital in Connecticut with the current and proposed Federal Information Processing Standard (FIPS) county and county-equivalent codes and CBSA assignments.

CCN	FIPS	Current County	Current CBSA	Proposed FIPS	Proposed Planning Area (County Equivalent)	Proposed CBSA
070002	09003	HARTFORD	25540	09110	CAPITOL	25540

070039	09009	NEW HAVEN	35300	09170	SOUTH CENTRAL CONNECTICUT	35300
07B010	09009	NEW HAVEN	35300	09170	SOUTH CENTRAL CONNECTICUT	35300
07B022	09001	FAIRFIELD	14860	09190	WESTERN CONNECTICUT	14860
07B033	09005	LITCHFIELD	07	09190	WESTERN CONNECTICUT	14860

We note that we proposed that a remote location of a multicampus hospital currently indicated with 07B033 would be located in the same CBSA as the main provider (070033). Therefore, consistent with the policy for remote locations of multicampus hospitals discussed in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41369 through 41374), it would no longer be necessary to identify this remote location separately from the main provider for wage index purposes.

We also note, as discussed in Section III.B.3 of the preamble of this final rule, we proposed to add both of the newly proposed rural planning regions in Connecticut to the list of “Lugar” counties.

4. Urban Counties That Become Rural Under the Revised OMB Delineations

As previously discussed, we proposed to implement the revised OMB statistical area delineations (based upon OMB Bulletin No. 23-01) beginning in FY 2025. Our analysis shows that a total of 53 counties (and county equivalents) and 33 hospitals that were once considered part of an urban CBSA would be considered to be located in a rural area, beginning in FY 2025, under these revised OMB delineations. The following chart lists the 53 urban counties that will become rural under the revised OMB delineations. We note that there are four cases (CBSA 14100 [Bloomsburg-Berwick, PA], CBSA 19180 [Danville, IL], CBSA 20700 [East Stroudsburg, PA], and CBSA 35100 [New Bern, NC]) where all constituent counties in an urban CBSA become rural under the revised OMB delineations.

We proposed that the wage data for all hospitals located in the counties listed in the chart above would now be considered when calculating their respective State’s rural wage index. We refer readers to section III.G.6 of the preamble of this final rule for a discussion of the 5 percent cap policy. We believe that this policy, which caps any reduction in a hospital’s wage index value at 5 percent of the prior year wage index value, provides an adequate transition to mitigate any potential sudden negative financial impacts due to the adoption of wage index policies, including the adoption of revised OMB labor market delineations.

We also proposed revisions to the list of counties deemed urban under section 1886(d)(8)(B) of the Act, which would affect a number of the hospitals located in these proposed rural counties. We note that we proposed to add 17 of the 53 counties listed above to the list of “Lugar” counties whose hospitals, pursuant to section 1886(d)(8)(B), are deemed to be in an urban area. We refer readers to section III.F.4.b for further discussion.

In addition, we note the provisions of § 412.102 of our regulations continue to apply with respect to determining DSH payments. Specifically, in the first year after a hospital loses urban

status, the hospital will receive an adjustment to its DSH payment that equals two-thirds of the difference between the urban DSH payments applicable to the hospital before its redesignation from urban to rural and the rural DSH payments applicable to the hospital subsequent to its redesignation from urban to rural. In the second year after a hospital loses urban status, the hospital will receive an adjustment to its DSH payment that equals one third of the difference between the urban DSH payments applicable to the hospital before its redesignation from urban to rural and the rural DSH payments applicable to the hospital subsequent to its redesignation from urban to rural.

5. Rural Counties That Become Urban Under the Revised OMB Delineations

As previously discussed, we proposed to implement the revised OMB statistical area delineations (based upon OMB Bulletin No. 23-01) beginning in FY 2025. Analysis of these OMB statistical area delineations shows that a total of 54 counties (and county equivalents) and 24 hospitals that were located in rural areas would be located in urban areas under the revised OMB delineations. The following chart lists the 54 rural counties that will be urban under the revised OMB delineations.

COUNTIES THAT GAIN URBAN STATUS

55123	VERNON	29100	La Crosse-Onalaska, WI-MN

We proposed that when calculating the area wage index, the wage data for hospitals located in these counties would be included in their new respective urban CBSAs. We also note that due to the proposed adoption of the revised OMB delineations, some CAHs that were

previously located in rural areas may be located in urban areas. The regulations at §§ 412.103(a)(6) and 485.610(b)(5) provide affected CAHs with a two-year transition period that begins from the date the redesignation becomes effective. The affected CAHs must reclassify as rural during this transition period to retain their CAH status after the two-year transition period ends. We refer readers to the FY 2015 IPPS/LTCH final rule (79 FR 50162 through 50163) for further discussion of the two-year transition period for CAHs. We also note that special statuses limited to hospitals located in rural areas (such as MDH or SCH status) may be terminated if hospitals are located in proposed urban counties. In these cases, affected hospitals should apply for rural reclassification status under § 412.103 prior to October 1, 2024, to ensure no disruption in status.

6. Urban Counties That Move to a Different Urban CBSA Under the Revised OMB Delineations

In addition to rural counties becoming urban and urban counties becoming rural, some urban counties shift from one urban CBSA to a new or existing urban CBSA under the new OMB delineations.

In some cases, the change in CBSA extends only to a change in name. Revised CBSA names can be found in Table 3 of the addendum of the final rule. In other cases, the CBSA number also changes. For these CBSAs, the list of constituent urban counties in FY 2024 and FY 2025 is the same (except in instances where an urban county became rural, or a rural county became urban, as discussed in the previous section). The following table lists the CBSAs where, under the new delineations, the CBSA name and number change but the constituent counties do not change (not including instances where an urban county became rural, or a rural county became urban).

URBAN AREAS WITH CBSA NAME AND NUMBER CHANGE			
FY 2024 CBSA Code	FY 2024 CBSA Name	Proposed FY 2025 CBSA Code	Proposed FY 2025 CBSA Name
45540	The Villages, FL	48680	Wildwood-The Villages, FL
23844	Gary, IN	29414	Lake County-Porter County-Jasper County, IN
15680	California-Lexington Park, MD	30500	Lexington Park, MD
35154	New Brunswick-Lakewood, NJ	29484	Lakewood-New Brunswick, NJ

URBAN AREAS WITH CBSA NAME AND NUMBER CHANGE			
FY 2024 CBSA Code	FY 2024 CBSA Name	Proposed FY 2025 CBSA Code	Proposed FY 2025 CBSA Name
39100	Poughkeepsie-Newburgh-Middletown, NY	28880	Kiryas Joel-Poughkeepsie-Newburgh, NY
17460	Cleveland-Elyria, OH	17410	Cleveland, OH

In some cases, all of the urban counties from a FY 2024 CBSA have moved and been subsumed by another CBSA in FY 2025. The following table lists the CBSAs that, under the new delineations, are subsumed by an another CBSA.

URBAN AREAS BEING SUBSUMED BY ANOTHER CBSA			
FY 2024 CBSA Code	FY 2024 CBSA Name	Proposed FY 2025 CBSA Code	Proposed FY 2025 CBSA Name
31460	Madera, CA	23420	Fresno, CA
36140	Ocean City, NJ	12100	Atlantic City-Hammonton, NJ
41900	San Germán, PR	32420	Mayagüez, PR

In other cases, some counties shift between existing and new CBSAs, changing the constituent makeup of the CBSAs. For example, Calvert County, MD moved from the current CBSA 12580 (Washington-Arlington-Alexandria, DC-VA-MD-WV) into proposed CBSA 30500 (Lexington Park, MD). The other constituent counties of CBSA 12580 are split into urban CBSAs 47664 (Washington, DC-MD) and 11694 (Arlington-Alexandria-Reston, VA-WV). The following chart lists the urban counties that split off from one urban CBSA and move to a newly proposed or modified urban CBSA under the revised OMB delineations.

For hospitals located in these counties that move from one CBSA to another under the revised OMB delineations, there may be impacts, both negative and positive, upon their specific wage index values. We refer readers to section III.F.3.b.. of the preamble of this final rule for discussion of our proposals to address the assignment of MGCRB wage index reclassifications

for hospitals currently reclassified to these modified CBSAs.

Comment: Multiple commenters were broadly supportive of CMS's proposed update to the IPPS wage index with the revised OMB delineations and the continuation of the policy to cap wage index decreases that a hospital can experience in a given year. MedPAC reiterated its concern with flaws in the wage index methodology, including continued concern with the rise in the number of MGCRB reclassifications. MedPAC urged CMS to improve the accuracy and equity of Medicare's wage index methodologies for IPPS hospitals and other providers by ensuring that wage indexes are less manipulable, more accurately and precisely reflect geographic differences in market-wide labor costs, and limit how much wage index values can differ among providers that are competing for the same pool of labor. MedPAC cited its June 2023 report to Congress, which recommended that Congress repeal the existing Medicare wage index statutes, including current exceptions, and require the Secretary to phase in new wage index methodologies for hospitals and other types of providers that:

- use all-employer, occupation-level wage data with different occupation weights for the wage index of each provider type;
- reflect local area level differences in wages between and within metropolitan statistical areas and statewide rural areas; and
- smooth wage index differences across adjacent local areas.

Another commenter requested that CMS solicit input from the hospital community on reforms to the wage index and efforts to improve the sustainability of workforce, especially in rural and underserved communities.

Response: We appreciate the comments supporting adoption of the revised OMB delineations and refer commenters to section III.G.2 of this final rule for additional discussion of the continuation of the 5 percent annual cap on hospital wage index reductions. We appreciate commenters' continued concern and MedPAC's recommendations for Congressional action on wage index reform. In the 2012 *Report to Congress: Plan to Reform the Medicare Wage Index*,

CMS addressed several of MedPAC's recommendations and found significant benefits to an alternative wage index methodology. However, CMS concluded that any potential changes must be considered in conjunction with the statutorily required reclassifications and adjustments that are applicable to the current wage index determinations. There are several statutory provisions that enable a hospital to receive a wage index other than that which is computed for its geographic area. We believe that these provisions, which may have been designed to ameliorate or correct perceived inequities that hospitals may experience, would complicate the implementation of the significant modifications to the current wage index framework described in MedPAC's June 2023 report to Congress.

Comment: A commenter did not agree with CMS' adoption of OMB's CBSA delineation revisions. The commenter stated that OMB cautions that CBSAs are not intended for any non-statistical uses and should only be used with full consideration of the effects of using these delineations for such purposes. Further, the commenter stated that the Metropolitan Areas Protection and Standardization Act (MAPS Act) bars the automatic propagation of OMB revisions in CBSA delineations to geographic area determinations in non-statistical federal programs, and shall propagate for any non-statistical use only if the relevant agency determines that such a propagation supports the purposes of the program, is in the public interest, and adopts the change through notice-and-comment rulemaking. The commenter contends that if CMS chooses to adopt new OMB delineations, CMS must fully explain why reliance on the updated CBSAs as set forth by OMB is appropriate for purposes of the FY 2025 hospital wage index adjustments. The commenter stated that CMS has not provided an appropriate rationale for relying on the updated CBSAs and proposed to adopt the revised CBSAs by default. The commenter contends that CMS must make a fact-specific determination of those CBSAs' suitability for Medicare reimbursement purposes, including whether it would be appropriate to use additional data to modify OMB's delineations to ensure that such changes are appropriate for purposes of defining regional labor markets for hospital workers.

Response: CMS acknowledges that the CBSA definitions and delineations were not specifically created for the purpose of determining a hospital wage index. However, based on the reasons stated in prior rulemaking, we continue to believe that these definitions and delineations, which are regularly reviewed and updated by OMB, are the best proxy for CMS to use to adjust hospital payment rates based on geographic variations in labor costs in accordance with the statute. Section 1886(d)(3)(E) of the Act requires that, as part of the methodology for determining prospective payments to hospitals, the Secretary must adjust the standardized amounts “for area differences in hospital wage levels by a factor (established by the Secretary) reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level.” We refer readers to the FY 1985 IPPS final rule (50 FR 24375 through 24377) and the FY 1995 IPPS final rule (60 FR 29218 through 29220) for a history of the outreach, consultation, and discussion of the challenges faced in defining appropriate labor market areas for purposes of the wage index methodology. As with any classification system in which boundaries must be established, it is impossible to designate boundaries that will be completely satisfactory to all concerned. There was no consensus among the interested parties on a choice for new labor market areas, and CMS concluded the adoption and continuation of an MSA-based framework was the most prudent course of action. We also refer readers to the FY 2005 rule (69 FR 49027 through 49028) for further discussion regarding the process and outreach CMS undertook before initially adopting OMB CBSAs as the basis for the wage index methodology. We found that the CBSA framework offered a useful proxy for labor market area delineations and that none of the alternative labor market areas that were studied provided a distinct improvement over the use of MSAs.

As stated previously, CMS continued to evaluate other potential methods to calculate variations in geographic labor markets in a manner that maintains or improves consistency and equity in hospital payments in response to recommendations from MedPAC. However, as stated in the 2012 Report to Congress: Plan to Reform the Medicare Wage Index (on the web at

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Reform>), CMS has concluded that implementing any of the recommended revisions to wage index methodologies would require Congressional action. The commenter did not suggest any alternative method for defining geographic labor market areas and, given our decades long history of using OMB CBSA (and the prior Primary MSA) definitions and delineations for wage index purposes, we continue to believe adopting OMB revisions in a timely manner is essential to the IPPS wage index by creating a more accurate representation of geographic variations in wage levels. CMS is aware of the MAPS Act requirements for the adoption of CBSA definitions for non-statistical use and believes that we have provided an adequate rationale to support our proposed adoption through notice and comment rulemaking. As we stated in the proposed rule (89 FR 36140), we believe that using the revised delineations based on OMB Bulletin No. 23-01 will increase the integrity of the IPPS wage index by creating a more accurate representation of current geographic variations in wage levels. While the adoption of the revised delineations will have both positive and negative impacts on specific hospitals and labor markets, we believe that periodically updating the labor market delineations using objective criteria and based on the most recently available commuting data will serve the public's interest in ensuring accurate Medicare payments to hospitals under the IPPS by more accurately reflecting current geographic variations in labor costs in the hospital payment methodology. While some CBSAs would be modified in significant ways, the criteria for MSA, Micropolitan Statistical Area, and Metropolitan Division definitions finalized by OMB are generally consistent with past updates, and we do not find that the adoption of these delineations will create extreme variations in payments to hospitals, especially when considering the impact of the policy to cap annual wage index reductions at 5 percent. On this basis, and for the reasons we stated in prior rulemaking as described above, we have determined that their use supports the purpose of adjusting hospital payment rates based on geographic variations in labor costs in accordance with the statute. We have reviewed our findings and impacts relating to the new OMB delineations and find no compelling reason to

delay implementation. Therefore, we are finalizing the proposed policies implementing the revised OMB delineations, including the policy for the treatment of Micropolitan Statistical areas, Metropolitan divisions, and the change to county-equivalent definitions for the State of Connecticut.

7. Transition

Overall, we believe implementing the new OMB labor market area delineations would result in wage index values being more representative of the actual current costs of labor in a given area. However, we recognize that some hospitals would experience decreases in wage index values as a result of our proposed implementation of the new labor market area delineations. We also realize that some hospitals would have higher wage index values due to our proposed implementation of the new labor market area delineations.

In the past, we have provided for transition periods when adopting changes that have significant payment implications, particularly large negative impacts. When adopting new OMB delineations based on the decennial census for the 2005 and 2015 wage indexes, we applied a 3-year transition for urban hospitals that became rural under the new delineations and a 50/50 blended wage index adjustment for all hospitals that would experience any decrease in their actual payment wage index (69 FR 49032 through 49034 and 79 FR 28060 through 28062).

In connection with our adoption in FY 2021 of the updates in OMB Bulletin 18–04, which included more modifications to the CBSAs than are typical for OMB bulletins issued between decennial censuses, we adopted a policy to place a 5 percent cap on any decrease in a hospital's wage index from the hospital's final wage index in FY 2020 so that a hospital's final wage index for FY 2021 would not be less than 95 percent of its final wage index for FY 2020 (85 FR 58753 through 58755). Given the unprecedented nature of the COVID–19 public health emergency (PHE), we adopted a policy in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45164 through 45165) to apply an extended transition to the FY 2022 wage index for hospitals affected by the transition in FY 2021 to mitigate significant negative impacts of, and provide additional

time for hospitals to adapt to, the CMS decision to adopt the revised OMB delineations. In the FY 2023 IPPS/ LTCH PPS final rule (87 FR 49018 through 49021), under the authority at sections 1886(d)(3)(E) and 1886(d)(5)(I)(i) of the Act, we finalized a policy for FY 2023 and subsequent years to apply a 5 percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline.

We believe that this permanent cap policy, reflected at 42 CFR 412.64(h)(7) and discussed in section in III.G.6. of the preamble of this final rule, sufficiently mitigates any large negative impacts of adopting the new delineations. As we stated when finalizing the permanent 5 percent cap policy in the FY 2023 IPPS/ LTCH PPS final rule (87 FR 49018 through 49021), we further considered the comments we received during the FY 2022 rulemaking recommending a permanent 5 percent cap policy to prevent large year-to-year variations in wage index values as a means to reduce overall volatility for hospitals. We do not believe any additional transition period is necessary considering that the current cap on wage index decreases, which was not in place when we implemented the decennial census updates in FY 2005 and FY 2015, ensures that a hospital's wage index would not be less than 95 percent of its final wage index for the prior year.

Comment: A commenter requested that in addition to the permanent cap policy, CMS implement a 3-year wage index transition period consistent with prior updates to the CBSA categorizations made due to OMB updates.

Response: We note that when we previously adopted revised OMB delineations, the majority of negatively impacted hospitals received a wage index adjustment for only one fiscal year via a 50/50 blend of wage index values using the then-current and newly adopted delineations (79 FR 49960). Hospitals that were reassigned from an urban to rural area as a result of our adoption of the revised OMB delineations received a 3-year transition from their previous urban area, as long as they did not obtain a new MGCRB reclassification during that time period. As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018 through

49021), the 5 percent cap on annual wage index reductions was intended to make unnecessary any future transitions in connection with wage index policy implementations, including the adoption of revised labor market area definitions. Based on our analysis of wage index differences between FY 2024 and FY 2025, we estimate that only 117 hospitals (less than 4 percent) will receive a wage index cap that did not receive the cap in FY 2024. This indicates any impact on overall wage index values that could be caused by the adoption of the revised delineations would be relatively small. Furthermore, given the iterative and interactive effects of different reclassification and wage index hold-harmless policies, it is difficult to isolate the effects on wage index values (both positive and negative) that are due solely to the adoption of the revised delineations. That is, hospitals may make different reclassification decisions based on the transition policy, rather than the actual impacts of the revised delineations. We believe that any attempt to tailor a transition policy specifically to the impacts of adopting revised labor market delineations is not likely to yield results that more accurately reflect current differences in area wages than the 5 percent cap policy. We believe the 5 percent cap policy ensures that hospitals will not experience large payment reductions as a result of annual changes in their wage index value, allows adequate time for hospitals to evaluate reclassification options, and provides consistency and predictability in wage index values. Largely due to the modification of the rural wage index calculation finalized in FY 2024 IPPS/LTCH final rule (88 FR 58971 through 58977), a much larger number of urban and rural hospitals within the same state (nearly 60 percent) receive identical wage index values (prior to the application of other policies, such as the outmigration adjustment, 5 percent cap on annual wage index decreases, and low-wage index hospital policy). This fact suggests that there is even less need for separate transition policies for urban and rural hospitals in response to changes in geographic delineations than there was previously. Furthermore, we did not receive a comment from any hospital (urban or rural) citing specific negative impacts due solely or primarily to the proposed adoption of the revised OMB delineations. For these reasons, we do not believe it is necessary to implement any additional or

alternative transition policy to the 5 percent cap discussed in section III.G.6 of this final rule.

C. Worksheet S-3 Wage Data for the FY 2025 Wage Index

1. Cost Reporting Periods beginning in FY 2021 for FY 2025 Wage Index

The FY 2025 wage index values are based on the data collected from the Medicare cost reports submitted by hospitals for cost reporting periods beginning in FY 2021 (the FY 2024 wage indexes were based on data from cost reporting periods beginning during FY 2020).

The FY 2025 wage index includes all of the following categories of data associated with costs paid under the IPPS (as well as outpatient costs):

- Salaries and hours from short-term, acute care hospitals (including paid lunch hours and hours associated with military leave and jury duty).

- Home office costs and hours.

- Certain contract labor costs and hours, which include direct patient care, certain top management, pharmacy, laboratory, and nonteaching physician Part A services, and certain contract indirect patient care services (as discussed in the FY 2008 final rule with comment period (72 FR 47315 through 47317)).

- Wage-related costs, including pension costs (based on policies adopted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51586 through 51590) and modified in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49505 through 49508)) and other deferred compensation costs.

Consistent with the wage index methodology for FY 2024, the wage index for FY 2025 excludes the direct and overhead salaries and hours for services not subject to IPPS payment, such as skilled nursing facility (SNF) services, home health services, costs related to GME (teaching physicians and residents) and certified registered nurse anesthetists (CRNAs), and other subprovider components that are not paid under the IPPS. The FY 2025 wage index also excludes the salaries, hours, and wage-related costs of hospital-based rural health clinics (RHCs), and Federally Qualified Health Centers (FQHCs), because Medicare pays for these costs outside of the IPPS (68 FR 45395). In addition, salaries, hours, and wage-related costs of CAHs are

excluded from the wage index for the reasons explained in the FY 2004 IPPS final rule (68 FR 45397 through 45398). Similar to our treatment of CAHs, as discussed later in this section, we proposed to exclude Rural Emergency Hospitals (REHs) from the wage index.

For FY 2020 and subsequent years, other wage-related costs are also excluded from the calculation of the wage index. As discussed in the FY 2019 IPPS/LTCH final rule (83 FR 41365 through 41369), other wage-related costs reported on Worksheet S-3, Part II, Line 18 and Worksheet S-3, Part IV, Line 25 and subscripts, as well as all other wage-related costs, such as contract labor costs, are excluded from the calculation of the wage index.

Comment: One commenter encouraged CMS needs to give consideration to policy options that can incentivize safe staffing practices, for the sake of Medicare patients, without simultaneously encouraging hospitals to pay excessively high wages for temporary staff. The commenter also asked that CMS include sick leave in the wage index with the expectation that hospitals and other facilities will allow payment for the entire uncapped time that staff are sick.

Response: We include the categories of data listed above that are associated with costs paid under the IPPS, which includes temporary staff. We also include sick leave in the wage index. For complete detail on what is allowed to be included in the wage data, we refer the reader to the Provider Reimbursement Manual (PRM), Part 2 (Pub. 15-2), Chapter 40, sections 4005.2 – 4005.4. Also, we appreciate the commenters concern with regard to safe staffing practices. We note, that since the time the end of the COVID-19 PHE, hospitals have begun to reduce their reliance on temporary staff such as traveling nurses. Also, some states have begun to explore capping the wages charged by travel nursing agencies. We thank the commenter for their input on this matter.

2. Use of Wage Index Data by Suppliers and Providers Other Than Acute Care Hospitals Under the IPPS

Data collected for the IPPS wage index also are currently used to calculate wage indexes applicable to suppliers and other providers, such as SNFs, home health agencies (HHAs),

ambulatory surgical centers (ASCs), and hospices. In addition, they are used for prospective payments to IRFs, IPFs, and LTCHs, and for hospital outpatient services. We note that, in the IPPS rules, we do not address comments pertaining to the wage indexes of any supplier or provider except IPPS providers and LTCHs. Such comments should be made in response to separate proposed rules for those suppliers and providers.

3. Verification of Worksheet S-3 Wage Data

The wage data for the FY 2025 wage index were obtained from Worksheet S-3, Parts II, III and IV of the Medicare cost report, CMS Form 2552-10 (OMB Control Number 0938-0050 with an expiration date September 30, 2025) for cost reporting periods beginning on or after October 1, 2020, and before October 1, 2021. For wage index purposes, we refer to cost reports beginning on or after October 1, 2020, and before October 1, 2021, as the “FY 2021 cost report,” the “FY 2021 wage data,” or the “FY 2021 data.” Instructions for completing the wage index sections of Worksheet S-3 are included in the Provider Reimbursement Manual (PRM), Part 2 (Pub. 15-2), Chapter 40, Sections 4005.2 through 4005.4. The data file used to construct the FY 2025 wage index includes FY 2021 data submitted to us as of June 2024. As in past years, we performed an extensive review of the wage data, mostly through the use of edits designed to identify aberrant data.

Consistent with the IPPS and LTCH PPS ratesettings, our policy principles with regard to the wage index include generally using the most current data and information available, which is usually data on a 4-year lag (for example, for the FY 2023 wage index we used cost report data from FY 2019). We stated in the FY 2023 IPPS/LTCH final rule (87 FR 48994) that we will be looking at the differential effects of the COVID-19 PHE on the audited wage data in future fiscal years. We also stated we plan to review the audited wage data, and the impacts of the COVID-19 PHE on such data and evaluate these data for future rulemaking. For the FY 2025 wage index, the best available data typically would be from the FY 2021 wage data.

In the proposed rule we stated that in considering the impacts of the COVID-19 PHE on the FY 2021 wage data, we compared that data with recent historical data. Based on pre-reclassified wage data, the changes in the wage data from FY 2020 to FY 2021 show the following compared to the annual changes for the most recent 3 fiscal year periods (that is, FY 2017 to FY 2018, FY 2018 to FY 2019 and FY 2019 to FY 2020):

- Approximately 91 percent of hospitals have an increase in their average hourly wage (AHW) from FY 2020 to FY 2021 compared to a range of 76-86 percent of hospitals for the most recent 3 fiscal year periods.
- Approximately 97 percent of all CBSA AHWs are increasing from FY 2020 to FY 2021 compared to a range of 84-91 percent of all CBSA AHWs for the most recent 3 fiscal year periods.
- Approximately 51 percent of all urban areas have an increase in their area wage index from FY 2020 to FY 2021 compared to a range of 36-43 percent of all urban areas for the most recent 3 fiscal year periods.
- Approximately 55 percent of all rural areas have an increase in their area wage index from FY 2020 to FY 2021 compared to a range of 31-46 percent of all rural areas for the most recent 3 fiscal year periods.
- The unadjusted national average hourly wage increased by a range of 2.4-5.4 percent per year from FY 2017 – FY 2020. For FY 2021, the unadjusted national average hourly increased by 8.7 percent from FY 2020.

Similar to the FY 2024 wage index, we stated it is not readily apparent even if the comparison with the historical trends had indicated greater differences at a national level in this context, how any changes due to the COVID-19 PHE differentially impacted the wages paid by individual hospitals. Furthermore, even if changes due to the COVID-19 PHE did differentially impact the wages paid by individual hospitals over time, it is not clear how those changes could

be isolated from changes due to other reasons and what an appropriate potential methodology might be to adjust the data to account for the effects of the COVID-19 PHE.

Lastly, we also noted that we have not identified any significant issues with the FY 2021 wage data itself in terms of our audits of this data. As usual, the data was audited by the Medicare Administrative Contractors (MACs), and there were no significant issues reported across the data for all hospitals.

Taking all of these factors into account, we stated that we believe the FY 2021 wage data is the best available wage data to use for FY 2025 and proposed to use the FY 2021 wage data for FY 2025.

We welcomed comments from the public with regard to the FY 2021 wage data. We also noted, AHW data by provider and CBSA, including the data upon which the comparisons provided previously are based, is available in our Public Use Files released with each proposed and final rule each fiscal year. The Public Use Files for the respective FY Wage Index Home Page can be found on the Wage Index Files webpage at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/wage-index-files>.

Comment: A commenter noted that for FY 2025, CMS proposed to use data from the FY 2021 cost reports to determine the area wage index modifications. The commenter stated that CMS is already using the FY 2022 cost reports for rate setting and therefore CMS should use the FY 2022 cost reports for area wage index modifications.

Response: As discussed previously, the latest available audited wage data is from FY 2021. We do not possess audited wage data from a more recent period. We are uncertain to what the commenter meant to refer with respect to the use of FY 2022 cost reports for rate setting and are unable to respond further to the commenter's suggestion.

Comment: One commenter stated that although CMS provides some information about this analysis, they recommend CMS provide additional information, such as specific tables or

files for the public to review, to confirm the agency's conclusion. The commenter stated that they are skeptical of the agency's conclusion, as workforce costs continue to account for a substantial portion of hospital expenses, driven in part by use of contract labor and shortages that were accelerated by many of the impacts of the pandemic.

Response: As stated above, AHW data by provider and CBSA, including the data upon which the comparisons as previously described are based, is available in our Public Use Files released with each proposed and final rule each fiscal year. The Public Use Files for the respective FY Wage Index Home Page can be found on the Wage Index Files web page at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files>. Also, as usual, the data was audited by the MACs, and there were no significant issues reported across the data for all hospitals including contract labor.

We did not receive any other comments regarding the use of the FY 2021 wage data for FY 2025. We are finalizing as proposed to use the FY 2021 wage data for the FY 2025 wage index.

We requested that our MACs revise or verify data elements that resulted in specific edit failures. For the proposed FY 2025 wage index, we identified and excluded 69 providers with aberrant data that should not be included in the wage index. However, we stated that if data elements for some of these providers are corrected, we intend to include data from those providers in the final FY 2025 wage index. We also adjusted certain aberrant data and included these data in the wage index. For example, in situations where a hospital did not have documentable salaries, wages, and hours for housekeeping and dietary services, we imputed estimates, in accordance with policies established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967). We instructed MACs to complete their verification of questionable data elements and to transmit any changes to the wage data no later than March 20, 2024. After we issued the proposed rule, for the final FY 2025 wage index, we restored the data of 8 hospitals to the wage index, because their data was either verified or improved and removed

the data of 3 hospitals with aberrant data. Thus, 64 hospitals with aberrant data remain excluded from the FY 2025 wage index ($69 - 8 + 3 = 64$).

Comment: One commenter stated that certain Medicare Administrative Contractors (MACs) may be taking different stances on whether to allow or how to calculate the allowable portion of contract labor when determining a hospital's wage index. The commenter indicated that although it seems some MACs have taken steps to correct this after hospitals have appealed such actions, CMS should ensure a uniform process is followed.

Response: All hospitals and MACs are provided with the same instructions for reviewing the wage data, including instructions for determining the allowable portion of contract labor. Also, complete instructions with regard to what hospitals can and cannot include in the wage data and contract labor are in PRM, Part 2 (Pub. 15-2), Chapter 40, section 4005.2. Further, as the commenter mentions, if there is an issue during the review process, hospitals can follow the appeal process described below.

In constructing the proposed FY 2025 wage index, we included the wage data for facilities that were IPPS hospitals in FY 2021, inclusive of those facilities that have since terminated their participation in the program as hospitals, as long as those data did not fail any of our edits for reasonableness. We stated in the proposed rule (89 FR 36151- 36152) that we believe that including the wage data for these hospitals is, in general, appropriate to reflect the economic conditions in the various labor market areas during the relevant past period and to ensure that the current wage index represents the labor market area's current wages as compared to the national average of wages. However, we excluded the wage data for CAHs as discussed in the FY 2004 IPPS final rule (68 FR 45397 through 45398); that is, any hospital that is designated as a CAH by 7 days prior to the publication of the preliminary wage index public use file (PUF) is excluded from the calculation of the wage index. For the proposed FY 2025 wage index, we removed 8 hospitals that converted to CAH status on or after January 23, 2023, the cut-off date for CAH exclusion from the FY 2024 wage index, and through and including January 24, 2024,

the cut-off date for CAH exclusion from the FY 2025 wage index. We noted that we also removed 2 hospitals that converted to CAH status prior to January 23, 2023. We did not receive any comments with regard to this proposal, and we are finalizing as proposed to exclude hospitals that have subsequently converted to CAH from the wage index calculation. Since the proposed rule, we learned of 1 more hospital that converted to CAH status on or after January 22, 2023, and through and including January 23, 2024. We removed this additional hospital from the FY 2025 wage index due to its conversion to CAH status.

The Consolidated Appropriations Act (CAA), 2021, was signed into law on December 27, 2020. Section 125 of Division CC (section 125) established a new rural Medicare provider type: Rural Emergency Hospitals (REHs). (We refer the reader to the CMS website at <https://www.cms.gov/medicare/health-safety-standards/guidance-for-laws-regulations/hospitals/rural-emergency-hospitals> for additional information on REHs.) In doing so, section 125 amended section 1861(e) of the Act, which provides the definition of a hospital and states that the term “hospital” does not include, unless the context otherwise requires, a critical access hospital (as defined in subsection (mm)(1)) or a rural emergency hospital (as defined in subsection (kkk)(2)). Section 125 also added section 1861(kkk) to the Act, which sets forth the requirements for REHs. Per section 1861(kkk)(2) of the Act, one of the requirements for an REH is that it does not provide any acute care inpatient services (other than post-hospital extended care services furnished in a distinct part unit licensed as a skilled nursing facility (SNF)). In the proposed rule we stated that, similar to CAHs, we believe hospitals that have subsequently converted to REH status should be removed from the wage index calculation, because they are a separately certified Medicare provider type and are not comparable to other short-term, acute care hospitals as they do not provide inpatient hospital services. For FY 2025, we proposed to treat REHs the same as CAHs and to exclude 15 REHs from the wage index. Accordingly, we proposed that, similar to our policy on CAHs, any hospital that is designated as a REH by 7 days prior to the publication of the preliminary wage index public use file (PUF) is

excluded from the calculation of the wage index. We did not receive any comments with regard to this proposal, and we are finalizing as proposed to exclude hospitals that have subsequently converted to REH from the wage index calculation. Since the proposed rule, we learned of 4 more hospitals that converted to REH status on or after January 22, 2023, and through and including January 23, 2024, the cut-off date for REH exclusion from the FY 2025 wage index, for a total of 19 hospitals that were removed from the FY 2025 wage index due to conversion to REH status. In summary, we calculated the FY 2025 wage index using the Worksheet S-3, Parts II and III wage data of 3,074 hospitals.

For the FY 2025 wage index, we allotted the wages and hours data for a multicampus hospital among the different labor market areas where its campuses are located using campus full-time equivalent (FTE) percentages as originally finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51591). Table 2, which contains the FY 2025 wage index associated with this final rule (available via the internet on the CMS website), includes separate wage data for the campuses of 26 multicampus hospitals. The following chart lists the multicampus hospitals by CMS certification number (CCN) and the FTE percentages on which the wages and hours of each campus were allotted to their respective labor market areas:

CCN of Main Campus of Multicampus Hospital	Full-Time Equivalent Percentage of Main Campus	CCN of Sub Campus of Multicampus Hospital	Full-Time Equivalent Percentage of Sub Campus
050121	0.86	05B121	0.14
070010	0.86	07B010	0.14
070022	0.99	07B022	0.01
100029	0.52	10B029	0.48
100167	0.91	10B167	0.09
140010	0.81	14B010	0.19
220074	0.89	22B074	0.11
310069	0.18	31B069	0.82
330103	0.67	33B103	0.33
330195	0.89	33B195	0.11

We note that, in past years, in Table 2, we have placed a “B” to designate the subordinate campus in the fourth position of the hospital CCN. However, for the FY 2019 IPPS/LTCH PPS proposed and final rules and subsequent rules, we have moved the “B” to the third position of the CCN. Because all IPPS hospitals have a “0” in the third position of the CCN, we believe that placement of the “B” in this third position, instead of the “0” for the subordinate campus, is the most efficient method of identification and interferes the least with the other variable digits in the CCN.

4. Process for Requests for Wage Index Data Corrections

a. Process for Hospitals to Request Wage Index Data Corrections

The preliminary, unaudited Worksheet S–3 wage data files for the proposed FY 2025 wage index were made available on May 23, 2023, through the internet on the CMS website at <https://www.cms.gov/medicare/medicare-fee-service-payment/acuteinpatientpps/wage-index-files/fy-2025-wage-index-home-page>. We subsequently identified some providers that were

inadvertently omitted from the FY 2025 preliminary Worksheet S-3 wage data file originally posted on May 23, 2023. Therefore, on July 12, 2023, we posted an updated FY 2025 preliminary Worksheet S-3 wage data file to include these missing providers. In addition, the Calendar Year (CY) 2022 occupational mix survey data was made available on July 12, 2023, through the internet on the CMS website at <https://www.cms.gov/medicare/medicare-fee-service-payment/acuteinpatientpps/wage-index-files/fy-2025-wage-index-home-page>. On August 14, 2023, we posted an updated CY 2022 Occupational Mix survey data file that includes survey data for providers that were inadvertently omitted from the file posted on July 12, 2023.

On January 31, 2024, we posted a public use file (PUF) at <https://www.cms.gov/medicare/medicare-fee-service-payment/acuteinpatientpps/wage-index-files/fy-2025-wage-index-home-page> containing FY 2025 wage index data available as of January 31, 2024. This PUF contains a tab with the Worksheet S–3 wage data (which includes Worksheet S–3, Parts II and III wage data from cost reporting periods beginning on or after October 1, 2020, through September 30, 2021; that is, FY 2021 wage data), a tab with the occupational mix data (which includes data from the CY 2022 occupational mix survey, Form CMS–10079), a tab containing the Worksheet S–3 wage data of hospitals deleted from the January 31, 2024 wage data PUF, and a tab containing the CY 2022 occupational mix data of the hospitals deleted from the January 31, 2024 occupational mix PUF. In a memorandum dated January 31, 2024, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the January 31, 2024, wage index data PUFs, and the process and timeframe for requesting revisions in accordance with the FY 2025 Hospital Wage Index Development Time Table available at <https://www.cms.gov/files/document/fy2025-hospital-wage-index-development-timetable.pdf>.

In the interest of meeting the data needs of the public, beginning with the proposed FY 2009 wage index, we post an additional PUF on the CMS website that reflects the actual data that are used in computing the proposed wage index. The release of this file does not alter the

current wage index process or schedule. We notify the hospital community of the availability of these data as we do with the current public use wage data files through our Hospital Open Door Forum. We encourage hospitals to sign up for automatic notifications of information about hospital issues and about the dates of the Hospital Open Door Forums at the CMS website at <https://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums>.

In a memorandum dated May 4, 2023, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the preliminary wage index data files and the CY 2022 occupational mix survey data files posted on May 23, 2023, and the process and timeframe for requesting revisions.

If a hospital wished to request a change to its data as shown in the May 23, 2023, preliminary wage data files and occupational mix data files, the hospital had to submit corrections along with complete, detailed supporting documentation to its MAC so that the MAC received them by September 1, 2023. Hospitals were notified of these deadlines and of all other deadlines and requirements, including the requirement to review and verify their data as posted in the preliminary wage index data files on the internet, through the letters sent to them by their MACs.

November 3, 2023, was the date by when MACs notified State hospital associations regarding hospitals that failed to respond to issues raised during the desk reviews. Additional revisions made by the MACs were transmitted to CMS throughout January 2024. CMS published the wage index PUFs that included hospitals' revised wage index data on January 31, 2024. Hospitals had until February 16, 2024, to submit requests to the MACs to correct errors in the January 31, 2024, PUF due to CMS or MAC mishandling of the wage index data, or to revise desk review adjustments to their wage index data as included in the January 31, 2024, PUF. Hospitals also were required to submit sufficient documentation to support their requests. Hospitals' requests and supporting documentation must have been received by the MAC by the February deadline (that is, by February 16, 2024, for the FY 2025 wage index).

After reviewing requested changes submitted by hospitals, MACs were required to transmit to CMS any additional revisions resulting from the hospitals' reconsideration requests by March 20, 2024. Under our current policy as adopted in the FY 2018 IPPS/ LTCH PPS final rule (82 FR 38153), the deadline for a hospital to request CMS intervention in cases where a hospital disagreed with a MAC's handling of wage data on any basis (including a policy, factual, or other dispute) was April 3, 2024. Data that were incorrect in the preliminary or January 31, 2024, wage index data PUFs, but for which no correction request was received by the February 16, 2024, deadline, are not considered for correction at this stage. In addition, April 3, 2024, was the deadline for hospitals to dispute data corrections made by CMS of which the hospital was notified after the January 31, 2024, PUF and at least 14 calendar days prior to April 3, 2024 (that is, March 20, 2024), that do not arise from a hospital's request for revisions. The hospital's request and supporting documentation must be received by CMS (and a copy received by the MAC) by the April deadline (that is, by April 3, 2024, for the FY 2025 wage index). We refer readers to the FY 2025 Hospital Wage Index Development Time Table for complete details.

Hospitals were given the opportunity to examine Table 2 associated with the proposed rule, which is listed in section VI. of the Addendum to the proposed rule and available via the internet on the CMS website at <https://www.cms.gov/medicare/medicare-fee-service-payment/acuteinpatientpps/wage-index-files/fy-2025-wage-index-home-page>. Table 2 associated with the proposed rule contained each hospital's proposed adjusted average hourly wage used to construct the wage index values for the past 3 years, including the proposed FY 2025 wage index, which was constructed from FY 2021 data. We noted in the proposed rule that the proposed hospital average hourly wages shown in Table 2 only reflected changes made to a hospital's data that were transmitted to CMS by early February 2024.

We posted the final wage index data PUFs on April 29, 2024, on the CMS website at <https://www.cms.gov/medicare/medicare-fee-service-payment/acuteinpatientpps/wage-index-files/fy-2025-wage-index-home-page>. The April 2024 PUFs are made available solely for the

limited purpose of identifying any potential errors made by CMS or the MAC in the entry of the final wage index data that resulted from the correction process (the process for disputing revisions submitted to CMS by the MACs by March 20, 2024, and the process for disputing data corrections made by CMS that did not arise from a hospital's request for wage data revisions as discussed earlier), as previously described.

After the release of the April 2024 wage index data PUFs, changes to the wage and occupational mix data can only be made in those very limited situations involving an error by the MAC or CMS that the hospital could not have known about before its review of the final wage index data files. Specifically, neither the MAC nor CMS will approve the following types of requests:

- Requests for wage index data corrections that were submitted too late to be included in the data transmitted to CMS by the MACs on or before March 20, 2024.
- Requests for correction of errors that were not, but could have been, identified during the hospital's review of the January 31, 2024, wage index PUFs.
- Requests to revisit factual determinations or policy interpretations made by the MAC or CMS during the wage index data correction process.

If, after reviewing the April 2024 final wage index data PUFs, a hospital believes that its wage or occupational mix data are incorrect due to a MAC or CMS error in the entry or tabulation of the final data, the hospital is given the opportunity to notify both its MAC and CMS regarding why the hospital believes an error exists and provide all supporting information, including relevant dates (for example, when it first became aware of the error). The hospital was required to send its request to CMS and to the MAC so that it was received no later than May 29, 2024. May 29, 2024, was also the deadline for hospitals to dispute data corrections made by CMS of which the hospital was notified on or after 13 calendar days prior to April 3, 2024 (that is, March 21, 2024), and at least 14 calendar days prior to May 29, 2024 (that is, May 15, 2024), that did not arise from a hospital's request for revisions. (Data corrections made by CMS of

which a hospital is notified on or after 13 calendar days prior to May 29, 2024 (that is, May 16, 2024), may be appealed to the Provider Reimbursement Review Board (PRRB)). In accordance with the FY 2025 Hospital Wage Index Development Time Table posted on the CMS website at <https://www.cms.gov/files/document/fy2025-hospital-wage-index-development-timetable.pdf>, the May appeals were required to be submitted to CMS through an online submission process or through email. We refer readers to the FY 2025 Hospital Wage Index Development Time Table for complete details.

Verified corrections to the wage index data received timely (that is, by May 29, 2024) by CMS and the MACs were incorporated into the final FY 2025 wage index, which will be effective October 1, 2024.

We created the processes previously described to resolve all substantive wage index data correction disputes before we finalize the wage and occupational mix data for the FY 2025 payment rates. Accordingly, hospitals that do not meet the procedural deadlines set forth earlier will not be afforded a later opportunity to submit wage index data corrections or to dispute the MAC's decision with respect to requested changes. Specifically, our policy is that hospitals that do not meet the procedural deadlines as previously set forth (requiring requests to MACs by the specified date in February and, where such requests are unsuccessful, requests for intervention by CMS by the specified date in April) will not be permitted to challenge later, before the PRRB, the failure of CMS to make a requested data revision. We refer readers also to the FY 2000 IPPS final rule (64 FR 41513) for a discussion of the parameters for appeals to the PRRB for wage index data corrections. As finalized in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156), this policy also applies to a hospital disputing corrections made by CMS that do not arise from a hospital's request for a wage index data revision. That is, a hospital disputing an adjustment made by CMS that did not arise from a hospital's request for a wage index data revision is required to request a correction by the first applicable deadline. Hospitals that do not

meet the procedural deadlines set forth earlier will not be afforded a later opportunity to submit wage index data corrections or to dispute CMS' decision with respect to changes.

Again, we believe the wage index data correction process described earlier provides hospitals with sufficient opportunity to bring errors in their wage and occupational mix data to the MAC's attention. Moreover, because hospitals had access to the final wage index data PUFs by late April 2024, they have an opportunity to detect any data entry or tabulation errors made by the MAC or CMS before the development and publication of the final FY 2025 wage index by August 2024, and the implementation of the FY 2025 wage index on October 1, 2024. Given these processes, the wage index implemented on October 1 should be accurate. Nevertheless, in the event that errors are identified by hospitals and brought to our attention after May 29, 2024, we retain the right to make midyear changes to the wage index under very limited circumstances.

Specifically, in accordance with § 412.64(k)(1) of our regulations, we make midyear corrections to the wage index for an area only if a hospital can show that: (1) The MAC or CMS made an error in tabulating its data; and (2) the requesting hospital could not have known about the error or did not have an opportunity to correct the error, before the beginning of the fiscal year. For purposes of this provision, "before the beginning of the fiscal year" means by the May deadline for making corrections to the wage data for the following fiscal year's wage index (for example, May 29, 2024, for the FY 2025 wage index). This provision is not available to a hospital seeking to revise another hospital's data that may be affecting the requesting hospital's wage index for the labor market area. As indicated earlier, because CMS makes the wage index data available to hospitals on the CMS website prior to publishing both the proposed and final IPPS rules, and the MACs notify hospitals directly of any wage index data changes after completing their desk reviews, we do not expect that midyear corrections will be necessary. However, under our current policy, if the correction of a data error changes the wage index value for an area, the revised wage index value will be effective prospectively from the date the correction is made.

In the FY 2006 IPPS final rule (70 FR 47385 through 47387 and 47485), we revised § 412.64(k)(2) to specify that, effective on October 1, 2005, that is, beginning with the FY 2006 wage index, a change to the wage index can be made retroactive to the beginning of the Federal fiscal year only when CMS determines all of the following: (1) The MAC or CMS made an error in tabulating data used for the wage index calculation; (2) the hospital knew about the error and requested that the MAC and CMS correct the error using the established process and within the established schedule for requesting corrections to the wage index data, before the beginning of the fiscal year for the applicable IPPS update (that is, by the May 29, 2024, deadline for the FY 2025 wage index); and (3) CMS agreed before October 1 that the MAC or CMS made an error in tabulating the hospital's wage index data and the wage index should be corrected.

In those circumstances where a hospital requested a correction to its wage index data before CMS calculated the final wage index (that is, by the May 29, 2024 deadline for the FY 2025 wage index), and CMS acknowledges that the error in the hospital's wage index data was caused by CMS' or the MAC's mishandling of the data, we believe that the hospital should not be penalized by our delay in publishing or implementing the correction. As with our current policy, we indicated that the provision is not available to a hospital seeking to revise another hospital's data. In addition, the provision cannot be used to correct prior years' wage index data; it can only be used for the current Federal fiscal year. In situations where our policies would allow midyear corrections other than those specified in § 412.64(k)(2)(ii), we continue to believe that it is appropriate to make prospective-only corrections to the wage index.

We note that, as with prospective changes to the wage index, the final retroactive correction will be made irrespective of whether the change increases or decreases a hospital's payment rate. In addition, we note that the policy of retroactive adjustment will still apply in those instances where a final judicial decision reverses a CMS denial of a hospital's wage index data revision request.

b. Process for Data Corrections by CMS After the January 31 Public Use File (PUF)

The process set forth with the wage index timetable discussed in section III.C.4. of the preamble of this final rule allows hospitals to request corrections to their wage index data within prescribed timeframes. In addition to hospitals' opportunity to request corrections of wage index data errors or MACs' mishandling of data, CMS has the authority under section 1886(d)(3)(E) of the Act to make corrections to hospital wage index and occupational mix data to ensure the accuracy of the wage index. As we explained in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49490 through 49491) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56914), section 1886(d)(3)(E) of the Act requires the Secretary to adjust the proportion of hospitals' costs attributable to wages and wage-related costs for area differences reflecting the relative hospital wage level in the geographic areas of the hospital compared to the national average hospital wage level. We believe that, under section 1886(d)(3)(E) of the Act, we have discretion to make corrections to hospitals' data to help ensure that the costs attributable to wages and wage-related costs in fact accurately reflect the relative hospital wage level in the hospitals' geographic areas.

We have an established multistep, 15-month process for the review and correction of the hospital wage data that is used to create the IPPS wage index for the upcoming fiscal year. Since the origin of the IPPS, the wage index has been subject to its own annual review process, first by the MACs, and then by CMS. As a standard practice, after each annual desk review, CMS reviews the results of the MACs' desk reviews and focuses on items flagged during the desk review, requiring that, if necessary, hospitals provide additional documentation, adjustments, or corrections to the data. This ongoing communication with hospitals about their wage data may result in the discovery by CMS of additional items that were reported incorrectly or other data errors, even after the posting of the January 31 PUF, and throughout the remainder of the wage index development process. In addition, the fact that CMS analyzes the data from a regional and even national level, unlike the review performed by the MACs that review a limited subset of hospitals, can facilitate additional editing of the data the need for which may not be readily apparent to the MACs. In these occasional instances, an error may be of sufficient magnitude

that the wage index of an entire CBSA is affected. Accordingly, CMS uses its authority to ensure that the wage index accurately reflects the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level, by continuing to make corrections to hospital wage data upon discovering incorrect wage data, distinct from instances in which hospitals request data revisions.

We note that CMS corrects errors to hospital wage data as appropriate, regardless of whether that correction will raise or lower a hospital's average hourly wage. For example, as discussed in section III.C. of the preamble of the FY 2019 IPPS/LTCH PPS final rule (83 FR 41364), in situations where a hospital did not have documentable salaries, wages, and hours for housekeeping and dietary services, we imputed estimates, in accordance with policies established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967). Furthermore, if CMS discovers after conclusion of the desk review, for example, that a MAC inadvertently failed to incorporate positive adjustments resulting from a prior year's wage index appeal of a hospital's wage-related costs such as pension, CMS would correct that data error, and the hospital's average hourly wage would likely increase as a result.

While we maintain CMS' authority to conduct additional review and make resulting corrections at any time during the wage index development process, in accordance with the policy finalized in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156) and as first implemented with the FY 2019 wage index (83 FR 41389), hospitals are able to request further review of a correction made by CMS that did not arise from a hospital's request for a wage index data correction. Instances where CMS makes a correction to a hospital's data after the January 31 PUF based on a different understanding than the hospital about certain reported costs, for example, could potentially be resolved using this process before the final wage index is calculated. We believe this process and the timeline for requesting review of such corrections (as described earlier and in the FY 2018 IPPS/LTCH PPS final rule) promote additional transparency in instances where CMS makes data corrections after the January 31 PUF and

provide opportunities for hospitals to request further review of CMS changes in time for the most accurate data to be reflected in the final wage index calculations. These additional appeals opportunities are described earlier and in the FY 2025 Hospital Wage Index Development Time Table, as well as in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156).

D. Method for Computing the FY 2025 Unadjusted Wage Index

The method used to compute the proposed FY 2025 wage index without an occupational mix adjustment follows the same methodology that we used to compute the wage indexes without an occupational mix adjustment in the FY 2021 IPPS/LTCH PPS final rule (see 85 FR 58758– 58761), and we did not propose any changes to this methodology. We have restated our methodology in this section of this rule.

Step 1.—We gathered data from each of the non-Federal, short-term, acute care hospitals for which data were reported on the Worksheet S–3, Parts II and III of the Medicare cost report for the hospital’s cost reporting period relevant to the wage index (in this case, for FY 2025, these were data from cost reports for cost reporting periods beginning on or after October 1, 2020, and before October 1, 2021). In addition, we included data from hospitals that had cost reporting periods beginning prior to the October 1, 2020 begin date and extending into FY 2021 but that did not have any cost report with a begin date on or after October 1, 2020 and before October 1, 2021. We include this data because no other data from these hospitals would be available for the cost reporting period as previously described, and because particular labor market areas might be affected due to the omission of these hospitals. However, we generally describe these wage data as data applicable to the fiscal year wage data being used to compute the wage index for those hospitals. We note that, if a hospital had more than one cost reporting period beginning during FY 2021 (for example, a hospital had two short cost reporting periods beginning on or after October 1, 2020, and before October 1, 2021), we include wage data from only one of the cost reporting periods, the longer, in the wage index calculation. If there was more than one cost reporting period and the periods were equal in length, we included the wage

data from the later period in the wage index calculation.

Step 2.—Salaries.—The method used to compute a hospital’s average hourly wage excludes certain costs that are not paid under the IPPS. (We note that, beginning with FY 2008 (72 FR 47315), we included what were then Lines 22.01, 26.01, and 27.01 of Worksheet S–3, Part II of CMS Form 2552–96 for overhead services in the wage index. Currently, these lines are lines 28, 33, and 35 on CMS Form 2552–10. However, we note that the wages and hours on these lines are not incorporated into Line 101, Column 1 of Worksheet A, which, through the electronic cost reporting software, flows directly to Line 1 of Worksheet S–3, Part II. Therefore, the first step in the wage index calculation is to compute a “revised” Line 1, by adding to the Line 1 on Worksheet S–3, Part II (for wages and hours respectively) the amounts on Lines 28, 33, and 35.) In calculating a hospital’s Net Salaries (we note that we previously used the term “average” salaries in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51592), but we now use the term “net” salaries) plus wage-related costs, we first compute the following: Subtract from Line 1 (total salaries) the GME and CRNA costs reported on CMS Form 2552–10, Lines 2, 4.01, 7, and 7.01, the Part B salaries reported on Lines 3, 5 and 6, home office salaries reported on Line 8, and exclude salaries reported on Lines 9 and 10 (that is, direct salaries attributable to SNF services, home health services, and other subprovider components not subject to the IPPS). We also subtract from Line 1 the salaries for which no hours were reported. Therefore, the formula for Net Salaries (from Worksheet S–3, Part II) is the following:

$$((\text{Line 1} + \text{Line 28} + \text{Line 33} + \text{Line 35}) - (\text{Line 2} + \text{Line 3} + \text{Line 4.01} + \text{Line 5} + \text{Line 6} + \text{Line 7} + \text{Line 7.01} + \text{Line 8} + \text{Line 9} + \text{Line 10})).$$

To determine Total Salaries plus Wage-Related Costs, we add to the Net Salaries the costs of contract labor for direct patient care, certain top management, pharmacy, laboratory, and nonteaching physician Part A services (Lines 11, 12 and 13), home office salaries and wage-related costs reported by the hospital on Lines 14.01, 14.02, and 15, and nonexcluded area wage-related costs (Lines 17, 22, 25.50, 25.51, and 25.52). We note that contract labor and home office

salaries for which no corresponding hours are reported are not included. In addition, wage-related costs for nonteaching physician Part A employees (Line 22) are excluded if no corresponding salaries are reported for those employees on Line 4. The formula for Total Salaries plus Wage-Related Costs (from Worksheet S-3, Part II) is the following: ((Line 1 + Line 28 + Line 33 + Line 35) - (Line 2 + Line 3 + Line 4.01 + Line 5 + Line 6 + Line 7 + Line 7.01 + Line 8 + Line 9 + Line 10)) + (Line 11 + Line 12 + Line 13 + Line 14.01 + 14.02 + Line 15) + (Line 17 + Line 22 + 25.50 + 25.51 + 25.52).

Step 3.—Hours.—With the exception of wage-related costs, for which there are no associated hours, we compute total hours using the same methods as described for salaries in Step 2. The formula for Total Hours (from Worksheet S-3, Part II) is the following:

((Line 1 + Line 28 + Line 33 + Line 35) - (Line 2 + Line 3 + Line 4.01 + Line 5 + Line 6 + Line 7 + Line 7.01 + Line 8 + Line 9 + Line 10)) + (Line 11 + Line 12 + Line 13 + Line 14.01 + 14.02 + Line 15).

Step 4.—For each hospital reporting both total overhead salaries and total overhead hours greater than zero, we then allocate overhead costs to areas of the hospital excluded from the wage index calculation. First, we determine the “excluded rate”, which is the ratio of excluded area hours to Revised Total Hours (from Worksheet S-3, Part II) with the following formula: (Line 9 + Line 10)/(Line 1 + Line 28 + Line 33 + Line 35) - (Lines 2, 3, 4.01, 5, 6, 7, 7.01, and 8 and Lines 26 through 43). We then compute the amounts of overhead salaries and hours to be allocated to the excluded areas by multiplying the previously discussed ratio by the total overhead salaries and hours reported on Lines 26 through 43 of Worksheet S-3, Part II. Next, we compute the amounts of overhead wage-related costs to be allocated to the excluded areas using three steps:

- We determine the “overhead rate” (from Worksheet S-3, Part II), which is the ratio of overhead hours (Lines 26 through 43 minus the sum of Lines 28, 33, and 35) to revised hours excluding the sum of lines 28, 33, and 35 (Line 1 minus the sum of Lines 2, 3, 4.01, 5, 6, 7, 7.01,

8, 9, 10, 28, 33, and 35). We note that, for the FY 2008 and subsequent wage index calculations, we have been excluding the overhead contract labor (Lines 28, 33, and 35) from the determination of the ratio of overhead hours to revised hours because hospitals typically do not provide fringe benefits (wage-related costs) to contract personnel. Therefore, it is not necessary for the wage index calculation to exclude overhead wage-related costs for contract personnel. Further, if a hospital does contribute to wage-related costs for contracted personnel, the instructions for Lines 28, 33, and 35 require that associated wage-related costs be combined with wages on the respective contract labor lines. The formula for the Overhead Rate (from Worksheet S-3, Part II) is the following: $(\text{Lines 26 through 43} - \text{Lines 28, 33 and 35}) / (((\text{Line 1} + \text{Lines 28, 33, 35}) - (\text{Lines 2, 3, 4.01, 5, 6, 7, 7.01, 8, and 26 through 43})) - (\text{Lines 9 and 10})) + (\text{Lines 26 through 43} - \text{Lines 28, 33, and 35}))$.

- We compute overhead wage-related costs by multiplying the overhead hours ratio by wage-related costs reported on Part II, Lines 17, 22, 25.50, 25.51, and 25.52.

- We multiply the computed overhead wage-related costs by the previously described excluded area hours ratio.

Finally, we subtract the computed overhead salaries, wage-related costs, and hours associated with excluded areas from the total salaries (plus wage-related costs) and hours derived in Steps 2 and 3.

Step 5.—For each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the employment cost index (ECI) for compensation for each 30-day increment from October 14, 2020, through April 15, 2022, for private industry hospital workers from data obtained from the Bureau of Labor Statistics' (BLS') Office of Compensation and Working Conditions. We use the ECI because it reflects the price increase associated with total compensation (salaries plus fringes) rather than just the increase in salaries. In addition, the ECI includes managers as well as other hospital workers. This

methodology to compute the monthly update factors uses actual quarterly ECI data and assures that the update factors match the actual quarterly and annual percent changes. We also note that, since April 2006 with the publication of March 2006 data, the BLS' ECI uses a different classification system, the North American Industrial Classification System (NAICS), instead of the Standard Industrial Codes (SICs), which no longer exist. We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and we did not propose to make any changes to the usage of the ECI for FY 2025. The factors used to adjust the hospital's data are based on the midpoint of the cost reporting period, as indicated in this rule.

Step 6.—Each hospital is assigned to its appropriate urban or rural labor market area before any reclassifications under section 1886(d)(8)(B), 1886(d)(8)(E), or 1886(d)(10) of the Act. Within each urban or rural labor market area, we add the total adjusted salaries plus wage-related costs obtained in Step 5 for all hospitals in that area to determine the total adjusted salaries plus wage-related costs for the labor market area.

Step 7.—We divide the total adjusted salaries plus wage-related costs obtained under Step 6 by the sum of the corresponding total hours (from Step 4) for all hospitals in each labor market area to determine an average hourly wage for the area.

Step 8.—We add the total adjusted salaries plus wage-related costs obtained in Step 5 for all hospitals in the Nation and then divide the sum by the national sum of total hours from Step 4 to arrive at a national average hourly wage.

Step 9.—For each urban or rural labor market area, we calculate the hospital wage index value, unadjusted for occupational mix, by dividing the area average hourly wage obtained in Step 7 by the national average hourly wage computed in Step 8.

Step 10.—For each urban labor market area for which we do not have any hospital wage data (either because there are no IPPS hospitals in that labor market area, or there are IPPS hospitals in that area but their data are either too new to be reflected in the current year's wage

index calculation, or their data are aberrant and are deleted from the wage index), we finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42305) that, for FY 2020 and subsequent years' wage index calculations, such CBSAs' wage index would be equal to total urban salaries plus wage-related costs (from Step 5) in the State, divided by the total urban hours (from Step 4) in the State, divided by the national average hourly wage from Step 8 (see 84 FR 42305 and 42306,). We stated that we believe that, in the absence of wage data for an urban labor market area, it is reasonable to use a statewide urban average, which is based on actual, acceptable wage data of hospitals in that State, rather than impute some other type of value using a different methodology. For calculation of the FY 2025 wage index, we note there is one urban CBSA for which we do not have IPPS hospital wage data. In Table 3 (which is available via the internet on the CMS website), which contains the area wage indexes, we include a footnote to indicate to which CBSA this policy applies. This CBSA's wage index is calculated as described, based on the FY 2020 IPPS/LTCH PPS final rule methodology (84 FR 42305). Under this step, we also apply our policy with regard to how dollar amounts, hours, and other numerical values in the wage index calculations are rounded, as discussed in this section of this final rule.

We refer readers to section II. of the Appendix of the final rule for the policy regarding rural areas that do not have IPPS hospitals.

Step 11.— Section 4410 of Public Law 105–33 provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. The areas affected by this provision are identified in Table 2 listed in section VI. of the Addendum to the final rule and available via the internet on the CMS website.

The following is our policy with regard to rounding of the wage data (dollar amounts, hours, and other numerical values) in the calculation of the unadjusted and adjusted wage index, as finalized in the FY 2020 IPPS/LTCH final rule (84 FR 42306). For data that we consider to be “raw data,” such as the cost report data on Worksheets S–3, Parts II and III, and the

occupational mix survey data, we use such data “as is,” and do not round any of the individual line items or fields. However, for any dollar amounts within the wage index calculations, including any type of summed wage amount, average hourly wages, and the national average hourly wage (both the unadjusted and adjusted for occupational mix), we round the dollar amounts to 2 decimals. For any hour amounts within the wage index calculations, we round such hour amounts to the nearest whole number. For any numbers not expressed as dollars or hours within the wage index calculations, which could include ratios, percentages, or inflation factors, we round such numbers to 5 decimals. However, we continue rounding the actual unadjusted and adjusted wage indexes to 4 decimals, as we have done historically.

As discussed in the FY 2012 IPPS/LTCH PPS final rule, in “Step 5,” for each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the ECI for compensation for each 30-day increment from October 14, 2020, through April 15, 2022, for private industry hospital workers from the BLS’ Office of Compensation and Working Conditions data. We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and we did not propose any changes to the usage of the ECI for FY 2025. The factors used to adjust the hospital’s data were based on the midpoint of the cost reporting period, as indicated in the following table.

MIDPOINT OF COST REPORTING PERIOD

After	Before	Adjustment Factor
10/14/2020	11/15/2020	1.06153
11/14/2020	12/15/2020	1.05922
12/14/2020	01/15/2021	1.05683
01/14/2021	02/15/2021	1.05414
02/14/2021	03/15/2021	1.05116
03/14/2021	04/15/2021	1.04786
04/14/2021	05/15/2021	1.04421
05/14/2021	06/15/2021	1.04023
06/14/2021	07/15/2021	1.03606
07/14/2021	08/15/2021	1.03183
08/14/2021	09/15/2021	1.02755
09/14/2021	10/15/2021	1.02318
10/14/2021	11/15/2021	1.01870
11/14/2021	12/15/2021	1.01409

After	Before	Adjustment Factor
12/14/2021	01/15/2022	1.00941
01/14/2022	02/15/2022	1.00471
02/14/2022	03/15/2022	1.00000
03/14/2022	04/15/2022	0.99537

For example, the midpoint of a cost reporting period beginning January 1, 2021, and ending December 31, 2021, is June 30, 2021. An adjustment factor of 1.03606 was applied to the wages of a hospital with such a cost reporting period.

Previously, we also would provide a Puerto Rico overall average hourly wage. As discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56915), prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we calculated a Puerto Rico specific wage index that was applied to the labor-related share of the Puerto Rico-specific standardized amount. Section 601 of Division O, Title VI (section 601) of the Consolidated Appropriations Act, 2016 (Pub. L. 114-113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. As we stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56915 through 56916), because Puerto Rico hospitals are no longer paid with a Puerto Rico specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act, as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need to calculate a Puerto Rico specific average hourly wage and wage index. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national average hourly wage (unadjusted for occupational mix) and the national wage index, which is applied to the national labor-related share of the national standardized amount. Therefore, for FY 2025, there is no Puerto Rico-specific overall average hourly wage or wage index.

Based on the previously discussed methodology, we stated in the proposed rule (89 FR

36159) that the proposed FY 2025 unadjusted national average hourly wage was \$54.80

Based on the previously described methodology, the final FY 2025 unadjusted national average hourly wage is the following:

Final FY 2025 Unadjusted National Average Hourly Wage	\$55.03
---	---------

E. Occupational Mix Adjustment to the FY 2025 Wage Index

As stated earlier, section 1886(d)(3)(E) of the Act provides for the collection of data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program, to construct an occupational mix adjustment to the wage index, for application beginning October 1, 2004 (the FY 2005 wage index). The purpose of the occupational mix adjustment is to control for the effect of hospitals' employment choices on the wage index. For example, hospitals may choose to employ different combinations of registered nurses, licensed practical nurses, nursing aides, and medical assistants for the purpose of providing nursing care to their patients. The varying labor costs associated with these choices reflect hospital management decisions rather than geographic differences in the costs of labor.

1. Use of New 2022 Medicare Wage Index Occupational Mix Survey for the FY 2025 Wage Index

Section 304(c) of Appendix F, Title III of the Consolidated Appropriations Act, 2001 (Pub. L. 106– 554) amended section 1886(d)(3)(E) of the Act to require CMS to collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program and to measure the earnings and paid hours of employment for such hospitals by occupational category. As discussed in the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25402 through 25403) and final rule (86 FR 45173), we collected data in 2019 to compute the occupational mix adjustment for the FY 2022, FY 2023, and FY 2024 wage indexes. A new measurement of occupational mix is required for FY 2025.

The FY 2025 occupational mix adjustment is based on a new calendar year (CY) 2022 survey. Hospitals were required to submit their completed 2022 surveys (Form CMS-10079,

OMB Number 0938-0907, expiration date January 31, 2026) to their MACs by July 1, 2023.

The preliminary, unaudited CY 2022 survey data were posted on the CMS website on July 12, 2023. As with the Worksheet S-3, Parts II and III cost report wage data, as part of the FY 2025 desk review process, the MACs revised or verified data elements in hospitals' occupational mix surveys that resulted in certain edit failures.

Consistent with the IPPS and LTCH PPS ratesettings, our policy principles with regard to the occupational mix adjustment include generally using the most current data and information available, which is usually occupational mix data on a 3-year lag in the first year of the use of the occupational mix survey (for example, for the FY 2022 wage index we used occupational mix data from 2019; we also used this data for the FY 2023 and FY 2024 wage indexes). In the FY 2024 IPPS/LTCH final rule (88 FR 58969-58970), a commenter had concerns that the occupational mix data [that would be used for FY 2025?] may be skewed due to the COVID-19 PHE, and we stated that we planned to assess the CY 2022 Occupational Mix Survey data in the FY 2025 IPPS final rule.

In the proposed rule, we explained that based on pre-reclassified wage data, we computed the unadjusted and adjusted wage indexes for FY 2025 using the 2022 occupational mix survey data. We then measured the increases and decreases by CBSA as a result of the 2022 occupational mix survey data. We compared this table to the same table for the FY 2024 wage indexes, which used the 2019 occupational mix data, as well as the FY 2021 wage indexes, which used the 2016 occupational mix data. We stated that this table demonstrates the impact of the occupational mix adjusted wage data compared to unadjusted wage data for the most recent three occupational mix surveys using the 2022 survey data compared to the 2019 survey data and the 2016 survey data. That is, it shows whether hospitals' wage indexes will increase or decrease under the 2022 survey data as compared to the most recent years using the prior 2019 survey data and 2016 survey data respectively.

	CY 2016 Occupational Mix Survey (Using FY 2021 Wage Data)	CY 2019 Occupational Mix Survey (Using FY 2024 Wage Data)	CY 2022 Occupational Mix Survey (Using FY 2025 Wage Data)
Number of Urban Areas Wage Index Increasing	238 (57.77%)	231 (56.07%)	248 (60.19%)
Number of Rural Areas Wage Index Increasing	20 (42.55%)	27 (57.45%)	28 (59.57%)
Number of Urban Areas Wage Index Increasing by Greater Than or Equal to 1 Percent But Less Than 5 Percent	114 (27.67%)	125 (30.34%)	148 (35.92%)
Number of Urban Areas Wage Index Increasing by 5 percent or More	7 (1.7%)	5 (1.21%)	6 (1.46%)
Number of Rural Areas Wage Index Increasing by Greater Than or Equal to 1 Percent But Less Than 5 percent	9 (19.15%)	12 (25.53%)	17 (36.17%)
Number of Rural Areas Wage Index Increasing by 5 Percent or More	0 (0%)	0 (0%)	0 (0%)
Number of Urban Areas Wage Index Decreasing	173 (41.99%)	179 (43.45%)	163 (39.56%)
Number of Rural Areas Wage Index Decreasing	26 (55.32%)	20 (42.55%)	19 (40.43%)
Number of Urban Areas Wage Index Decreasing by Greater Than or Equal to 1 Percent But Less Than 5 percent	80 (19.42%)	78 (18.93%)	85 (20.63%)
Number of Urban Areas Wage Index Decreasing by 5 Percent or More	1 (0.24%)	3 (0.73%)	1 (0.24%)
Number of Rural Areas Wage Index Decreasing by Greater Than or Equal to 1 Percent But Less than 5 Percent	8 (17.02%)	8 (17.02%)	6 (12.77%)
Number of Rural Areas Wage Index Decreasing by 5 Percent or More	0 (0%)	0 (0%)	0 (0%)
Largest Positive Impact for an Urban Area	6.46%	7.17%	8.43%
Largest Positive Impact for a Rural Area	3.89%	4.07%	3.85%
Largest Negative Impact for an Urban Area	-5.91%	-5.56%	-6.16%
Largest Negative Impact for a Rural Area	-1.79%	-2.56%	-4.17%
Urban Areas Unchanged by Application of the Occupational Mix Adjustment	1 (0.24%)	2 (0.49%)	1 (0.24%)
Rural Areas Unchanged by Application of the Occupational Mix Adjustment	1 (2.13%)	0 (0%)	0 (0%)

Based on the table, we stated that increases and decreases by CBSA are alike across each year of occupational mix data. For example, 60.19 percent of urban areas' wage indexes are increasing in FY 2025 due to the CY 2022 occupational mix data compared to 56.07 percent in FY 2024 using CY 2019 occupational mix data. Similarly, 59.57 percent of rural areas' wage indexes are increasing in FY 2025 due to the CY 2022 occupational mix data compared to 57.45 percent in FY 2024 using CY 2019 occupational mix data. We also noted that similar to the wage data, it is not readily apparent, even if the comparison with the historical trends had indicated greater differences by CBSA in this context, how any changes due to the COVID-19 PHE differentially impacted the occupational mix adjusted wages paid in each CBSA. Furthermore, even if hypothetically changes due to the COVID-19 PHE did differentially impact the

occupational mix adjusted wage index over time, it is not clear how those changes could be isolated from changes due to other reasons and what an appropriate potential methodology might be to adjust the data accordingly.

Lastly, we also noted that we have not identified any significant issues with the 2022 occupational mix data itself in terms of our audits of this data. As usual, the data was audited by the MACs, and there were no significant issues reported across the data for all hospitals.

Taking all these factors into account, we stated that we believe the CY 2022 occupational mix data is the best available data to use for FY 2025 and proposed to use the CY 2022 occupational mix data for FY 2025.

We did not receive any comments with regard to the use of the CY 2022 occupational mix data for FY 2025. We are finalizing as proposed to use the CY 2022 occupational mix data for the FY 2025 wage index.

2. Calculation of the Occupational Mix Adjustment for FY 2025

For FY 2025, we proposed to calculate the occupational mix adjustment factor using the same methodology that we have used since the FY 2012 wage index (76 FR 51582 through 51586) and to apply the occupational mix adjustment to 100 percent of the FY 2025 wage index. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42308), we modified our methodology with regard to how dollar amounts, hours, and other numerical values in the unadjusted and adjusted wage index calculation are rounded, to ensure consistency in the calculation. According to the policy finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42308 and 42309), for data that we consider to be “raw data,” such as the cost report data on Worksheets S-3, Parts II and III, and the occupational mix survey data, we continue to use these data “as is,” and not round any of the individual line items or fields. However, for any dollar amounts within the wage index calculations, including any type of summed wage amount, average hourly wages, and the national average hourly wage (both the unadjusted and adjusted for occupational mix), we round such dollar amounts to 2 decimals. We round any hour amounts within the wage index

calculations to the nearest whole number. We round any numbers not expressed as dollars or hours in the wage index calculations, which could include ratios, percentages, or inflation factors, to 5 decimals. However, we continue rounding the actual unadjusted and adjusted wage indexes to 4 decimals, as we have done historically.

Similar to the method we use for the calculation of the wage index without occupational mix, salaries and hours for a multicampus hospital are allotted among the different labor market areas where its campuses are located. Table 2 associated with this final rule (which is available via the internet on the CMS website), which contains the final FY 2025 occupational mix adjusted wage index, includes separate wage data for the campuses of multicampus hospitals. We refer readers to section III.C. of the preamble of this final rule for a chart listing the multicampus hospitals and the FTE percentages used to allot their occupational mix data.

Because the statute requires that the Secretary measure the earnings and paid hours of employment by occupational category not less than once every 3 years, all hospitals that are subject to payments under the IPPS, or any hospital that would be subject to the IPPS if not granted a waiver, must complete the occupational mix survey, unless the hospital has no associated cost report wage data that are included in the proposed FY 2025 wage index. For the proposed FY 2025 wage index, we used the Worksheet S-3, Parts II and III wage data of 3,075 hospitals, and we used the occupational mix surveys of 2,950 hospitals for which we also had Worksheet S-3 wage data, which represented a “response” rate of 96 percent (2,950/3,075). For the proposed FY 2025 wage index, we applied proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586). As a result of applying this methodology, the proposed FY 2025 occupational mix adjusted national average hourly wage was \$54.73.

We did not receive any comments on our proposed calculation of the occupational mix adjustment to the FY 2025 wage index. Thus, for the reasons discussed in this final rule and in

the FY 2025 IPPS/LTCH PPS proposed rule, we are finalizing our proposal without modification to calculate the occupational mix adjustment factor using the same methodology that we have used since the FY 2012 wage index and to apply the occupational mix adjustment to 100 percent of the FY 2025 wage index.

Comment: A commenter asked CMS to consider not accepting occupational mix surveys that may show data that is detrimental to patient care. The commenter cited an example such as downgrading registered nurse (RN) positions to licensed practical nurse positions in a way that forces the ratio of RNs to patients to an unsafe level.

Response: We thank the commenter for their comments. We understand the commenter has concerns with regard to hospital patient care. However, as stated previously, the purpose of the occupational mix adjustment is to control for the effect of hospitals' employment choices on the wage index; not to control for hospital patient care.

Comment: We received a comment with regard to the methodology to compute the FY 2025 wage index advocating that CMS do so without an occupational mix adjustment.

Response: Section 1886(d)(3)(E) of the Act requires CMS to collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program, in order to construct an occupational mix adjustment to the wage index. Therefore, per current law, we must apply an occupational mix adjustment to the wage index. For the final FY 2025 wage index, we are using the Worksheet S-3, Parts II and III wage data of 3,074 hospitals, and we are using the occupational mix surveys of 2,956 hospitals for which we also had Worksheet S-3 wage data, which represented a "response" rate of 96 percent (2,956/3,074). For the final FY 2025 wage index, we are applying proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586). As a result of applying this methodology, the final FY 2025 occupational mix adjusted national average hourly wage is the following:

Final FY 2025 Occupational Mix Adjusted National Average Hourly Wage	\$54.97
--	---------

3. Implementation of the Occupational Mix Adjustment and the FY 2025 Occupational Mix Adjusted Wage Index

As discussed in section III.E. of the preamble of this final rule, for FY 2025, we are applying the occupational mix adjustment to 100 percent of the FY 2025 wage index. We calculated the occupational mix adjustment using data from the 2022 occupational mix survey, using the methodology described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51582—51586).

Based on the 2022 occupational mix survey data, the FY 2025 national average hourly wages for each occupational mix nursing subcategory as calculated in Step 2 of the occupational mix calculation are as follows:

Occupational Mix Nursing Subcategory	Average Hourly Wage
National RN	\$60.40
National LPN and Surgical Technician	\$35.02
National Nurse Aide, Orderly, and Attendant	\$23.58
National Medical Assistant	\$23.12
National Nurse Category	\$50.14

The national average hourly wage for the entire nurse category is computed in Step 5 of the occupational mix calculation. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of greater than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of less than 1.0. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of less than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of greater than 1.0.

Based on the 2022 occupational mix survey data, we determined (in Step 7 of the occupational mix calculation) the following:

National Percentage of Hospital Employees in the Nurse Category	45%
National Percentage of Hospital Employees in the All Other Occupations Category	55%

F. Hospital Redesignations and Reclassifications

The following sections III.F.1 through III.F.4 discuss revisions to the wage index based on hospital redesignations and reclassifications. Specifically, hospitals may have their geographic area changed for wage index payment by applying for urban to rural reclassification under section 1886(d)(8)(E) of the Act (implemented at § 412.103), reclassification by the Medicare Geographic Classification Review Board (MGCRB) under section 1886(d)(10) of the Act, Lugar status redesignations under section 1886(d)(8)(B) of the Act, or a combination of the foregoing.

1. Urban to Rural Reclassification Under Section 1886(d)(8)(E) of the Act, Implemented at § 412.103

Under section 1886(d)(8)(E) of the Act, a qualifying prospective payment hospital located in an urban area may apply for rural status for payment purposes separate from reclassification through the MGCRB. Specifically, section 1886(d)(8)(E) of the Act provides that, not later than 60 days after the receipt of an application (in a form and manner determined by the Secretary) from a subsection (d) hospital that satisfies certain criteria, the Secretary shall treat the hospital as being located in the rural area (as defined in paragraph (2)(D)) of the State in which the hospital is located. We refer readers to the regulations at § 412.103 for the general criteria and application requirements for a subsection (d) hospital to reclassify from urban to rural status in accordance with section 1886(d)(8)(E) of the Act (such hospitals are referred to herein as “§ 412.103 hospitals”). The FY 2012 IPPS/LTCH PPS final rule (76 FR 51595 through 51596) includes our policies regarding the effect of wage data from reclassified or redesignated hospitals. We refer readers to the FY 2024 IPPS/LTCH final rule (88 FR 58971 through 58977) for a review of our policy finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49004) to calculate the rural floor with the wage data of urban hospitals reclassifying to rural areas under § 412.103, and discussion of our modification to the calculation of the rural wage index and its implications for the rural floor.

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41369 through 41374), we codified certain policies regarding multicampus hospitals in the regulations at §§ 412.92, 412.96, 412.103, and 412.108. We stated that reclassifications from urban to rural under § 412.103 apply to the entire hospital (that is, the main campus and its remote location(s)). We also stated that a main campus of a hospital cannot obtain Sole Community Hospital (SCH), Rural Referral Center (RRC), or Medicare Dependent Hospital (MDH) status, or rural reclassification under § 412.103, independently or separately from its remote location(s), and vice versa. In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49012 and 49013), we added § 412.103(a)(8) to clarify that for a multicampus hospital, approved rural reclassification status applies to the main campus and any remote location located in an urban area, including a main campus or any remote location deemed urban under section 1886(d)(8)(B) of the Act. If a remote location of a hospital is located in a different CBSA than the main campus of the hospital, it is CMS' longstanding policy to assign that remote location a wage index based on its own geographic area to comply with the statutory requirement to adjust for geographic differences in hospital wage levels (section 1886(d)(3)(E) of the Act). Hospitals are required to identify and allocate wages and hours based on FTEs for remote locations located in different CBSAs on Worksheet S-2, Part I, Lines 165 and 166 of form CMS-2552-10. In calculating wage index values, CMS identifies the allocated wage data for these remote locations in Table 2 with a "B" in the 3rd position of the CCN. These remote locations of hospitals with § 412.103 rural reclassification status in a different CBSA are identified in Table 2, and hospitals should evaluate potential wage index outcomes for their remote location(s) when withdrawing or terminating MGCRB reclassification, or canceling § 412.103 rural reclassification status.

We also note that in the FY 2024 IPPS /LTCH PPS final rule (88 FR 59038 through 59039), we changed the effective date of rural reclassification for a hospital qualifying for rural reclassification under § 412.103(a)(3) by meeting the criteria for SCH status (other than being located in a rural area), and also applying to obtain SCH status under § 412.92, where eligibility

for SCH classification depends on a hospital merger. Specifically, we finalized that in these circumstances, and subject to the hospital meeting the requirements set forth at § 412.92(b)(2)(vi), the effective date for rural reclassification will be the effective date set forth in § 412.92(b)(2)(vi).

Finally, we remind hospitals currently located in rural areas becoming urban under the adoption of the revised OMB delineations that if they have SCH, MDH, or RRC status, they may choose to apply for a § 412.103 urban to rural reclassification if qualifying criteria are met to maintain the SCH, MDH, or RRC status. We advise hospitals to evaluate their options and if desired, apply for § 412.103 urban to rural reclassification before the beginning of FY 2025, to avoid a lapse in SCH, MDH, or RRC status at the beginning of FY 2025 should we finalize our proposal to adopt the revised OMB delineations.

Comment: A commenter suggested that CMS remove the 1 year waiting period required by § 412.103(g)(4) for hospitals to cancel rural reclassification. The commenter stated that CMS' concern in promulgating the policy is no longer applicable due to its choice to link the rural floor and rural wage index as one calculation. The commenter asserted that this rule, which was finalized in FY 2022 IPPS rulemaking, was intended to disincentivize hospitals from cancelling their rural reclassification before the lock-in date at 412.103(b)(6), and then obtaining a new rural reclassification after the lock-in date, so the hospital could receive the rural wage index without having its wage data included in the rural wage index calculation (effectively receiving a higher rural wage index than if its wage data was included).

Response: We appreciate the commenter's input. We did not propose any changes to § 412.103(g)(4), because we still believe that the 1 year waiting period to cancel rural reclassifications is relevant. While the incentive to game the rural wage index may be less now that the rural wage index is the same as the rural floor, as the commenter described, hospitals can still attempt to maximize payment by strategically timing cancellation of a § 412.103 rural reclassification. Hospitals may choose to hold a § 412.103 rural reclassification for a variety of

reasons, such as the 340B drug pricing program administered by HRSA, SCH or RRC eligibility, or to use rural criteria for reclassifying through the MGCRB under § 412.230. Without the minimum waiting period at § 412.103(g)(4), such a hospital could cancel its § 412.103 rural reclassification each year in time to not be included in the rural floor calculation (for example, if the hospital expects the inclusion of its wage data would lower the calculation), and then obtain a new § 412.103 rural reclassification after the lock-in date. We continue to believe that including § 412.103 rural reclassifications in the rural wage index calculation for at least one fiscal year before they may be canceled will help to ensure consistency and predictability of wage index values.

a. Update to Rural Criteria at § 412.103(a)(1)

Section 1886(d)(8)(E) of the Act describes criteria for hospitals located in urban areas to be treated as being located in a rural area of their state. The criterion at section 1886(d)(8)(E)(ii)(I) of the Act requires that the hospital be located in a rural census tract of a metropolitan statistical area (as determined under the most recent modification of the Goldsmith Modification, originally published in the Federal Register on February 27, 1992 (57 FR 6725)).

This condition is implemented in the regulation at § 412.103(a)(1), which currently states: “the hospital is located in a rural census tract of a Metropolitan Statistical Area (MSA) as determined under the most recent version of the Goldsmith Modification, the Rural-Urban Commuting Area codes, as determined by the Office of Rural Health Policy (ORHP) of the Health Resources and Services Administration (HRSA), which is available via the ORHP Web site at: <http://www.ruralhealth.hrsa.gov> or from the U.S. Department of Health and Human Services, Health Resources and Services Administration, Office of Rural Health Policy, 5600 Fishers Lane, Room 9A–55, Rockville, MD 20857.”

The Goldsmith Modification¹⁹⁰ was originally designed to identify rural census tracts located in Metropolitan counties for purposes of grant eligibility unrelated to the hospital IPPS

¹⁹⁰ Known as the “Goldsmith Modification” for its principal developer, Harold F. Goldsmith, this method is described in detail in the paper “Improving the Operational Definition of ‘Rural Areas’ for Federal Programs” available at <https://www.ruralhealthinfo.org/pdf/improving-the-operational-definition-of-rural-areas.pdf>.

but were incorporated by section 1886(d)(8)(E)(ii)(I) of the Act for purposes related to the hospital wage index.

The Federal Office of Rural Health Policy (FORHP) (known as ORHP in § 412.103) later funded development of Rural-Urban Commuting Area (RUCA) codes via the U.S. Department of Agriculture's (USDA) Economic Research Service as the latest version of the Goldsmith Modification, described in a May 3, 2007 Federal Register notice (72 FR 24589), to address limitations of the original Goldsmith Modification. RUCAs, like the Goldsmith Modification, are based on a sub-county unit, the census tract, permitting a finer delineation of what constitutes rural areas inside Metropolitan areas (72 FR 24590). In that notice, HRSA stated it believes that the use of RUCAs allows more accurate targeting of resources intended for the rural population to determine programmatic eligibility for rural areas inside of Metropolitan counties. Using data from the Census Bureau, every census tract in the United States is assigned a RUCA code. In the May 3, 2007 Federal Register, HRSA stated that FORHP considers all census tracts with RUCA codes 4–10 to be rural, plus an additional 132 large area census tracts with RUCA codes 2 or 3 (72 FR 24591). They also stated that FORHP will continue to seek refinements in the use of RUCAs.

FORHP has since published a revised definition of eligibility for rural health grants for FY 2022 in a January, 12, 2021 Federal Register Notice (86 FR 2418 through 2420). Specifically, FORHP added Metropolitan Statistical Area (MSA) counties that contain no Urbanized Area (UA)¹⁹¹ to the areas eligible for the rural health grant programs. FORHP did not remove any areas from the rural definition in the FY 2022 Federal Register Notice.

It has come to our attention that our current regulation text at § 412.103(a)(1) does not describe FORHP's expanded definition of a "rural area" from the FY 2022 Federal Register Notice. In addition, § 412.103(a)(1) contains a web link that is no longer active and requires

¹⁹¹ UAs are defined by the Census Bureau as densely settled areas with a total population of at least 50,000 people (86 FR 2418).

updating. We believe the current rural definition used by FORHP for purposes of the rural health grant program constitutes “the most recent modification of the Goldsmith Modification” referred to in the statute, since the expanded definition of rural constitutes a refinement to the use of RUCA codes, which were developed as the latest version of the Goldsmith Modification. As stated in the FY 2022 Federal Register Notice (86 FR 2420), the expanded criteria reflect FORHP’s desire to accurately identify areas that are rural in character using a data-driven methodology that relies on existing geographic identifiers and utilizes standard, national level data sources. Therefore, we proposed to amend our regulation text at § 412.103(a)(1) to provide a reference to the most recent Federal Register notice issued by HRSA defining “rural areas.” In this way, there will be no need to update the Medicare regulations if FORHP develops a further modification of the Goldsmith Modification or if the weblink changes. FORHP has published the current link in the Federal Register notice (86 FR 2418- 2420) along with the most recent revisions to the current complete rural definition, and it is available via the Rural Health Grants Eligibility Analyzer at <https://data.hrsa.gov/tools/rural-health>.

We proposed to amend the regulation text at 412.103(a)(1) to read: the hospital is located in a rural census tract of a Metropolitan Statistical Area (MSA) as determined under the most recent version of the Goldsmith Modification, using the Rural-Urban Commuting Area codes and additional criteria, as determined by the Federal Office of Rural Health Policy (FORHP) of the Health Resources and Services Administration (HRSA), which is available at the web link provided in the most recent Federal Register notice issued by HRSA defining rural areas.

We did not receive any comments on this proposal and are finalizing as proposed to amend the regulation text at § 412.103(a)(1).

b. Policy for Canceling § 412.103 Reclassifications of Terminated Providers

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49499 through 49500), CMS discussed its longstanding policy to terminate MGCRB wage index reclassification status under section 1886(d)(10) of the Act for hospitals with terminated CMS certification numbers (CCN). We

determined that it would be appropriate to terminate the MGCRB reclassification status for these hospitals (with a limited exception for certain locations acquired by another hospital in a different CBSA), as the hospital may no longer be able to make timely and informed decisions regarding reclassification statuses.

At the time, we did not articulate a similar policy for hospitals reclassified as rural under § 412.103. While policies regarding MGCRB reclassification were adopted for purposes related to the hospital wage index, § 412.103 reclassifications may have broader implications. At the time the policy to terminate MGCRB reclassifications for hospitals with terminated CCNs was implemented, § 412.103 reclassifications were less common, and generally had negligible effects on State rural wage index values. Prior to FY 2024, as a result of various wage index value hold-harmless policies, discussed in detail in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58973-58974), § 412.103 hospital data rarely affected a state's final rural wage index value. Under the current policy first implemented in FY 2024, however, § 412.103 hospital data is only excluded from the rural wage index when indicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. Hospitals reclassified under § 412.103 now impact the rural wage index value of most states. We refer readers to the FY 2024 IPPS/LTCH final rule (88 FR 58973 through 58977) for discussion on how CMS finalized the current policy to include the wage index data for § 412.103 hospitals in more iterations of the rural wage index calculation. Furthermore, following the policy implemented in the April 21, 2016, interim final rule with comment period (IFC) (81 FR 23428 through 23438), which allowed hospitals to maintain dual § 412.103 and MGCRB reclassification status, the number of rural reclassifications has grown significantly. We now believe it is appropriate to propose a policy regarding terminated or "tied-out" hospitals, effective for FY 2025, to address our concerns regarding the impacts these hospitals would have on rural wage index values. Therefore, we proposed that § 412.103 reclassifications will be considered cancelled for the purposes of calculating the area wage index for any hospital with a CCN listed as terminated or "tied-out" as of the date that the hospital

ceased to operate with an active CCN. We propose to obtain and review the best available CCN termination status lists as of the § 412.103(b)(6) “lock-in” date (60 days after the proposed rule for the FY is displayed in the Federal Register). The lock-in date is used to determine whether a hospital has been approved for § 412.103 reclassification in time for that status to be included in the upcoming year’s wage index development. We believe using this date for evaluating CCN terminations would be consistent with the wage index development timeline.

As stated previously, § 412.103 reclassification may have other implications for hospital status and payment. Hospitals may obtain rural reclassification for several reasons, such as to convert to a Critical Access Hospital (CAH), or to obtain SCH status. Eligibility requirements for Rural Emergency Hospital (REH) qualification under section 1861(kkk)(3) of the Act included a reference to reclassification under section 1886(d)(8)(E) (implemented by § 412.103). We note that our proposal to consider § 412.103 reclassifications cancelled for the purposes of calculating area wage index for any hospital with a CCN listed as terminated or “tied-out” is not intended to alter or affect the qualification for such statuses or to have other effects unrelated to hospital wage index calculations. The rural reclassification status would remain in effect for any period that the original PPS hospital remains in operation with an active CCN. For REH qualification requirement purposes, this would include the date of enactment of the Consolidated Appropriations Act, 2021 (Pub. L. 116-260), which was December 27, 2020. We believe this policy provides consistency and predictability in wage index values.

Comment: Commenters were supportive of our proposed policy to cancel the rural reclassification status for hospitals with terminated (“tied-out”) CCNs. Commenters reiterated CMS’ concern that these hospitals may no longer be able to make timely and informed decisions regarding their reclassification status.

Response: We thank commenters for their support and are finalizing the proposed policy to consider rural reclassifications to be cancelled for the purposes of calculating the area wage index for any hospital with a CCN listed as terminated or “tied-out” as of the date that the

hospital ceased to operate with an active CCN. CMS will obtain and review the best available CCN termination status lists as of the § 412.103(b)(6) “lock-in” date (60 days after the proposed rule for the FY is displayed in the Federal Register).

2. General Policies and Effects of MGCRB Reclassification and Treatment of Dual Reclassified Hospitals

Under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. Hospitals must apply to the MGCRB to reclassify not later than 13 months prior to the start of the fiscal year for which reclassification is sought (usually by September 1). Generally, hospitals must be proximate to the labor market area to which they are seeking reclassification and must demonstrate characteristics similar to hospitals located in that area. The MGCRB issues its decisions by the end of February for reclassifications that become effective for the following fiscal year (beginning October 1). The regulations applicable to reclassifications by the MGCRB are located in §§ 412.230 through 412.280. (We refer readers to a discussion in the FY 2002 IPPS final rule (66 FR 39874 and 39875) regarding how the MGCRB defines mileage for purposes of the proximity requirements.) The general policies for reclassifications and redesignations and the policies for the effects of hospitals’ reclassifications and redesignations on the wage index are discussed in the FY 2012 IPPS/LTCH PPS final rule for the FY 2012 final wage index (76 FR 51595 and 51596).

In addition, in the FY 2012 IPPS/ LTCH PPS final rule, we discussed the effects on the wage index of urban hospitals reclassifying to rural areas under § 412.103. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42332 through 42336), we finalized a policy to exclude the wage data of urban hospitals reclassifying to rural areas under § 412.103 from the calculation of the rural floor, but we reverted to the pre-FY 2020 policy in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49002 through 49004). Hospitals that are geographically located in States without any rural areas are ineligible to apply for rural reclassification in accordance with the provisions of § 412.103.

On April 21, 2016, we published an interim final rule with comment period (IFC) in the Federal Register (81 FR 23428 through 23438) that included provisions amending our regulations to allow hospitals nationwide to have simultaneous § 412.103 and MGCRB reclassifications. For reclassifications effective beginning FY 2018, a hospital may acquire rural status under § 412.103 and subsequently apply for a reclassification under the MGCRB using distance and average hourly wage criteria designated for rural hospitals. In addition, we provided that a hospital that has an active MGCRB reclassification and is then approved for redesignation under § 412.103 will not lose its MGCRB reclassification; such a hospital receives a reclassified urban wage index during the years of its active MGCRB reclassification and is still considered rural under section 1886(d) of the Act for other purposes.

We discussed that when there is both a § 412.103 redesignation and an MGCRB reclassification, the MGCRB reclassification controls for wage index calculation and payment purposes. Prior to FY 2024, we excluded hospitals with § 412.103 redesignations from the calculation of the reclassified rural wage index if they also have an active MGCRB reclassification to another area. That is, if an application for urban reclassification through the MGCRB is approved and is not withdrawn or terminated by the hospital within the established timelines, we consider the hospital's geographic CBSA and the urban CBSA to which the hospital is reclassified under the MGCRB for the wage index calculation. We refer readers to the April 21, 2016 IFC (81 FR 23428 through 23438) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56922 through 56930), in which we finalized the April 21, 2016 IFC, for a full discussion of the effect of simultaneous reclassifications under both the § 412.103 and the MGCRB processes on wage index calculations. For FY 2024 and subsequent years, we refer readers to section III.G.1 of the preamble of the FY 2024 IPPS/LTCH PPS final rule for discussion of our policy to include hospitals with a § 412.103 redesignation that also have an active MGCRB reclassification to another area in the calculation of the reclassified rural wage index (88 FR 58971 through 58977).

Comment: A commenter explained that due to the lag in IPPS rulemaking where the cost report data used to set rates can be from up to four years prior, there is a period of up to 4 years in which there is no AHW data associated with a newly created “B” campus in the case of a new multicampus hospital. The commenter encouraged CMS to close the lag of up to four years during which a newly merged provider is ineligible to receive a new MGCRB reclassification because there is no AHW data associated with the “B” provider number. The commenter suggested that CMS amend the regulations at § 412.230(d)(2) to provide that when a new owner accepts assignment of the existing hospital’s Medicare provider agreement, or in the case of a common ownership provider consolidation in which a new subcampus provider number is created, the wage data associated with the previous hospital’s provider number can be used in calculating the new hospital’s 3-year average hourly wage until such time as at least 1 year of wage data is accumulated under the new subprovider.

Response: We did not propose any modifications to the regulations at § 412.230(d)(2) and consider this comment out of scope of the proposed rule. We may consider revisiting our policies in future rulemaking to address the scenario of newly merged providers. We note that, as described in section III.G.6, remote locations with “B” provider number are eligible to receive a 5 percent cap on annual wage index decreases relative to the wage index assigned in the prior fiscal year.

Comment: A couple of commenters asked CMS to revise the regulations for appropriate proximity data at § 412.230(c)(1) to include waterways travelled by ferry boat as travel over an improved road. These commenters stated that each year, the MGCRB denies reclassification requests based on use of a ferry route to meet the proximity criteria, and these decisions are overturned via administrative appeal. The commenters urged CMS to eliminate unnecessary appeals by clarifying in the regulations that distance traveled by ferry boats is included when calculating proximity for reclassification requests.

Response: We agree with the commenter that a modification to § 412.230(c)(1) to

address waterways travelled by ferry boat could reduce administrative appeals. However, we did not propose any modifications to the regulations at § 412.230(c)(1) and are not finalizing any changes in this final rule. We note that a potential future proposal to modify § 412.230(c)(1) could contemplate whether the MGCRB should include or exclude the distances traveled via ferry boats for purposes of determining proximity during its review of reclassification requests.

a. Revision to Allow § 412.103 Hospitals to Use Geographic Area or Rural Area for
Reclassification

On May 10, 2021, we published an interim final rule with comment period (IFC) in the Federal Register (86 FR 24735 through 24739) that included provisions amending our regulations to allow hospitals with a rural redesignation to reclassify through the MGCRB using the rural reclassified area as the geographic area in which the hospital is located. We revised our regulation so that the redesignated rural area, and not the hospital's geographic urban area, is considered the area a § 412.103 hospital is located in for purposes of meeting MGCRB reclassification criteria, including the average hourly wage comparisons required by § 412.230(a)(5)(i) and (d)(1)(iii)(C). Similarly, we revised the regulations to consider the redesignated rural area, and not the geographic urban area, as the area a § 412.103 hospital is located in for purposes of applying the prohibition at § 412.230(a)(5)(i) on reclassifying to an area with a pre-reclassified average hourly wage lower than the pre-reclassified average hourly wage for the area in which the hospital is located. Effective for reclassification applications due to the MGCRB for reclassification beginning in FY 2023, a § 412.103 hospital could apply for a reclassification under the MGCRB using the State's rural area as the area in which the hospital is located. We refer readers to the May 10, 2021 IFC (86 FR 24735 through 24739) and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45187 through 45190), in which we finalized the May 10, 2021 IFC, for a full discussion of these policies.

In a comment on the May 10, 2021 IFC (86 FR 24735 through 24739), a commenter noted that the IFC states that a hospital reclassified under § 412.103 could potentially reclassify

to any area with a pre-reclassified average hourly wage that is higher than the pre-reclassified average hourly wage for the rural area of the state for purposes of the regulation at § 412.230(a)(5)(i). The commenter asserted that CMS' use of the word "could" in this context seems to suggest that CMS would allow the hospital to use either its home average hourly wage or the rural average hourly wage for purposes of the regulation at § 412.230(a)(5)(i). The commenter suggested that CMS allow both comparison options, because the rural average hourly wage may occasionally be higher than the hospital's home urban area's average hourly wage.

In response, we clarified that the commenter's interpretation of our policy is correct. We stated that while the court's decision in *Bates County Memorial Hospital v. Azar* requires CMS to permit hospitals to reclassify to any area with a pre-reclassified average hourly wage that is higher than the pre-reclassified average hourly wage for the rural area of the state, we do not believe that we are required to limit hospitals from using their geographic home area for purposes of the regulation at § 412.230(a)(5)(i). Therefore, we clarified that we would allow hospitals to reclassify to an area with an average hourly wage that is higher than the average hourly wage of either the hospital's geographic home area or the rural area (86 FR 45189).

While we clarified our policy in response to the aforementioned comment, the regulation text inadvertently was not similarly clarified to reflect this policy. Therefore, we proposed to revise the regulation text at § 412.230(a)(5)(i) to reflect our policy clarified in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45189). While it has been CMS' policy to allow a § 412.103 hospital to use either its geographic area or the rural area of the state for purposes of § 412.230(a)(5)(i), we believe that synchronizing the regulation text with our policy clarified in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45189) is necessary for consistency and to reduce unnecessary administrative appeals.

Specifically, we proposed to replace the phrase in the regulation at § 412.230(a)(5)(i) that reads "in the rural area of the state" with the phrase "either in its geographic area or in the rural area of the state." Section 412.230(a)(5)(i) with this proposed revision would read: An

individual hospital may not be redesignated to another area for purposes of the wage index if the pre-reclassified average hourly wage for that area is lower than the pre-reclassified average hourly wage for the area in which the hospital is located. An urban hospital that has been granted redesignation as rural under § 412.103 is considered to be located either in its geographic area or in the rural area of the state for the purposes of this paragraph (a)(5)(i).

Comment: A commenter supported this proposal to revise the regulations at § 412.230(a)(5)(i), stating that it would promote consistency between CMS policy and MGCRB practice by eliminating unnecessary administrative appeals.

Response: We appreciate the commenter's support. In consideration of the public comment received, we are finalizing our proposal to revise the regulations at § 412.230(a)(5)(i) as proposed without modification.

3. MGCRB Reclassification Issues for FY 2025

a. FY 2025 Reclassification Application Requirements and Approvals

As previously stated, under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. The specific procedures and rules that apply to the geographic reclassification process are outlined in regulations under 42 CFR 412.230 through 412.280. There are 470 hospitals approved for wage index reclassifications by the MGCRB starting in FY 2025. Because MGCRB wage index reclassifications are effective for 3 years, for FY 2025, hospitals reclassified beginning in FY 2023 or FY 2024 are eligible to continue to be reclassified to a particular labor market area based on such prior reclassifications for the remainder of their 3-year period. There were 256 hospitals approved for wage index reclassifications in FY 2023 that will continue for FY 2025, and 352 hospitals approved for wage index reclassifications in FY 2024 that will continue for FY 2025. Of all the hospitals approved for reclassification for FY 2023, FY 2024, and FY 2025, 1,078 hospitals (approximately 32.5 percent of IPPS hospitals) are in a MGCRB reclassification status for FY 2025 (with 237 of these hospitals reclassified back to their urban

geographic location). We refer readers to Section III.F.3.b of this final rule for information on the effects of implementation of new OMB labor market area delineations on reclassified hospitals.

Under the existing regulations at § 412.273, hospitals that have been reclassified by the MGCRB are permitted to withdraw their applications if the request for withdrawal is received by the MGCRB any time before the MGCRB issues a decision on the application, or after the MGCRB issues a decision, provided the request for withdrawal is received by the MGCRB within 45 days of the date that CMS' annual notice of proposed rulemaking is issued in the Federal Register concerning changes to the inpatient hospital prospective payment system and proposed payment rates for the fiscal year for which the application has been filed. Please note that Section III.F.3.c. of this final rule finalizes our proposal to change the deadline for the withdrawal requests to 45 days from the date of filing for public inspection of the proposed rule at the website of the Office of the Federal Register.

For information about the current process for withdrawing, terminating, or canceling a previous withdrawal or termination of a 3-year reclassification for wage index purposes, we refer readers to § 412.273, as well as the FY 2002 IPPS final rule (66 FR 39887 through 39888) and the FY 2003 IPPS final rule (67 FR 50065 through 50066). Additional discussion on withdrawals and terminations, and clarifications regarding reinstating reclassifications and “fallback” reclassifications were included in the FY 2008 IPPS final rule (72 FR 47333) and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38148 through 38150).

Applications for FY 2026 reclassifications are due to the MGCRB by September 1, 2024. This is also the current deadline for canceling a previous wage index reclassification withdrawal or termination under § 412.273(d) for the FY 2025 cycle.

Applications and other information about MGCRB reclassifications may be obtained beginning in mid-July 2024 via the internet on the CMS website at

<https://www.cms.gov/medicare/regulations-guidance/geographic-classification-review-board>.

This collection of information was previously approved under OMB Control Number 0938–0573, which expired on January 31, 2021. A reinstatement of this PRA package is currently being developed. The public will have an opportunity to review and submit comments regarding the reinstatement of this PRA package through a public notice and comment period separate from this rulemaking.

Comment: A commenter asked that CMS issue additional guidance to provide clarity for the process and timeline of MGCRB decisions, noting that there is no limit in how early the MGCRB can issue its decisions. The commenter requested that CMS prohibit the MGCRB from issuing decisions prior to the first week of February to allow hospitals ample time to submit documentation of rural reclassification, SCH and RRC status in support of their reclassification applications, or to submit withdrawals based on the January PUF. The commenter also suggested that to alleviate the burden of hospitals appealing MGCRB decisions, CMS could modify § 412.256(c) to provide for the MGCRB to also issue requests for additional information rather than deny applications due to incomplete information or if the MGCRB maps distance for proximity differently than the hospital's submission.

Response: We disagree with the commenter that CMS should limit how early the MGCRB can issue its decisions to provide time for hospitals to submit additional documentation. According to § 412.256(a)(2), a complete application must be received not later than the first day of the 13-month period preceding the Federal fiscal year for which reclassification is requested. Hospitals could avoid a denial due to incomplete information or avoid an administrative appeal by submitting a complete application at the time of filing, rather than relying on the MGCRB's current practice of accepting supporting documentation up until the date of review. Hospitals wishing to withdraw based on the January PUF can still withdraw after the MGCRB's decision in accordance with the regulations at § 412.273.

With regard to the commenter's suggested revision to the regulation at § 412.256(c), we did not propose any modifications to the regulations at § 412.256(c) and believe that the current

regulation at § 412.256(c) already provides for a robust and transparent process. Specifically, the regulation at 412.256(c)(1) states: “The MGCRB will review an application within 15 days of receipt to determine if the application is complete. If the MGCRB determines that an application is incomplete, the MGCRB will notify the hospital, with a copy to CMS, within the 15 day period, that it has determined that the application is incomplete and may dismiss the application if a complete application is not filed by September 1.” We reiterate that a hospital can avoid the administrative burden of an appeal by submitting a complete application at the time of filing.

b. Effects of Implementation of Revised OMB Labor Market Area Delineations on Reclassified Hospitals

(1) Background

Reclassifications granted under section 1886(d)(10) of the Act are effective for 3 fiscal years, so that a hospital or county group of hospitals would be assigned a wage index based upon the wage data of hospitals in the labor market area to which it reclassified for a 3-year period. Because hospitals that have been reclassified beginning in FY 2023, 2024, or 2025 were reclassified based on the current labor market delineations, under the revised OMB delineations based on the OMB Bulletin No. 23–01 beginning in FY 2025 the CBSAs to which they have been reclassified, or the CBSAs where they are located, may change. In the proposed rule, we encouraged hospitals with current reclassifications to verify area wage indexes in Table 2 in the appendix, and to confirm that the CBSAs to which they have been reclassified for FY 2025 would continue to provide a higher wage index than their geographic area wage index. Hospitals were able to withdraw or terminate their FY 2025 reclassifications by contacting the MGCRB within 45 days from the date the proposed rule was issued in the Federal Register (§ 412.273(c)).

(2) Assignment Policy for Hospitals Reclassified to a CBSA where One or More Counties Move to the Rural Area or One or More Rural Counties Move into the CBSA

We proposed that in the case where a CBSA adds a current rural county, or loses a current constituent rural county, a hospital’s current reclassification to the resulting CBSA would

be maintained. In some cases, a hospital may be located in a rural county that would join the CBSA to which the hospital is reclassified. We note that in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49977), CMS terminated reclassifications when, as a result of adopting the revised OMB delineations, a hospital's geographic county was located in the CBSA for which it was approved for MGCRB reclassification. At that time, there was no means for a hospital to obtain an MGCRB reclassification to its own geographic area (which we refer to as "home area" reclassifications). However, as discussed in the FY 2017 IPPS/ LTCH PPS final rule (81 FR 56925), "home area" reclassifications have since become possible as a result of the change in policy in the 2016 IFC (81 FR 23428 through 23438) discussed earlier allowing for dual reclassifications. We therefore do not believe it is necessary to terminate these reclassifications as we did in FY 2015. In general, once the MGCRB has approved a reclassification in accordance with subpart L of 42 CFR part 412, that reclassification remains in place for 3 years (see § 412.274(b)(2)) unless terminated by the hospital pursuant to § 412.273, and CMS does not reevaluate whether the hospital continues to meet the criteria for reclassification during the three-year period. As such, we proposed to maintain these as "home area" reclassifications instead of terminating them.

If a county is removed from a CBSA and becomes rural, a hospital in that county with a current "home area" reclassification would no longer be geographically located in the CBSA to which they are reclassified. We proposed that these reclassifications would no longer be considered "home area" reclassifications, and the hospital would be assigned the wage index applicable to other hospitals that reclassify into the CBSA (which may be lower than the wage index calculated for hospitals geographically located in the CBSA due to the hold harmless provision at section 1886(d)(8)(C)(i) of the Act).¹⁹²

¹⁹² In accordance with section 1886(d)(8)(C)(i) of the Act, the wage index for hospitals located in a geographic area cannot be reduced by the inclusion of reclassified hospitals. Therefore, if the inclusion of reclassified hospitals reduces the combined wage index by more than 1 percentage point, hospitals reclassified into the area would receive a wage index that includes their data, whereas hospitals geographically located there would receive a wage index that does not.

Finally, as discussed in section III.B.4, all the constituent counties of CBSA 14100 (Bloomsberg-Berwick, PA), CBSA 19180 (Danville, IL), CBSA 20700 (East Stroudsburg, PA) and CBSA 35100 (New Bern, NC) become rural under the revised OMB delineations. There are 6 hospitals with reclassifications to these previously urban CBSAs.

MGCRB Case No.	CCN	Reclassification CBSA
23C0258	140113	19180
24C0548	340142	35100
25C0039	390013	14100
25C0491	390137	20700
25C0492	390237	20700
24C0541	390045	14100

As there is no sufficiently similar urban CBSA in the revised delineations, we proposed that hospitals' MGCRB reclassifications to these CBSAs would be terminated for FY 2025. The effect of such terminations would be that these hospitals would receive the wage index for the CBSA in which they are geographically located, or in the case of hospitals with § 412.103 reclassification, the rural wage index. While we would prefer to maintain the remaining years of a MGCRB reclassification and transition these reclassified hospitals to the most appropriate CBSA under the revised delineations, because there are no urban counties remaining in the CBSAs listed above to which they are currently reclassified, there is no urban area to which they can be assigned that includes at least one county from the CBSA to which the MGCRB approved reclassification. We received no comments regarding our proposed policy to maintain MGCRB reclassification to a CBSA that either gains or loses one or more counties to or from a rural area, nor did we receive comments regarding our proposed policy for addressing home area reclassifications in these areas. We are finalizing these policies as proposed.

Comment: A commenter described the treatment of the hospitals that had active MGCRB reclassifications through FY 2025 to CBSAs where all constituent counties become rural under the revised OMB delineations as unfair. The commenter stated the proposal to terminate these reclassifications without reassignment to another urban area disadvantages

certain hospitals. The commenter contended that as many as four hospitals will be assigned a lower wage index based on their state's rural wage index or rural floor value. The commenter noted, as discussed above, that CMS does not generally reevaluate whether the hospital continues to meet the criteria for reclassification during the three-year period approved by the MGCRB. The commenter also cited impacts on the state rural wage index due to the requirement under section 1886(d)(8)(C)(ii) of the Act to exclude wage data for urban hospitals with dual § 412.103 and MGCRB reclassifications in calculating the rural wage index unless doing so reduces the rural wage index. The commenter stated that by terminating reclassifications in this manner, CMS has disadvantaged these hospitals by limiting their actions when it comes to their preferred wage index area. The commenter provided several alternative methods to assign the reclassification for these hospitals, including assigning the reclassification to their "home" geographic area, the next closest CBSA, or another CBSA to which the hospital can demonstrate it would meet reclassification criteria, or would have a high level of commuting interchange.

Response: We considered the commenter's concern and alternative suggestions to avoid terminating the MGCRB reclassifications. As we discussed previously, once approved by the MGCRB, a reclassification to the approved area is valid for a period of three fiscal years and generally is not subject to review. However, as discussed later in this section, we believe that when the CBSA to which reclassification was approved is substantially changed due to the adoption of revised labor market delineations, in order to continue to give effect to the approved reclassification, CMS should identify which area best represents the urban labor market to which a hospital's reclassification was approved. That is, when the labor market area delineations are updated, the new delineations may or may not contain a CBSA resembling that to which a hospital was previously reclassified. Where possible, CMS assigns a hospital's reclassification to a CBSA that contains the nearest urban county that was previously located in the CBSA to which the MGCRB approved reclassification or to another nearby CBSA that contains at least one urban county from the approved CBSA. In the case of these hospitals, which had reclassified to

urban CBSAs, this is not possible, as no part of their approved CBSA would remain urban under the revised delineations. Furthermore, section 1886(d)(10)(C) of the Act indicates that the Board is responsible for reviewing and approving MGCRB applications, and CMS’s policy aims to give effect only to reclassifications approved by the Board. By assigning a reclassified hospital to a CBSA that contains at least one urban county from its previously approved CBSA, we believe that we are substantively maintaining an existing approved reclassification. We do not believe it would be possible to assign a hospital temporarily to another CBSA (as suggested by the commenter) in an equitable manner. Any number of hospitals might hypothetically be eligible for MGCRB reclassification to different labor markets due to changes to labor market delineations and would potentially request immediate reclassification by CMS, rather than waiting at least one fiscal year to apply to the MGCRB. As stated in the proposed rule, we believe that the 5 percent cap on annual decreases in wage index values provides for an adequate transition for any hospitals that are negatively affected by the adoption of the revised OMB labor market delineations. CMS evaluated the impacts on the hospitals that the commenter asserted would be negatively impacted by our proposal to terminate their MGCRB reclassifications (listed in the table above). We find minimal impact on their wage index values for FY 2025. The wage index values for the six hospitals for which we proposed to terminate the reclassification are all increasing in FY 2025 compared to FY 2024 (in amounts ranging from 1.7 to 9.7 percent). While some of these hospitals may have been able to obtain higher wage index values by having an MGCRB reclassification to another urban area, the overall benefits would be nominal.

Furthermore, while we acknowledge that dual § 412.103 and MGCRB reclassification status has an impact on the rural wage index, as described in detail in the FY 2024 final rule (88 FR 58971 through 58977), we are not convinced that this impact warrants any special exception or treatment by CMS. Section 1886(d)(8)(C)(ii) of the Act ensures that the effects of MGCRB and “Lugar” reclassification policies do not reduce the rural wage index. In the case of a dual reclass hospital losing its MGCRB reclassification, each hospital had adequate time to cancel its

§ 412.103 reclassification by the June 9, 2024 deadline, if preferred. We believe this option allowed hospitals to evaluate whether the benefits of rural reclassification outweighed any negative impact its wage data would have on the rural wage index calculation. We do not believe our approach of terminating the reclassifications of hospitals that had reclassified to CBSAs that have no comparator under the revised OMB delineations negatively impacts the overall accuracy of the IPPS wage index.

For these reasons, CMS will not adopt any of the alternative reclassification assignment approaches suggested by the commenter. Each recommendation requires CMS to effectively initiate and approve a new MGCRB reclassification. In each recommended option, no part of any CBSA that could be assigned was included in the original application approved by the MGCRB. We are finalizing the policy to terminate MGCRB reclassifications in cases where the CBSA to which a hospital's reclassification was approved became rural under the revised OMB delineations adopted in this final rule.

(3) Assignment Policy for Hospitals Reclassified to a CBSA where the CBSA Number Changes, or the CBSA is Subsumed by another CBSA

We proposed that in the case of a CBSA that experiences a change in CBSA number, or where all urban counties in the CBSA are subsumed by another CBSA, MGCRB reclassifications approved to the FY 2024 CBSA would be assigned the revised FY 2025 CBSA (as described in the section III.B.6). In some cases, this reconfiguration of CBSAs would result in an MGCRB reclassification approved to a different area becoming a "home area" reclassification, if a hospital's current geographic urban CBSA is subsumed by its reclassified CBSA. Otherwise, the current reclassification would continue to the proposed revised CBSA number.

We did not receive any comments specific to this proposal and are finalizing this policy to assign the revised CBSA number to hospitals reclassified to a CBSA where the CBSA number changes, or the CBSA is subsumed by another CBSA.

(4) Assignment Policy for Hospitals Reclassified to CBSAs where One or More Counties Move to a New or Different Urban CBSA

In some cases, adopting the revised OMB delineations would result in one or more counties splitting apart from their current CBSAs to form new CBSAs, or counties shifting from one CBSA designation to another CBSA. If CBSAs are split apart, or if counties shift from one CBSA to another under the revised OMB delineations, for hospitals that have reclassified to these CBSAs we must determine which reclassified area to assign to the hospital for the remainder of a hospital’s 3-year reclassification period.

Consistent with the policy implemented in FY 2021 (85 FR 58743 through 58753), we proposed to assign current “home area” reclassifications to these CBSAs to the hospital’s geographic CBSA. That is, hospitals that were approved for MGCRB reclassification to the geographic area they are located in effective for FYs 2023, 2024, or 2025 would continue to be assigned a reclassification to their geographic “home area.” The assigned “home area” reclassification CBSA may be different from previous years if the hospital is located in a county that was relocated to a new or different urban CBSA.

The following is a table of hospitals with current “home area” reclassification to CBSAs where one or more counties move to a new or different urban CBSA under the revised OMB delineations. The reclassification noted by an asterisk on the “MGCRB Case Number” was withdrawn for FY 2025, but may be reinstated for FY 2026.

ASSIGNED HOME AREA RECLASSIFICATIONS			
CCN	MGCRB CASE NUMBER	Approved CBSA	Final FY 25 CBSA
100248	25C0431	45300	41304
150035	24C0222	23844	29414
190036	25C0118	35380	35380
220015	25C0368	11200	11200
360075	25C0526	17460	17410
360077	25C0527	17460	17410
360123	25C0525	17460	17410

360137	24C0418	17460	17410
360180	24C0023	17460	17410
360230	25C0528	17460	17410
490113	25C0250*	47894	11694
500005	24C0300	42644	42644

Consistent with the policy CMS implemented in the FY 2005 IPPS final rule (69 FR 49054 through 49056), the FY 2015 IPPS final rule (79 FR 49973 through 49977), and in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58743 through 58753), for FY 2025, if a CBSA would be reconfigured due to adoption of the revised OMB delineations and it would not be possible for the reclassification to continue seamlessly to the reconfigured CBSA (not including “home area” reclassifications, which were discussed previously), we believe it would be appropriate for us to determine the best alternative location to assign current reclassifications for the remaining 3 years. Therefore, to maintain the integrity of a hospital’s 3-year reclassification period, we proposed that current geographic reclassifications (applications approved effective for FY 2023, FY 2024, or FY 2025) that would be affected by CBSAs that are split apart or counties that shift to another CBSA under the revised OMB delineations, would ultimately be assigned to a CBSA under the revised OMB delineations that contains at least one county (or county equivalent) from the reclassified CBSA under the current FY 2024 delineations, and that would be generally consistent with rules that govern geographic reclassification. That is, consistent with the policy finalized in FY 2015 (79 FR 49973) we proposed a policy that other affected reclassified hospitals be assigned to a CBSA that would contain the most proximate county that (1) is located outside of the hospital’s proposed FY 2025 geographic labor market area, and (2) is part of the original FY 2024 CBSA to which the hospital is reclassified. We believe that assigning reclassifications to the CBSA that contains the nearest county that meets the aforementioned criteria satisfies the statutory requirement at section 1886(d)(10)(D)(v) of the Act by maintaining reclassification status for a period of 3 fiscal years, while generally respecting the longstanding principle of geographic proximity in the labor market reclassification process. For county group reclassifications, we proposed that we would follow the same policy, except that we would

reassign hospitals in a county group reclassification to the CBSA under the revised OMB delineations that contains the county to which the majority of hospitals in the group reclassification are geographically closest. We also proposed to allow such hospitals, or county groups of hospitals, to submit a request to the wageindex@cms.hhs.gov mailbox for reassignment to another proposed CBSA that would contain a county that is part of the current CBSA to which it was approved to be reclassified (based on FY 2024 delineations) if the hospital or county group of hospitals can demonstrate compliance with applicable reclassification proximity rules, as described later in this section.

The following Table X provides a list of current FY 2024 CBSAs (column 1) where one or more counties would be relocated to a new or different urban CBSA under the proposed policy. Hospitals with active MGCRB reclassifications into the current FY 2024 CBSAs in column 1 would be subject to the reclassification assignment policy described in this subsection. The third column of “eligible” CBSAs lists all proposed revised CBSAs that contain at least one county that is part of the current FY 2024 CBSA (in column 1).

TABLE X. CBSAS WHERE ONE OR MORE COUNTIES WILL BE RELOCATED TO A NEW OR DIFFERENT URBAN CBSA.		
Approved CBSA	Approved CBSA Name	Eligible CBSA
42644	Seattle-Bellevue-Kent, WA	42644, 21794
12060	Atlanta-Sandy Springs-Alpharetta, GA	12054, 31924
29404	Lake County-Kenosha County, IL-WI	29404, 28450
45300	Tampa-St. Petersburg-Clearwater, FL	45294, 41304
44140	Springfield, MA	44140, 11200
35380	New Orleans-Metairie, LA	35380, 43640
45780	Toledo, OH	45780, 41780
21060	Elizabethtown-Fort Knox, KY	21060, 31140
47894	Washington-Arlington-Alexandria, DC-VA-MD-WV	47764, 11694, 30500
34820	Myrtle Beach-Conway-North Myrtle Beach, SC-NC	34820, 48900
34100	Morristown, TN	34100, 28940

We did not receive any comments regarding the MGCRB reclassification assignment and reassignment policy. We are finalizing the policy as proposed.

We received five requests to reassign the assigned CBSA to a different eligible CBSA (as described in Table X). One request was related to the comment summarized above regarding the termination of reclassification for hospitals reclassified to areas where all counties in the CBSA would become rural. This hospital (CCN 140113) requested to have its MGCRB reclassification reassigned to its geographic “home” CBSA 16580. We did not propose this CBSA as eligible for reassignment and are denying this request for the reasons discussed earlier. We note that this hospital, by cancelling its current § 412.103 rural reclassification, will receive the wage index for its geographic CBSA in FY 2025. The remaining requests are as follows:

CCN	MGCRB Case No.	Assigned CBSA	Reassignment Request
110001	24C0022	12054	31924
250162	25C0244	43640	35380
490113	25C0250	11694	47764
420085	25C0464	34820	48900

We note that MGCRB Case No. 25C0250 (CCN 490113) was a “home area” reclassification and was assigned its new geographic “home area” in the proposed rule. We did not explicitly address in the proposed rule whether hospitals with “home area” reclassifications to a CBSA that had one or more counties move to a new or different CBSA would be eligible to request reassignment to that new or different CBSA. However, we find that the case meets the proposed requirements for reassignment applicable generally to hospitals whose reclassifications are reassigned on the basis of changes to the CBSA under the revised OMB delineations, as the hospital is requesting to be reclassified to an area that is a) not its geographic CBSA and b) contains at least one county from its approved CBSA.

After reviewing the submitted materials, we have determined these four requests meet the appropriate distance requirements for reassignment and have approved the requests as described.

Table Y lists all hospitals subject to our reclassification assignment and reassignment policy and the CBSA assigned or reassigned for FY 2025 under this policy. Cases marked with an asterisk were withdrawn or terminated for FY 2025 but may be reinstated in FY 2026.

We note that the Office of Hearings Case and Document Management System (OH CDMS) may not be updated to reflect different CBSA numbers for reclassification assignments and reassignments finalized in this rule. When making withdrawal, termination, or reinstatement requests for these cases, the original CBSA number may be displayed in the OH CDMS. If hospitals require further assistance in this matter, please contact wageindex@cms.hhs.gov.

(5) Assignment Policy for Hospitals Reclassified to CBSAs Reconfigured Due to the Migration to Connecticut Planning Regions

As discussed in section III.B., CMS is adopting the revised OMB Bulletin No. 23-01 delineations, which use planning regions instead of counties as the basis for CBSA construction in the State of Connecticut. There are five current urban CBSAs that include at least one county in Connecticut. These are 14860 (Bridgeport-Stamford-Norwalk, CT), 25540 (Hartford-East Hartford-Middletown, CT), 35300 (New Have-Milford, CT), 35980 (Norwich-New London, CT), and 49340 (Worcester, MA-CT). In the FY 2025 CBSAs, based on the OMB Bulletin No.

23-01 delineations, there are five CBSAs that will contain at least one county-equivalent “planning region.” The five CBSAs are 14860 (Bridgeport-Stamford-Danbury, CT), 25540 (Hartford-West Hartford-East Hartford, CT), 35300 (New Haven, CT), 35980 (Norwich-New London-Willimantic, CT), and 47930 (Waterbury-Shelton, CT).

As there was significant reconfiguration of the CBSAs due to the transition from counties to planning regions, we proposed to adopt a similar assignment policy for hospitals reclassified to CBSAs that currently include Connecticut counties as we did for hospitals reclassified to CBSAs where one or more counties move to a new or different urban CBSA (described in the previous subsection).

The following table lists all current “home area” reclassifications to one of the CBSAs that currently contain at least one county in Connecticut.

ASSIGNED HOME AREA RECLASSIFICATIONS			
CCN	Case Number	Approved CBSA	FY 25 CBSA
070028	23C0454	14860	14860
07B022	24C0497	14860	14860
070034	25C0394	14860	14860
070033	25C0396	14860	14860

The following table provides a list of current FY 2024 CBSAs (column 1) that contain at least one county in Connecticut. Under the proposal, hospitals with active MGCRB reclassifications into the CBSAs in column 1 would be subject to the reclassification assignment policy. The third column of “eligible” CBSAs lists all revised CBSAs that contain at least one planning region that is part of the current FY 2025 CBSA (in column 1). Consistent with the policy discussed in the previous section, we proposed a policy that affected reclassified hospitals be assigned to a CBSA that would contain the most proximate planning region that (1) is located outside of the hospital’s proposed FY 2025 geographic labor market area, and (2) contains a portion of a county included in the original FY 2024 CBSA to which the hospital is reclassified.

TABLE X. CBSAS WHERE ONE OR MORE COUNTY EQUIVALENTS WILL BE RELOCATED TO A NEW OR DIFFERENT URBAN CBSA		
Approved CBSA	Approved CBSA Name	Eligible CBSA
14860	Bridgeport-Stamford-Norwalk, CT	14860, 47930
25540	Hartford-East Hartford-Middletown, CT	25540, 47930

35300	New Haven-Milford, CT	35300, 47930
35980	Norwich-New London, CT	35980, 25540
49340	Worcester, MA-CT	49340, 35980

We believe that assigning reclassifications to the CBSA that contains the nearest county-equivalent planning region that meets the aforementioned criteria satisfies the statutory requirement at section 1886(d)(10)(v) of the Act by maintaining reclassification status for a period of 3 fiscal years, while generally respecting the longstanding principle of geographic proximity in the labor market reclassification process. For county group reclassifications, we would follow our proposed policy, as previously discussed, except that we proposed to reassign hospitals in a county group reclassification to the CBSA under the revised OMB delineations that contains the county-equivalent to which the majority of hospitals in the group reclassification are geographically closest. We also proposed to allow such hospitals, or county groups of hospitals, to submit a request to the wageindex@cms.hhs.gov mailbox for reassignment to another proposed CBSA that would contain a county that is part of the current CBSA to which it was approved to be reclassified (based on FY 2024 delineations) if the hospital or county group of hospitals can demonstrate compliance with applicable reclassification proximity rules.

We did not receive any comments regarding the MGCRB reclassification assignment and reassignment policy due to the adoption of the revised Connecticut county-equivalents. We are finalizing the policy as proposed.

We received two requests from hospitals affected by this policy to reassign the assigned CBSA to a different eligible CBSA (as described in Table X).

CCN	MGCRB Case No.	Assigned CBSA	Reassignment Request
070020	25C0245	47930	14860
070025	25C0377	47930	35300

After reviewing the submitted materials, we have determined both requests meet the appropriate distance requirements for reassignment and have approved these requests.

Table Y lists all hospitals subject to our reclassification assignment and reassignment policy for CBSAs reconfigured due to the migration to Connecticut planning regions and the CBSA assigned or reassigned for FY 2025 under this policy. Cases marked with an asterisk were withdrawn for FY 2025 but may be reinstated in FY 2026.

TABLE Y. HOSPITALS SUBJECT TO RECLASSIFICATION ASSIGNMENT POLICY			
CCN	MGCRB Case No.	Approved CBSA	Final Rule CBSA
070002	23C0378	35300	47930
070004	25C0393	14860	14860
070017	25C0376	14860	47930
070020	25C0245	14860	14860
070025	25C0377	35300	35300
070031	23C0418	14860	14860
070035	25C0379	14860	47930
070036	25C0399*	35980	35980
220020	23C0205	49340	49340
220077	24C0318	49340	49340
410009	25G0087	49340	35980

We note that the OH CDMS may not be updated to reflect different CBSA numbers for reclassification assignments and reassignments finalized in this rule. When making withdrawal, termination, or reinstatement requests for these cases, the original CBSA number may be displayed in the OH CDMS. If hospitals require further assistance in this matter, please contact wageindex@cms.hhs.gov.

d. Change to Timing of Withdrawals at 412.273(c)

As mentioned in section III.F.3.a of this final rule, under the regulations at § 412.273, hospitals that have been reclassified by the MGCRB are permitted to withdraw or terminate an approved reclassification. The current regulations at § 412.273(c)(1)(ii) and (c)(2) for withdrawals and terminations require the request to be received by the MGCRB within 45 days of the date that CMS' annual notice of proposed rulemaking is issued in the Federal Register concerning changes to the IPPS and proposed payment rates.

In the 2018 IPPS/LTCH PPS Final Rule (82 FR 38148 through 38150), we finalized changes to the 45-day notification rules so that hospitals have 45 days from the public display of the annual proposed rule for the IPPS instead of 45 days from publication to inform CMS of certain requested changes relating to the development of the hospital wage index. We stated that we believe that the public has access to the necessary information from the date of public display of the proposed rule at the Office of the Federal Register and on its website to make the decisions at issue. While we finalized changes to the 45-day notification rules for decisions about the outmigration adjustment and waiving Lugar status, we did not finalize a change to the timing for withdrawing or terminating MGCRB decisions.

Instead, in response to comments expressing concern that some hospitals may be disadvantaged if the Administrator's decision on a hospital's request for review of an MGCRB decision has not been issued prior to the proposed deadline for submitting withdrawal or termination requests to the MGCRB, we maintained our existing policy of requiring hospitals to request from the MGCRB withdrawal or termination of an MGCRB reclassification within 45 days of issuance in the **Federal Register**. We stated in the FY 2018 IPPS/ LTCH PPS final rule (82 FR 38149) that considering the usual dates of the MGCRB's decisions (generally early February) and of the public display of the IPPS proposed rule, the maximum amount of time for an Administrator's decision to be issued may potentially extend beyond the proposed deadline of 45 days from the date of public display.

However, the MGCRB currently issues decisions earlier, in January, which mitigates this concern. For example, the MGCRB has sent decision letters to hospitals via email on January 23, 2024, for the FY 2025 cycle and on January 31, 2023, for the FY 2024 cycle. We believe that the MGCRB will continue to issue its decisions in January, due to their upgrade to an electronic system that expedites processing applications and issuing decision letters efficiently. The regulations at §§ 412.278(a) and (b)(1) provide that a hospital may request the Administrator to review the MGCRB decision within 15 days after the date the MGCRB issues its decision. Under

§ 412.278(f)(2)(i), the Administrator issues a decision not later than 90 days following receipt of the party's request for review. Consequently, MGCRB decisions could be issued as late as the end of January, and the 15 days the hospital has to request the Administrator's review, plus the 90 days the Administrator has to issue a decision, would result in hospitals receiving the results of the review prior to 45 days after display (which would be May 16th if the proposed rule is displayed on the target date of April 1, but later if there is a delay).

While the current timing of MGCRB decisions in January allows for hospitals to receive the results of any review prior to 45 days after display of the proposed rule for the relevant FY, and we expect this timing to continue, we acknowledge that section 1886(d)(10)(C)(iii)(I) of the Act grants the MGCRB 180 days after the application deadline to render a decision. If the MGCRB were to delay issuing decisions until the last day possible according to the Statute, which is February 28th, a hospital requesting the Administrator's review may not receive the results of the review prior to 45 days after display.

Therefore, we proposed to change the deadline for hospitals to withdraw or terminate MGCRB classifications from within 45 days of the date that the annual notice of proposed rulemaking is issued in the Federal Register to within 45 days of the public display of the annual notice of proposed rulemaking on the website of the Office of the Federal Register, or within 7 calendar days of receiving a decision of the Administrator in accordance with § 412.278 of this part, whichever is later. This change will synchronize this deadline with other wage index deadlines, such as the deadlines for accepting the outmigration adjustment and waiving or reinstating Lugar status. As hospitals typically know the results of the Administrator's decisions on reviews within 45 days of the public display of the proposed rule for the upcoming fiscal year, we believe hospitals have access to the information they need to make reclassification decisions. In the rare circumstance that a hospital would not receive the results of the review prior to 45 days of the public display date, or receives the results of the review less than 7 days before the deadline, the hospital would have 7 calendar days after receiving the Administrator's decision to

request to withdraw or terminate MGCRB classification. While we do not anticipate frequent use of this extension, we believe this fully addresses the concern that some hospitals may be disadvantaged if the Administrator's decision on a hospital's request for review of an MGCRB decision has not been issued prior to the deadline for submitting withdrawal or termination requests to the MGCRB. We believe that 7 days after receiving the Administrator's decision affords hospitals adequate time to make calculated reclassification decisions.

Specifically, we proposed to change the words "within 45 days of the date that CMS' annual notice of proposed rulemaking is issued in the Federal Register" in the regulation text at 412.273(c)(1)(ii) and 412.273(c)(2) for withdrawals and terminations to "within 45 days of the date of filing for public inspection of the proposed rule at the website of the Office of the Federal Register, or within 7 calendar days of receiving a decision of the Administrator in accordance with § 412.278 of this part, whichever is later".

Comment: We received several comments opposing our proposal. Commenters expressed that the proposed change would give providers less time to analyze their reclassification options and to make appropriate elections. Some of the commenters pointed out that under CMS' proposal, hospitals would have less time to make decisions based on the final wage data PUF, which was issued this year on April 29. A commenter asked that if CMS finalizes this proposal, it should make available all relevant information for a hospital to make an informed decision by the same public display date, including: the final wage data PUF, an updated list of Administrator appeal decisions, and the MGCRB's listing of its FY 2025 group & individual decisions. Another commenter noted that the timeframe could be even tighter in future years if the target date of April 1st for issuing the IPPS proposed rule is met, which would give a hospital only 14 business days from the April 29th PUF until 45 days from display (May 16th) to make reclassification decisions.

Response: We understand the commenters' concern that the proposal shortens the timeframe for hospitals to make reclassification decisions. However, we note that none of the

commenters maintained that hospitals would not have access to the information necessary to make an informed decision, just that the timeframe would be shortened, which our proposal discusses is necessary to synchronize this deadline with other wage index deadlines. We also note that none of the commenters requested that we modify the proposed extended deadline of within 7 calendar days of receiving a decision of the Administrator. Therefore, we continue to believe that the revised timeframe provides hospitals adequate time to access the information they need to make informed reclassification decisions. Furthermore, the other information that commenters requested be made available by the start of the 45-day timeframe, such as the final wage data PUF and administrative appeal decisions, is not necessarily available at the current start of the 45 day timeframe. Hospitals currently expect to begin evaluating their reclassification options based on the best available information and may choose to finalize their decisions as more updated information becomes available during the timeframe for withdrawals. Other than adjusting to a shortened timeframe, we believe that this proposal does not create a new disadvantage for hospitals, nor does it prevent hospitals from making informed reclassification decisions since more updated information does become available during the timeframe for withdrawals. For the reasons enumerated in our proposal and in this response, we continue to believe that the revised timeline provides hospitals adequate time to make informed decisions about their reclassification options.

Therefore, we are finalizing our proposed changes without modification to the regulations for withdrawals and terminations at § 412.273(c)(1)(ii) & (c)(2).

4. Redesignations Under Section 1886(d)(8)(B) of the Act

a. Lugar Status Determinations

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), we adopted the policy that, beginning with FY 2012, an eligible hospital that waives its Lugar status to receive the out-migration adjustment has effectively waived its deemed urban status and, thus, is rural for all purposes under the IPPS effective for the fiscal year in which the hospital receives the

outmigration adjustment. In addition, in that rule, we adopted a minor procedural change that would allow a Lugar hospital that qualifies for and accepts the out-migration adjustment (through written notification to CMS within 45 days from the issuance of the proposed rule in the Federal Register) to waive its urban status for the full 3-year period for which its out-migration adjustment is effective. By doing so, such a Lugar hospital would no longer be required during the second and third years of eligibility for the out-migration adjustment to advise us annually that it prefers to continue being treated as rural and receive the out-migration adjustment. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56930), we further clarified that if a hospital wishes to reinstate its urban status for any fiscal year within this 3-year period, it must send a request to CMS within 45 days of the issuance of the proposed rule in the Federal Register for that particular fiscal year. We indicated that such reinstatement requests may be sent electronically to wageindex@cms.hhs.gov. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38147 through 38148), we finalized a policy revision to require a Lugar hospital that qualifies for and accepts the out-migration adjustment, or that no longer wishes to accept the out-migration adjustment and instead elects to return to its deemed urban status, to notify CMS within 45 days from the date of public display of the proposed rule at the Office of the Federal Register. These revised notification timeframes were effective beginning October 1, 2017. In addition, in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38148), we clarified that both requests to waive and to reinstate “Lugar” status may be sent to wageindex@cms.hhs.gov. To ensure proper accounting, we request hospitals to include their CCN, and either “waive Lugar” or “reinstate Lugar”, in the subject line of these requests. We received five timely requests for hospitals to accept the county out-migration adjustment in lieu of its “Lugar” reclassification. The requests were from CCNs 150030, 320033, 340126, 390183, and 390330. When applicable, the hospitals were informed that this election would result in a cancelation of their rural reclassification status under § 412.103, effective Oct 1, 2024. We also informed hospital that for the request to be approved, the hospital must withdraw or terminate any active MGCRB reclassification. All requests have

been approved and will remain in effect for the remainder of the 3-year out-migration adjustment period.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42314 and 42315), we clarified that in circumstances where an eligible hospital elects to receive the outmigration adjustment within 45 days of the public display date of the proposed rule at the Office of the Federal Register in lieu of its Lugar wage index reclassification, and the county in which the hospital is located would no longer qualify for an outmigration adjustment when the final rule (or a subsequent correction notice) wage index calculations are completed, the hospital's request to accept the outmigration adjustment would be denied, and the hospital would be automatically assigned to its deemed urban status under section 1886(d)(8)(B) of the Act. We stated that final rule wage index values would be recalculated to reflect this reclassification, and in some instances, after taking into account this reclassification, the out-migration adjustment for the county in question could be restored in the final rule. However, as the hospital is assigned a Lugar reclassification under section 1886(d)(8)(B) of the Act, it would be ineligible to receive the county outmigration adjustment under section 1886(d)(13)(G) of the Act.

b. Effects of Implementation of Revised OMB Labor Market Area Delineations on Redesignations Under Section 1886(d)(8)(B) of the Act

As discussed in section III.A.2. of the preamble of this final rule, CMS is updating the CBSA labor market delineations to reflect the changes made in the July 15, 2023, OMB Bulletin 23-01. In that section, we noted that 54 currently rural counties will be added to new or existing urban CBSAs. Of those 54 counties, 22 are currently deemed urban under section 1886(d)(8)(B) of the Act. We proposed that hospitals located in such a "Lugar" county, barring another form of wage index reclassification, are assigned the reclassified wage index of a designated urban CBSA. Section 1886(d)(8)(B) of the Act defines a deemed urban county as a "rural county adjacent to one or more urban areas" that meets certain commuting thresholds. Since we proposed to modify the status of these 22 counties from rural to urban, they would no longer

qualify as “Lugar” counties. Hospitals located within these counties would be considered geographically urban under the revised OMB delineations. The table in this section of this rule lists the counties that are no longer deemed urban under section 1886(d)(8)(B) of the Act under the revised OMB delineations. We note that in almost all instances, the “Lugar” county is joining the same (or a substantially similar) urban CBSA as it was deemed to in FY 2024.

COUNTIES THAT WILL NO LONGER BE DEEMED URBAN UNDER 1886(d)(8)(B) OF THE ACT DUE TO URBAN GEOGRAPHICAL STATUS			
FIPS County Code	County Name	Proposed FY 25 CBSA	Proposed FY 25 CBSA Name
01087	MACON	12220	Auburn-Opelika, AL
01127	WALKER	13820	Birmingham, AL
12133	WASHINGTON	37460	Panama City-Panama City Beach, FL
13187	LUMPKIN	12054	Atlanta-Sandy Springs-Roswell, GA
15005	KALAWAO	27980	Kahului-Wailuku, HI

18159	TIPTON	26900	Indianapolis-Carmel-Greenwood, IN
18179	WELLS	23060	Fort Wayne, IN
21179	NELSON	31140	Louisville/Jefferson County, KY-IN
22053	JEFFERSON DAVIS	29340	Lake Charles, LA
26015	BARRY	24340	Grand Rapids-Wyoming-Kentwood, MI
28009	BENTON	32820	Memphis, TN-MS-AR
32019	LYON	39900	Reno, NV
39007	ASHTABULA	17410	Cleveland, OH
42073	LAWRENCE	38300	Pittsburgh, PA
45087	UNION	43900	Spartanburg, SC
46033	CUSTER	39660	Rapid City, SD
47081	HICKMAN	34980	Nashville-Davidson--Murfreesboro--Franklin, TN
48007	ARANSAS	18580	Corpus Christi, TX
48035	BOSQUE	47380	Waco, TX
51063	FLOYD	13980	Blacksburg-Christiansburg-Radford, VA
51181	SURRY	47260	Virginia Beach-Chesapeake-Norfolk, VA-NC

We note that in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49973 through 49977), when we adopted large scale changes to the CBSA labor market delineations based on the new 2010 decennial census, we also re-evaluated the commuting data thresholds for all eligible rural counties in accordance with the requirement set forth in section 1886(d)(8)(B)(ii)(II) of the Act to base the list of qualifying hospitals on the most recently available decennial population data. Therefore, we proposed to reevaluate the “Lugar” status for all counties in FY 2025 using the same commuting data table used to develop the OMB Bulletin No. 23-01 revised delineations. The data table is the “2016-2020 5-Year American Community Survey Commuting Flows” (available on OMB’s website: <https://www.census.gov/data/tables/2020/demo/metro->

micro/commuting-flows-2020.html). We also proposed to use the same methodology discussed in the FY 2020 IPPS/LTCH final rule (84 FR 42315 through 42318) to assign the appropriate reclassified CBSA for hospitals in “Lugar” counties. That is, when assessing which CBSA to assign, we will sum the total number of workers that commute from the “Lugar” county to both “central” and “outlying” urban counties (rather than just “central” county commuters).

By applying the 2020 American Community Survey (ACS) commuting data to the updated OMB labor market delineations, we proposed the following changes to the current “Lugar” county list: 17 of the 53 urban counties that were proposed to become rural under the revised OMB delineations, and both newly created rural Connecticut planning region county-equivalents would qualify as “Lugar” counties. We also determined that, as proposed, 33 rural counties (an approximately 11 hospitals) would lose “Lugar” status, as the county no longer meets the commuting thresholds or adjacency criteria specified in section 1886(d)(8)(B) of the Act.

We noted that Litchfield County, CT is no longer listed as a “Lugar” county as it is not included in the revised CBSA delineations. The majority of Litchfield County is now within the Northwest Hills Planning Region county-equivalent, with some of the county’s current constituent townships assigned to other urban county-equivalents. We also noted that in prior fiscal years, Merrimack County, NH was included as a “Lugar” redesignated county pursuant to the provision at § 412.62(f)(1)(ii)(B), which deems certain rural counties in the New England region to be part of urban areas. Merrimack County now meets the commuting standards to be considered deemed urban under the “Lugar” statute at section 1886(d)(8)(B) of the Act.

We recognize that the changes to the “Lugar” list may have negative financial impacts for hospitals that lose deemed urban status. We believe that the 5 percent cap on negative wage index changes discussed in section III.G.6, would mitigate significant negative payment impacts for FY 2025, and would afford hospitals adequate time to fully assess any additional

reclassification options available to them. We also note that special statuses limited to hospitals located in rural areas (such as MDH or SCH status) may be terminated if hospitals are deemed urban under section 1886(d)(8)(B) of the Act. In these cases, hospitals should apply for rural reclassification status under § 413.103 prior to October 1, 2024, if they wish to ensure no disruption in status.

We did not receive any comments regarding the implementation of revised OMB labor market area delineations for redesignations under section 1886(d)(8)(B) of the Act. We are finalizing without modification the list of proposed qualifying counties listed in the prior table.

G. Wage Index Adjustments: Rural Floor, Imputed Floor, State Frontier Floor, Out-Migration Adjustment, Low Wage Index, and Cap on Wage Index Decrease Policies

The following adjustments to the wage index are listed in the order that they are generally applied. First, the rural floor, imputed floor, and state frontier floor provide a minimum wage index. The rural floor at section 4410(a) of the Balanced Budget Act of 1997 (Pub. L. 105–33) provides that the wage index for hospitals in urban areas of a State may not be less than the wage index applicable to hospitals located in rural areas in that State. The imputed floor at section 1886(d)(3)(E)(iv) of the Act provides a wage index minimum for all-urban states. The state frontier floor at section 1886(d)(3)(E)(iii) of the Act requires that hospitals in frontier states cannot be assigned a wage index of less than 1.0000. Next, the out-migration adjustment at section 1886(d)(13)(A) of the Act is applied, potentially increasing the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county but work in a different county or counties with a higher wage index. The low-wage index hospital adjustment finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42325 through 42339) is then applied, which increases the wage index values for hospitals with wage indexes at or below the 25th percentile. Finally, all hospital wage index decreases are capped at 95 percent of the hospital’s final wage index in the prior fiscal year, according to the policy finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018 through 49021).

1. Rural Floor

Section 4410(a) of the Balanced Budget Act of 1997 (Pub. L. 105–33) provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. This provision is referred to as the rural floor. Section 3141 of the Patient Protection and Affordable Care Act (Pub. L. 111–148) also requires that a national budget neutrality adjustment be applied in implementing the rural floor. Based on the FY 2025 wage index associated with this final rule (which is available via the internet on the CMS website), and based on the calculation of the rural floor including the wage data of hospitals that have reclassified as rural under § 412.103, we estimate that 771 hospitals would receive the rural floor in FY 2025. The budget neutrality impact of the proposed application of the rural floor is discussed in section II.A.4.e. of Addendum A of this final rule.

In the FY 2023 IPPS/ LTCH PPS final rule (87 FR 48784), CMS finalized a policy change to calculate the rural floor in the same manner as we did prior to the FY 2020 IPPS/LTCH PPS final rule, in which the rural wage index sets the rural floor. We stated that for FY 2023 and subsequent years, we would include the wage data of § 412.103 hospitals that have no MGCRB reclassification in the calculation of the rural floor, and include the wage data of such hospitals in the calculation of “the wage index for rural areas in the State in which the county is located” as referred to in section 1886(d)(8)(C)(iii) of the Act.

In the FY 2024 IPPS/LTCH final rule (88 FR 58971-77), we finalized a policy change beginning that year to include the data of *all* § 412.103 hospitals, even those that have an MGCRB reclassification, in the calculation of the rural floor and the calculation of “the wage index for rural areas in the State in which the county is located” as referred to in section 1886(d)(8)(C)(iii) of the Act. We explained that after revisiting the case law, prior public comments, and the relevant statutory language, we agreed that the best reading of section 1886(d)(8)(E)’s text that CMS “shall treat the [§ 412.103] hospital as being located in the rural

area” is that it instructs CMS to treat § 412.103 hospitals the same as geographically rural hospitals for the wage index calculation.

Accordingly, in the FY 2024 IPPS/ LTCH PPS final rule, we finalized a policy to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to exclude “dual reclass” hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) that are implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. (For additional information on these changes, we refer readers to the FY 2024 IPPS/ LTCH PPS final rule (88 FR 58971 through 58977).)

Comment: Commenters supported CMS’ continued treatment of hospitals reclassified as rural under § 412.103 in the same manner as geographically rural hospitals for the rural wage index and rural floor calculations. A commenter specifically agreed with CMS’ interpretation of case law as discussed in the proposed rule and stated that restoring equality between a state’s rural floor and its rural wage index is an appropriate and fair implementation of the statute. One commenter requested that CMS confirm whether the pre-reclassified wage index for each hospital reflects if the hospital has reclassified under § 412.103.

Multiple commenters expressed concern over the rural floor budget neutrality factor. A commenter disagreed with CMS’ decision to budget neutralize the policy to include hospitals with simultaneous § 412.103 and MGCRB reclassifications in the rural wage index calculation. The commenter stated that some hospitals are paying a substantial cost for an artificial increase in the wage index of other hospitals, and that this cost escalates as hospitals around the country make reclassification decisions to take advantage of this policy change. Another commenter pointed out that the rural floor budget neutrality factor has more than doubled over the past decade, with the most notable increase occurring in FY 2024 due to CMS’ decision to include § 412.103 reclassifications along with geographically rural hospitals in the rural wage index calculations. The commenter stated that the rural floor budget neutrality factor decreased IPPS payments by 2.87% that year, compared to 1.56% the year before. Similarly, a commenter

requested that CMS provide an impact table with the FY 2025 final rule and with subsequent rulemakings showing the number of hospitals and total payments impacted by the policy, with results aggregated at the state level.

Other commenters acknowledged CMS' statutory budget neutrality requirement but challenged CMS' application of the rural floor. These commenters argued that section 4410(b) of the Balanced Budget Act of 1997 (BBA) exempts urban and reclassified rural hospitals that receive the rural floor from having their wage indexes reduced. According to these commenters, the rural floor budget neutrality adjustment should be applied only to the wage indexes of hospitals not receiving the rural floor (i.e.: non-reclassified rural hospitals, and urban hospitals with wage indexes above the rural floor).

Response: While we did not propose any changes to the rural floor policy in the FY 2025 IPPS/LTCH PPS proposed rule, we appreciate the commenters' continued support.

In response to the commenter asking for clarification about how § 412.103 hospitals are reflected in the pre-reclassified wage index, we are clarifying that the pre-reclassified wage index reflects hospitals' locations prior to any form of reclassification for budget neutrality purposes.

We understand the commenter's concerns regarding the effect that the rural floor budget neutrality factor has on some hospitals as other hospitals make reclassification decisions to take advantage of the rural floor policy. The commenter noting the increase in the rural floor budget neutrality factor in FY 2024 is correct that the budget neutrality factor increased by 2.87% that year, compared to 1.56% the year before. As we noted in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58975), we expect that the number of IPPS hospitals assigned their State's rural wage index will increase in future years as hospitals adjust to the policy and as the relative value of States' rural wage index values increase due to the inclusion of hospitals that strategically obtain § 412.103 reclassification. As a result, the majority of hospitals (if not all) will be assigned identical wage index values within their states. For example, for FY 2025, 58% of geographically urban hospitals are receiving a wage index equal to their State's rural floor,

imputed floor, or frontier floor prior to any outmigration, low wage index hospital, or 5 percent decrease cap adjustments. As we stated in last year's IPPS/LTCH PPS final rule (88 FR 58975), as substantially more hospitals receive the rural floor, there will be a consequently greater budget neutrality impact. However, we believe this result would be unavoidable given the requirement of section 1886(d)(8)(E) of the Act to treat § 412.103 hospitals 'as being located in the rural area' of the state, as well as the requirement at sections 4410(b) of the BBA 1997 and 3141 of the Patient Protection and Affordable Care Act (Pub. L. 111-148) that a uniform, national budget neutrality adjustment be applied in implementing the rural floor. With regard to the commenter requesting evaluation of the impacts of the policy at the hospital and state-specific levels, we refer the commenter to the IPPS Payment Impact File associated with this final rule (available on the CMS website at: <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/fy-2025-ipp-pps-final-rule-home-page>) and to section II.A.4.d. of the Addendum to this final rule for a discussion of the rural floor budget neutrality factor. The area wage index prior to the application of the rural floor is available in Table 3.

With regard to the commenters' assertion that urban and reclassified rural hospitals that receive the rural floor should be excluded from the application of the rural floor budget neutrality factor, we considered this approach in the FY 2008 IPPS proposed and final rules (72 FR 24787 and 72 FR 47325) and believe we have applied the rural floor budget neutrality adjustment in a manner consistent with the statute. Specifically, in the FY 2008 IPPS proposed rule, we rejected a reading of section 4410(b) of the BBA requiring that the budget neutrality adjustment would be applied only to those hospitals that do not receive the rural floor, because urban hospitals receiving the rural floor would receive a higher wage index than the rural hospitals within the same State (because hospitals receiving the rural floor would not be subject to budget neutrality, whereas rural hospitals would be) (72 FR 24787). We continue to believe that such a reading would not be consistent with the best reading of the statute. The statute sets a floor for urban hospitals. The statute does not instruct CMS to pay urban hospitals a wage index higher than the

wage index applicable to rural hospitals, and contains no suggestion that the general budget neutrality provisions of section 1886(d)(8)(D)—which expressly apply to the adjustments made in section 1886(d)(C)—should not apply. In the FY 2008 IPPS final rule, we adopted the current approach to implement rural floor budget neutrality by applying a uniform, national adjustment to the wage index (72 FR 47325). Since then, Congress specifically endorsed our approach in section 3141 of the Patient Protection and Affordable Care Act (Pub. L. 111–148), which requires that the rural floor budget neutrality adjustment be applied “in the same manner as the Secretary administered such [adjustment] for discharges occurring during fiscal year 2008 (through a uniform, national adjustment to the area wage index).”

In addition, we note that section 4410 of the BBA to which the commenter refers provides that the rural floor is equal to “the area wage index applicable under [section 1886(d)(3)(E) of the Social Security Act] to hospitals located in rural areas in the State.” Under our existing policy, the rural floor and the rural wage index for the state are the same after application of the rural floor budget neutrality adjustment factor, and nothing in section 4410 of the BBA requires otherwise. Put differently, CMS’ methodology amounts to merely calculating the amount of the rural floor such that it is the same as the final rural wage index for the state, rather than reducing the wage indices of low wage urban hospitals or reclassified rural hospitals that receive the rural floor relative to what they would be otherwise—in that way it appropriately implements both section 4410 of the BBA and section 3141 of the ACA. Thus, consistent with our longstanding methodology for implementing the rural floor, we believe it is appropriate to continue to apply a budget neutrality adjustment to all hospitals’ wage indexes.

2. Imputed Floor

In the FY 2005 IPPS final rule (69 FR 49109 through 49111), we adopted the imputed floor policy as a temporary 3-year regulatory measure to address concerns from hospitals in all-urban States that have stated that they are disadvantaged by the absence of rural hospitals to set a wage index floor for those States. We extended the imputed floor policy eight times since its

initial implementation, the last of which was adopted in the FY 2018 IPPS/LTCH PPS final rule and expired on September 30, 2018. We refer readers to further discussions of the imputed floor in the IPPS/LTCH PPS final rules from FYs 2014 through 2019 (78 FR 50589 through 50590, 79 FR 49969 through 49971, 80 FR 49497 through 49498, 81 FR 56921 through 56922, 82 FR 38138 through 38142, and 83 FR 41376 through 41380, respectively) and to the regulations at § 412.64(h)(4). For FYs 2019, 2020, and 2021, hospitals in all-urban states received a wage index that was calculated without applying an imputed floor, and we no longer included the imputed floor as a factor in the national budget neutrality adjustment.

Section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2), enacted on March 11, 2021, amended section 1886(d)(3)(E)(i) of the Act and added section 1886(d)(3)(E)(iv) of the Act to establish a minimum area wage index for hospitals in all-urban States for discharges occurring on or after October 1, 2021. Specifically, section 1886(d)(3)(E)(iv)(I) and (II) of the Act provides that for discharges occurring on or after October 1, 2021, the area wage index applicable to any hospital in an all-urban State may not be less than the minimum area wage index for the fiscal year for hospitals in that State established using the methodology described in § 412.64(h)(4)(vi) as in effect for FY 2018. Unlike the imputed floor that was in effect from FYs 2005 through 2018, section 1886(d)(3)(E)(iv)(III) of the Act provides that the imputed floor wage index shall not be applied in a budget neutral manner. Section 1886(d)(3)(E)(iv)(IV) of the Act provides that, for purposes of the imputed floor wage index under clause (iv), the term all-urban State means a State in which there are no rural areas (as defined in section 1886(d)(2)(D) of the Act) or a State in which there are no hospitals classified as rural under section 1886 of the Act. Under this definition, given that it applies for purposes of the imputed floor wage index, we consider a hospital to be classified as rural under section 1886 of the Act if it is assigned the State’s rural area wage index value.

Effective beginning October 1, 2021 (FY 2022), section 1886(d)(3)(E)(iv) of the Act reinstates the imputed floor wage index policy for all-urban States, with no expiration date, using

the methodology described in § 412.64(h)(4)(vi) as in effect for FY 2018. We refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45176 through 45178) for further discussion of the original imputed floor calculation methodology implemented in FY 2005 and the alternative methodology implemented in FY 2013.

Based on data available for this final rule, States that will be all-urban States as defined in section 1886(d)(3)(E)(iv)(IV) of the Act, and thus hospitals in such States that will be eligible to receive an increase in their wage index due to application of the imputed floor for FY 2025, are identified in Table 3 associated with this final rule. States with a value in the column titled “State Imputed Floor” are eligible for the imputed floor.

The regulations at § 412.64(e)(1) and (4) and (h)(4) and (5) implement the imputed floor required by section 1886(d)(3)(E)(iv) of the Act for discharges occurring on or after October 1, 2021. The imputed floor will continue to be applied for FY 2025 in accordance with the policies adopted in the FY 2022 IPPS/LTCH PPS final rule. For more information regarding our implementation of the imputed floor required by section 1886(d)(3)(E)(iv) of the Act, we refer readers to the discussion in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45176 through 45178).

Comment: We received comments supporting the application of the imputed floor. A commenter opposed the imputed floor stating that the imputed floor continues to unfairly manipulate the wage index to benefit a handful of only-urban states and territories.

Response: We thank the commenters for their input. As discussed earlier, the imputed floor is a statutory requirement under section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2) which requires the Secretary to establish a minimum area wage index for hospitals in all-urban States for discharges occurring on or after October 1, 2021. We did not propose any changes to the methodology for calculating the imputed floor as set forth in § 412.64(e)(1) and (4) and (h)(4) and (5). Therefore, in accordance with the statute and existing regulations, we are applying the imputed floor for hospitals in all-urban States for FY 2025.

3. State Frontier Floor for FY 2025

Section 10324 of Public Law 111–148 requires that hospitals in frontier States cannot be assigned a wage index of less than 1.0000. (We refer readers to the regulations at § 412.64(m) and to a discussion of the implementation of this provision in the FY 2011 IPPS/ LTCH PPS final rule (75 FR 50160 through 50161).) In the FY 2025 IPPS/LTCH PPS proposed rule, we did not propose any changes to the frontier floor policy for FY 2025. In the proposed rule we stated 41 hospitals would receive the frontier floor value of 1.0000 for their FY 2025 proposed wage index. These hospitals are located in Montana, North Dakota, South Dakota, and Wyoming.

We did not receive any public comments on the application of the State frontier floor for FY 2025. In this final rule, 41 hospitals will receive the frontier floor value of 1.0000 for their FY 2025 wage index. These hospitals are located in Montana, North Dakota, South Dakota, and Wyoming. We note that while Nevada meets the criteria of a frontier State, all hospitals within the State currently receive a wage index value greater than 1.0000.

The areas affected by the rural and frontier floor policies for the final FY 2025 wage index are identified in Table 3 associated with this final rule, which is available via the internet on the CMS website.

4. Out-Migration Adjustment Based on Commuting Patterns of Hospital Employees

In accordance with section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, beginning with FY 2005, we established a process to make adjustments to the hospital wage index based on commuting patterns of hospital employees (the “out-migration” adjustment). The process, outlined in the FY 2005 IPPS final rule (69 FR 49061), provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county but work in a different county (or counties) with a higher wage index.

Section 1886(d)(13)(B) of the Act requires the Secretary to use data the Secretary determines to be appropriate to establish the qualifying counties. When the provision of section 1886(d)(13) of the Act was implemented for the FY 2005 wage index, we analyzed commuting data compiled by the U.S. Census Bureau that were derived from a special tabulation of the 2000 Census journey-to-work data for all industries (CMS extracted data applicable to hospitals). These data were compiled from responses to the “long-form” survey, which the Census Bureau used at that time, and which contained questions on where residents in each county worked (69 FR 49062). However, the 2010 Census was “short form” only; information on where residents in each county worked was not collected as part of the 2010 Census. The Census Bureau worked with CMS to provide an alternative dataset based on the latest available data on where residents in each county worked in 2010, for use in developing a new out-migration adjustment based on new commuting patterns developed from the 2010 Census data beginning with FY 2016.

To determine the out-migration adjustments and applicable counties for FY 2016, we analyzed commuting data compiled by the Census Bureau that were derived from a custom tabulation of the American Community Survey (ACS), an official Census Bureau survey, utilizing 2008 through 2012 (5-year) Microdata. The data were compiled from responses to the ACS questions regarding the county where workers reside and the county to which workers commute. As we discussed in prior IPPS/LTCH PPS final rules, most recently in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58983), we have applied the same policies, procedures, and computations since FY 2012. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49500 through 49502) for a full explanation of the revised data source. We also stated that we would consider determining out-migration adjustments based on data from the next Census or other available data, as appropriate.

As discussed earlier in section III.B., CMS proposed to adopt revised delineations from the OMB Bulletin 23-01, published July 21, 2023. The revised delineations incorporate population estimates based on the 2020 decennial census, as well as updated journey-to-work

commuting data. The Census Bureau once again worked with CMS to provide an alternative dataset based on the latest available data on where residents in each county worked, for use in developing a new out-migration adjustment based on new commuting patterns. We analyzed commuting data compiled by the Census Bureau that were derived from a custom tabulation of the ACS, utilizing 2016 through 2020 data. The Census Bureau produces county level commuting flow tables every 5 years using non-overlapping 5-year ACS estimates. The data include demographic characteristics, home and work locations, and journey-to-work travel flows. The custom tabulation requested by CMS was specific to general medical and surgical hospital and specialty (except psychiatric and substance use disorder treatment) hospital employees (hospital sector Census code 8191/NAICS code 6221 and 6223) who worked in the 50 States, Washington, DC, and Puerto Rico and, therefore, provided information about commuting patterns of workers at the county level for residents of the 50 States, Washington, DC, and Puerto Rico.

For the ACS, the Census Bureau selects a random sample of addresses where workers reside to be included in the survey, and the sample is designed to ensure good geographic coverage. The ACS samples approximately 3.5 million resident addresses per year.¹⁹³ The results of the ACS are used to formulate descriptive population estimates, and, as such, the sample on which the dataset is based represents the actual figures that would be obtained from a complete count.

For FY 2025, and subsequent years, we proposed that the out-migration adjustment will be based on the data derived from the previously discussed custom tabulation of the ACS utilizing 2016 through 2020 (5-year) Microdata. As discussed earlier, we believe that these data are the most appropriate to establish qualifying counties, because they are the most accurate and up-to-date data that are available to us. Furthermore, we stated in the proposed rule (89 FR

¹⁹³ According to the Census Bureau, the effects of the PHE on ACS activities in 2020 resulted in a lower number of addresses (~2.9 million) in the sample, as well as fewer interviews than a typical year.

36183) that with the proposed transition of several counties in Connecticut to “planning region” county equivalents (discussed in section III.B.3. of the preamble the proposed rule), the continued use of a commuting dataset developed with expiring county definitions would be less accurate in approximating commuting flows. We proposed that the FY 2025 out-migration adjustments continue to be based on the same policies, procedures, and computation that were used for the FY 2012 out-migration adjustment. We have applied these same policies, procedures, and computations since FY 2012, and we believe they continue to be appropriate for FY 2025. (We refer readers to a full discussion of the out-migration adjustment, including rules on deeming hospitals reclassified under section 1886(d)(8) or section 1886(d)(10) of the Act to have waived the out-migration adjustment, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51601 through 51602).) Table 2 of this final rule (which is available via the internet on the CMS website) lists the out-migration adjustments for the FY 2025 wage index.

We did not receive any comments regarding the proposed policy to use the custom tabulations of the ACS 2016 through 2020 (5-year) Microdata as the basis for the out-migration adjustment. We are finalizing the policy as proposed. We also note that we published the raw data file received from the US Census Bureau on the FY 2025 IPPS Proposed Rule Home Page. The file is item 15 in the supplementary file section at <https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/fy-2025-ipp-pps-proposed-rule-home-page>

5. Continuation of the Low Wage Index Hospital Policy and Budget Neutrality Adjustment

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42325 through 42339), we finalized a policy to address the artificial magnification of wage index disparities, based in part on comments we received in response to our request for information included in our FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20372 through 20377). In the FY 2020 IPPS/LTCH final rule, based on those public comments and the growing disparities between wage index values for high- and low-wage-index hospitals, we explained that those growing disparities are likely

caused, at least in part, by the use of historical wage data to prospectively set hospitals' wage indexes. That lag creates barriers to hospitals with low wage index values being able to increase employee compensation, because those hospitals will not receive corresponding increases in their Medicare payment for several years (84 FR 42327). Accordingly, we finalized a policy that provided certain low wage index hospitals with an opportunity to increase employee compensation without the usual lag in those increases being reflected in the calculation of the wage index (as they would expect to do if not for the lag).¹⁹⁴ We accomplished this by temporarily increasing the wage index values for certain hospitals with low wage index values and doing so in a budget neutral manner through an adjustment applied to the standardized amounts for all hospitals, as well as by changing the calculation of the rural floor. As explained in the FY 2020 IPPS/LTCH proposed rule (84 FR 19396) and final rule (84 FR 42329), we indicated that the Secretary has authority to implement the low wage index hospital policy proposal under both section 1886(d)(3)(E) of the Act and under his exceptions and adjustments authority under section 1886(d)(5)(I) of the Act.

We increased the wage index for hospitals with a wage index value below the 25th percentile wage index value for a fiscal year by half the difference between the otherwise applicable final wage index value for a year for that hospital and the 25th percentile wage index value for that year across all hospitals (the low wage index hospital policy). We stated in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42326 through 42328) our intention that this policy would be effective for at least 4 years, beginning in FY 2020, to allow employee compensation increases implemented by these hospitals sufficient time to be reflected in the wage index calculation.

¹⁹⁴ In the FY 2020 IPPS/LTCH proposed rule, we agreed with respondents to a previous request for information who indicated that some current wage index policies create barriers to hospitals with low wage index values from being able to increase employee compensation due to the lag between when hospitals increase the compensation and when those increases are reflected in the calculation of the wage index. We noted that this lag results from the fact that the wage index calculations rely on historical data. We also agreed that addressing this systemic issue did not need to wait for comprehensive wage index reform given the growing disparities between low and high wage index hospitals, including rural hospitals that may be in financial distress and facing potential closure (84 FR 19394 and 19395).

We note that the FY 2020 low wage index hospital policy and the related budget neutrality adjustment are the subject of pending litigation in multiple courts. On July 23, 2024, the Court of Appeals for the D.C. Circuit held that the Secretary lacked authority under 1886(d)(3)(E) or 1886(d)(5)(I)(i) of the Act to adopt the low wage index hospital policy for FY 2020, and that the policy and related budget neutrality adjustment must be vacated. *Bridgeport Hosp. v. Becerra*, Nos. 22-5249, 22-5269, 2024 WL 3504407, at *7-*8 & n.6 (D.C. Cir. July 23, 2024). As of the date of this Rule's publication, the time to seek further review of the D.C. Circuit's decision in *Bridgeport Hospital* has not expired. *See* Fed. R. App. P. 40(a)(1). The government is evaluating the decision and considering options for next steps.

As noted earlier, we finalized this policy in the FY 2020 IPPS/LTCH final rule to provide low wage index hospitals with an opportunity to increase employee compensation without the usual lag in those increases being reflected in the calculation of the wage index (as they would expect to do if not for the lag). This continues to be the purpose of the policy. We stated in the FY 2020 IPPS/LTCH PPS final rule our intention that it would be in effect for at least 4 years beginning October 1, 2019 (84 FR 42326). We also stated we intended to revisit the issue of the duration of this policy in future rulemaking as we gained experience under the policy. What could not have been anticipated at the time the policy was promulgated was that implementation of the policy would occur during the COVID-19 PHE, which was declared starting in January of 2020 and continued until May of 2023. The effects of the COVID-19 PHE complicate our ability to evaluate the low wage index hospital policy and our ability to determine whether low-wage hospitals have been provided a sufficient opportunity to increase employee compensation under the policy without the usual lag.

In the proposed rule, to help gauge the impact of the COVID-19 PHE relative to the impact of the low wage index hospital policy, we examined the aggregate revenue each hospital reported on their FY 2020 cost reports from the COVID-19 PHE Provider Relief Fund, the Small

Business Administration Loan Forgiveness program, and other sources of COVID-19 related funding such as payroll retention credits and state emergency relief funds. Specifically, we examined Worksheet G-3, lines 24.50 through 24.60 for each IPPS hospital's 2020 cost report. We found that hospitals in the aggregate reported \$31.1 billion in COVID-19 related funding, and of that amount low-wage hospitals reported \$3.6 billion. These amounts are much larger than, and likely had a much greater impact on hospital operations, the approximately \$230 million impact of the low wage index hospital policy.¹⁹⁵ For example, COVID-19 related funding impacted the ability of hospitals, both low-wage hospitals and non-low wage hospitals, to change employee compensation in ways that overshadowed any differential impact of the low wage index hospital policy between the two groups that may have occurred in the absence of the COVID-19 PHE.

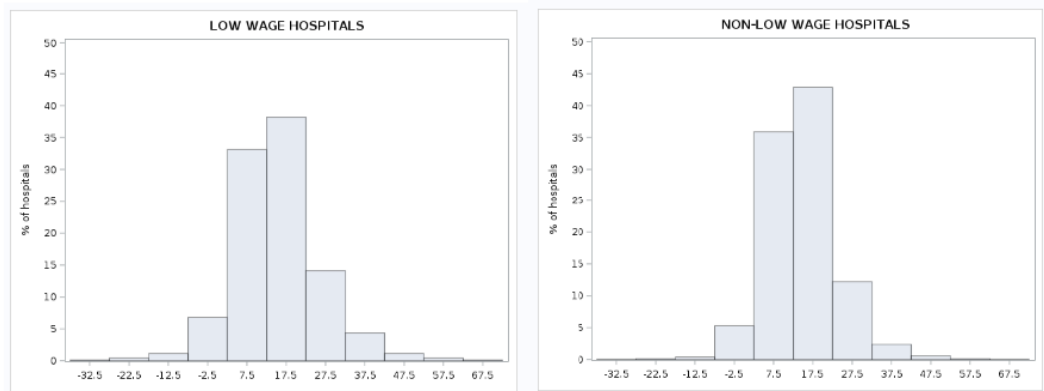

In addition to examining the COVID-19 related funding data, we also examined the wage index data itself. For the FY 2025 wage index the best available data typically would be from the FY 2021 wage data from hospital cost reports. As discussed earlier in more detail in section III.C, in considering the impacts of the COVID-19 PHE on the FY 2021 hospital wage data, we compared that data with recent historical data. While there are some differences, in the proposed rule we stated that it is not readily apparent how any changes due to the COVID-19 PHE differentially impacted the wages paid by individual hospitals. Furthermore, even if changes due to the COVID-19 PHE did differentially impact the wages paid by individual hospitals over time, it is not clear how those changes could be isolated from changes due to other reasons and what an appropriate potential methodology might be to adjust the data to account for the effects of the COVID-19 PHE. Our inability to isolate the wage data changes due to the COVID-19 PHE and disentangle them from changes due to the low wage index hospital policy makes isolating and

¹⁹⁵ As discussed in the FY 2020 IPPS final rule, the low wage index hospital policy was implemented in a budget neutral manner. In order to ensure that the overall effect of the application of the low wage index hospital policy was budget neutral, we applied a budget neutrality factor of 0.997987 to the FY 2020 standardized amount (84 FR 42667). The IPPS spending associated with the accounting statement in the FY 2020 IPPS final rule was approximately \$113 billion. Applying the budget neutrality adjustment to the IPPS spending associated with the accounting statement results in roughly a \$230 million impact of the low wage index hospital policy.

evaluating the impact of the low wage index hospital policy challenging. We reached similar conclusions with respect to the FY 2020 hospital wage data.

To help further inform our FY 2025 rulemaking with respect to the low wage index hospital policy, in the proposed rule we stated that we also conducted an analysis of hospitals that received an increase to their wage index due to the policy in FY 2020 (referred to as the low wage index hospitals for brevity in the following discussion). Specifically, for each low wage index hospital we calculated the percent increase in its average hourly wages (AHWs) from FY 2019 to FY 2021 based on dividing its FY 2021 average hourly wage (using the wage data one year after the low wage index hospital policy was implemented in FY 2020, available on the FY 2025 IPPS Proposed Rule webpage) by its average hourly wage from the FY 2019 wage data (the wage data one year before the low wage index hospital policy was implemented in FY 2020, available on the FY 2023 IPPS final rule webpage). We performed the same calculation for the hospitals that were not low wage index hospitals. We then compared the distributions of the average hourly wage increases between the two groups. The results are shown in the following chart (Chart 1).

CHART 1. COMPARISON OF THE DISTRIBUTION OF THE PERCENTAGE CHANGE IN AHWS FROM FY 2019 TO FY 2021 FOR LOW WAGE INDEX HOSPITALS AND NON-LOW WAGE INDEX HOSPITALS

In general, the chart shows that the distribution of the changes in the average hourly wages of the low wage index hospitals (mean=15.1%, standard deviation=11.0%) is similar to

the distribution of the changes in the average hourly wages of the non-low wage index hospitals (mean=14.7%, standard deviation=8.9%). Although some low-wage hospitals have indicated to us that they did use the increased payments they received under the low wage index hospital policy to increase wages more than they otherwise would have, the similarity in the two distributions indicates that, based on the audited wage data available to us, the policy has generally not yet had the effect of substantially reducing the wage index disparities that existed at the time the policy was promulgated. Also, to the extent that wage index disparities for a subset of low wage index hospitals has diminished, it is unclear to what extent that is attributable to the low wage index hospital policy given the effects of the COVID-19 PHE (as discussed later in this section).

The COVID-19 PHE ended in May of 2023. With regard to the wage index, 4 years is the minimum time before increases in employee compensation included in the Medicare cost report could be reflected in the wage index data. The first full fiscal year of wage data after the COVID-19 PHE is the FY 2024 wage data, which would be available for the FY 2028 IPPS/LTCH PPS rulemaking. As we explained earlier in this section, at the time the low wage index hospital policy was finalized, our intention was that it would be in effect for at least 4 fiscal years beginning October 1, 2019, and to revisit the issue of the duration of this policy as we gained experience under the policy. Because the effects of the COVID-19 PHE complicate our ability to evaluate the low wage index hospital policy and our ability to determine whether low-wage hospitals have been provided a sufficient opportunity to increase employee compensation under the policy without the usual lag, we proposed that the low wage index hospital policy and the related budget neutrality adjustment would be effective for at least three more years, beginning in FY 2025. We noted that this would result in the policy being in effect for at least 4 full fiscal years in total after the end of the COVID-19 PHE in May of 2023. We also stated that this will allow us to gain experience under the policy for the same duration and in an environment more similar to the one we expected at the time the policy was first promulgated.

To offset the estimated increase in IPPS payments to hospitals with wage index values below the 25th percentile wage index value, for FY 2025 and for subsequent fiscal years during which the low wage index hospital policy is in effect, we proposed to apply a budget neutrality adjustment in the same manner as we have applied it since FY 2020, as a uniform budget neutrality factor applied to the standardized amount. We refer readers to section II.A.4.f. of the Addendum to the proposed rule and this final rule for further discussion of the budget neutrality adjustment for FY 2025.

Comment: Several commenters supported the proposed low wage index hospital policy and asked CMS to continue the policy. Commenters benefiting from the low wage policy indicated that the policy has been helpful in addressing wage disparities and supporting hospitals in economically challenged areas. Commenters also stated that the policy prioritizes patients, promoting health equity and benefitting millions of patients across the country. Commenters conveyed that the policy allows for the ability to further sustain and build the health care system our changing population deserves, and to rebalance the disparity of care that exists between economically diverse areas of our nation.

Commenters indicated that the low wage index policy has helped to slightly level the playing field in Medicare reimbursement for rural hospitals and cautioned CMS that any efficacy analysis regarding the policy should recognize that the policy does not operate in a vacuum. According to commenters, low-wage hospitals face numerous challenges beyond just the wage index that make it difficult for them to significantly increase wages, particularly in relation to high-wage hospitals. Commenters stated that having a lower wage index over many years makes it difficult to ever catch up to high-wage hospitals. According to commenters, even though the wage index for many low-wage hospitals has increased since the policy began, their wage index remains significantly below the wage index for most high-wage hospitals.

Commenters also expressed that beyond staffing issues, low-wage hospitals generally have higher Medicare utilization in relation to total patient volume, and as a result Medicare

losses are a higher proportion of their operations. The commenters indicated these hospitals face difficulty in making up for these losses as they receive less utilization from patients with traditional third-party insurance payment. Commenters explained that because of this, additional reimbursement provided by the low wage index hospital policy minimizes operating losses and allows operations to continue, thereby creating the potential for low-wage hospitals to be more competitive in recruiting staff than they would be absent the adjustment.

Response: We thank the commenters for their support of the low wage index hospital policy and for the proposal to extend the policy for at least three more years, beginning in FY 2025. We also appreciate learning from the commenters that the policy has been meaningful and effective in reducing wage index disparities. We also thank commenters for their thoughts on the unique circumstances faced by low-wage hospitals compared to high-wage hospitals with respect to the wage index.

Comment: Several commenters expressed their support for the continued implementation of the low wage index hospital policy but urged CMS to not include the budget neutral aspect, stating that CMS is not bound by statute to implement this policy in a budget neutral manner. A commenter stated that if low-wage hospitals were using increased payments associated with the low wage index hospital policy to increase wages at a rate faster than the national average (according to the commenter this would indicate the wage gap is closing), the budget neutrality adjustment associated with the policy should decrease, as it would cost less for CMS to maintain the policy over time as wages in bottom quartile markets converged with other CBSAs, compressing the wage index. According to this commenter, this is not happening as there has been a significant increase in the budget neutrality adjustment required to implement this policy in FY 2024 and FY 2025 suggesting that the bottom quartile policy has been ineffective. The commenter stated that they chose FY 2024 and FY 2025 for their analysis because these FYs are the first to consist of wage data impacted by the low wage index hospital policy, as FY 2024 used FY 2020 wage data, the FY the low wage index hospital policy was first effective, and FY

2025 uses FY 2021 wage data, the most current available FY wage data reflecting low wage index hospital policy data. Commenters also stated that the lever CMS has to pull to make the policy budget neutral, reducing the national standardized amount for all PPS hospitals nationally, intensifies historical Medicare underpayment and harms some of the very hospitals the policy is intended to help. Some commenters suggested that new funding replace the need for the policy to be budget neutral. These commenters stated that Medicare consistently reimburses inpatient PPS hospitals less than the cost of care and referenced that MedPAC estimates that hospitals' aggregate Medicare margins will be negative 13% in 2024 and that aggregate Medicare margins in 2022 were a negative 12.7% excluding federal relief funds. These commenters stated that these figures represent a continuance of a longstanding trend of substantially negative Medicare margins,¹⁹⁶ suggesting a strong need to add funds into the system by implementing the low wage hospital policy in a non-budget neutral manner. Commenters also stated that those hospitals that fall between approximately the 22nd and 25th percentile are receiving a reduction to the wage-adjusted standardized rate because the amount of benefit received is less than the cost to fund the benefit (the low wage index hospital policy budget neutrality factor applied is allegedly larger than the increase the hospital would receive due to the policy). These commenters suggested holding hospitals under the 25th percentile harmless.

Commenters also provided other suggestions for data and alternative methodologies to include: reducing the wage index for hospitals with values above the 75th percentile; working with Congress on a more permanent fix to address the disparities in the wage index by establishing a national floor for all hospitals; and seeking input from the hospital community on best overall reform options that will improve the sustainability of the workforce, especially in rural and underserved communities.

¹⁹⁶ MedPAC. (2024). March 2024 Report to the Congress: Medicare Payment Policy. Chapter 3 – Hospital inpatient and outpatient services. https://www.medpac.gov/wp-content/uploads/2024/03/Mar24_Ch3_MedPAC_Report_To_Congress_SEC.pdf

Response: As discussed in previous rulemaking regarding the low wage index hospital policy in response to comments, we disagree with the commenters that the low wage index hospital policy should be implemented in a non-budget neutral manner. Specifically, as we stated in response to similar comments in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42331 and 42332), the FY 2022 IPPS/LTCH PPS final rule (86 FR 45180), the FY 2023 IPPS/LTCH PPS final rule (87 FR 49007), and the FY 2024 IPPS/LTCH PPS final rule (88 FR 58979), under section 1886(d)(3)(E) of the Act, “[a]ny adjustments or updates” to the wage index are required to be implemented in a budget neutral manner. However, even if the wage index were not required to be budget neutral under section 1886(d)(3)(E) of the Act, we would consider it inappropriate to use the wage index to increase or decrease overall IPPS spending. As we stated in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42331), the wage index is designed to be a relative measure of the wages and wage-related costs of subsection (d) hospitals. As a result, as we explained in the FY 2020 IPPS/ LTCH PPS final rule, if it were determined that section 1886(d)(3)(E) of the Act does not require the wage index to be budget neutral, we invoke our authority at section 1886(d)(5)(I) of the Act in support of such a budget neutrality adjustment.

Regarding the comment stating that an increase in the budget neutrality adjustment required to implement the low wage index hospital policy in FY 2024 and FY 2025 suggests that the policy has been ineffective, we disagree. As discussed earlier in this section, the effects of the COVID-19 PHE complicate our ability to evaluate the low wage index hospital policy and our ability to determine whether low-wage hospitals have been provided a sufficient opportunity to increase employee compensation under the policy without the usual lag. Because of this, we proposed that the low wage index hospital policy and the related budget neutrality adjustment would be effective for at least three more years, beginning in FY 2025. We noted that this would result in the policy being in effect for at least 4 full fiscal years in total after the end of the COVID-19 PHE in May of 2023. We also stated that this will allow us to gain experience under the policy for the same duration and in an environment more similar to the one we expected at

the time the policy was first promulgated. For FY 2025 and for subsequent fiscal years during which the low wage index hospital policy is in effect, we also proposed to apply the associated budget neutrality adjustment in the same manner as we have applied it since FY 2020, as a uniform budget neutrality factor applied to the standardized amount.

With regard to the commenter's concern that application of the low wage index hospital policy may result in a reduction to overall payment if the amount of benefit received from the policy is less than the reduction to the standardized amount, as explained in response to comments in previous rulemaking, we believe we have applied both the quartile policy and the budget neutrality policy appropriately. Specifically, as we explained most recently in response to comments in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58979), the quartile adjustment is applied to the wage index, which results in an increase to the wage index for hospitals below the 25th percentile. The budget neutrality adjustment is applied to the standardized amount to ensure that the low wage index hospital policy is implemented in a budget neutral manner. Thus, consistent with our current methodology for implementing wage index budget neutrality under section 1886(d)(3)(E) of the Act and with how we implemented budget neutrality for the low wage index hospital policy in FY 2020, we believe it is appropriate to continue to apply a budget neutrality adjustment to the national standardized amount for all hospitals so that the low wage index hospital policy is implemented in a budget neutral manner for FY 2025.

Regarding the comment suggesting funds be added to the wage index system through implementation of the low wage index hospital policy in a non-budget neutral manner to account for alleged Medicare reimbursement underpayments, we disagree. We believe it would be inappropriate to use the wage index to increase or decrease overall IPPS spending. As we discuss elsewhere in this section, the intent of the low wage index hospital policy is to increase the accuracy of the wage index as a technical adjustment, and not to use the wage index as a policy tool to address non-wage issues related to hospitals, or the laudable goals of the overall financial health of hospitals in low-wage areas or broader wage index reform.

Regarding the comment about reducing the wage index for hospitals with values above the 75th percentile, as we discussed in our response to comments in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58979), in the FY 2020 IPPS/LTCH final rule (84 FR 42329), we noted that we originally proposed to reduce the wage index values for high wage index hospitals using a methodology analogous to the methodology used to increase the wage index values for low wage index hospitals, as described in section III.N.3.a. of the preamble of the proposed rule; that is, we proposed to decrease the wage index values for high wage index hospitals by a uniform factor of the distance between the hospital's otherwise applicable wage index and the 75th percentile wage index value for a fiscal year across all hospitals. In response to comments we received (84 FR 42329 and 42330), we acknowledged that some commenters presented reasonable policy arguments that we should consider further regarding the relationship between our proposed budget neutrality adjustment targeting high-wage hospitals and the design of the wage index to be a relative measure of the wages and wage-related costs of subsection (d) hospitals in the United States. Therefore, in the FY 2020 IPPS/LTCH final rule, we did not finalize our proposal to target that budget neutrality adjustment on high-wage hospitals (84 FR 42331). Regarding the comment about the establishment of a national floor for all hospitals, as we pointed out in response to comments in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58979 through 58980), we noted in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42338 through 42339) that we do not have evidence a national rural labor market exists or would be created if we were to adopt this alternative, and this alternative would not increase the accuracy of the wage index. Also, we believe we have applied both the quartile policy and the budget neutrality policy appropriately, as we explained in response to comments in the FYs 2021, 2022 and 2023 IPPS/LTCH PPS final rules and most recently FY 2024 IPPS/LTCH PPS final rule (88 FR 58979 through 58980). The quartile adjustment is applied to the wage index, which resulted in an increase to the wage index for hospitals below the 25th percentile. The budget neutrality

adjustment is applied to the standardized amount to ensure that the low wage index hospital policy is implemented in a budget neutral manner.

Comment: Several commenters opposed the low wage index hospital policy, stating that it is outside the agency's statutory authority under section 1886(d)(3)(E) of the Act. Specifically, some commenters expressed their belief that although the policy is intended to help rural hospitals, some rural hospitals in certain states do not benefit from this policy. Furthermore, commenters stated that the policy undermines the intent of the wage index by not recognizing real differences in labor costs.

Similar to comments made on the low wage index hospital policy in the FY 2022 IPPS/LTCH PPS rulemaking (86 FR 45179), a commenter argued that the low wage index hospital policy is ineffective, pointing to an Office of Inspector General (OIG) report¹⁹⁷ that suggests a complicated set of issues in local labor markets determines hospital wages in addition to Medicare payment rates. The commenter encouraged CMS to replicate the OIG's analysis using the most recently available audited wage data (FYs 2020 and 2021) and share the results in the final rule. According to the commenter, if the findings are the same as in the OIG's analysis, it will further demonstrate that the low wage index hospital policy has not had the intended effect and should not be continued.

Response: As we stated in response to similar comments in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58980), we believe we addressed the stated concerns in our responses to comments when we first finalized the low wage index hospital policy and the related budget neutrality adjustment in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42325 through 42332). Regarding the policy's effect on rural hospitals, as we stated in the FY 2020 IPPS/ LTCH PPS final rule (84 FR 42328), the wage index is a technical payment adjustment. The intent of the low wage index hospital policy is to increase the accuracy of the wage index as a technical adjustment, and not to use the wage index as a policy tool to address non-wage issues related to

¹⁹⁷ <https://oig.hhs.gov/oas/reports/region1/12000502.asp>

rural hospitals, or the laudable goals regarding the overall financial health of hospitals in low-wage areas or broader wage index reform. The low wage index hospital policy aims to increase the accuracy of the wage index as a relative measure, because it addresses barriers that low wage index hospitals face in increasing their employee compensation in ways that we would expect if there were no lag between the time a hospital increases employee compensation and the time these increases are reflected in the wage index, and allows those increases to be more timely reflected in the wage index. While one effect of the policy may be to improve the overall financial well-being of low-wage hospitals, and we would welcome that effect, it is not the rationale for our policy. In response to comments stating the policy exceeds CMS' statutory authority, we refer the commenters to our prior discussion of the authority for the policy in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42326 through 42332).

In response to the assertion that the low wage index hospital policy does not recognize real differences in labor costs, we continue to believe, for the reasons stated in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42327 and 42328), that by preserving the rank order in wage index values, our policy continues to reflect meaningful distinctions between the employee compensation costs faced by hospitals in different geographic areas. We note, as we have discussed earlier in this section, generally the wage index for the upcoming fiscal year is predictive in nature as wage index data that will be used for the upcoming fiscal year is the most current data and information available, which is usually historical data on a 4-year lag (for example, for the FY 2024 wage index we used cost report data from FY 2020). Thus, under the low wage index hospital policy, we believe the wage index for low wage index hospitals appropriately reflects the relative hospital wage level in those areas compared to the national average hospital wage level.

Some commenters stated that our policy is ineffective, referencing the OIG report cited above. As we explained in our response to comments in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45179), we believe that the numerous comments we continue to receive in support of this

policy indicate that many low-wage hospitals are indeed helped by this policy. Specifically, comments stating that the policy has been helpful in addressing wage disparities and allowing low wage hospitals to be more competitive in recruiting staff, indicate that the policy helped low wage hospitals to raise wages. In response to the commenter's suggestion to refine our criteria to target a subset of low-wage hospitals, such as low-wage hospitals that are rural or that have negative profit margins, we believe that this would not maintain the rank order in wage index values. As we stated earlier, we believe that maintaining the rank order of wage index values is important to reflect meaningful distinctions between the employee compensation costs faced by hospitals in different geographic areas. Even several commenters that disagreed with our policy stressed the need for the wage index to be an accurate measure of the *relative* level of wages in different areas. A highly targeted approach that selected individual hospitals for relief would not maintain the rank order of wage index values and thus would be inconsistent with the construction of a relative measure of area wage levels. While it might be possible to refine our criteria for a more targeted approach, we believe it is reasonable to conclude that our current policy will have the intended effect of providing the opportunity for low-wage hospitals to increase compensation. As we stated earlier in this section, the policy being in effect for at least 4 full fiscal years in total after the end of the COVID-19 PHE will allow us to gain experience under the policy for the same duration and in an environment more similar to the one we expected at the time the policy was first promulgated. The availability of wage data from low-wage hospitals applicable to this time period will help us assess our reasonable expectation that hospitals will increase their employee compensation as a result of wage index increases under this policy. Once the increased employee compensation is reflected in the wage data, there may be no need for the continuation of the policy, given that we would expect the resulting increases in the wage index to continue after the temporary policy is discontinued. Again, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45179 through 45180) for more information

regarding our summary of and response to public comments about the aforementioned OIG report.

Comment: Many commenters noted that the low wage index hospital policy is currently the subject of pending litigation in *Bridgeport*. A few commenters urged CMS not to finalize the policy for FY 2025, or to wait until a final court decision is reached. Commenters suggested CMS should eliminate the budget neutrality adjustments for FYs 2020, 2021, 2022, 2023 and 2024 in light of *Bridgeport*.

Response: We appreciate the commenters' input. As noted previously, the FY 2020 low wage index hospital policy and the related budget neutrality adjustment are the subject of pending litigation in multiple courts. On July 23, 2024, the Court of Appeals for the D.C. Circuit held that the Secretary lacked authority under 1886(d)(3)(E) or 1886(d)(5)(I)(i) of the Act to adopt the low wage index hospital policy for FY 2020, and that the policy and related budget neutrality adjustment must be vacated. *Bridgeport Hosp. v. Becerra*, Nos. 22-5249, 22-5269, 2024 WL 3504407, at *7-*8 & n.6 (D.C. Cir. July 23, 2024). As of the date of this Rule's publication, the time to seek further review of the D.C. Circuit's decision in *Bridgeport Hospital* has not expired. *See* Fed. R. App. P. 40(a)(1). The government is evaluating the decision and considering options for next steps.

Commenters: Many commenters agreed with CMS that there is currently insufficient data to support modifying or discontinuing the low wage index hospital policy because of the COVID-19 pandemic impacts on wage data. According to commenters, hospitals are still recognizing lasting impacts of the COVID-19 PHE and appreciate the agency identifying this as a reality. Commenters indicated that the continuation of this critical policy in FY 2025 and beyond will provide stability and allow hospitals with an ability to recruit and retain desperately needed health care staff. Commenters recommended an extension of the low wage index hospital policy through FY 2030, at minimum, to ensure there is adequate post-pandemic wage

data to support keeping or ending the policy. Commenters supporting an extension of the policy through FY 2030 referred to and supported CMS' acknowledgement that the first full FY of wage data after the COVID-19 PHE ended would not be available until the FY 2028 IPPS/LTCH PPS rulemaking given that the policy began in FY 2020. Commenters also noted that the policy should have a specific expiration date or definitive end date.

Regarding CMS' comparison of the distribution of the percentage change in AHWs from FY 2019 to FY 2021 for low wage index hospitals and non-low wage index hospitals, commenters agreed with CMS that the analysis did not show a substantial effect on reducing wage disparities. However, commenters asked CMS to evaluate whether this is due to other factors, such as inflation and other market forces impacted by the effects of the COVID-19 PHE, which are not clearly accounted for or represented in the current low wage index hospital policy, or if this is due to the ineffectiveness of the low wage index hospital policy. Commenters submitted the results of a separate analysis to emphasize that wages across the board have increased in recent years. Specifically, commenters submitted an analysis from the Kaiser Family Foundation (KFF) and Peterson Center, which evaluated changes in hospital employment data, including wage data, from February 2020 at the start of the COVID-19 pandemic through early 2024. Commenters stated that this analysis found that the average weekly earnings for healthcare employees had gone up 20.8% from \$1,038 to \$1,254 weekly in January 2024. Commenters further stated that even more specific to the IPPS, the report found that hospital workers wages saw a 20.3% increase between February 2020 to January 2024, going from \$1,269 to \$1,527 per week.¹⁹⁸ Commenters pointed out that CMS also observed this shift in wages, as outlined in CMS' analysis of audited wage data for FY 2020 to 2021 in the proposed rule, which saw larger increases in average hourly wages and wage indexes than compared to

¹⁹⁸ "What are the recent trends in health sector employment?" Peterson-KFF Health System Tracker, March 27, 2024. <https://www.healthsystemtracker.org/chart-collection/what-are-the-recent-trends-health-sectoremployment/#Cumulative%20%20change%20in%20average%20weekly%20earnings,%20since%20February%202020%20-%20January%202024>

years prior and noted that CMS acknowledged that there are several challenges related to determining the cause of these changes, including uncertainty around the impact of the COVID-19 PHE. According to commenters, for a variety of reasons, including the COVID-19 PHE and other factors impacting wages, it is likely that changes observed in employee compensation may not be directly related to the low wage index hospital policy. These commenters urged CMS to tackle these issues in a more thoughtful and comprehensive manner that improves the standing of low wage index hospitals without impairing the standing of high wage index hospitals.

According to some commenters, CMS misunderstands the various programs that provided financial support to hospitals during the COVID-19 PHE. These commenters explained that all of the programs, including the Provider Relief Fund, state emergency relief funds and Small Business Administration Loan Forgiveness program, were intended in some fashion to replace some or all revenue hospitals lost due to decreases in demand associated with the COVID-19 PHE and cover the extraordinary costs hospitals incurred responding to the PHE that are not reimbursed through payments from Medicare, Medicaid, and commercial payers. The commenters stated that the funds from these programs were distributed using consistent criteria that applied to all eligible hospitals and therefore were not intended to advantage certain hospitals over others by increasing revenue for some hospitals and not others in a given category, as the low wage index hospital policy does. According to the commenters, the COVID-19 relief programs were intended to replace revenue that hospitals lost as a result of circumstances beyond their control and cover the extraordinary costs of saving patients' lives, mitigating the spread of a deadly pathogen, and protecting communities during a global pandemic. These commenters stated that if CMS was concerned data from the COVID-19 period were so flawed it could not determine the impact of the bottom quartile policy on impacted hospitals, it might stand to reason that the data would also be so flawed that they could not be used for payment updates. According to the commenters, CMS had enough confidence in the "normalcy" of data from years (federal and calendar) impacted by COVID-19 to use it to set MS-DRG weights, fixed-loss

outlier thresholds, wage index values, and other key components of the IPPS in FY 2024 and it further proposes to use data from COVID-19 impacted years for the same functions in FY 2025. Finally, the commenters explained that CMS even acknowledges this in the proposed rule by stating that while there are some differences, it is not readily apparent how any changes due to the COVID-19 PHE differentially impacted the wages paid by individual hospitals. According to the commenters, the proposed rule attempts to justify this continuation by discussing the challenges of normalizing hospital wage data to understand the impact of this policy if changes due to the COVID-19 PHE did differentially impact wages paid by hospitals over time. The commenters stated that if CMS is confident enough in the data to use them for rate setting, then it should be confident enough to assume there was no differential impact that would spoil an impact analysis of the bottom quartile policy.

Response: We thank commenters for their input and concurrence regarding insufficient data to support modifying or discontinuing the policy because of the COVID-19 PHE impacts on wage data. We also thank the commenters for their support for this policy continuing for FY 2025 and beyond. We continue to believe that the comments in support of the policy, specifically comments from relatively low-wage hospitals stating that the increased payments under the policy have allowed them stability and an ability to recruit and retain desperately needed health care staff, have reduced hiring and employment barriers for these hospitals. Regarding the requests by commenters to extend the policy until FY 2030 or to establish a definitive end or expiration date for the policy, as we mentioned in the proposed rule, the COVID-19 PHE ended in May of 2023. Four years is the minimum time before increases in employee compensation included in the Medicare cost report could be reflected in the wage index data. The first full fiscal year of wage data after the COVID-19 PHE is the FY 2024 wage data, which would be available for the FY 2028 IPPS/LTCH PPS rulemaking. As we explained earlier in this section, at the time the low wage index hospital policy was finalized, our intention was that it would be in effect for at least 4 fiscal years beginning October 1, 2019, and to revisit

the issue of the duration of this policy as we gained experience under the policy. Because the effects of the COVID-19 PHE complicate our ability to evaluate the low wage index hospital policy and our ability to determine whether low-wage hospitals have been provided a sufficient opportunity to increase employee compensation under the policy without the usual lag, we proposed that the low wage index hospital policy and the related budget neutrality adjustment would be effective for at least three more years, beginning in FY 2025. This would result in the policy being in effect for at least 4 full fiscal years in total after the end of the COVID-19 PHE in May of 2023. This will allow us to gain experience under the policy for the same duration and in an environment more similar to the one we expected at the time the policy was first promulgated. Until we are able to evaluate hospital wage data from the period after the end of the COVID-19 PHE and gain experience under the low wage index hospital policy to determine the policy's effectiveness, we are not able to determine or project a definitive end date of the policy. Therefore, in this final rule, we are not extending the policy until FY 2030, nor establishing a definitive end or expiration date.

Regarding the comments about CMS' attempt to gauge the impact of the COVID-19 PHE relative to the impact of the low wage index hospital policy by examining the aggregate revenue each hospital reported on their FY 2020 cost reports from the COVID-19 PHE Provider Relief Fund, the Small Business Administration Loan Forgiveness program, and other sources of COVID-19 related funding such as payroll retention credits and state emergency relief funds, we disagree with the commenters. Our intention was not to convey that the purpose of various COVID-19 related funding opportunities was the same as the purpose of the low wage index hospital policy, but instead, to provide a statistical comparison examining the overall amount hospitals reported in COVID-19 related funding to the portion of that amount the amount low-wage hospitals received. Our explanation in the proposed rule and earlier in this section also aimed to explain our thinking that COVID-19 related funding played a role in increasing hospital employee compensation, and since that was and remains the goal of the low wage index hospital

policy, it was not possible to quantify which sources of funding, COVID-19 related or low wage index hospital policy, actually contributed to hospitals increasing employee compensation. In addition, as explained earlier in this section we compared FY 2021 wage data from hospital cost reports and historical cost report data to consider the impacts of the COVID-19 PHE on the FY 2021 hospital wage data. In both comparisons, the COVID-19 related funding data comparison between all hospitals and low-wage hospitals and the comparison between FY 2021 wage data from hospital cost reports and historical cost report data, while there were differences noted, as we stated in the proposed rule and again earlier in this section, it is not readily apparent how any changes due to the COVID-19 PHE differentially impacted the wages paid by individual hospitals. Again, as we have stated earlier in this section, the effects of the COVID-19 PHE complicate our ability to evaluate the low wage index hospital policy and our ability to determine whether low-wage hospitals have been provided a sufficient opportunity to increase employee compensation under the policy without the usual lag.

We appreciate the comment concerning CMS' use of data from the COVID-19 PHE period for payment update purposes. However, the purpose of and data used for general payment updates is different than that of the low wage index hospital policy. We primarily use two data sources in the IPPS and LTCH PPS ratesetting: claims data and cost report data. The claims data source is the Medicare Provider Analysis and Review (MedPAR) file, which includes fully coded diagnostic and procedure data for all Medicare inpatient hospital bills for discharges in a fiscal year. The cost report data source is the Medicare hospital cost report data files from the most recent quarterly Healthcare Cost Report Information System (HCRIS) release. Our goal is always to use the best available data overall for ratesetting. However, due to the impact of the COVID-19 PHE on our ordinary payment update data, we finalized modifications to our usual payment update procedures in order to satisfy the purpose of updating payments, approximating the inpatient experience at IPPS hospitals and LTCHs in FY 2024 (88 FR 58651 through 58553). As we discuss throughout this section, the purpose of the low wage

index hospital policy is to provide low wage index hospitals with an opportunity to increase employee compensation without the usual lag in those increases being reflected in the calculation of the wage index (as they would expect to do if not for the lag). We also discussed earlier in this section that to the extent that wage index disparities for a subset of low wage index hospitals has diminished, it is unclear to what extent that is attributable to the low wage index hospital policy given the effects of the COVID-19 PHE (as discussed below). Again, as we stated earlier in this section, even if changes due to the COVID-19 PHE did differentially impact the wages paid by individual hospitals over time, it is not clear how those changes could be isolated from changes due to other reasons and what an appropriate potential methodology might be to adjust the data accordingly. Therefore, the concerns we identified about the use of data from the time period during the COVID-19 PHE are specific to the purpose of the low wage index hospital policy. Maintaining the policy for at least 4 full fiscal years in total after the end of the COVID-19 PHE in May of 2023 will allow us to gain experience under the policy for the same duration and in an environment more similar to the one we expected at the time the policy was first promulgated and will provide us with the best opportunity to evaluate the effectiveness of the policy.

Regarding the commenters' thoughts on CMS' comparison of the distribution of the percentage change in AHWs from FY 2019 to FY 2021 for low wage index hospitals and non-low wage index hospitals, we appreciate the separate analysis referenced by commenters that the commenters indicate confirms CMS' analysis that based on the data currently available, the low wage index hospital policy has not yet had the effect of substantially reducing the wage index disparities that existed at the time the policy was promulgated. We also appreciate the commenters' suggestions for further evaluation of data as it becomes available and acknowledgement of whether other factors may play a role in assessing the effectiveness of the low wage index hospital policy. As we explained earlier in this section, the uncertainty around the impact of the COVID-19 PHE and its effects on CMS' ability to assess and compare wage

data make it difficult to sufficiently assess the effectiveness of the policy at this time. We also appreciate the input from commenters charging CMS to be as thoughtful and comprehensive as possible to address the effectiveness and implementation of this policy going forward. As we indicated in the proposed rule and previous rulemaking, we finalized this policy in the FY 2020 IPPS/LTCH final rule to provide low wage index hospitals with an opportunity to increase employee compensation without the usual lag in those increases being reflected in the calculation of the wage index (as they would expect to do if not for the lag). This continues to be the purpose of the policy. As we explained earlier in this section, at the time the low wage index hospital policy was finalized, our intention was that it would be in effect for at least 4 fiscal years beginning October 1, 2019, and to revisit the issue of the duration of this policy as we gained experience under the policy. The effects of the COVID–19 PHE complicate our ability to evaluate the low wage index hospital policy and our ability to determine whether low wage hospitals have been provided a sufficient opportunity to increase employee compensation under the policy without the usual lag. As we discussed in the proposed rule, if the policy were to be in effect for at least 4 full fiscal years in total after the end of the COVID–19 PHE in May of 2023, it would allow us to gain experience under the policy for the same duration and in an environment more similar to the one we expected at the time the policy was first promulgated.

Therefore, after consideration of the comments received, and for the reasons stated previously in the proposed rule, we are finalizing as proposed that the low wage index hospital policy and the related budget neutrality adjustment be effective for at least three more years, beginning in FY 2025. For purposes of the low wage index hospital policy, based on the data for this final rule, the table displays the 25th percentile wage index value across all hospitals for FY 2025.

FY 2025 25 th Percentile Wage Index Value	0.9007
--	--------

6. Cap on Wage Index Decreases and Budget Neutrality Adjustment

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018 through 49021), we finalized a wage index cap policy and associated budget neutrality adjustment for FY 2023 and subsequent fiscal years. Under this policy, we apply a 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline. A hospital's wage index will not be less than 95 percent of its final wage index for the prior FY. If a hospital's prior FY wage index is calculated with the application of the 5-percent cap, the following year's wage index will not be less than 95 percent of the hospital's capped wage index in the prior FY. Except for newly opened hospitals, we apply the cap for a FY using the final wage index applicable to the hospital on the last day of the prior FY. A newly opened hospital will be paid the wage index for the area in which it is geographically located for its first full or partial fiscal year, and it will not receive a cap for that first year, because it will not have been assigned a wage index in the prior year. The wage index cap policy is reflected at § 412.64(h)(7). We apply the cap in a budget neutral manner through a national adjustment to the standardized amount each fiscal year. For more information about the wage index cap policy and associated budget neutrality adjustment, we refer readers to the discussion in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018 through 49021).

We explained in the proposed rule that for FY 2025, we would apply the wage index cap and associated budget neutrality adjustment in accordance with the policies adopted in the FY 2023 IPPS/LTCH PPS final rule. We noted that the budget neutrality adjustment will be updated, as appropriate, based on the final rule data. We refer readers to the Addendum of this final rule for further information regarding the budget neutrality calculations.

Comment: Commenters thanked CMS for the 5% cap on all wage index decreases regardless of the circumstances causing the decline, including the adoption of revised CBSA delineations. Many commenters specifically stated that they appreciate CMS' recognition that significant year-over-year changes in the wage index can occur due to external factors beyond a hospital's control and that this policy increases predictability of IPPS payments. Many

commenters supported the cap but urged CMS to apply this policy in a non-budget neutral manner. MedPAC supported the policy to cap wage index decreases, but urged CMS to apply a cap to wage index increases as well. A commenter stated that even a 5% decrease could be impactful to the financial stability of certain hospitals, and asked CMS to consider a smaller percentage point cap for safety net hospitals.

Response: We thank the commenters for their support. We note that we did not propose any changes to this policy in the FY 2025 IPPS/ LTCH PPS proposed rule. With regard to the commenters requesting that CMS apply this policy in a non-budget neutral manner, we refer readers to our response to similar comments in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58981). We appreciate MedPAC’s suggestion that the cap on wage index changes should also be applied to increases in the wage index. However, as we stated in the FY 2023 IPPS/ LTCH PPS final rule (87 FR 49021), one purpose of the proposed policy is to help mitigate the significant negative impacts of certain wage index changes. That is, we cap decreases because we believe that a hospital would be able to more effectively budget and plan when there is predictability about its expected minimum level of IPPS payments in the upcoming fiscal year. We do not have a policy to limit wage index increases because we do not believe such a policy is needed to enable hospitals to more effectively budget and plan their operations. Therefore, we believe it is appropriate for hospitals that experience an increase in their wage index value to receive that wage index value. With regard to the commenter’s request for CMS to consider a smaller percentage point cap for safety net hospitals, we do not believe it is appropriate to bifurcate the policy to provide a greater benefit to specific hospitals, nor is it clear how CMS would define “safety net hospitals” for the specialized cap the commenter requested.

H. FY 2025 Wage Index Tables

In this FY 2025 IPPS/LTCH PPS final rule, we have included the following wage index tables: Table 2 titled “Case-Mix Index and Wage Index Table by CCN”; Table 3 titled “Wage Index Table by CBSA”; Table 4A titled “List of Counties Eligible for the Out-Migration

Adjustment under Section 1886(d)(13) of the Act’’; and Table 4B titled ‘‘Counties redesignated under section 1886(d)(8)(B) of the Act (Lugar Counties).’’ We refer readers to section VI. of the Addendum to this final rule for a discussion of the wage index tables for FY 2025.

I. Labor-Related Share for the FY 2025 Wage Index

Section 1886(d)(3)(E) of the Act directs the Secretary to adjust the proportion of the national prospective payment system base payment rates that are attributable to wages and wage-related costs by a factor that reflects the relative differences in labor costs among geographic areas. It also directs the Secretary to estimate from time to time the proportion of hospital costs that are labor-related and to adjust the proportion (as estimated by the Secretary from time to time) of hospitals’ costs that are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the portion of hospital costs attributable to wages and wage-related costs as the labor-related share. The labor-related share of the prospective payment rate is adjusted by an index of relative labor costs, which is referred to as the wage index.

Section 403 of Public Law 108–173 amended section 1886(d)(3)(E) of the Act to provide that the Secretary must employ 62 percent as the labor-related share unless this would result in lower payments to a hospital than would otherwise be made. However, this provision of Public Law 108-173 did not change the legal requirement that the Secretary estimate from time to time the proportion of hospitals’ costs that are attributable to wages and wage-related costs. Thus, hospitals receive payment based on either a 62-percent labor-related share, or the labor-related share estimated from time to time by the Secretary, depending on which labor-related share results in a higher payment.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45208), we rebased and revised the hospital market basket to a 2018-based IPPS hospital market basket, which replaced the 2014-based IPPS hospital market basket, effective beginning October 1, 2021. Using the 2018-based IPPS market basket, we finalized a labor-related share of 67.6 percent for discharges occurring on or after October 1, 2021. In addition, in FY 2022, we implemented this revised and

rebased labor-related share in a budget neutral manner (86 FR 45193, 86 FR 45529 through 45530). However, consistent with section 1886(d)(3)(E) of the Act, we did not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000.

The labor-related share is used to determine the proportion of the national IPPS base payment rate to which the area wage index is applied. We include a cost category in the labor-related share if the costs are labor intensive and vary with the local labor market. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45204 through 45207), we included in the labor-related share the national average proportion of operating costs that are attributable to the following cost categories in the 2018-based IPPS market basket: Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; and All Other: Labor-Related Services. In the proposed rule, for FY 2025, we did not propose to make any further changes to the labor-related share. For FY 2025, we are finalizing the policy to continue to use a labor-related share of 67.6 percent for discharges occurring on or after October 1, 2024. We note that, consistent with our established frequency of rebasing the IPPS market basket every 4 years, we anticipate proposing to rebase and revise the IPPS market basket in the FY 2026 IPPS/LTCH PPS proposed rule. Our preliminary evaluation of more recent Medicare cost report data for IPPS hospitals for 2022 indicates that the major IPPS market basket cost weights (particularly the compensation and drug cost weights) are similar to those finalized in the 2018-based IPPS market basket.

As discussed in section V.B. of the preamble of this final rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we applied the Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage to the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016

(Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need for us to calculate a Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage for application to the Puerto Rico-specific standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national labor-related share and nonlabor-related share percentages that are applied to the national standardized amount. Accordingly, for FY 2025, we did not propose a Puerto Rico-specific labor-related share percentage or a nonlabor-related share percentage.

Tables 1A and 1B, which are published in section VI. of the Addendum to this FY 2025 IPPS/LTCH PPS final rule and available via the internet on the CMS website, reflect the national labor-related share. Table 1C, in section VI. of the Addendum to this FY 2025 IPPS/LTCH PPS final rule and available via the internet on the CMS website, reflects the national labor-related share for hospitals located in Puerto Rico. For FY 2025, for all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are less than or equal to 1.0000, we are applying the wage index to a labor-related share of 62 percent of the national standardized amount. For all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are greater than 1.000, for FY 2025, we are applying the wage index to a labor-related share of 67.6 percent of the national standardized amount.

Comment: Several commenters recommended CMS raise the labor-related share from the current 67.6 percent to at least 72.8 percent, which is the figure CMS calculated for the proposed updated labor-related share for LTCHs for FY 2025. A commenter supported CMS not

proposing to increase the labor-related share.

Response: We did not propose to make any further changes to the labor related share for FY 2025. Also, we do not believe it would be appropriate to use the labor-related share for LTCHs, which was calculated specifically for the LTCH PPS instead of the labor related share computed for the hospitals paid under the IPPS. As discussed earlier, for FY 2025, we are continuing to use a labor-related share of 67.6 percent for discharges occurring on or after October 1, 2024.

IV. Payment Adjustment for Medicare Disproportionate Share Hospitals (DSHs) for FY 2025 (§ 412.106)

A. General Discussion

Section 1886(d)(5)(F) of the Act provides for additional Medicare payments to subsection (d) hospitals that serve a significantly disproportionate number of low-income patients. The Act specifies two methods by which a hospital may qualify for the Medicare disproportionate share hospital (DSH) adjustment. Under the first method, hospitals that are located in an urban area and have 100 or more beds may receive a Medicare DSH payment adjustment if the hospital can demonstrate that, during its cost reporting period, more than 30 percent of its net inpatient care revenues are derived from State and local government payments for care furnished to patients with low incomes. This method is commonly referred to as the “Pickle method.” The second method for qualifying for the DSH payment adjustment, which is the more commonly used method, is based on a complex statutory formula under which the DSH payment adjustment is based on the hospital’s geographic designation, the number of beds in the hospital, and the level of the hospital’s disproportionate patient percentage (DPP).

A hospital’s DPP is the sum of two fractions: the “Medicare fraction” and the “Medicaid fraction.” The Medicare fraction (also known as the “SSI fraction” or “SSI ratio”) is computed by dividing the number of the hospital’s inpatient days that are furnished to patients who were entitled to both Medicare Part A and Supplemental Security Income (SSI) benefits by the hospital’s total number of patient days furnished to patients entitled to benefits under Medicare Part A. The Medicaid fraction is computed by dividing the hospital’s number of inpatient days furnished to patients who, for such days, were eligible for Medicaid, but were not entitled to benefits under Medicare Part A, by the hospital’s total number of inpatient days in the same period.

DSH Eligibility	Qualifying Criteria
Statutory Formula	A hospital that has a disproportionate patient percentage equal to or exceeding 15 percent may qualify for the Medicare DSH adjustment. We refer readers to 42 CFR 412.106 for the specific eligibility criteria and payment formulas.

“Pickle Method”	A hospital that is located in an urban area and has 100 or more beds may qualify to receive a Medicare DSH payment adjustment if the hospital can demonstrate that, during its cost reporting period, more than 30 percent of its net inpatient care revenues are derived from State and local government payments for care furnished to patients with low incomes.
-----------------	---

Because the DSH payment adjustment is part of the IPPS, the statutory references to “days” in section 1886(d)(5)(F) of the Act have been interpreted to apply only to hospital acute care inpatient days. Regulations located at 42 CFR 412.106 govern the Medicare DSH payment adjustment and specify how the DPP is calculated as well as how beds and patient days are counted in determining the Medicare DSH payment adjustment. Under § 412.106(a)(1)(i), the number of beds for the Medicare DSH payment adjustment is determined in accordance with bed counting rules for the IME adjustment under § 412.105(b).

Section 3133 of the Patient Protection and Affordable Care Act (Pub. L. 111-148), as amended by section 10316 of the same Act and section 1104 of the Health Care and Education Reconciliation Act (Pub. L. 111-152), added a section 1886(r) to the Act that modifies the methodology for computing the Medicare DSH payment adjustment. We refer to these provisions collectively as section 3133 of the Affordable Care Act. Beginning with discharges in FY 2014, hospitals that qualify for Medicare DSH payments under section 1886(d)(5)(F) of the Act receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments. This provision applies equally to hospitals that qualify for DSH payments under section 1886(d)(5)(F)(i)(I) of the Act and those hospitals that qualify under the Pickle method under section 1886(d)(5)(F)(i)(II) of the Act.

The remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured, is available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. The payments to each hospital for a fiscal year are based on the hospital’s amount of uncompensated care for a given time period relative to the total amount of uncompensated care for that same time period reported

by all hospitals that receive Medicare DSH payments for that fiscal year.

Since FY 2014, section 1886(r) of the Act has required that hospitals that are eligible for DSH payments under section 1886(d)(5)(F) of the Act receive 2 separately calculated payments:

Medicare DSH Payment	An empirically justified DSH payment equal to 25% of the amount determined under the statutory formula in section 1886(d)(5)(F) of the Act.
Medicare DSH Uncompensated Care Payment	An uncompensated care payment determined as the product of 3 factors, as discussed in this section.

Specifically, section 1886(r)(1) of the Act provides that the Secretary shall pay to such subsection (d) hospital 25 percent of the amount the hospital would have received under section 1886(d)(5)(F) of the Act for DSH payments, which represents the empirically justified amount for such payment, as determined by the MedPAC in its March 2007 Report to Congress.¹⁹⁹ We refer to this payment as the “empirically justified Medicare DSH payment.”

In addition to this empirically justified Medicare DSH payment, section 1886(r)(2) of the Act provides that, for FY 2014 and each subsequent fiscal year, the Secretary shall pay to such subsection (d) hospital an additional amount equal to the product of three factors. The first factor is the difference between the aggregate amount of payments that would be made to subsection (d) hospitals under section 1886(d)(5)(F) of the Act if subsection (r) did not apply and the aggregate amount of payments that are made to subsection (d) hospitals under section 1886(r)(1) of the Act for such fiscal year. Therefore, this factor amounts to 75 percent of the payments that would otherwise be made under section 1886(d)(5)(F) of the Act.

The second factor is, for FY 2018 and subsequent fiscal years, 1 minus the percent change in the percent of individuals who are uninsured, as determined by comparing the percent of individuals who were uninsured in 2013 (as estimated by the Secretary, based on data from the Census Bureau or other sources the Secretary determines appropriate, and certified by the Chief Actuary of CMS) and the percent of individuals who were uninsured in the most recent period for

¹⁹⁹ <https://www.medpac.gov/document/march-2007-report-to-the-congress-medicare-payment-policy/>.

which data are available (as so estimated and certified).

The third factor is a percent that, for each subsection (d) hospital, represents the quotient of the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data), including the use of alternative data where the Secretary determines that alternative data are available which are a better proxy for the costs of subsection (d) hospitals for treating the uninsured, and the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act. Therefore, this third factor represents a hospital's uncompensated care amount for a given time period relative to the uncompensated care amount for that same time period for all hospitals that receive Medicare DSH payments in the applicable fiscal year, expressed as a percent.

For each hospital, the product of these three factors represents its additional payment for uncompensated care for the applicable fiscal year. We refer to the additional payment determined by these factors as the "uncompensated care payment." In brief, the uncompensated care payment for an individual hospital is determined as the product of the following 3 factors:

Factor 1	75% of the total amount of DSH payments that would otherwise be made under section 1886(d)(5)(F) of the Act.
Factor 2	1 minus the percent change in the percent of individuals who are uninsured.
Factor 3	The hospital's uncompensated care amount relative to the uncompensated care amount for all hospitals that receive DSH payments, expressed as a percentage.

Section 1886(r) of the Act applies to FY 2014 and each subsequent fiscal year. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50620 through 50647) and the FY 2014 IPPS interim final rule with comment period (78 FR 61191 through 61197), we set forth our policies for implementing the required changes to the Medicare DSH payment methodology made by section 3133 of the Affordable Care Act for FY 2014. In those rules, we noted that, because section 1886(r) of the Act modifies the payment required under section 1886(d)(5)(F) of the Act, it affects only the DSH payment under the operating IPPS. It does not revise or replace the capital IPPS DSH payment provided under the regulations at 42 CFR part 412, subpart M, which was established through the exercise of the Secretary's discretion in implementing the capital IPPS

under section 1886(g)(1)(A) of the Act.

Finally, section 1886(r)(3) of the Act provides that there shall be no administrative or judicial review under section 1869, section 1878, or otherwise of any estimate of the Secretary for purposes of determining the factors described in section 1886(r)(2) of the Act or of any period selected by the Secretary for the purpose of determining those factors. Therefore, there is no administrative or judicial review of the estimates developed for purposes of applying the three factors used to determine uncompensated care payments, or of the periods selected to develop such estimates.

B. Eligibility for Empirically Justified Medicare DSH Payments and Uncompensated Care Payments

The payment methodology under section 3133 of the Affordable Care Act applies to “subsection (d) hospitals” that would otherwise receive a DSH payment made under section 1886(d)(5)(F) of the Act. Therefore, hospitals must receive empirically justified Medicare DSH payments in a fiscal year to receive an additional Medicare uncompensated care payment for that year. Specifically, section 1886(r)(2) of the Act states that, in addition to the empirically justified Medicare DSH payment made to a subsection (d) hospital under section 1886(r)(1) of the Act, the Secretary shall pay to “such subsection (d) hospitals” the uncompensated care payment. Section 1886(r)(2)’s reference to “such subsection (d) hospitals” refers to hospitals that receive empirically justified Medicare DSH payments under section 1886(r)(1) for the applicable fiscal year.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622) and the FY 2014 IPPS interim final rule with comment period (78 FR 61193), we explained that hospitals that are not eligible to receive empirically justified Medicare DSH payments in a fiscal year will not receive uncompensated care payments for that year. We also specified that we would make a determination concerning eligibility for interim uncompensated care payments based on each hospital’s estimated DSH status (that is, eligibility to receive empirically justified Medicare DSH

payments) for the applicable fiscal year (using the most recent data that are available). For the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36188 through 36189), we estimated DSH status for all hospitals using the most recent available SSI ratios and information from the most recent available Provider Specific File. We noted that FY 2020 SSI ratios available on the CMS website were the most recent available SSI ratios at the time of developing the proposed rule.²⁰⁰ We stated that if more recent data on DSH eligibility became available before the final rule, we would use such data in the final rule. The FY 2021 SSI ratios are the most recent data available at the time of developing this FY 2025 IPPS/LTCH PPS final rule.

Our final determinations of a hospital's eligibility for uncompensated care and empirically justified Medicare DSH payments will be based on the hospital's actual DSH status at cost report settlement for FY 2025.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622) and in the rulemakings for subsequent fiscal years, we have specified our policies for several specific classes of hospitals within the scope of section 1886(r) of the Act. Eligible hospitals include the following:

- Subsection (d) Puerto Rico hospitals that are eligible for DSH payments also are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under section 1886(r) of the Act (78 FR 50623 and 79 FR 50006).
- Sole community hospitals (SCHs) that are paid under the IPPS Federal rate receive interim payments based on what we estimate and project their DSH status to be prior to the beginning of the fiscal year (based on the best available data at that time) subject to settlement through the cost report. If they receive interim empirically justified Medicare DSH payments in a fiscal year, they will also be eligible to receive interim uncompensated care payments for that fiscal year on a per discharge basis. Final eligibility determinations will be made at the end of the cost reporting period at settlement, and both interim empirically justified Medicare DSH

²⁰⁰

<https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh>.

payments and uncompensated care payments will be adjusted accordingly (78 FR 50624 and 79 FR 50007).

- Medicare-dependent, small rural hospitals (MDHs) are paid based on the IPPS Federal rate or, if higher, the IPPS Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the updated hospital-specific rate from certain specified base years (76 FR 51684). The IPPS Federal rate that is used in the MDH payment methodology is the same IPPS Federal rate that is used in the SCH payment methodology. Because MDHs are paid based on the IPPS Federal rate, they continue to be eligible to receive empirically justified Medicare DSH payments and uncompensated care payments if their DPP is at least 15 percent, and we apply the same process to determine MDHs' eligibility for interim empirically justified Medicare DSH and interim uncompensated care payments as we do for all other IPPS hospitals. Recently enacted legislation has extended the MDH program through December 31, 2024. We refer readers to section V.F. of the preamble of this final rule for further discussion of the MDH program.

Section 307 of the Consolidated Appropriations Act, 2024 extended the MDH program through December 31, 2024. We will continue to make a determination concerning an MDH's eligibility for interim empirically justified Medicare DSH and uncompensated care payments based on the hospital's estimated DSH status for the applicable fiscal year.

- IPPS hospitals that elect to participate in the Bundled Payments for Care Improvement Advanced (BPCI Advanced) model, will continue to be paid under the IPPS and, therefore, are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments until the Model's final performance year, which ends on December 31, 2025. For further information regarding the BPCI Advanced model, we refer readers to the CMS website at <https://innovation.cms.gov/innovation-models/bpci-advanced>.

- IPPS hospitals that participate in the Comprehensive Care for Joint Replacement (CJR) Model's (80 FR 73300) continue to be paid under the IPPS and, therefore, are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments We

refer the reader to the final rule that appeared in the May 3, 2021, **Federal Register** (86 FR 23496), which extended the CJR Model for an additional three performance years. The Model's final performance year ends on December 31, 2024. For additional information on the CJR Model, we refer readers to the CMS website at

<https://www.cms.gov/priorities/innovation/innovation-models/CJR>.

- Transforming Episode Accountability Model (TEAM) is a new episode-based payment model, which is discussed in section X.A. of the preamble of this final rule. Hospitals participating in TEAM would continue to be paid under the IPPS and, therefore, are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments. The model's start date is January 1, 2026.

Ineligible hospitals include the following:

- Maryland hospitals are not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under the payment methodology of section 1866(r) of the Act because they are not paid under the IPPS. As discussed in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41402 through 41403), CMS and the State have entered into an agreement to govern payments to Maryland hospitals under a new payment model, the Maryland Total Cost of Care (TCOC) Model, which began on January 1, 2019. Under the Maryland TCOC Model, which concludes on December 31, 2026, Maryland hospitals are not paid under the IPPS and are ineligible to receive empirically justified Medicare DSH payments and uncompensated care payments under section 1886(r) of the Act.

- SCHs that are paid under their hospital-specific rate are not eligible for Medicare DSH and uncompensated care payments (78 FR 50623 and 50624).

- Hospitals participating in the Rural Community Hospital Demonstration Program are not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under section 1886(r) of the Act because they are not paid under the IPPS (78 FR 50625 and 79 FR 50008). The Rural Community Hospital Demonstration Program was

originally authorized for a 5-year period by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108-173).²⁰¹ The period of participation for the last hospital in the demonstration under this most recent legislative authorization will end on June 30, 2028. Under the payment methodology that applies during this most recent extension of the demonstration program, participating hospitals do not receive empirically justified Medicare DSH payments, and they are excluded from receiving interim and final uncompensated care payments. At the time of development of this final rule, we believe 23 hospitals may participate in the demonstration program at the start of FY 2025.

In response to our comment solicitation on these policies in the proposed rule, we received comments related to the eligibility of SCHs paid under hospital-specific rates and MDHs to receive empirically justified DSH and uncompensated care payments. Because we consider these public comments to be outside the scope of the proposed rule, we are not addressing them in this final rule.

C. Empirically Justified Medicare DSH Payments

As we have discussed earlier, section 1886(r)(1) of the Act requires the Secretary to pay 25 percent of the amount of the Medicare DSH payment that would otherwise be made under section 1886(d)(5)(F) of the Act to a subsection (d) hospital. Because section 1886(r)(1) of the Act merely requires the Secretary to pay a designated percentage of these payments, without revising the criteria governing eligibility for DSH payments or the underlying payment methodology, we stated in the FY 2014 IPPS/LTCH PPS final rule that we did not believe that it was necessary to develop any new operational mechanisms for making such payments.

Therefore, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50626), we implemented

²⁰¹ The Rural Community Hospital Demonstration Program was extended for a subsequent 5-year period by sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111-148). The period of performance for this 5-year extension period ended on December 31, 2016. Section 15003 of the 21st Century Cures Act (Pub. L. 114 255), enacted on December 13, 2016, again amended section 410A of Pub. L. 108-173 to require a 10-year extension period (in place of the 5-year extension required by the Affordable Care Act), therefore requiring an additional 5-year participation period for the demonstration program. Section 15003 of Pub. L. 114-255 also required a solicitation for applications for additional hospitals to participate in the demonstration program. The period of performance for this 5-year extension period ended December 31, 2021. The Consolidated Appropriations Act, 2021 (Pub. L. 116-260) amended section 410A of Pub. L. 108-173 to extend the demonstration program for an additional 5-year period.

this provision by advising Medicare Administrative Contractors (MACs) to simply adjust subsection (d) hospitals' interim claim payments to an amount equal to 25 percent of what would have been paid if section 1886(r) of the Act did not apply. We also made corresponding changes to the hospital cost report so that these empirically justified Medicare DSH payments could be settled at the appropriate level at the time of cost report settlement. We provided more detailed operational instructions and cost report instructions following issuance of the FY 2014 IPPS/LTCH PPS final rule that are available on the CMS website at <https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2014-Transmittals-Items/R5P240.html>.

In response to our comment solicitation on these policies in the proposed rule, a commenter stated that some subsection (d) hospitals' ability to meet the eligibility requirements for empirically justified DSH payments is at risk due to changes to the Medicaid fraction of their DPPs. The commenter explained that many hospitals will no longer be eligible for empirically justified payments as a result of the unwinding of the Medicaid continuous enrollment condition. The commenter also stated that the unexpectedly high rate of Medicaid beneficiaries losing coverage because of redeterminations is placing many hospitals at risk of falling below the 15 percent minimum DPP. The commenter requested that CMS allow hospitals whose eligibility for empirically justified payments has been impacted by unwinding to receive empirically justified payments, retroactively and in the future. Because we consider this public comment to be outside the scope of the proposed rule, we are not addressing this comment in this final rule.

D. Supplemental Payment for Indian Health Service (IHS) and Tribal Hospitals and Puerto Rico Hospitals

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49047 through 49051), we established a new supplemental payment for IHS/Tribal hospitals and hospitals located in Puerto Rico for FY 2023 and subsequent fiscal years. This payment was established to help to mitigate the impact of the decision to discontinue the use of low-income insured days as a proxy for

uncompensated care costs for these hospitals and to prevent undue long-term financial disruption for these providers. The regulations located at 42 CFR 412.106(h) govern the supplemental payment. In brief, the supplemental payment for a fiscal year is determined as the difference between the hospital's base year amount and its uncompensated care payment for the applicable fiscal year as determined under § 412.106(g)(1). The base year amount is the hospital's FY 2022 uncompensated care payment adjusted by one plus the percent change in the total uncompensated care amount between the applicable fiscal year (that is, FY 2025 for purposes of this rulemaking) and FY 2022, where the total uncompensated care amount for a fiscal year is determined as the product of Factor 1 and Factor 2 for that year. If the base year amount is equal to or lower than the hospital's uncompensated care payment for the current fiscal year, then the hospital would not receive a supplemental payment because the hospital would not be experiencing financial disruption in that year as a result of the use of uncompensated care data from the Worksheet S-10 in determining Factor 3 of the uncompensated care payment methodology.

In the FY 2025 IPPS/LTCH PPS proposed rule, we did not propose any changes to the methodology for determining supplemental payments. For FY 2025, we will calculate the supplemental payments to eligible IHS/Tribal and Puerto Rico hospitals consistent with the methodology described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49047 through 49051) and § 412.106(h).

As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49048 and 49049), the eligibility and payment processes for the supplemental payment are consistent with the processes for determining eligibility to receive interim and final uncompensated care payments adopted in FY 2014 IPPS/LTCH PPS final rule. We note that the MAC will make a final determination with respect to a hospital's eligibility to receive the supplemental payment for a fiscal year, in conjunction with its final determination of the hospital's eligibility for DSH payments and uncompensated care payments for that fiscal year.

Comment: One commenter reiterated their recommendations that were submitted in response to the proposal to establish these supplemental payments in the FY 2023 IPPS/LTCH PPS proposed rule. The commenter recommended that CMS calculate the supplemental payment for Puerto Rico hospitals using a base year amount determined using a Medicare SSI days proxy of at least 42 percent of the hospital's Medicaid days, to reflect the local poverty level, instead of the current base year amount, which incorporates the proxy that was applied from FY 2017 through FY 2022 of 14 percent of the hospital's Medicaid days and that was based on national data on the relationship between Medicare SSI days and Medicaid days. The commenter also requested that CMS extend eligibility for uncompensated care payments to all acute care hospitals in Puerto Rico, including those that do not qualify for empirically justified DSH payments, stating that it is consistent with the plain language and intent of Section 3133 of the Affordable Care Act. The commenter also stated that there are eight Puerto Rico hospitals that are projected to not receive empirically justified DSH payments for FY 2025 and these hospitals may miss the qualifying threshold because of the lack of SSI coverage for residents of the U.S. territories. As an alternative to the recommended policy of extending eligibility for uncompensated care payments to all acute care hospitals in Puerto Rico, the same commenter proposed that CMS could determine a hospital's eligibility to receive uncompensated care payments and supplemental payments using the suggested proxy data for the hospitals' Medicare SSI days of 42 percent.

Another commenter thanked CMS for continuing to provide supplemental payments but requested that CMS evaluate alternatives that would better support hospitals in Puerto Rico if uninsured days increased. This commenter asserted that the current supplemental payment policy only protects against the reduction of uncompensated care payments below FY 2022 levels. The commenter stated that the current policy is not helpful if uninsured patient volumes rise above FY 2022 levels. The same commenter further expressed that they would support a return to the prior method of using a proxy to determine uninsured days for hospitals in Puerto Rico given the

challenges related to Worksheet S-10 data collection for hospitals in Puerto Rico.

Response: We appreciate the concerns and input raised by commenters regarding the calculation of Factor 3 for hospitals in Puerto Rico and IHS and Tribal hospitals. We continue to recognize the unique financial circumstances and challenges faced by Puerto Rico hospitals related to uncompensated care cost reporting on Worksheet S-10.

Regarding the commenter's request that all acute care hospitals in Puerto Rico receive uncompensated care payments regardless of DSH eligibility, we refer readers to the policy initially adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622 and 50623), which explains that hospitals, including Puerto Rico hospitals, must be eligible to receive empirically justified Medicare DSH payments to receive an uncompensated care payment for that fiscal year. As discussed earlier in this section of this final rule and in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49048 and 49049), the processes for determining eligibility for supplemental payments and making interim and final payments are consistent with the processes for determining eligibility to receive interim and final uncompensated care payments adopted in the FY 2014 IPPS/LTCH PPS final rule and the approach used to make interim uncompensated care payments on a per discharge basis.

With respect to the commenters who recommended that CMS determine eligibility for uncompensated care payments and supplemental payments using the suggested Medicare SSI days proxy of 42 percent and calculate the supplemental payment for Puerto Rico hospitals using a base year amount determined from that same Medicare SSI days proxy data, we note that in the FY 2025 IPPS/LTCH PPS proposed rule, we did not propose to adopt any changes to our policies for determining eligibility for uncompensated care payments or supplemental payments, nor did we propose changes to our methodology for calculating supplemental payments. We also note that we did not propose to adopt a proxy for Puerto Rico hospitals' Medicare SSI days for purposes of determining eligibility for empirically justified DSH payments. Therefore, we consider these comments to be outside the scope of the proposed rule. However, we refer readers

to our responses to similar comments in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58992 and 58993) and the FY 2023 IPPS/LTCH PPS final rule (87 FR 49049 and 49050) for further discussion on these issues.

Concerning the comment encouraging CMS to evaluate alternatives to supplemental payments to better support hospitals in the case of increasing uninsured days, including using a proxy to determine uninsured days for hospitals in Puerto Rico, we refer readers to our responses to similar comments in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48780) and the FY 2024 IPPS/LTCH PPS final rule (88 FR 58640). As we explained in those rulemakings, prior to FY 2023, we used low-income insured days as a proxy for uncompensated care costs. Fluctuations in uninsured days were never a direct consideration in the calculation of uncompensated care payments. Therefore, we continue to believe that supplemental payments, which are based on the FY 2022 uncompensated care payments calculated for Puerto Rico hospitals and IHS and Tribal hospitals using low income insured days proxy data, are the appropriate approach for hospitals located in Puerto Rico and IHS and Tribal hospitals.

As discussed earlier in this section, for FY 2025, we will calculate the supplemental payments to eligible IHS/Tribal and Puerto Rico hospitals consistent with the methodology described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49047 through 49051) and § 412.106(h).

E. Uncompensated Care Payments

As we discussed earlier, section 1886(r)(2) of the Act provides that, for each eligible hospital in FY 2014 and subsequent years, the uncompensated care payment is the product of three factors, which are discussed in the next sections.

1. Calculation of Factor 1 for FY 2025

Section 1886(r)(2)(A) of the Act establishes Factor 1 in the calculation of the uncompensated care payment. The regulations located at 42 CFR 412.106(g)(1)(i) govern the Factor 1 calculation. Under a prospective payment system, we would not know the precise aggregate Medicare DSH payment amounts that would be paid for a fiscal year until cost report settlement for all IPPS hospitals is completed, which occurs several years after the end of the fiscal year. Therefore, section 1886(r)(2)(A)(i) of the Act provides authority to estimate this amount by specifying that, for each fiscal year to which the provision applies, such amount is to be estimated by the Secretary. Similarly, we would not know the precise aggregate empirically justified Medicare DSH payment amounts that would be paid for a fiscal year until cost report settlement for all IPPS hospitals is completed. Thus, section 1886(r)(2)(A)(ii) of the Act provides authority to estimate this amount. In brief, Factor 1 is the difference between the Secretary's estimates of: (1) the amount that would have been paid in Medicare DSH payments for the fiscal year, in the absence of section 1886(r) of the Act; and (2) the amount of empirically justified Medicare DSH payments that are made for the fiscal year, which takes into account the requirement to pay 25 percent of what would have otherwise been paid under section 1886(d)(5)(F) of the Act.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36190), we proposed to continue the policy that has applied since the FY 2014 final rule (78 FR 50627 through 50631): to determine Factor 1 from the most recently available estimates of the aggregate amount of Medicare DSH payments that would be made for FY 2025 in the absence of section 1886(r)(1) of the Act and the aggregate amount of empirically justified Medicare DSH payments that would be

made for FY 2025, both as calculated by CMS' Office of the Actuary (OACT). Consistent with the policy that has applied in previous years, these estimates will not be revised or updated subsequent to publication of our final projections in this FY 2025 IPPS/LTCH PPS final rule.

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36190 through 36192), to calculate both estimates, we used the most recently available projections of Medicare DSH payments for the fiscal year, as calculated by OACT using the most recently filed Medicare hospital cost reports with Medicare DSH payment information and the most recent DPPs and Medicare DSH payment adjustments provided in the IPPS Impact File. The projection of Medicare DSH payments for the fiscal year is also partially based on OACT's Part A benefits projection model, which projects, among other things, inpatient hospital spending. Projections of DSH payments additionally require projections of expected increases in utilization and case-mix. The assumptions that were used in making these inpatient hospital spending, utilization, and case-mix projections and the resulting estimates of DSH payments for FY 2022 through FY 2025 are discussed later in this section and in the table titled "Factors Applied for FY 2022 through FY 2025 to Estimate Medicare DSH Expenditures Using FY 2021 Baseline."

For purposes of calculating Factor 1 and modeling the impact of the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36190 through 36192), we used OACT's January 2024 Medicare DSH estimates, which were based on data from the December 2023 update of the Medicare Hospital Cost Report Information System (HCRIS) and the FY 2024 IPPS/LTCH PPS final rule IPPS Impact File, published in conjunction with the publication of the FY 2024 IPPS/LTCH PPS final rule. Because SCHs that are projected to be paid under their hospital-specific rate are ineligible for empirically justified Medicare DSH payments and uncompensated care payments, they were excluded from the January 2024 Medicare DSH estimates. Because Maryland hospitals are not paid under the IPPS, they are also ineligible for empirically justified Medicare DSH payments and uncompensated care payments and were also excluded from OACT's January 2024 Medicare DSH estimates.

The 23 hospitals that CMS expects will participate in the Rural Community Hospital Demonstration Program in FY 2025 were also excluded from OACT's January 2024 Medicare DSH estimates because under the payment methodology that applies during the demonstration, these hospitals are not eligible to receive empirically justified Medicare DSH payments or uncompensated care payments.

For the proposed rule, using the data sources previously discussed, OACT's January 2024 estimates of Medicare DSH payments for FY 2025 without regard to the application of section 1886(r)(1) of the Act was approximately \$13.943 billion. Therefore, also based on OACT's January 2024 Medicare DSH estimates, the estimate of empirically justified Medicare DSH payments for FY 2025, with the application of section 1886(r)(1) of the Act, was approximately \$3.486 billion (or 25 percent of the total amount of estimated Medicare DSH payments for FY 2025). Under § 412.106(g)(1)(i), Factor 1 is the difference between these two OACT estimates. Therefore, in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35934), we proposed that Factor 1 for FY 2025 would be \$10,457,250,000, which is equal to 75 percent of the total amount of estimated Medicare DSH payments for FY 2025 (\$13.943 billion minus \$3.486 billion). We noted that, consistent with our approach in previous rulemakings, OACT intended to use more recent data that may become available for purposes of projecting the final Factor 1 estimates for the FY 2025 IPPS/LTCH PPS final rule (89 FR 36191).

In the FY 2025 IPPS/LTCH PPS proposed rule, we noted that the Factor 1 estimates for IPPS/LTCH PPS proposed rules are generally consistent with the economic assumptions and actuarial analysis used to develop the President's Budget estimates under current law, and Factor 1 estimates for IPPS/LTCH PPS final rules are generally consistent with those used for the Midsession Review of the President's Budget.²⁰² Consistent with historical practice, we stated in the proposed rule that we expected the Midsession Review would have updated economic

²⁰² As we have in the past, for additional information on the development of the President's Budget, we refer readers to the Office of Management and Budget website at <https://www.whitehouse.gov/omb/budget>.

assumptions and actuarial analysis, which we would use for the development of Factor 1 estimates in the FY 2025 IPPS/LTCH PPS final rule.

For a general overview of the principal steps involved in projecting future inpatient costs and utilization, we referred readers to the “2024 Annual Report of the Boards of Trustees of the Federal Hospital Insurance and Federal Supplementary Medical Insurance Trust Funds,” available on the CMS website at <https://www.cms.gov/oact/tr/2024> under “Downloads.”²⁰³ The actuarial projections contained in these reports are based on numerous assumptions regarding future trends in program enrollment, utilization and costs of health care services covered by Medicare, as well as other factors affecting program expenditures. In addition, although the methods used to estimate future costs based on these assumptions are complex, they are subject to periodic review by independent experts to ensure their validity and reasonableness. We also referred readers to the 2018 Actuarial Report on the Financial Outlook for Medicaid for a discussion of general issues regarding Medicaid projections (available at <https://www.cms.gov/data-research/research/actuarial-studies/actuarial-report-financial-outlook-medicaid>).

In the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36190 through 36192), we included information regarding the data sources, methods, and assumptions employed by OACT’s actuaries in determining our estimate of Factor 1. We indicated the historical HCRIS data update OACT used to estimate Medicare DSH payments; we explained that the most recent Medicare DSH payment adjustments provided in the IPPS Impact File were used, and we provided the components of all the update factors that were applied to the historical data to estimate the Medicare DSH payments for the upcoming fiscal year, along with the associated rationale and assumptions. The discussion also included descriptions of the “Other” and “Discharges” assumptions and provided additional information regarding how we address

²⁰³ We note that the annual reports of the Medicare Boards of Trustees to Congress represent the Federal Government’s official evaluation of the financial status of the Medicare Program.

Medicaid expansion.

We invited public comments on our proposed Factor 1 for FY 2025.

Comment: As in previous years, some commenters expressed concerns and requested greater transparency in the methodology used by CMS and OACT to calculate Factor 1. A few commenters emphasized their inability to accurately replicate CMS' calculations without clarity on how inputs, such as the effects of the COVID-19 PHE on Medicare discharges, case mix, Medicaid enrollment, and subsequent disenrollment through redeterminations, impact Factor 1 estimates. Some of these commenters requested that CMS provide details of its Factor 1 calculation in advance of the publication of the IPPS/LTCH PPS final rule and in the IPPS/LTCH PPS proposed rule each year going forward, so that sufficient data is available to replicate CMS' DSH payment calculations and enable commenters to provide more informed comments in future years. Another commenter requested that CMS provide detailed explanations for how the agency calculates Factor 1 to ensure safety net providers are not being disproportionately impacted.

A few commenters asserted that the lack of opportunity afforded to hospitals to review the data used in rulemaking is in violation of the Administrative Procedure Act. These commenters expressed concerns about the lack of transparency in how Factor 1 is calculated, arguing that hospitals cannot meaningfully comment on the Factor 1 calculation methodology given the lack of details provided by CMS in each IPPS/LTCH PPS proposed rule. In particular, these commenters stated that the FY 2025 IPPS/LTCH PPS proposed rule provided neither sufficient details nor a complete explanation of the treatment of Medicaid expansions in the calculation for Factor 1.

Additionally, while some commenters thanked CMS for increasing the "Other" factor from the amount finalized in the FY 2024 final rule, several commenters stated that CMS failed to provide sufficient details on how the "Other" factor is calculated, including both the overall calculation and individual inputs used to determine the estimate. Some of these commenters

requested that CMS publish a detailed methodology of its “Other” calculation, specifying how all components contribute to changes in its estimate from year to year. Other commenters expressed concern about the lack of clarity regarding the ending of COVID-19 PHE flexibilities, such as payment add-ons and the unwinding of the Medicaid continuous enrollment condition, and their impact on the “Other” factor. These commenters suggested that CMS address this issue by disaggregating the variables that contribute to the “Other” factor and then demonstrating the separate impacts of each of those variables on the final value. A couple of commenters requested that CMS clarify why the “Other” factor frequently varies in successive rulemaking cycles.

Response: We thank the commenters for their input. We disagree with commenters’ assertion regarding the lack of transparency with respect to the methodology and assumptions used in the calculation of Factor 1. As explained in the FY 2025 IPPS/LTCH PPS proposed rule and in this section of this final rule, we have been and continue to be transparent about the methodology and data used to estimate Factor 1. Regarding the commenters who reference the Administrative Procedure Act, we note that under the Administrative Procedure Act, a proposed rule is required to include either the terms or substance of the proposed rule or a description of the subjects and issues involved. In this case, the FY 2025 IPPS/LTCH PPS proposed rule (86 FR 36190-36192) included a detailed discussion of our proposed Factor 1 methodology and the data sources that would be used in making our final estimate. Accordingly, we believe commenters were able to meaningfully comment on our proposed estimate of Factor 1.

To provide additional context, and as we have explained in prior rulemakings (*see example*, 88 FR 58995), we note that Factor 1 is not estimated in isolation from other projections made by OACT. The Factor 1 estimates for the proposed rules are generally consistent with the economic assumptions and actuarial analyses used to develop the President’s Budget estimates under current law, and the Factor 1 estimates for the final rule are generally consistent with those used for the Midsession Review of the President’s Budget. As we have in the past, we refer readers to the “Midsession Review of the President’s FY 2025 Budget” for additional

information on the development of the President’s Budget and the specific economic assumptions used in the Midsession Review of the President’s FY 2025 Budget, available on the Office of Management and Budget website at: <https://www.whitehouse.gov/omb/budget>. Consistent with our prior rulemakings, in the FY 2025 IPPS/LTCH proposed rule, we indicated that we expected that the Midsession Review would have updated economic assumptions and actuarial analysis, which would be used in the development of Factor 1 estimates for this final rule. We recognize that our reliance on the economic assumptions and actuarial analyses used to develop the President’s Budget and the Midsession Review of the President’s Budget in estimating Factor 1 has an impact on hospitals, health systems, and other impacted parties who wish to replicate the Factor 1 calculation by, for example, modeling the relevant Medicare Part A portion of the President’s Budget. Yet, we believe commenters are able to meaningfully comment on our proposed estimate of Factor 1 without replicating the budget.

For a general overview of the principal steps involved in projecting future inpatient costs and utilization, we refer readers to the “2024 Annual Report of the Boards of Trustees of the Federal Hospital Insurance and Federal Supplementary Medical Insurance Trust Funds,” available under “Downloads” on the CMS website at: <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/ReportsTrustFunds/index.html>. We note that the annual reports of the Medicare Boards of Trustees to Congress represent the Federal Government’s official evaluation of the financial status of the Medicare Program. The actuarial projections contained in these reports are based on numerous assumptions regarding future trends in program enrollment, utilization, and costs of health care services covered by Medicare, as well as other factors affecting program expenditures. In addition, given that the methods used to estimate future costs based on these assumptions are complex, they are subject to periodic review by independent experts to ensure their validity and reasonableness.

Additionally, as described in more detail later in this section, in the FY 2025 IPPS/LTCH PPS proposed rule, we included information regarding the data sources, methods, and

assumptions employed by the actuaries to determine the OACT's estimate of Factor 1. We explained that the most recent Medicare DSH payment adjustments provided in the IPPS Impact File were used, and we provided the components of all update factors that were applied to the historical data to estimate the Medicare DSH payments for the upcoming fiscal year, along with the associated rationale and assumptions. This discussion also included a description of the "Other," "Case-Mix," and "Discharges" assumptions, as well as additional information regarding the estimated impact of the COVID-19 PHE on our calculation of Factor 1. For additional context, our calculation of the "Other" factor for FY 2025 reflects the expectation that DSH payments will grow faster than IPPS payments in 2025.

Regarding the commenter who expressed concern that our proposed calculation of Factor 1 would disproportionately impact safety net providers, we continue to believe that estimating Factor 1 based on the economic data and assumptions detailed in this final rule and the FY 2025 IPPS/LTCH PPS proposed rule is appropriate and consistent with the requirements of section 1886(r)(2)(A) of the Act.

Comment: Many commenters requested that CMS provide additional detail on the calculations and assumptions related to the "Discharges" component used in the Factor 1 formula. A couple commenters asked that CMS provide an explanation as to why the "Discharges" component for FY 2023 and FY 2024 finalized in the FY 2024 IPPS/LTCH PPS final rule decreased in the FY 2025 IPPS proposed rule. Several commenters questioned the actuarial assumption of "recent trends recovering back to the long-term trend and assumption related to how many beneficiaries will be enrolled in Medicare Advantage (MA) plans." A commenter requested that CMS ensure the "Discharges" component of Factor 1 accurately reflects trends in Medicare Fee-for-Service (FFS) utilization in FY 2025, given concerns about the adequacy of the CY 2025 MA rate update and the recent trend of providers terminating contracts with MA plans due to excessive prior authorization denial rates and slow payments. The same commenter further detailed that these considerations would steer beneficiaries with

greater health needs away from MA and into Medicare FFS. To address changing FFS utilization, the commenter recommended that CMS use more recent data to accurately reflect discharge volumes.

Finally, a commenter commended CMS for increasing the Factor 1 estimate for FY 2025, while another commenter requested that CMS increase the FY 2025 Factor 1 “Update” component consistent with the MedPAC recommended increases to the IPPS market basket used to estimate DSH payments for FY 2022, FY 2024, and FY 2025. This commenter cited MedPAC’s March 2023 and March 2024 Reports to Congress, where the Commission recommended a 1.0 percent increase to the FY 2024 market basket percentage and a 1.5 percent increase to the FY 2025 market basket percentage increase.

Response: We thank the commenters for their input. Regarding commenters’ request for additional detail on the calculations and assumptions underlying the “Discharges” factor, we refer the commenters to the discussion elsewhere in this section of this final rule and the relevant discussion in the FY 2025 IPPS/LTCH PPS proposed rule (86 FR 36190-36192), which detail the calculations and assumptions we used to calculate the FY 2025 “Discharges” factor. We also note that in updating our estimate of Factor 1 for this final rule, we considered, as appropriate, the same set of factors that we used in the FY 2024 IPPS/LTCH PPS proposed rule and in prior rulemakings (*see example*, (88 FR 58993 through 58998)). As we stated we would do in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36191), we then updated our estimates for the FY 2025 “Discharges” component, and other Factor 1 components, to incorporate the latest available data based on more recent economic assumptions and actuarial analyses.

In response to commenters’ request that CMS explain why the projection of the “Discharges” component in the FY 2025 IPPS/LTCH PPS proposed rule was lower than the projections for FY 2023 and FY 2024, we point commenters to discussion elsewhere in this section of this final rule and relevant discussion in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36192), which detail the calculations and assumptions we used to calculate the FY 2025

“Discharges” factor. We also note that consistent with the policy that we have applied since FY 2014 (*see example*, (78 FR 50628 through 50630 and 78 FR 61194)), our estimates for the “Discharges” component in our proposed and final rules are updated using the most recently available data and economic assumptions and actuarial analyses at the time of rulemaking.

Regarding the comments on the impacts of MA enrollment on Medicare FFS discharge volume, we refer commenters to the actuarial projections and assumptions regarding future trends in Medicare FFS and MA program enrollment, utilization, and costs of health care services covered by Medicare, as well as other factors affecting Medicare FFS and MA program expenditures, contained in the “2024 Annual Report of the Boards of Trustees of the Federal Hospital Insurance and Federal Supplementary Medical Insurance Trust Funds,” available under “Downloads” on the CMS website at: <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/ReportsTrustFunds/index.html>, which we considered in developing our estimate of the “Discharges” factor for FY 2025. We also note that, consistent with prior years (*see example*, (88 FR 58997)) our estimate of the “Discharges” component for FY 2025 in this final rule incorporates only claims from the Medicare FFS program rather than claims from the MA program. Accordingly, we believe that the FY 2025 “Discharges” factor in this final rule accurately reflects trends in Medicare FFS discharges.

Regarding the commenter who requested that CMS increase the FY 2025 Factor 1 “Update” component consistent with the MedPAC recommended increases to the IPPS market basket used to estimate DSH payments for FY 2022, FY 2024, and FY 2025, we refer readers to the discussion in section V.B. of the preamble of this final rule. Consistent with the inpatient hospital update discussion in section V.B. of the preamble of this final rule, OACT is using the final inpatient hospital market basket update and productivity adjustment for FY 2025 based on the more recent data available for this final rule for the final FY 2025 “Update” component in the Factor 1 calculation.

After consideration of the public comments we received, we are finalizing, as proposed,

the methodology for calculating Factor 1 for FY 2025. We discuss the resulting Factor 1 amount for FY 2025 in this final rule. Consistent with prior rulemakings, for this final rule, OACT used the most recently submitted Medicare cost report data from the March 31, 2024, update of HCRIS to identify Medicare DSH payments and the most recent Medicare DSH payment adjustments provided in the Impact File and applied update factors and assumptions for projected changes in utilization and case-mix to estimate Medicare DSH payments for the upcoming fiscal year.

The June 2024 OACT estimate for Medicare DSH payments for FY 2025, without regard to the application of section 1886(r)(1) of the Act, was approximately \$14.013 billion. This estimate excluded Maryland hospitals, which participate in the Maryland Total Cost of Care Model and are not paid under the IPPS, hospitals participating in the Rural Community Hospital Demonstration, and SCHs paid under their hospital-specific payment rate. Therefore, based on this June 2024 estimate, the estimate of empirically justified Medicare DSH payments for FY 2025, with the application of section 1886(r)(1) of the Act, was approximately \$3.503 billion (or 25 percent of the total amount of estimated Medicare DSH payments for FY 2025). Under § 412.106(g)(1)(i), Factor 1 is the difference between these two OACT estimates. Therefore, the final Factor 1 for FY 2025 is \$10,509,750,000, which is equal to 75 percent of the total amount of estimated Medicare DSH payments for FY 2025 (\$14,013,000,000 minus \$3,503,250,000).

OACT’s estimates for FY 2025 for this final rule began with a baseline of \$13.401 billion in Medicare DSH expenditures for FY 2021. The following table shows the factors applied to update this baseline through the current estimate for FY 2025:

Factors Applied for FY 2022 through FY 2025 to Estimate Medicare DSH Expenditures Using FY 2021 Baseline						
FY	Update	Discharges	Case-Mix	Other	Total	Estimated DSH Payment (in billions)*
2022	1.025	0.946	0.997	0.9940	0.9611	12.880
2023	1.043	0.946	0.990	1.0501	1.0259	13.214
2024	1.031	0.984	1.005	1.0230	1.0434	13.787
2025	1.029	0.981	1.005	1.0022	1.0164	14.013

*Rounded.

In this table, the discharges column shows the changes in the number of Medicare FFS inpatient hospital discharges. The discharge figures for FY 2022 and FY 2023 are based on Medicare claims data that have been adjusted by a completion factor to account for incomplete claims data. We note that these claims data reflect the impact of the COVID-19 pandemic. The discharge figure for FY 2024 is based on preliminary data. The discharge figure for FY 2025 is an assumption based on recent historical experience, an assumed partial return to pre-COVID 19 trends, and assumptions related to how many beneficiaries will be enrolled in MA plans. Accordingly, the discharge figures for FY 2022 to FY 2025 incorporate the actual impact and estimated future impact of the COVID-19 pandemic.

The case-mix column shows the estimated change in case-mix for IPPS hospitals. The case-mix figures for FY 2022 and FY 2023 are based on actual claims data adjusted by a completion factor to account for incomplete claims data. We note that these claims data reflect the impact of the COVID-19 pandemic. The case-mix figures for FY 2024 and for FY 2025 are assumptions based on the 2012 “Review of Assumptions and Methods of the Medicare Trustees’ Financial Projections” report by the 2010-2011 Medicare Technical Review Panel.²⁰⁴

The “Other” column reflects the change in other factors that contribute to the Medicare DSH estimates. These factors include the difference between the total inpatient hospital discharges and IPPS discharges and various adjustments to the payment rates that have been included over the years but are not reflected in the other columns (such as the 20 percent add-on for COVID-19 discharges). In addition, the “Other” column includes a factor for the estimated changes in Medicaid enrollment through FY 2023. Based on the most recent available data, Medicaid enrollment is estimated to change as follows: +8.3 percent in FY 2022, +5.2 percent in FY 2023, -11.9 percent in FY 2024, and -5.3 percent in FY 2025. In future IPPS rulemakings, our assumptions regarding Medicaid enrollment may change based on actual enrollment in the

²⁰⁴ <https://www.cms.gov/research-statistics-data-and-systems/statistics-trends-and-reports/reportstrustfunds/downloads/technicalpanelreport2010-2011.pdf>

States.

We note that, in developing their estimates of the effect of Medicaid expansion on Medicare DSH expenditures, our actuaries have assumed that the new Medicaid enrollees are healthier than the average Medicaid enrollee and, therefore, receive fewer hospital services.²⁰⁵ Specifically, based on the most recent available data at the time of developing this final rule, OACT assumed per capita spending for Medicaid beneficiaries who enrolled due to the expansion to be approximately 80 percent of the average per capita expenditures for a pre-expansion Medicaid beneficiary, due to the better health of these beneficiaries. The same assumption was used for the new Medicaid beneficiaries who enrolled in 2020 and thereafter due to the COVID-19 pandemic. This assumption is consistent with recent internal estimates of Medicaid per capita spending pre-expansion and post-expansion. In future IPPS rulemakings, the assumption about the average per-capita expenditures of Medicaid beneficiaries who enrolled due to the COVID-19 pandemic may change.

The following table shows the factors that are included in the “Update” column of the previous table:

FY	Market Basket Percentage	Productivity Adjustment	Documentation and Coding	Total Update Percentage
2022	2.7	0.7	0.5	2.5
2023	4.1	0.3	0.5	4.3
2024	3.3	0.2	0.0	3.1
2025	3.4	0.5	0.0	2.9

Note: All figures in this table are the final inpatient hospital updates for the applicable fiscal year. The FY 2025 figures reflect the inpatient hospital updates and productivity adjustment and are based on the 2nd quarter 2024 IHS Global Inc. (IGI) forecast, the most recent forecast available at the time of development of this final rule. We refer readers to section V.B. of the preamble of this final rule for a complete discussion of the changes in the inpatient hospital update for FY 2025.

²⁰⁵ For a discussion of general issues regarding Medicaid projections, we refer readers to the 2018 Actuarial Report on the Financial Outlook for Medicaid, which is available at <https://www.cms.gov/files/document/2018-report.pdf> .

2. Calculation of Factor 2 for FY 2025

a. Background

Section 1886(r)(2)(B) of the Act establishes Factor 2 in the calculation of the uncompensated care payment. Section 1886(r)(2)(B)(ii) of the Act provides that, for FY 2018 and subsequent fiscal years, the second factor is 1 minus the percent change in the percent of individuals who are uninsured, as determined by comparing the percent of individuals who were uninsured in 2013 (as estimated by the Secretary, based on data from the Census Bureau or other sources the Secretary determines appropriate, and certified by the Chief Actuary of CMS) and the percent of individuals who were uninsured in the most recent period for which data are available (as so estimated and certified).

We are continuing to use the methodology that was used in FY 2018 through FY 2024 to determine Factor 2 for FY 2025 – to use the National Health Expenditure Accounts (NHEA) data to determine the percent change in the percent of individuals who are uninsured. We refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38197 and 38198) for a complete discussion of the NHEA and why we determined, and continue to believe, that it is the data source for the rate of uninsurance that, on balance, best meets all our considerations and is consistent with the statutory requirement that the estimate of the rate of uninsurance be based on data from the Census Bureau or other sources the Secretary determines appropriate.

In brief, the NHEA represents the government's official estimates of economic activity (spending) within the health sector. The NHEA includes comprehensive enrollment estimates for total private health insurance (PHI) (including direct and employer-sponsored plans), Medicare, Medicaid, the Children's Health Insurance Program (CHIP), and other public programs, and estimates of the number of individuals who are uninsured. The NHEA data are publicly available on the CMS website at <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/NationalHealthExpendData/index.html>.

To compute Factor 2 for FY 2025, the first metric that is needed is the proportion of the

total U.S. population that was uninsured in 2013. For a complete discussion of the approach OACT used to prepare the NHEA's estimate of the rate of uninsurance in 2013, including the data sources used, we refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 58998 and 58999).

The next metrics needed to compute Factor 2 for FY 2025 are projections of the rate of uninsurance in both CY 2024 and CY 2025. On an annual basis, OACT projects enrollment and spending trends for the coming 10-year period. The most recent projections are for 2023 through 2032 and were published on June 12, 2024. Those projections used the latest NHEA historical data that were available at the time of their construction (that is, historical data through 2022). The NHEA projection methodology accounts for expected changes in enrollment across all of the categories of insurance coverage previously listed. For a complete discussion of how the NHEA data account for expected changes in enrollment across all the categories of insurance coverage previously listed, we refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 58999).

b. Factor 2 for FY 2025

Using these data sources and the previously described methodologies, at the time of developing the proposed rule and using the NHEA data for 2022 through 2031 that were published on June 14, 2023, OACT estimated that the uninsured rate for the historical, baseline year of 2013 was 14 percent, and that the uninsured rates for CYs 2024 and 2025 were 8.5 percent and 8.8 percent, respectively (89 FR 36193). As required by section 1886(r)(2)(B)(ii) of the Act, the Chief Actuary of CMS certified these estimates. We refer readers to OACT's Memorandum on Certification of Rates of Uninsured prepared for the FY 2025 IPPS/LTCH PPS proposed rule for further details on the methodology and assumptions that were used in the projection of these rates of uninsurance.²⁰⁶

As with the CBO estimates on which we based Factor 2 for fiscal years before FY 2018, the NHEA estimates are for a calendar year. Under the approach originally adopted in the FY

²⁰⁶ <https://www.cms.gov/files/document/certification-rates-uninsured-2025-proposed-rule.pdf>.

2014 IPPS/LTCH PPS final rule, we have used a weighted average approach to project the rate of uninsurance for each fiscal year. We continue to believe that, in order to estimate the rate of uninsurance during a fiscal year accurately, Factor 2 should reflect the estimated rate of uninsurance that hospitals will experience during the fiscal year, rather than the rate of uninsurance during only one of the calendar years that the fiscal year spans. Accordingly, in the FY 2025 IPPS/LTCH PPS proposed rule, we proposed to continue to apply the weighted average approach used in past fiscal years to estimate this final rule's rate of uninsurance for FY 2025.

OACT certified the estimate of the rate of uninsurance for FY 2025 determined using this weighted average approach to be reasonable and appropriate for purposes of section 1886(r)(2)(B)(ii) of the Act. In the proposed rule (89 FR 36193), we noted that we may also consider the use of more recent data that may become available for purposes of estimating the rates of uninsurance used in the calculation of the final Factor 2 for FY 2025.

In the proposed rule, we outlined the calculation of the proposed Factor 2 for FY 2025 as follows:

- Percent of individuals without insurance for CY 2013: 14 percent.
- Percent of individuals without insurance for CY 2024: 8.5 percent.
- Percent of individuals without insurance for CY 2025: 8.8 percent.
- Percent of individuals without insurance for FY 2025: $(0.25 \text{ times } 0.085) + (0.75 \text{ times } 0.088) = 8.7 \text{ percent.}$
- Factor 2: $1 - |((0.14 - 0.087)/0.14)| = 1 - 0.3786 = 0.6214 \text{ (62.14 percent).}$

We proposed that Factor 2 for FY 2025 would be 62.14 percent.

The proposed FY 2025 uncompensated care amount was equivalent to proposed Factor 1 multiplied by proposed Factor 2, which was \$6,498,135,150.00.

We invited public comments on our proposed Factor 2 for FY 2025.

Comment: Most commenters discussed Factor 2 in the context of the impact of the temporary COVID-19 PHE provisions on the uninsured rate, such as the Families First

Coronavirus Response Act's Medicaid continuous coverage provision and the American Rescue Plan's Marketplace enhanced premium tax credits. Many large and small healthcare organizations and associations disagreed with CMS' estimates for the FY 2025 uninsured rate and urged OACT to update its estimate of Factor 2 to account for the projected increases in the number of uninsured individuals as Medicaid unwinding continues and Medicaid redeterminations continue to be processed.

A few commenters expressed their concern that the NHEA data source that CMS proposed to use for Factor 2 does not reflect current trends in the uninsured rate as the Medicaid continuous enrollment provisions unwind. Many commenters also indicated that they expect increases in the uninsured rates in their communities. Citing CMS' statement in the proposed rule that the agency could consider more recent data that may become available for the calculation of final Factor 2 for FY 2025, these commenters urged CMS to use more recent and accurate data sources to account for the anticipated increase in the uninsured rate. Considering the expiration of the COVID-19 PHE and the unwinding of the Medicaid continuous enrollment provisions, some of these commenters urged CMS to consider utilizing alternative data sources and calculations to ensure that the Factor 2 estimate accurately reflects the current coverage landscape, including uninsurance rates.

Several commenters referenced data sources and analyses, such as analyses by the Kaiser Family Foundation (KFF) and the Urban Institute, that project that at least 22 million individuals will lose their Medicaid coverage in FY 2024, with the number expected to grow in FY 2025. These commenters stated that they expect at least an additional 5.0 million uninsured individuals for processed redeterminations and an additional 1.7 million for those yet to be processed. Another commenter cited an analysis by the Alliance of Safety-Net Hospitals that indicated that there will be 32.5 million uninsured individuals in FY 2024, yielding an uninsurance rate of 9.6 percent for FY 2024. Accordingly, these commenters requested that CMS increase Factor 2 to reflect the anticipated increase in the uninsured population. A commenter recommended that

CMS consider implementing a one-time increase in the percentage used in Factor 2 to account for the lag in data and anticipated rise in the uninsured rate as Medicaid unwinding continues in FY 2025.

Several commenters indicated their support for CMS' proposed increases in FY 2025's Factor 2 and Medicare DSH uncompensated care payments, compared to the FY 2024 Factor 2 and Medicare DSH uncompensated care payments. Some commenters raised concerns regarding the proposed increase in uncompensated care payments for FY 2025, stating that an increase in uncompensated care payments in one year does not make up for underpayments in prior years. In addition, a few commenters asked CMS to increase the uncompensated care amount beyond the amount proposed in the FY 2025 IPPS/LTCH PPS proposed rule, while others urged CMS to increase the uncompensated care amount for community safety-net hospitals in particular given that these hospitals are already financially strained.

A commenter requested that CMS ensure that the assumptions used for the FY 2025 IPPS/LTCH PPS proposed rule's Factor 1 are internally consistent with the assumptions used in the FY 2025 IPPS/LTCH PPS proposed rule's Factor 2. This commenter noted that CMS estimated an 18.2 percentage point decline in Medicaid enrollment between FY 2023 and FY 2025 when calculating Factor 1 but did not account for the same decline in the number of Medicaid beneficiaries when estimating the uninsured rate in Factor 2.

Response: We thank the commenters for their input and diligence regarding the estimate of Factor 2 included in the proposed rule. In response to the comments concerning the NHEA data source used for calculating Factor 2 for FY 2025, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38197 and 38198) for a complete discussion of the NHEA and why we determined, and continue to believe, that it is the data source for the rate of uninsurance that, on balance, best meet all our considerations for ensuring that the data source meets the statutory requirement that the estimate be based on data from the Census Bureau, or other sources the Secretary determines appropriate. We continue to believe that the NHEA will

provide reasonable estimates for the rate of uninsurance that are available in conjunction with the IPPS rulemaking cycle.

In the FY 2025 IPPS/LTCH PPS proposed rule, we explained that we used the most recent available estimates from the NHEA at that time, and we refer readers to the relevant discussion in the proposed rule and OACT's Memorandum on Certification of Rates of Uninsured prepared for the proposed rule for further details on the methodology and assumptions used in the proposed rule's calculation of the projected uninsured rate. In brief, we indicated that our projection of the rates of uninsurance for CY 2024 and CY 2025 were from the latest NHEA historical data available and accounted for expected changes in enrollment across all categories of insurance coverage. Using estimates from the NHEA that were publicly available at the time of the proposed rule, OACT estimated the legislative impacts and effects of the COVID-19 PHE on insurance coverage when it developed the estimate of rates of uninsurance included in the proposed rule. We note, in particular, that OACT's estimates in the proposed rule considered the COVID-19 PHE provisions and the latest available Medicaid projections publicly available at that time.

In response to commenters who requested that we update the Factor 2 estimates and account for any anticipated changes in the uninsured rate using more recent or alternative data sources, in the proposed rule (89 FR 36193), we stated we may consider the use of more recent data that may become available for purposes of estimating the rates of uninsurance used in the calculation of the final Factor 2 for FY 2025. In this final rule, we are using the most recent NHEA estimates for the rate of uninsurance, which became available on June 12, 2024, and account for the legislative impacts of the expiration of the Families First Coronavirus Response Act's Medicaid continuous coverage provision, the extension of the American Rescue Plan's Marketplace enhanced premium tax credits via the Inflation Reduction Act, and the effects of the COVID-19 PHE on insurance coverage. Consistent with prior final IPPS/LTCH PPS rulemakings (*see, e.g.*, the FY 2024 IPPS/LTCH PPS final rule (88 FR 59000)), we are using the

updated NHEA data for the final Factor 2 calculation because we believe that it is the most appropriate measure of changes in the rate of uninsurance.

Based on these latest projections, we note that the insured share of the population is expected to have been 93.1 percent in CY 2023. In CY 2024, a decrease in Medicaid enrollment on an average monthly basis of 10.2 million enrollees is expected, with an additional decline of 1.6 million enrollees projected in CY 2025.²⁰⁷ Notably, many individuals who are being disenrolled as a result of Medicaid unwinding are expected to already have comprehensive coverage from another source (such as through an employer). Over 2023-2025, enrollment in direct-purchased insurance, a category of insurance that includes Marketplace qualified health plans, is projected to increase by a total of 8.3 million enrollees largely as a result of the Inflation Reduction Act's temporary extension of enhanced Marketplace subsidies and a temporary Special Enrollment Period for consumers losing Medicaid or Children's Health Insurance coverage due to Medicaid unwinding.

Regarding the commenter who expressed concerns that there may be a discrepancy between assumptions regarding Medicaid enrollment used in FY 2025 IPPS/LTCH PPS proposed rule's Factor 1 and Factor 2, we note that the Medicaid enrollment data used for purposes of uninsured rate projections use the most recent available calendar year data and are generally consistent with the Federal fiscal year data used for purposes of the Factor 1 estimates.²⁰⁸

These changes in enrollment, along with projected trends in other forms of coverage (e.g., employer-sponsored or direct purchase insurance), are expected to result in an insured share of the population of 92.7 percent in CY 2024 (a decrease from 93.1 percent in CY 2023)

²⁰⁸ The projected decline in Medicaid enrollment from its monthly peak (or the month in which enrollment is at its highest level) is larger than when it is calculated on an average monthly enrollment basis, which conceptually reflects the summation of the monthly enrollment estimates for a given year and divided by 12. As a result, comparisons of Medicaid enrollment across months, or for FY versus CY, can differ notably. This partly explains the Medicaid enrollment estimate differences in the assumptions regarding Medicaid enrollment used in the proposed rule's Factor 1 and 2.

and 92.3 percent in CY 2025. We note that the most recent NHEA projections anticipate that the uninsured population will increase from 22.8 million in CY 2023 and 24.4 million in CY 2024 to 26.1 million in CY 2025 and 29.6 million in CY 2026. The projected increase of the uninsured population in CY 2026 is related to the expiration of the enhanced Marketplace subsidies that year. For more detailed projections of health insurance enrollment that underlie the estimation of final Factor 2, we refer readers to NHEA's [Table 17 Health Insurance Enrollment and Enrollment Growth Rates](#). (Available on the CMS website at: <https://www.cms.gov/data-research/statistics-trends-and-reports/national-health-expenditure-data/projected>)

Regarding the comments requesting that CMS increase the uncompensated care amount for FY 2025, generally or for community safety-net hospitals in particular, we continue to believe that estimating Factor 2 based on the best available data is appropriate and consistent with the requirements of section 1886(r)(2)(B)(ii) of the Act.

Comment: Several commenters urged CMS to be transparent in the calculation of Factor 2 and how it accounts for the expiration of the Medicaid continuous enrollment provisions, while others urged CMS to be transparent regarding the data sources used for calculating Factor 2 and the assumptions behind the uninsured rate. Other commenters requested that CMS publish a detailed methodology on the calculation of the FY2025 proposed rule's Factor 2 and the NHEA projections.

Response: In response to the comments concerning transparency, we note that the accompanying OACT memo contains additional background describing the methods used to derive the FY 2025 rate of uninsured for this final rule²⁰⁹. We also note that section 1886(r)(2)(B)(ii) of the Act permits us to use a data source other than CBO estimates to determine the percent change in the rate of uninsurance beginning in FY 2018. As explained elsewhere in this section of this final rule, the NHEA data and methodology that were used to

²⁰⁹ OACT Memorandum on Certification of Rates of Uninsured. Available at: <https://www.cms.gov/medicare/medicare-fee-for-servicePayment/AcuteInpatientPPS/dsh>.

estimate Factor 2 for this final rule are transparent and best meet all of our considerations for ensuring reasonable estimates for the rate of uninsurance that are available in conjunction with the IPPS/LTCH PPS rulemaking cycle, and we have concluded it is appropriate to update the projection of the FY 2025 rate of uninsurance using the most recent NHEA data. For additional information on the projection of the uninsured, see page 28 of the projection's methodology documentation. (Available on the CMS website at: <https://www.cms.gov/research-statistics-data-and-systems/statistics-trends-and-reports/nationalhealthexpenddata/downloads/projectionmethodology.pdf>).

After consideration of the public comments we received, we are updating the calculation of Factor 2 for FY 2025 to incorporate more recent data from NHEA. The final estimates of the percent of uninsured individuals have been certified by the Chief Actuary of CMS. We note that the CY 2024 and CY 2025 uninsurance rates are projected to be higher than CY 2023's partly because of the expiration of the Medicaid continuous enrollment provisions and the projected declines in Medicaid enrollment in CY 2024 and CY 2025, which are also larger in the final rule than in the proposed rule. However, the lower projected rates of uninsurance in CY 2024 and CY 2025 in the final rule relative to the proposed rule largely reflect higher expected enrollment in direct-purchase insurance in those years. This higher expected enrollment is associated with enrollment in Marketplace plans and is related to i) the Inflation Reduction Act's extension of the American Rescue Plan Act's enhanced Marketplace premium subsidies through 2025 and ii) a Special Enrollment Period open to those who are no longer eligible for Medicaid coverage due to state-based redeterminations.

The calculation of the final Factor 2 for FY 2025 using a weighted average of OACT's updated projections for CY 2024 and CY 2025 is as follows:

- Percent of individuals without insurance for CY 2013: 14.0 percent
- Percent of individuals without insurance for CY 2024: 7.3 percent
- Percent of individuals without insurance for CY 2025: 7.7 percent

- Percent of individuals without insurance for FY 2025: $(0.25 \text{ times } 0.073) + (0.75 \text{ times } 0.077) = 7.6 \text{ percent}$
- Factor 2: $1 - |((0.076 - 0.14) / 0.14)| = 1 - 0.457 = 0.5429 \text{ (54.29 percent)}$

Therefore, the final Factor 2 for FY 2025 is 54.29 percent. The final FY 2025 uncompensated care amount is $\$10,509,750,000 * 0.5429 = \$5,705,743,275$.

Final FY 2025 Uncompensated Care Amount	\$ 5,705,743,275
--	------------------

3. Calculation of Factor 3 for FY 2025

a. General Background

Section 1886(r)(2)(C) of the Act defines Factor 3 in the calculation of the uncompensated care payment. As we have discussed earlier, section 1886(r)(2)(C) of the Act states that Factor 3 is equal to the percent, for each subsection (d) hospital, that represents the quotient of: (1) the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data (including, in the case where the Secretary determines alternative data are available that are a better proxy for the costs of subsection (d) hospitals for treating the uninsured, the use of such alternative data)); and (2) the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act for such period (as so estimated, based on such data).

Therefore, Factor 3 is a hospital-specific value that expresses the proportion of the estimated uncompensated care amount for each subsection (d) hospital and each subsection (d) Puerto Rico hospital with the potential to receive Medicare DSH payments relative to the estimated uncompensated care amount for all hospitals estimated to receive Medicare DSH payments in the fiscal year for which the uncompensated care payment is to be made. Factor 3 is applied to the product of Factor 1 and Factor 2 to determine the amount of the uncompensated care payment that each eligible hospital will receive for FY 2014 and subsequent fiscal years. In order to implement the statutory requirements for this factor of the uncompensated care payment formula, it was necessary for us to determine: (1) the definition of uncompensated care or, in other words, the specific items that are to be included in the numerator (that is, the estimated uncompensated care amount for an individual hospital) and the denominator (that is, the estimated uncompensated care amount for all hospitals estimated to receive Medicare DSH payments in the applicable fiscal year); (2) the data source(s) for the estimated uncompensated care amount; and (3) the timing and manner of computing the quotient for each hospital estimated to receive Medicare DSH payments. The statute instructs the Secretary to estimate the

amounts of uncompensated care for a period based on appropriate data. In addition, we note that the statute permits the Secretary to use alternative data in the case where the Secretary determines that such alternative data are available that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured. For a discussion of the methodology, we used to calculate Factor 3 for fiscal years 2014 through 2022, we refer readers to the FY 2024 IPPS/LTCH final rule (88 FR 59001 and 59002).

b. Background on the Methodology Used to Calculate Factor 3 for FY 2023 and Subsequent Years

Section 1886(r)(2)(C) of the Act governs the selection of the data to be used in calculating Factor 3 and allows the Secretary the discretion to determine the time periods from which we will derive the data to estimate the numerator and the denominator of the Factor 3 quotient. Specifically, section 1886(r)(2)(C)(i) of the Act defines the numerator of the quotient as the amount of uncompensated care for a subsection (d) hospital for a period selected by the Secretary. Section 1886(r)(2)(C)(ii) of the Act defines the denominator as the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act for such period. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50634 through 50647), we adopted a process of making interim payments with final cost report settlement for both the empirically justified Medicare DSH payments and the uncompensated care payments required by section 3133 of the Affordable Care Act. Consistent with that process, we also determined the time period from which to calculate the numerator and denominator of the Factor 3 quotient in a way that would be consistent with making interim and final payments. Specifically, we must have Factor 3 values available for hospitals that we estimate will qualify for Medicare DSH payments for a fiscal year and for those hospitals that we do not estimate will qualify for Medicare DSH payments for that fiscal year but that may ultimately qualify for Medicare DSH payments for that fiscal year at the time of cost report settlement.

As described in the FY 2022 IPPS/LTCH PPS final rule, commenters expressed concerns that the use of only 1 year of data to determine Factor 3 would lead to significant variations in year-to-year uncompensated care payments. Some stakeholders recommended the use of 2 years of historical data from Worksheet S-10 data of the Medicare cost report (86 FR 45237). In the FY 2022 IPPS/LTCH PPS final rule, we stated that we would consider using multiple years of data when the vast majority of providers had been audited for more than 1 fiscal year under the revised reporting instructions. Audited FY 2019 cost reports were available for the development of the FY 2023 IPPS/LTCH PPS proposed and final rules. Feedback from previous audits and lessons learned were incorporated into the audit process for the FY 2019 reports.

In consideration of the comments discussed in the FY 2022 IPPS/LTCH PPS final rule, in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49036 through 49047), we finalized a policy of using a multi-year average of audited Worksheet S-10 data to determine Factor 3 for FY 2023 and subsequent fiscal years. We explained our belief that this approach would be generally consistent with our past practice of using the most recent single year of audited data from the Worksheet S-10, while also addressing commenters' concerns regarding year-to-year fluctuations in uncompensated care payments. Under this policy, we used a 2-year average of audited FY 2018 and FY 2019 Worksheet S-10 data to calculate Factor 3 for FY 2023. We also indicated that we expected FY 2024 would be the first year that 3 years of audited data would be available at the time of rulemaking. For FY 2024 and subsequent fiscal years, we finalized a policy of using a 3-year average of the uncompensated care data from the 3 most recent fiscal years for which audited data are available to determine Factor 3. Consistent with the approach that we followed when multiple years of data were previously used in the Factor 3 methodology, if a hospital does not have data for all 3 years used in the Factor 3 calculation, we will determine Factor 3 based on an average of the hospital's available data. For IHS and Tribal hospitals and Puerto Rico hospitals, we use the same multi-year average of Worksheet S-10 data to determine Factor 3 for FY 2024 and subsequent fiscal years as is used to determine Factor 3 for all other

DSH-eligible hospitals (in other words, hospitals eligible to receive empirically justified Medicare DSH payments for a fiscal year) to determine Factor 3.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49033 through 49047), we also modified our policy regarding cost reports that start in one fiscal year and span the entirety of the following fiscal year. Specifically, in the rare cases when we use a cost report that starts in one fiscal year and spans the entirety of the subsequent fiscal year to determine uncompensated care costs for the subsequent fiscal year, we would not use the same cost report to determine the hospital's uncompensated care costs for the earlier fiscal year. We explained that using the same cost report to determine uncompensated care costs for both fiscal years would not be consistent with our intent to smooth year-to-year variation in uncompensated care costs. As an alternative, we finalized our proposal to use the hospital's most recent prior cost report, if that cost report spans the applicable period.²¹⁰

(1) Scaling Factor

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 59003), we continued the policy finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49042) to address the effects of calculating Factor 3 using data from multiple fiscal years, in which we apply a scaling factor to the Factor 3 values calculated for all DSH-eligible hospitals so that total uncompensated care payments to hospitals that are projected to be DSH-eligible for a fiscal year will be consistent with the estimated amount available to make uncompensated care payments for that fiscal year. Pursuant to that policy, we divide 1 (the expected sum of all DSH-eligible hospitals' Factor 3 values) by the actual sum of all DSH-eligible hospitals' Factor 3 values and then multiply the quotient by the uncompensated care payment determined for each DSH-eligible hospital to obtain a scaled uncompensated care payment amount for each hospital. This process is designed

²¹⁰ For example, in determining Factor 3 for FY 2023, we did not use the same cost report to determine a hospital's uncompensated care costs for both FY 2018 and FY 2019. Rather, we used the cost report that spanned the entirety of FY 2019 to determine uncompensated care costs for FY 2019 and used the hospital's most recent prior cost report to determine its uncompensated care costs for FY 2018, provided that cost report spanned some portion of FY 2018.

to ensure that the sum of the scaled uncompensated care payments for all hospitals that are projected to be DSH-eligible is consistent with the estimate of the total amount available to make uncompensated care payments for the applicable fiscal year.

(2) New Hospital Policy for Purposes of Factor 3

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 59003), we continued our new hospital policy that was modified in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49042) and initially adopted in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42370 through 42371) to determine Factor 3 for new hospitals. Consistent with our policy of using multiple years of cost reports to determine Factor 3, we defined new hospitals as hospitals that do not have cost report data for the most recent year of data being used in the Factor 3 calculation. Under this definition, the cut-off date for the new hospital policy is the beginning of the fiscal year after the most recent year for which audits of the Worksheet S-10 data have been conducted. For FY 2024, the FY 2020 cost reports were the most recent year of cost reports for which audits of Worksheet S-10 data had been conducted. Thus, hospitals with CMS Certification Numbers (CCNs) established on or after October 1, 2020, were subject to the new hospital policy for FY 2024.

Under our modified new hospital policy, if a new hospital has a preliminary projection of being DSH-eligible based on its most recent available disproportionate patient percentage, it may receive interim empirically justified DSH payments. However, new hospitals will not receive interim uncompensated care payments because we would have no uncompensated care data on which to determine what those interim payments should be. The MAC will make a final determination concerning whether the hospital is eligible to receive Medicare DSH payments at cost report settlement. In FY 2024, while we continued to determine the numerator of the Factor 3 calculation using the new hospital's uncompensated care costs reported on Worksheet S-10 of the hospital's cost report for the current fiscal year, we determined Factor 3 for new hospitals using a denominator based solely on uncompensated care costs from cost reports for the most recent fiscal year for which audits have been conducted. In addition, we applied a scaling factor

to the Factor 3 calculation for a new hospital.²¹¹

(3) Newly Merged Hospital Policy

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 59004), we continued our policy of treating hospitals that merge after the development of the final rule for the applicable fiscal year similar to new hospitals. As explained in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50021), for these newly merged hospitals, we do not have data currently available to calculate a Factor 3 amount that accounts for the merged hospital's uncompensated care burden. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50021 and 50022), we finalized a policy under which Factor 3 for hospitals that we do not identify as undergoing a merger until after the public comment period and additional review period following the publication of the final rule or that undergo a merger during the fiscal year will be recalculated similar to new hospitals.

Consistent with the policy adopted in the FY 2015 IPPS/LTCH PPS final rule, in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59004), we stated that we would continue to treat newly merged hospitals in a similar manner to new hospitals, such that the newly merged hospital's final uncompensated care payment will be determined at cost report settlement where the numerator of the newly merged hospital's Factor 3 will be based on the cost report of only the surviving hospital (that is, the newly merged hospital's cost report) for the current fiscal year. However, if the hospital's cost reporting period includes less than 12 months of data, the data from the newly merged hospital's cost report will be annualized for purposes of the Factor 3 calculation. Consistent with the methodology used to determine Factor 3 for new hospitals described in section IV.E.3. of the preamble of this final rule, we continued our policy for determining Factor 3 for newly merged hospitals using a denominator that is the sum of the uncompensated care costs for all DSH-eligible hospitals, as reported on Worksheet S-10 of their cost reports for the most recent fiscal year for which audits have been conducted. In addition,

²¹¹ In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49042), we explained our belief that applying the scaling factor is appropriate for purposes of calculating Factor 3 for all hospitals, including new hospitals and hospitals that are treated as new hospitals, to improve consistency and predictability across all hospitals.

we apply a scaling factor, as discussed in section IV.E.3. of the preamble of this final rule, to the Factor 3 calculation for a newly merged hospital. In the FY 2024 IPPS/LTCH PPS final rule, we explained that consistent with past policy, interim uncompensated care payments for the newly merged hospital would be based only on the data for the surviving hospital's CCN available at the time of the development of the final rule.

(4) CCR Trim Methodology

The calculation of a hospital's total uncompensated care costs on Worksheet S-10 requires the use of the hospital's cost to charge ratio (CCR). In the FY 2024 IPPS/LTCH PPS final rule (88 FR 59004 through 59005), we continued the policy of trimming CCRs, which we adopted in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49043), for FY 2024. Under this policy, we apply the following steps to determine the applicable CCR separately for each fiscal year that is included as part of the multi-year average used to determine Factor 3:

Step 1: Remove Maryland hospitals. In addition, we will remove all-inclusive rate providers because their CCRs are not comparable to the CCRs calculated for other IPPS hospitals.

Step 2: Calculate a CCR "ceiling" for the applicable fiscal year with the following data: for each IPPS hospital that was not removed in Step 1 (including hospitals that are not DSH-eligible), we use cost report data to calculate a CCR by dividing the total costs on Worksheet C, Part I, Line 202, Column 3 by the charges reported on Worksheet C, Part I, Line 202, Column 8. (Combining data from multiple cost reports from the same fiscal year is not necessary, as the longer cost report will be selected.) The ceiling is calculated as 3 standard deviations above the national geometric mean CCR for the applicable fiscal year. This approach is consistent with the methodology for calculating the CCR ceiling used for high-cost outliers. Remove all hospitals that exceed the ceiling so that these aberrant CCRs do not skew the calculation of the statewide average CCR.

Step 3: Using the CCRs for the remaining hospitals in Step 2, determine the urban and

rural statewide average CCRs for the applicable fiscal year for hospitals within each State (including hospitals that are not DSH-eligible), weighted by the sum of total hospital discharges from Worksheet S-3, Part I, Line 14, Column 15.

Step 4: Assign the appropriate statewide average CCR (urban or rural) calculated in Step 3 to all hospitals, excluding all-inclusive rate providers, with a CCR for the applicable fiscal year greater than 3 standard deviations above the national geometric mean for that fiscal year (that is, the CCR “ceiling”).

Step 5: For hospitals that did not report a CCR on Worksheet S-10, Line 1, we assign them the statewide average CCR for the applicable fiscal year as determined in step 3.

After completing these steps, we re-calculate the hospital’s uncompensated care costs (Line 30) for the applicable fiscal year using the trimmed CCR (the statewide average CCR (urban or rural, as applicable)).

(5) Uncompensated Care Data Trim Methodology

After applying the CCR trim methodology, there are rare situations where a hospital has potentially aberrant uncompensated care data for a fiscal year that are unrelated to its CCR. Therefore, under the trim methodology for potentially aberrant uncompensated care costs (UCC) that was included as part of the methodology for purposes of determining Factor 3 in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58832), if the hospital’s uncompensated care costs for any fiscal year that is included as a part of the multi-year average are an extremely high ratio (greater than 50 percent) of its total operating costs in the applicable fiscal year, we will determine the ratio of uncompensated care costs to the hospital’s total operating costs from another available cost report, and apply that ratio to the total operating expenses for the potentially aberrant fiscal year to determine an adjusted amount of uncompensated care costs for the applicable fiscal year.²¹²

²¹² For example, if a hospital’s FY 2018 cost report is determined to include potentially aberrant data, data from its FY 2019 cost report would be used for the ratio calculation.

However, we note that we have audited the Worksheet S-10 data that will be used in the Factor 3 calculation for a number of hospitals. Because the UCC data for these hospitals have been subject to audit, we believe that there is increased confidence that if high uncompensated care costs are reported by these audited hospitals, the information is accurate. Therefore, as we explained in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58832), we determined it is unnecessary to apply the UCC trim methodology for a fiscal year for which a hospital's UCC data have been audited.

In rare cases, hospitals that are not currently projected to be DSH-eligible and that do not have audited Worksheet S-10 data may have a potentially aberrant amount of insured patients' charity care costs (line 23 column 2). In the FY 2024 IPPS/LTCH PPS final rule (88 FR 59004), we stated that in addition to the UCC trim methodology, we will continue to apply an alternative trim specific to certain hospitals that do not have audited Worksheet S-10 data for one or more of the fiscal years that are used in the Factor 3 calculation. For FY 2023 and subsequent fiscal years, in the rare case that a hospital's insured patients' charity care costs for a fiscal year are greater than \$7 million and the ratio of the hospital's cost of insured patient charity care (line 23 column 2) to total uncompensated care costs (line 30) is greater than 60 percent, we will not calculate a Factor 3 for the hospital at the time of proposed or final rulemaking. This trim will only impact hospitals that are not currently projected to be DSH-eligible; and therefore, are not part of the calculation of the denominator of Factor 3, which includes only uncompensated care costs for hospitals projected to be DSH-eligible. Consistent with the approach adopted in the FY 2022 IPPS/LTCH PPS final rule, if a hospital would be trimmed under both the UCC trim methodology and this alternative trim, we will apply this trim in place of the existing UCC trim methodology. We continue to believe this alternative trim more appropriately addresses potentially aberrant insured patient charity care costs compared to the UCC trim methodology, because the UCC trim is based solely on the ratio of total uncompensated care costs to total operating costs and does not consider the level of insured patients' charity care costs.

Similar to the approach initially adopted in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45245 and 45246), in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59005), we also stated that we would continue to use a threshold of 3 standard deviations from the mean ratio of insured patients' charity care costs to total uncompensated care costs (line 23 column 2 divided by line 30) and a dollar threshold that is the median total uncompensated care cost reported on most recent audited cost reports for hospitals that are projected to be DSH-eligible. We stated that we continued to believe these thresholds are appropriate to address potentially aberrant data. We also continued to include Worksheet S-10 data from IHS/Tribal hospitals and Puerto Rico hospitals consistent with our policy finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49047 through 49051). In addition, we continued our policy adopted in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49044) of applying the same threshold amounts originally calculated for the FY 2018 reports to identify potentially aberrant data for FY 2024 and subsequent fiscal years to facilitate transparency and predictability. If a hospital subject to this trim is determined to be DSH-eligible at cost report settlement, the MAC will calculate the hospital's Factor 3 using the same methodology used to calculate Factor 3 for new hospitals.

c. Methodology for Calculating Factor 3 for FY 2025

For FY 2025, consistent with § 412.106(g)(1)(iii)(C)(II), we are following the same methodology as applied in FY 2024 and described in the previous section of this final rule to determine Factor 3 using the most recent 3 years of audited cost reports, from FY 2019, FY 2020, and FY 2021. Consistent with our approach for FY 2024, for FY 2025, we are also applying the scaling factor, new hospital, newly merged hospital, CCR trim methodology, UCC trim, and alternative trim methodology policies discussed in the previous section of this final rule. For purposes of the FY 2025 IPPS/LTCH PPS proposed rule, we used reports from the December 2023 HCRIS extract to calculate Factor 3. In the proposed rule, we noted that we intended to use the March 2024 update of HCRIS to calculate the final Factor 3 for the FY 2025 IPPS/LTCH PPS final rule.

Thus, for FY 2025, we will use 3 years of audited Worksheet S-10 data to calculate Factor 3 for all eligible hospitals, including IHS and Tribal hospitals and Puerto Rico hospitals that have a cost report for 2013, following these steps:

Step 1: Select the hospital's longest cost report for each of the most recent 3 years of fiscal year (FY) audited cost reports (FY 2019, FY 2020, and FY 2021). Alternatively, in the rare case when the hospital has no cost report for a particular year because the cost report for the previous fiscal year spanned the more recent fiscal year, the previous fiscal year cost report will be used in this step. In the rare case that using a previous fiscal year cost report results in a period without a report, we would use the prior year report, if that cost report spanned the applicable period.²¹³ In general, we note that, for purposes of the Factor 3 methodology, references to a fiscal year cost report are to the cost report that spans the relevant fiscal year.

Step 2: Annualize the UCC from Worksheet S-10 Line 30, if a cost report is more than or less than 12 months. (If applicable, use the statewide average CCR (urban or rural) to calculate uncompensated care costs.)

Step 3: Combine adjusted and/or annualized uncompensated care costs for hospitals that merged using the merger policy.

Step 4: Calculate Factor 3 for all DSH-eligible hospitals using annualized uncompensated care costs (Worksheet S-10 Line 30) based on cost report data from the most recent 3 years of audited cost reports (from Step 1, 2 or 3). New hospitals and other hospitals that are treated as if they are new hospitals for purposes of Factor 3 are excluded from this calculation.

Step 5: Average the Factor 3 values from Step 4; that is, add the Factor 3 values, and divide that amount by the number of cost reporting periods with data to compute an average Factor 3 for the hospital. Multiply by a scaling factor, as discussed in the previous section of this

²¹³ For example, if a hospital does not have a FY 2020 cost report because the hospital's FY 2019 cost report spanned the FY 2020 time period, we will use the FY 2019 cost report that spanned the FY 2020 time period for this step. Using the same example, where the hospital's FY 2019 report is used for the FY 2020 time period, we will use the hospital's FY 2018 report if it spans some of the FY 2019 time period. We will not use the same cost report for both the FY 2020 and the FY 2019 time periods.

final rule.

We received comments regarding the definition of uncompensated care costs for purposes of the Factor 3 calculation, Worksheet S-10 cost report audits, the newly merged hospitals policy, and our Factor 3 calculation instructions.

Comment: Several commenters expressed their support for CMS' proposal to calculate Factor 3 for FY 2025 based on a three-year average of audited FY 2019, FY 2020, and FY 2021 Worksheet S-10 data and to use a three-year average of uncompensated care data from the 3 most recent fiscal years for which audited data are available to determine Factor 3 in subsequent fiscal years. Commenters specified that the use of a multi-year average of Worksheet S-10 data minimizes year-to-year volatility in uncompensated care payments. For example, commenters mentioned that use of a three-year average will smooth out significant fluctuations in the data across the COVID-19 PHE years. A commenter noted their long-standing support for using audited Worksheet S-10 data to calculate Factor 3, which they stated promotes an accurate and consistent calculation of uncompensated care costs.

Response: We are grateful to those commenters who expressed their support for our methodology of using a three-year average of audited FY 2019, FY 2020, and FY 2021 Worksheet S-10 data to calculate Factor 3 for FY 2025. As explained in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36194, we believe that using a multi-year average of Worksheet S-10 data will help provide assurance that hospitals' uncompensated care payments remain stable and are not subject to unpredictable swings and anomalies in a hospital's uncompensated care costs.

Comment: A commenter suggested alternative approaches to the uncompensated care payment calculation outside of the scope of methodological concepts concerning the blending of historical Worksheet S-10 data. The commenter recommended that CMS monitor changes in uncompensated care reported during the COVID-19 PHE to ensure Worksheet S-10 data accuracy and avoid large redistributions of Medicare DSH funding away from essential

hospitals.

Response: With regard to the commenter's suggestions unrelated to the previously discussed methodological concepts for the blending of historical Worksheet S-10 data, we consider these public comments to be outside the scope of the proposed rule, and we are not addressing them in this final rule. However, we appreciate the commenter's input and note that we may address it and other considerations in future rulemaking.

Comment: A few commenters suggested approaches to mitigate the impact of the COVID-19 PHE on the three-year average of Worksheet S-10 data. A few commenters recommended that CMS exclude FY 2020 data entirely from FY 2025 DSH calculations and instead use FY 2019, FY 2021, and FY 2022 data, as FY 2020 data is flawed due to the impacts of the COVID-19 PHE. The same commenters stated that FY 2020 data should be excluded from FY 2025 DSH calculations because it was excluded from most quality reporting metrics. A commenter encouraged CMS to regularly assess and identify any unusual trends in the Worksheet S-10 data. Another commenter expressed concern about the use of FY 2021 and FY 2022 data to calculate Factor 3 and requested that CMS lessen the effect of any large reductions in uncompensated care costs due to the COVID-19 PHE. The same commenter suggested that CMS ensure that its use of FY 2020 and FY 2021 Worksheet S-10 data for purposes of determining Factor 3 for FY 2025 does not reduce Factor 3 amounts for essential health systems. One commenter requested that CMS refine its methodology to calculate Factor 3 to account for changes in uncompensated care costs and recommended that CMS mitigate the effect of anomalies in the cost report data for the COVID-19 PHE period.

Response: Regarding requests for CMS to mitigate the impact of the COVID-19 PHE on the three-year average of Worksheet S-10 cost report data, we note that we will continue to use the three-year average of the most recently audited cost report data to determine Factor 3 for FY 2025 and subsequent years, consistent with the policy finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49038) and § 412.106(g)(1)(iii)(C)(II). In response to the comments requesting

that we exclude FY 2020 data, we continue to believe that using the three-year average will smooth the variation in year-to-year uncompensated care payments and lessen the impacts of the COVID-19 PHE and future unforeseen events. We also note that the calculations for Factor 1 and Factor 2 for FY 2025 reflect the estimated impact of the COVID-19 PHE on DSH payments. Further, we anticipate that there will be less fluctuation in cost report data as the PHE disruptions on healthcare utilization stabilize. In response to the commenters who encouraged CMS to regularly assess and identify any unusual trends in the Worksheet S-10 data and recommended that CMS mitigate the effect of anomalies in the cost report data for the COVID-19 PHE period, we note that the audit process for Worksheet S-10 cost reports will continue to be an important part of identifying potential irregularities in the data. We will continue to monitor the impacts of the PHE and will consider this issue further in future rulemaking, as appropriate.

Comment: A commenter recommended changes to the definition of uncompensated care costs and requested that CMS ensure its Factor 3 calculation methodology accurately captures the full range of uncompensated care costs that hospitals incur while providing care for disadvantaged patients. This commenter urged CMS to include all patient care costs in the cost-to-charge ratio (CCR), including teaching costs and costs for providing physician and other professional services, to ensure an accurate distribution of uncompensated care payments to hospitals with the highest levels of uncompensated care. This commenter stated that excluding Graduate Medical Education (GME) costs when calculating the CCR disproportionately impacts teaching hospitals. This commenter further suggested that CMS treat the unreimbursed portion of state or local indigent care as charity care. Finally, the commenter suggested that CMS revise the Worksheet S-10 data collected on Medicaid shortfalls to better capture actual shortfalls incurred by hospitals by allowing hospitals to deduct intergovernmental transfers (IGTs), certified public expenditures (CPEs), and provider taxes from their Medicaid revenue.

Response: We appreciate the commenter's suggestions for revisions and/or modifications to Worksheet S-10. We will consider modifications as necessary to further improve and refine

the information that is reported on Worksheet S-10 to support collection of the information regarding uncompensated care costs.

Regarding the request to include costs for teaching and providing physician and other professional services, including GME costs, when calculating the CCR, we note that because the CCR on Line 1 of Worksheet S-10 is obtained from Worksheet C, Part I, and is also used in other IPPS rate setting contexts (such as high-cost outliers and the calculation of the MS-DRG relative weights) from which it is appropriate to exclude the costs associated with physician and professional services and GME costs, we remain reluctant to adjust CCRs in the narrower context of calculating uncompensated care costs. Therefore, as stated in past final rules, including the FY 2022 IPPS/LTCH PPS final rule (86 FR 45241 and 45242) and the FY 2023 IPPS/LTCH PPS final rule (87 FR 49039), we continue to believe that it is not appropriate to modify the calculation of the CCR on Line 1 of Worksheet S-10 to include any additional costs in the numerator of the CCR calculation.

With regard to the comments requesting that payment shortfalls from Medicaid and state and local indigent care programs be included in uncompensated care cost calculations, we have consistently explained in past final rules (*see, e.g.*, the FY 2021 IPPS/LTCH PPS final rule (85 FR 58826), the FY 2022 IPPS/LTCH PPS final rule (86 FR 45238), and the FY 2023 IPPS/LTCH PPS final rule (87 FR 49039)), in response to similar comments that we believe there are compelling arguments for excluding such shortfalls from the definition of uncompensated care. We refer readers to those prior rules for further discussion.

Comment: A commenter expressed concern that insufficient Medicare DSH uncompensated care payments threaten to hamper CMS' focus on health equity efforts across certain programs, stating their belief that failing to keep pace with the need for uncompensated care resources affects safety-net hospitals that serve a disproportionate share of patients who experience inequitable health outcomes.

Response: We thank the commenter for their concern regarding the impact of the

distribution of uncompensated care payments on health equity efforts generally, and on safety-net hospitals, in particular. We may consider this issue in future rulemaking, as appropriate.

Comment: Several commenters reiterated support for using audited Worksheet S-10 data to promote accuracy and consistency. They stated that use of audited Worksheet S-10 data results in uncompensated care data that is most appropriate for use in calculating uncompensated care payments. A commenter encouraged CMS to continue auditing Worksheet S-10 data to ensure the most accurate information is used to calculate Factor 3. Another commenter commended CMS' revisions to the Worksheet S-10 audit protocols, stating that recent audits have been less resource intensive for hospitals compared to prior audit cycles, and that the adjustments after review were largely as expected or as requested.

Other commenters proposed changes to the Worksheet S-10 audit process. For example, a commenter requested that CMS disseminate a comprehensive audit policy and protocols that must be employed by all auditors and MACs and disclose these through notice and comment rulemaking. The same commenter reiterated a previous request made in prior comments that CMS implement a workable appeal or review process to correct errors and inconsistent audit disallowances in a timely manner. A commenter encouraged CMS to work with auditors to streamline the audit process and improve consistency. Another commenter requested that CMS make audit protocols publicly available and ensure that Worksheet S-10 audits impose minimal burden and are equitable and uniform across hospitals.

Response: We thank commenters for their feedback on the audits of the FY 2021 Worksheet S-10 data and their recommendations for future audits, as well as their support for the changes CMS has made to the Worksheet S-10 audit protocols. As we have stated in previous rulemakings in response to comments regarding audit protocols (*see, e.g.*, the FY 2024 IPPS/LTCH PPS final rule (88 FR 59008)), the audit protocols are provided to the MACs in advance of the audit to ensure consistency and timeliness in the audit process. CMS began auditing the FY 2021 Worksheet S-10 data for selected hospitals last year so that the audited

uncompensated care data for these hospitals would be available in time for use in the FY 2025 IPPS/LTCH PPS proposed rule. We chose to focus the audit on the FY 2021 cost reports in order to maximize the available audit resources. We also note that FY 2021 data are the most recent year of audited data under the revised cost report instructions that became effective on October 1, 2018.

We appreciate all commenters' input and recommendations on how to improve our audit process and reiterate our commitment to continue working with MACs and providers on audit improvements, which include making changes to increase the efficiency of the audit process, building on the lessons learned in previous audit years. We will take commenters' recommendations into consideration for future rulemaking.

Regarding the request to make public the audit policies and protocols, as we previously explained in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59008), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58822), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42368), and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56964) we do not make our protocols public as CMS desk review and audit protocols are confidential and are for CMS and MAC use only. In addition, there is no requirement under either the Administrative Procedure Act or the Medicare statute that CMS adopt audit policies or protocols through notice and comment rulemaking. As previously discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 59008) and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58822), to most efficiently and appropriately utilize our limited audit resources, we do not plan on introducing an audit appeal process at this time.
